ABBREVIATIONS

The titles of subjects, which are printed first in bold type, have been abbreviated within each article to the initial letter or letters.

ac., acre(s).
agric., agricultural.
ambas., ambassador(s).
Amer., American.
anct., ancient.
ann., annual.
arron., arrondissement.
A.-S., Anglo-Saxon.
A.V., Authorised Version.
b., born.
Biog. Dic., Biographical Dictionary.
bor., borough.
bp., birthplace.
Brit., British.
c., about.
C., Centigrade.
cap., capital.
cent., century (7th cent.).
chem., chemistry.
co., county.
com., commune.
cub. ft., cubic feet.
d., died.
Dan., Danish.
dept., department.
dimin., diminutive.
dist., district.
div., division.
E., east; eastern.
eccles., ecclesiastical.
ed., edition; edited.
educ., educated.
e.g., example.
Ency. Brit., *Encyclopædia Britannica*.
Eng., English.
estab., established; establishment.
fl., flourished.
Flem., Flemish.
fort. tn., fortified town.
Fr., French.
ft., feet.
Ger., German.
Gk., Greek.
gov., government.
Heb., Hebrew.
hist., history.
horticult., horticultural.
h.p., horse-power.
H.Q., headquarters.
hr(s), hour(s).
in., inch(es).
inhab., inhabitant(s).
is., island(s).
It., Italian.
Jap., Japanese.
jour., journal.
Lat., Latin.

lat., latitude.
lb., pound(s).
l. b., left bank.
long., longitude.
m., mile(s).
manuf., manufacture.
M.E., Middle English.
min., minute(s).
Mod. E., Modern English.
m.p.h., miles per hour.
mrkt tn., market town.
MS., MSS., manuscript(s).
mt, mts., mount, mountain(s).
N., north; northern.
N.T., New Testament.
O.E., Old English.
O.F., Old French.
O.T., Old Testament.
oz., ounce(s).
par., parish.
parl., parliamentary.
pop., population.
prin., principal.
prof., professor.
prov., province; provincial.
pub., published; publication.
R., river.
R.A.F., Royal Air Force.
R.B., bank.
rep., republic.
Rep. of Ireland, Eire.
R.N., Royal Navy.
Rom., Roman.
r.p.m., revolutions per minute.
R.V., Revised Version.
S., south; southern.
sec., second(s).
sev., several.
Sp., Spanish.
sp. gr., specific gravity.
sq. m., square miles.
temp., temperature.
ter., territory.
tn., town.
trans., translated, translation.
trib., tributary.
U.K., United Kingdom.
U.N., United Nations.
univ., university.
U.N.O., United Nations Organisation.
urb., urban.
U.S.A., United States of America.
vil., village.
vol., volume.
W., west; western.
Wm., William.
yd(s), yard(s).

E

Enabling Act, see CHURCH ASSEMBLY.

Enamel is, in the strict sense, the vitreous glaze or glazes fused on the surface of metallic objects and is a general term applied to objects decorated in this way. E., a soft glass, is a compound of sand or flint, soda potash, and red lead, which when melted produce a colourless, clear material called flux. While in a state of fusion, oxides of metals are added

Konklia, Cyprus, which have true *cloisonné* enamelling, i.e. E. fused in cells formed by thin metal strips bent to the outline of the pattern and soldered to the metal base. Outside Mycenaean and Gk art, the most ancient examples are bronze ornaments of the 9th cent. BC from a cemetery at Koban in the Caucasus. From the 3rd cent. BC Celtic craftsmen substituted red E. for coral, as on the

British Museum

AN ENAMEL PANEL SHOWING ST ANTHONY AND THE ARCHER, BY
LEONARD LIMOUSIN, 1536

The arms shown are those of Jean de Langeac, Bishop of Limoges, 1532-41.

to colour it, which stain the flux throughout its mass. The E., after being stirred, is poured on to a slab in cakes of about 5 in. in diameter. E. is made in varying degrees of hardness, and the harder the E. the greater the heat required to fuse it and the greater the durability. The cakes of E. are broken up and ground to powder in a mortar, washed, and spread on the metal. The object is then placed in a furnace until the powdered E. fuses with its metal base.

History.—It is not known when E.s were first made, for as yet none has been found belonging to the time of the Assyrians or Phoenicians. The earliest examples are 6 gold rings, found in a Mycenaean tomb of the 13th cent. BC at

Witham Shield (now in the Brit. Museum), where is used the technique of *champlevé* enamelling, i.e. E. fused in troughs or cells cut out in the metal baseplate. E.s were made in the N. provs. of the Rom. empire and re-appear in the 6th cent. AD in A.-S. England, e.g. in the Sutton Hoo Ship Burial (now in the Brit. Museum). The great revival of *cloisonné* E. commenced in Constantinople in the 10th cent. AD. The masterpiece of this Byzantine E. is the Pala d'Oro in St Mark's, Venice. In the 12th cent. a new style in the *champlevé* technique was begun in the valleys of the Rhine and Meuse, at Limoges in France and also in N. Spain. The undoubted masterpiece of this period is the pulpit at Klosterneuberg,

near Vienna, by Nicholas of Verdun (fl. 1181-1205). In the late 13th cent. a new method of E. was discovered in Italy, known as 'basse-taille,' i.e. a coloured translucent E. fused over a design engraved in low relief below the level of the surrounding metal so that after firing the E. is flush with surrounding metal area. The outstanding example of this technique is the Royal Gold Cup of the kings of France and England (in the Brit. Museum) made in Paris about 1380. A late medieval development was the *plique-à-jour* E., in which the translucent E. is fused in an openwork cloisonné frame, like a stained-glass window. At the same time, enamelling the surface of objects in the round was introduced, particularly for jewellery. In the 15th cent., in N. Italy and at Limoges, 'painted enamels' were first made, i.e. coloured E. applied by brush, spatula, or point over a design scratched in outline on the metal baseplate. The most famous craftsmen of this method were Nardon Penicaud (1474-1539), Pierre Raymond, Leonard Limousin, and Jean Penicaud. By the 17th cent. this style of E. had declined and was eclipsed by the *miniature painted* E.s, especially those of the Toutin family in Paris. However, in these E.s and the Battersea transfer-printed E.s the colours are not E.s but are applied after the E. is fired and fused, and are therefore not properly speaking within the category of E.s. See E. Molnir, *Dictionnaire des Émailleurs*, 1885; Otto von Falke, *Deutsche Schmelzarbeiten des Mittelalters*, 1904; J. J. Marguet de Vasselot, *Enaux Limousins, XVe siècle*, 1921; M. Chamot, *English Medieval Enamels*, 1930; W. L. Hildburgh, *Medieval Spanish Enamels*, 1936; J. J. Marguet de Vasselot, *Les Croix Limousines*, 1941; L. Falize, *Claudius Popelin et la renaissance des enaux peints*; M. S. Gautier, *Enaux Limousins*, 1950; J. J. Marguet de Vasselot, *Les Gemellions Limousins*, 1952; Paul Thoby, *Les Croix Limousines*, 1953; H. Maryon, *Metallwork and Enamelling*, 1954.

Enaré, see INARI.

Encasnia, see COMMEMORATION.

Encarnación, cap. of Itapúa dept, important commercial tn at the terminus of the Central Railway, Paraguay. Products include tobacco, cotton, rice, cattle, and timber. A train ferry connects E. with Posadas (q.v.), in NE. Argentina.

Encaustic Painting. This term is employed to describe a picture painted by means of heated wax. It is an ancient method of painting, and the final process consisted of an application of heated wax to the picture. This process is now practically obsolete, but some people consider that neither oil nor fresco paintings are so permanent as the E., which is unfortunately one of the lost arts. Emma J. Greenland, at the close of the 18th cent., did indeed make some experiments in the endeavour to ascertain the ancient methods, but they met with but poor success, the tint and texture being neither so brilliant

nor durable as oil painting. We have no important examples of classic Gk E. P., but some interesting Egyptian remains of the kind were brought to light at the Oasis of Fayum in 1888. The National Gallery has a series of these Greco-Rom. portraits from mummy-cases, painted in E., c. AD 40-250.

Encecladus, one of the 100-armed giants who revolted against Zeus. As he fled to Sicily he was transfixed by a thunderbolt and buried under Etna.

Encephalitis, inflammation of the brain. E. is sometimes associated with infantile paralysis (q.v.) and also, but more rarely, with any of the virus infections (see under CHICKEN-POX and MUMPS). It may also occur after vaccination (q.v.) when this is performed for the first time other than in infancy. It sometimes causes changes in personality and behaviour. *E. lethargica* or *Epidemic E.* (sleepy sickness) is a virus disease which sometimes occurs in epidemic form. The first noted epidemic occurred in Vienna in 1917 and was followed by an outbreak in Great Britain in 1918. The symptoms of the acute stage of the disease vary widely according to the part of the brain most affected and the severity of the infection. Most commonly there is fever, lethargy (or wakefulness at night and drowsiness in the day), muscular rigidity, and paralysis of the eye muscles causing double vision. The acute phase may last a few days or several weeks and complete recovery may ensue. Some cases do not completely recover, while others pass into a chronic stage of muscular rigidity and tremor characterised by a mechanical shuffling gait and an immobile, expressionless face. This condition, known as *paralysis agitans* or *Parkinsonism* (q.v.), is also seen in certain senile cerebral degenerative changes. *E. lethargica* must not be confused with *sleeping sickness* (q.v.), a tropical disease caused by the trypanosome parasite.

Encephalocele, a protrusion of a portion of the brain substance through an opening in the skull. It is most commonly a congenital condition.

Encephalon, or Brain (q.v.), is that enlarged upper portion of the cerebrospinal axis contained in the cranium. See BRAIN.

Enchantment, see FAIRIES; INCANTATION; MAGIC.

Encina (or **Enzina**), Juan del (1468-c. 1529), Sp. poet and founder of the secular drama in Spain, b. Salamanca, and studied under the great Sp. humanist Nebrija. He entered the Church, and became prior of León. He began writing poetry at a very early age, and *Cancionero*, a collection of odes, lyrics, and dramatic pieces, was printed at Salamanca in 1496. In 1519 he made a pilgrimage to Jerusalem, and wrote a poetical account of this in 1521. His fame, however, does not rest on either of these works, but on his *Representaciones*, 14 dramatic poems, partly religious, partly secular, the latter of which were acted in Spain in 1492. His most popular work, *La Farsa de Plácida y Victoriano*, was condemned by the

Inquisition and lost in 1559. E. was the first important Sp. dramatist, and had such imitators as L. Fernández and Torres Naharro.

Encke, Johann Franz (1791–1865), Ger. astronomer, studied under Gauss at Göttingen. On completing his studies there he became assistant at the observatory at Seeberg, afterwards vice-director, and in 1822 director. In 1825 he succeeded Bode as director of the Royal Observatory at Berlin. He superintended the execution of the star-maps of Berlin Academy (1830–59) and the erection of the new observatory (1832–5). He is most famous for his discussion of the orbit of the comet discovered by Pons, 26 Nov. 1818. It has since been known as E.'s comet, and has the shortest known period of about 3½ years. E. also wrote *Die Entfernung der Sonne* (2 tracts based on the transits of Venus, 1761 and 1769, 1822–4). See life by Bruhns, 1869.

Enclave, portion of a state within the boundaries of another, notably in Germany. To the proprietor state the E. is known as its 'exclave.'

Enclosures, see ALLOTMENTS; OPEN SPACES AND COMMONS.

'Encounter' monthly magazine giving an international review of literature, arts, current affairs, founded in Oct. 1953 by the co-editors, Stephen Spender and Irving Kristol, and sponsored by the Congress for Cultural Freedom. Politically a forum of debate with a marked interest in Asia, it also draws writers of original poems, stories, and criticism from all over the world.

Enkratites (Gk 'self-controlling'), a sect of Christian ascetics of the 2nd cent. at Rome and in Asia Minor. Their leader was the Gnostic Tatian, and they practised total abstinence from flesh, wine, and marriage. They substituted water for wine in the Eucharist, and were hence sometimes called Hydroparastatae, or Aquarians. They existed as late as the 4th cent., and the name came to be given to ascetic Gnostics generally.

Enherinal (Crinoidal) Limestones. This name is given to limestones which abound in the calcareous fragments of crinoids, large masses of the rock being entirely composed of the joints and fragments of their skeletons. Many cylindrical bodies may be found, some flat and coin-shaped, but more often they are elongated and perforated along their long axis by a canal. Hence in some parts these are called 'St. Cuthbert's beads.' Such remains are commonest in limestones of the Silurian, Devonian, and Carboniferous ages. Large beds occur in the Hamilton and Helderberg groups in New York state, and in the mt limestones of N. England.

Enherinites, see CRINOIDEA.

Encyclical Letters (from Lat. *encyclicus*, circular), an expression indicating in a general sense circular eccles. letters sent on some important occasions by the pope to the bishops. These letters differ from the papal bulls in that the latter generally have some more special object in view.

E. L. generally contain instructions and warnings against dangers which may threaten the Church.

Encyclopaedia, a derivative from the Gk *enkuklios paidia*, circular or complete education; it originally meant the whole group of studies which every free-born Gk youth was required to complete in preparation for active life: the liberal curriculum. The phrase was adopted by the Romans, and in both these ancient languages came to mean systematic study of, or instruction in, all the branches of learning. With this idea of encyclical education was soon associated the notion of collecting the materials of such instruction into a single work, where the contents and relations of the various arts and sciences should be systematically expounded. There were many early attempts to produce such a work, though the name E. was not used till the 16th cent. This is now its common application.

The earliest E.s were treatises or groups of connected treatises adapted for continuous study, not merely for reference, and they contained the more or less extensive accumulation of learning made by their authors individually. The first E. is said to have been compiled by Speusippus (d. 339 bc), a disciple of Plato, but of this nothing is known. Among the Romans, Marcus Terentius Varro (d. c. 27 bc) was the first encyclopaedist, but his *Disciplinarum Libri IX.* containing treatises on grammar, rhetoric, arithmetic, etc., and another work on Rom. antiquities, have both been lost. The earliest E. we possess is the famous *Historia Naturalis* of Pliny the Elder (AD 23–79), a work on natural science, considered especially with reference to human life, and including geography, medicine, and the hist. of art. In the 5th cent. Martinus Capella, a native of N. Africa, produced an E. of the 7 liberal arts, which was used extensively as a school text-book in the Middle Ages. A similar work was compiled by Isidore, bishop of Seville (c. 570–636), and there were one or two Gk E.s in the 12th cent. Of these early works the most important is the *Bibliotheca Mundi*, or *Speculum Maius*, or *Speculum Triplex*, of Vincent of Beauvais, a Dominican friar of the 13th cent. It was in the reign of Yung Lo (d. 1425) that the vast literary collection known to posterity as the *Great Encyclopaedia* was produced though never printed (see CHINA.—Literature). In 1541 the name cyclopaedia was first used by Ringelberg of Basel, and Paul Scalich used the term E. in 1559. The 17th cent. saw many E.s, including Alsted's 7 vols., in Lat.; the *Grand Dictionnaire Historique* of Louis Moreri, with an alphabetical arrangement; J. J. Hoffmann's *Lexicon Universale*; and, most famous of all, the *Dictionnaire Historique et Critique* of Pierre Bayle, 1697. The anct type was changing, and the E. was becoming assimilated to the dictionary. The alphabetical arrangement led to a change of purpose and character in the compilation, which became a work of reference, giving, instead of the exposition of the system of

is called 'potential' E. by way of distinction. A steam-hammer when at rest in its highest position is a good example of a system possessing 'potential' E. Again, in the vibrations of a pendulum, the E. is constantly being changed from a kinetic to a potential form and vice versa. All forms of E. can be classified under one or other of the types, kinetic or potential E. For instance, kinetic E. is present in mass motion, wave motion (sound, light, etc.), electric currents, etc.; and potential E. is recognised in raised masses, magnetised bodies, separated electric charges, etc. One characteristic of all E. is its property of transformation, and in all its transformations there is evident the principle of conservation of E. The physical law that is known by this name asserts that the total amount of E. in any isolated system is invariable in amount. E. may be added or abstracted from without, but as long as no external influences intervene the total quantity of E. within the system can neither increase nor decrease. It is usual, therefore, to say that the entire E. of the universe is conserved. Galileo seems to have been familiar with the idea that E. cannot be created, a fact which he inferred from a careful study of the machines, all of a simple nature, that were used in his day. However, there appear to be many cases in which E. is destroyed, and all mechanical E. is gradually wasted away by frictional and such-like losses, the mechanical E. being converted into heat E. The motions of the celestial bodies are far more easily described by the aid of the principles of conservation of E. than they could be without it. It is now recognised that mass can be converted into E., under certain conditions, according to the equation $E = mc^2$, where m is the mass, and c is the velocity of light. This conversion of mass into E. is the basis of atomic power. The principle of conservation of E. must now be qualified. It still holds if the mass is unchanged. Alternatively it can be replaced by a principle of conservation of mass and E., treated together. See RELATIVITY; METROLOGY.

Enez, Gk Enos, frontier vil. of Turkish Thrace at the mouth of the Maritsa. It is impossible for any but small vessels to enter the harbour owing to the silting sand. Pop. 550.

Enfantin, Barthélemy Prosper (1796-1864), son of a banker in Paris, became one of the chief founders of the Saint-Simon (q.v.) school of Socialism. From 1826 till 1830 he was associated with Bazard in carrying on H. de Saint-Simon's work, but they eventually disagreed on the question of marriage, E. being an advocate of free-love, which led to his prosecution in 1832. He was imprisoned for a year, and on his release became editor of the jour. *Le Crédit Public*. His collected works were pub. in *Œuvres de Saint-Simon et d'Enfantin*, 1865-78. See H. Castille, *Le Père Enfantin*, 1859.

Enfield: 1. Tn and par. of Middx, England, 10½ m. N. of London Bridge.

Early in its hist. it was the centre of trade for N. Middx; a market granted in 1304 was closed in 1869. Industries grew up in the 19th cent., and the Royal Ordnance Factory is at E. Lock in the N.E. It is now largely a residential suburb. Elizabeth I lived at Elysne Hall, no longer standing, before and after her accession. Charles and Mary Lamb lived at Chase Side, 1827-33. The par. church has a late 14th-cent. tower, and among its monuments is the remarkable brass of Joyce, Lady Tiptoft (d. 1446). It returns 2 members to Parliament. Pop. 110,000.

2. Tn of Connecticut, U.S.A., situated in Hartford co, on Connecticut R. It raises dairy and truck-farm products and tobacco, and manufs. hardware, carpets, paper and wood products, and woollens. Pop. 15,460.

Enfilade (Fr. from *enfiler*, to thread, to pass through from end to end), a military term used when the firing is directed along an enemy's line or parapet. It is a most effective form of fire, being extremely difficult to meet, and entrenchments or parapets are useless as cover. The usual form of defence against an E. is a *traverse*, or bank of earth raised at right angles to the lines of defence.

Enfranchisement, see COPYHOLD.

Engadine, Swiss part of the valley of the Upper Inn in the canton of the Grisons. It is traversed by a carriage road from the Malaja Plateau (5935 ft) at the SW. end to Martinsbruck (3406 ft) at the NE. end, a distance of 56 m. It is divided into the Upper and Lower E., the cap. of the former being Samaden, of the latter, Schuls. The Upper E. contains sev. lakes, and has favourite health resorts, the mineral waters of St Moritz having been known since the 16th cent. Pontresina is a centre for tourists. The valley is reached by road over the passes, and there is an electric railway running under the Albula Pass to St Moritz and Pontresina. The Alpine flora is very rich and varied. The Swiss National Park, an area of 54 sq. m., is in the Lower E. The language spoken is Ladin (an old Romansch tongue) or German-Swiss. Pop. 15,000.

Engelberg, beautifully situated vil. in the half-canton of Obwalden, Switzerland, the terminus of the electric railway from Stansstad on Lake Luzern; a favourite summer resort, and one of the most popular winter sports centres in Switzerland. It is 3345 ft high, and shut in on all sides by high mts. The Benedictine abbey, still surviving, was founded in 1120 and the whole valley ruled by the abbot until 1798. Pop. 2500.

Engels, Friedrich (1820-95), Ger. Socialist, b. Barmen, the son of a wealthy cotton-spinner. After spending 2 years in England writing for the organs of the Owenite and Chartist movements, he went to Paris and there visited Karl Marx (q.v.). The two became close friends and worked so much together during the remainder of their lives that the works of the one became more or less the works of the other. E. wrote in collaboration with Marx *Die heilige Familie oder Kritik der*

kritischen Kritik, 1845, and *Manifest der kommunistischen Partei*, the famous Communist manifesto (London, 1848; Eng. eds. 1848 and 1888). After the death of his friend he pub. the 3rd and last vol. of Marx's work, *Das Kapital*, 1885. See F. Mehring, *Aus dem Literarischen Nachlass von Karl Marx, Friedrich Engels, und Ferdinand Lassalle*, 1902; G. Mayer, *Friedrich Engels*, 1920; D. Ryazanoff, *Friedrich Engels und Karl Marx*, 1927; E. H. Carr, *Karl Marx*, 1934.

Engel's (until 1930's **Pokrovsk**), tn on the Volga, opposite Saratov, in Saratov Oblast. It has engineering, textile, and meat-packing industries. It was founded by Ukrainian Cossacks: from 1922 to 1941 it was the cap., economic and cultural centre of the Volga German autonomous rep. (q.v.). Pop. (1956) 79,000. Russian and Ukrainian (until 1941 also Germans).

Enghien, Henry I and II de Bourbon, Ducs d', see CONDÉ, PRINCE DE.

Enghien, Louis Antoine Henri de Bourbon Condé, Duc d' (1772-1804). Fr. nobleman, son of Henri Louis Joseph, prince of Condé, and Louise Thérèse Mathilde, sister of the duke of Orleans (Philippe Egalité), b. at Chantilly. In 1792 he was given a command in the Fr. royal army of *émigrés*, and served in the Condé army under his father and grandfather. After the peace of Lunéville (Feb. 1801) he retired to Ettenheim in Baden, having married the niece of Cardinal de Rohan, the Princess Charlotte. In 1804 he was falsely accused of being implicated in the Cadoudal-Pichegru conspiracy, and by Napoleon's orders was seized and taken to the castle of Vincennes, where after the pretence of a trial he was shot. He was the last of the house of Condé. It was a sentence which considerably shocked educ. opinion throughout Europe, and was one of Napoleon's biggest political mistakes. See A. Maricourt, *La Mort du Duc d'Enghien*, 1930.

Enghien (Flem. Edingen), tn in the prov. of Hainaut, Belgium, situated on the Fr.-Flem. language frontier. It is famous for its lace, and was once the seat of the Condé family, the dukes of E. The castle was burnt down, but the park, laid out in the 16th cent., still remains, and contains a stone cottage built by an ancestor of the present owner, the duke of Arenberg, for Jean-Jacques Rousseau. Pop. 4400.

Enghien-les-Bains, Fr. tn in the dept of Seine-et-Oise, on the E. lake, 8 m. from Paris. It is a health resort with sulphurous waters. Pop. 11,100.

Engine, contrivance for converting heat or chemical energy into mechanical energy of (usually reciprocating) motion; the name is also used for the steam locomotive. Turbines are usually specified as such. See AERO ENGINES; INTERNAL-COMBUSTION ENGINES; STEAM ENGINES.

Engineering, in the stricter sense, the art of constructing and using engines; but, in the wider sense, including the whole range of design and construction of what may be broadly termed 'works.' In a popular classification, we may consider

separately such branches as agric. E., automobile E., and marine E., but the orthodox classification is into the 5 divs.: civil, electrical, mechanical, mining, and chemical. For the prin. articles on E. see AERO ENGINES; ALTERNATING CURRENT; BOILER; BRIDGE; CANAL; CHEMICAL ENGINEERING; COAL MINING; CONVEYORS AND ELEVATORS; CYCLES AND CYCLING; DISTRIBUTION, ELECTRIC; DOCK; DRAINAGE; ELECTRIC MACHINES; ELECTRIC SUPPLY; FOUNDATIONS; FURNACES; GUNS; HARBOURS; MOTOR SHIPS; MINING; POWER STATIONS; PUMP; RAILWAYS; RIVER ENGINEERING; ROADS; ROCKETS AND SPACE TRAVEL; SHIPS AND SHIPBUILDING; STEAM; STEAM ENGINES; TELEGRAPHY; TELEPHONY; TELEVISION; TRANSMISSION, ELECTRIC; TUNNELING; TURBINES.

The term 'civil engineer' is used in contradistinction to that of military engineer: the work is concerned with all branches of civil construction, the design, construction, and maintenance of public works, such as docks, irrigation schemes, bridges, viaducts, roads, etc., and also what is rather vaguely called 'constructional engineering.' The directing body in Great Britain is the Institution of Civil Engineers. Electrical E. comprises the 2 classes, power and communication, and is concerned with the construction, installation, and maintenance of electrical machinery, power-stations, lighting, heating, transmission of electrical energy, and telecommunication. Practical considerations, especially of training, demand the retention of these orthodox divs., all of which have their appropriate governing body; thus the directing body of the electrical engineer is the Institution of Electrical Engineers. Mechanical E. is the most extensive branch of the profession and embraces the work of designing, constructing, and operating engines, whatever their motive-power—steam engines, gas engines, internal-combustion engines, etc. The directing body is the Institution of Mechanical Engineers. Mining E. is concerned with the building, erection, and working of apparatus for sinking mines, and geological surveying for metalliferous areas or oil-field development. The directing bodies are the Institution of Mining Engineers, the Institution of Mining and Metallurgy, and the Institute of Petroleum. Membership depends on the branch or branches of mining E. adopted. There is scope for the mining engineer both in Great Britain and overseas, in commercial companies—which in Britain generally implies coal, and sometimes iron ore, lead, and tin—as mine inspectors and surveyors under the Mines Dept., practical experience being essential.

Engineering, Military. M. E. is the adaptation of engineering practice to military requirements. As was evident in the First World War, a civilian engineer can readily take his place on the executive side of M. E., but on the administrative side military experience and training are required. A modern army must rely on

civilian resources to a very great extent, not only for manpower and material, but also for technical experts, and among the latter the military engineer is of the highest importance. The First World War gave a great impetus to scientific development, notably in chem., metallurgy, and physics, which 3 branches of scientific study have had a revolutionary effect on the military machine, e.g. in the making of poison gas, high explosives, and synthetic oil; in the application of the internal-combustion engine to aviation and tanks; and in wireless telegraphy, respectively. M. E. is directly concerned with all these developments, and in the decade before the outbreak of the Second World War the greatest problem for military engineers was 'mechanisation'; i.e. the utilisation of mechanically produced power in order to increase mobility and to conserve physical energy. The task of M. E. is to assimilate the tremendous increase of engineering knowledge into the technique of war. The co-operation of the general staff of a modern army with the military engineer is necessary to effect this process. But as the members of the general staff of a modern army are not experts in M. E., though they are responsible for policy, the modern military engineer must be able to act in a consultative capacity as well as to carry out the current and ordinary engineering work of an army. In other words, his task is to interpret the policy of the general staff in terms of the developments of science. Besides the military engineer there is the engineering specialist, whose duties are restricted to the work of research and design in military maintenance. On the extent to which the distinction between the military engineer and the specialist in design and research is preserved in departmental organisation, efficiency in M. E. will largely depend. Every new device, and every application of a new weapon, have their reactions on numerous other devices and weapons, e.g. if a more efficient anti-tank gun is produced, a faster or more highly armoured tank must replace previously existing tanks, and this, in turn, may call for progress in bridge design to carry a heavier tank. Thus, to attain all-round efficiency in an army, the fighting machines must be evolved as a co-ordinated whole; and it is in this sphere that the consultative advice of the military engineer assumes such importance. In the Brit. Army the training of military engineers is effected by the education and theoretical training of personnel of the Corps of Royal Engineers; which training comprises courses of theoretical training at Cambridge Univ. and the Royal Military College of Science, a course of applied practical training in military *matériel* at the School of Military Engineering, and experience in combatant duties by co-operation with other arms of the army through the R.E. field squadrons.

In the Second World War Brit. M.E. made a great contribution to victory on all the prin. fronts, e.g. in Italy, in 1943, if for no other reason than that in no prior

campaign had an enemy carried out demolition on such a scale and in terrain so perfectly adapted to it. In the area about the line Foggia-Naples, a region of mt gorge and riv., the Germans had blown almost every bridge and culvert, both on roads and railways, and there were entire sections of the railway along which their wrocker-train passed, uprooting and smashing every sleeper and cutting every rail. In these circumstances was used one of the great inventions of M. E., the *Bailey bridge*; standardised and adaptable to almost any load, it was the product of the Royal Engineers' Experimental Bridging School, after one of whose profs. it was named. This bridge can take loads as heavy as the largest tank on a transporter and solved the problem of bridging behind the line. The Royal Engineers were also responsible for the duty of sweeping the approaches to assault-crossings with the aid of *mine detectors*. *Bulldozers* led the tanks into battle, carving a path for them under heavy fire. In Italy the Volturno and Garigliano presented 2 major water-obstacles, and the crossings of these rivs. were carried out in successive phases—the infantry made the initial battle-crossing by assault boat, while their equipment followed by raft. The Engineers, meanwhile, worked to substitute bridges at the earliest possible moment and to pass a continuous stream of traffic. The first bridges were light, floating affairs carried on *folding boats*. These were quickly supplemented by Bailey bridges. These bridges also played a great part in the crossing of the Rhine on the Brit. section of that front in 1945. Another great M. E. achievement was the construction of a system of petrol pipe lines between the base ports and the front. The laying of these pipe lines was the work of engineer personnel from the United States, who quickly laid the pipe, installed the chain of boosting stations, and constructed the storage tanks, this latter operation involving very nice adjustment. Aerodrome work was another major task of M. E. Thus, in Italy, the Brit. Aerodrome Construction Company and the Amer. Aviation Engineers between them built some 30 airfields, mostly round Foggia. See also ENGINEERS, CORPS OF ROYAL.

Engineering Drawing is the chief medium by which the engineer conveys his ideas to others, and the drawing office is the connecting link between the engineering dept and the machine shops. The draughtsman's function is to develop the sketches drawn by the engineers into the finished drawing from which the machinist takes all his measurements. It is in the drawing office that the inventions come to life and indeed that many may reveal fatal flaws. From the pencil drawing an ink tracing is made on tracing paper or cloth; this work is done by junior draughtsmen, and in many works it is done by girls. Photo-prints are taken from these tracings, the commonest of which are the ferro-prussiate ('blue') prints or 'photostats.' Of these prints sev. are

sent to the drawing stores in the machine shops and 1 copy is put in the records. A drawing office is an excellent place for the young engineer to receive his training, for he sees designs of all the pieces of machinery from their earliest stages to completion. See J. Duncan, *An Introduction to Engineering Drawing*, 1922; A. Abbott, *Cryer Drawing and Design*, 1936; A. Cryer, *Engineering Drawing*, 1939.

Engineers, Corps of Royal. Before the year 1855 the technical elements of the Brit. Army, e.g. artillery and engineers, were provided by the Board of Ordnance. Both artillery and engineers officers formed part of the early 'Artillery Trains.' The system under which artillery units were raised for a campaign was found to be inadequate and uneconomical, and as a result artillery companies (now Royal Artillery) were estab. in 1716, and the ancestor of the R. E. in 1717, both emerging from the Board of Ordnance. Before 1782 the officers of the R. E. did not have military titles, but in that year they were first granted commissions. It was not until 1787, however, that the military officers of the Engineer Dept. were constituted the 'Corps of Royal Engineers,' the men being regimented in the Corps of Royal Military Artificers. When Napoleon invaded Egypt a detachment was sent to Constantinople to train the Turkish Army, and other companies performed good service in Egypt, Malta, Italy, Sicily, and the West Indies. In 1813 the title of the Corps of Royal Sappers and Miners replaced that of Military Artificers and did effective work under Wellington during the Peninsular and Waterloo campaigns. The Crimean War was the scene of manifold activities by the engineers, and the officers and men were, immediately afterwards, united to form one corps under the title of 'Royal Engineers.' After the Indian Mutiny the Bengal, Madras, and Bombay Corps of Engineers were transferred to the R. E.

Being a scientific corps the R. E. has 'nursed' many important branches of military science, particularly the Royal Flying Corps (now the R.A.F.), which was evolved from the Air Battalion of the R. E., and the Royal Corps of Signals, which was evolved from the Signal Units of the R. E. The work of the R. E.s in any theatre of war extends from fieldworks in forward areas to the construction, operation, and maintenance of ports on which the theatre is based, and right through the intervening organisations. They construct or adapt buildings necessary for barracks, hospitals, and stores. They make tracks and roads; provide water and light, and dispose of sewage; build roads, bridges, and ferries and lay, repair, and run the railways. They make and clear airfields and landing grounds. They do the army's survey work and produce maps. They are concerned in all major camouflage; they are expert in chemical warfare and smoke; they operate their own heavy engineering workshops and electrical installations.

They do ship and barge construction and repair; they undertake minelifting and bomb disposal, and conduct the army's postal service. They are responsible for movement control. Such operations are conducted in field units, and in L. of C. units which are not fully mobile.

The widespread services of this Corps are aptly expressed in their mottoes, granted in 1832, 'Ubique' and 'Quo fas est gloria ducunt.' The Queen is Colonel-in-Chief of the Corps.

See W. Porter and others, *The History of the Corps of Royal Engineers*, 7 vols., 1889-1952.

England. Topographically, England may be viewed with Wales or as a separate unit; administratively, for purposes of local and central gov., in matters of statistics, etc., they are almost invariably treated as one. A description of the geographical features peculiar to Wales, together with a list of the Welsh cos., and an account of the prin. Welsh industries and occupations, etc., and the hist. of the principality, will be found in the article Wales (q.v.). Communications (ports and inland transport) and imports and exports are dealt with in the article Great Britain (q.v.), in which will also be found cross-references to the prin. articles covering defence, education, economics and finance, gov. and administration, hist., housing, justice and the legal system, religion, social welfare, and the arts.

POSITION AND AREA.—Of the group of is. which lie off the W. coast of Europe, and which form the U.K. of Great Britain and Ireland, England (including Wales), the most important portion in wealth, pop. size, and possessing the centre of the gov. and administration, lies between lat. 55° 46' N. at the mouth of the Tweed and lat. 49° 57' 30" N. at the Lizard and between long. 1° 46' E. at Lowestoft and 5° 43' W. at Land's End. It is separated from Scotland to the N. by a line from Berwick-on-Tweed to the head of Solway Firth; bounded on the E. by the North Sea, S. by the Eng. Channel; the Strait of Dover, 21 m. at its narrowest point, divides it from the coast of France (100 m. distant at the Lizard). At the SW. corner the broad and deeply indented Bristol Channel parts the SW. of England from Wales and opens on the Atlantic; on the W., St George's Channel divides Wales from Ireland and leads to the Irish Sea and thence to North Channel separating Ireland and Scotland. The coast-line, following broad indentations and including the Isle of Wight and the is. of Anglesey, is about 2350 m. No point in the Brit. Isles is more than 75 m. from tidal water. The total area is 58,345 sq. m., of which E. contains 50,329 and Wales (including Monmouthshire) 8016 sq. m. (including inland water). The Channel Is. and the Isle of Man (qq.v.), in the Eng. Channel and the Irish Sea respectively, are described in separate articles.

ADMINISTRATIVE DIVISIONS.—England is divided into 41 geographical (or 50 administrative) cos., as follows: Bedfordshire,

Berkshire, Buckinghamshire, Cambridge-shire, Cheshire, Cornwall, Cumberland, Derbyshire, Devon, Dorset, Durham, Essex, Gloucestershire, Hampshire, Herefordshire, Hertfordshire, Huntingdonshire, Kent, Lancashire, Leicestershire, Lincolnshire, London, Middlesex, Monmouthshire, Norfolk, Northamptonshire, Northumberland, Nottinghamshire, Oxfordshire, Rutland, Shropshire, Somerset, Staffordshire, Suffolk, Surrey, Sussex, Warwickshire, Westmorland, Wiltshire, Worcestershire, and Yorkshire (q.v.).

GENERAL TOPOGRAPHICAL DESCRIPTION.—The is. group known as the Brit.

sion is taking place, and at Selsey Bill (Sussex) more than 34 ac. have been submerged in the past 20 years (the highest acreage lost at any point in Britain this century).

Inland, 2 marked divs. may be observed, the *Highland Zone* and the *Lowland Zone* (see also *EUROPE. Geology*). The highland zone comprises the Pennines (q.v.), running from N. to S. through N. England as far as the Midland plain (the high moorlands of the Pennines form an anticline with much picturesque scenery, particularly around the Peak (q.v.) in Derbyshire); the Lake District (q.v.) in the NW. a favourite area

G. Douglas Bolton

BIBURY, GLOUCESTERSHIRE: A TYPICAL ENGLISH VILLAGE

Isles lies on the continental shelf, surrounded by shallow waters. The N. Atlantic drift spreads warm water over the shelf and makes for a comparatively mild climate (see *CLIMATE*, below), without extremes of temp. There are many small natural harbours around the coast and since the riv. estuaries are relatively free from silting they have often provided suitable facilities for the building of ports. The Severn (210 m.) and the Thames (200 m.) are the 2 longest Eng. rivs. Coastal scenery is varied, ranging from chalk cliffs such as Shakespeare Cliff (Kent) and the Seven Sisters (Sussex), in the SE., to granite headlands in the SW. and red sandstone in Cumberland, while in East Anglia and around the Wash shingle and sand form a low-lying coastal area. On the North Sea coast, particularly between Thames and Humber, sea defences have been constructed to afford protection from incursion. In some places around the Eng. coast an. incur-

for touring, wild and beautiful, and containing Scafell Pike (q.v.), the highest Eng. peak; and the SW. peninsula (Devon and Cornwall). Considerable areas are over 1000 ft above sea-level, and large tracts of moorland occur, resulting from thin, poor soils. Cultivation is concentrated in the valleys. The lowland zone comprises the Midlands and SE., with East Anglia (q.v.) and the Fens (q.v.), which have, since the 17th cent., developed drainage systems to facilitate cultivation. From the chalk cliffs at Dover the N. Downs run in an arc across Kent and Surrey, overlooking the fertile Weald and the so-called 'Garden of England'; the S. Downs run along the S. coast through the co. of Sussex, behind the seaside resorts of the Eng. Channel (q.v.). The Midland plain forms an extensive agric. area, stretching from the Fenland cos. to Worcestershire, Warwickshire, and Gloucestershire (as far as the Bristol Channel, q.v.) and S. to the Thames Valley.

Little of this zone is as much as 1000 ft above sea-level and there is intensive cultivation of almost the whole region, industrial and urb. areas excepted.

CLIMATE.—The Eng. climate is equable. The Atlantic coasts enjoy a comparatively mild climate but may have heavy rainfall and storms (brought in from the ocean); the North Sea coast tends to be more liable to flooding. The ann. daily mean air temp. at sea-level (England and Wales) in 1955 was 49·7° F. (Aug. having a temp. of 64·8° F.); the ann. total rainfall (England

and Wales) in 1955 was 31·3 in. (heaviest in Dec. with 4·3 in.); and in England and Wales there were 4·47 mean hrs of sunshine per day in 1955 (July being the hottest month with 8·5 hrs per day). *See also* EUROPE, *Climate*.

G. Douglas Bolton

HALIFAX, YORKSHIRE, FROM THE TOP OF THE WAINHOUSE TOWER

and Wales) in 1955 was 31·3 in. (heaviest in Dec. with 4·3 in.); and in England and Wales there were 4·47 mean hrs of sunshine per day in 1955 (July being the hottest month with 8·5 hrs per day). *See also* EUROPE, *Climate*.

RURAL ENGLAND.—Intensive farming is carried on in both England and Wales, mostly on small or medium-sized farms, the average size being about 80 ac. (*see also* AGRICULTURE; SMALLHOLDINGS); of a total of 29·8 million ac. of agric. land, 24·5 million ac. are under crops and grass, the residue being rough grazing. The E. of England is predominantly arable while in the W. dairying predominates, though within a small area a variety of types of farming may be found, and market gardening is often carried on near the larger pop. centres. Stock rearing is carried on in the N.; the fatstock industry is concentrated in the Home Cos., the Midlands, and the E. cos. To some extent fruit and veget-

able growing is localised, with apples mostly in Kent and Hereford, cherries mostly in Kent, plums mostly in Worcestershire, strawberries mostly in Hants, Kent, and Norfolk, rhubarb mostly in Yorks, tomatoes mostly in Essex, vegetables mostly in Kent, Yorks, and the Fens. The Channel Is., Cornwall, and the Scilly Isles grow early vegetables, and spring flowers are also grown in these areas, the Scillies being the chief suppliers for the London and other markets. The bulb-fields of the S. Lincs-Isle of Ely area are

noteworthy. The pop. in the Eng. rural areas is divided between the farm-unit (particularly in the N.) or small vil., and the market in which often caters for the needs of a considerable locality. The latter will not act as a shopping centre and may have a small local industry (average pop. 5-10,000).

URBAN ENGLAND.—Following on from the previous section, the slightly larger tn., particularly if it is in the centre of an agric. dist., often develops other subsidiary industries, possibly connected with the supply of implements and with engineering (farm machinery and maintenance); here the average pop. is about 10-50,000. Alternatively, these larger tns may form centres for a single industry or industrial process (such as cotton spinning or weaving, coal- or iron-mining); the still larger unit will have a considerable variety of industry, both interdependent (as in the woollen and

cotton tns of Yorks and Lancs) and unrelated (as York, with heavy engineering and chocolate industries, or Luton, with motor-car and hat-making industries). Thirteen Eng. cities have over a quarter of a million inhab. and support a generally centralised and industrialised pop.; these are (in order of size) Birmingham, Liverpool, Manchester, Sheffield, Leeds, Bristol, Nottingham, Hull, Bradford, Newcastle upon Tyne, Leicester, Stoke-on-Trent, and Coventry (q.v.). London (q.v.), with its administrative, judicial, and social status, its position as cap. and seat of the central gov., in the middle of the largest conurbation in the country, is unique. It is the official place of residence of the sovereign and focal point for the Commonwealth (see POPULATION, Conurbations, below).

POPULATION.—The census figures for 1951 gave the total pop. for the U.K. as 50,225,000 (24,118,000 males and 26,107,000 females). The total for the U.K. at the mid-year estimate (1955) was 50,968,000. The total pop. of England and Wales at the 1951 census was 43,758,000 (21,016,000 males and 22,742,000 females), the pop. of Wales being 2,599,000, and the total figures at the mid-year estimates for 1955 were 44,441,000 (21,389,000 males and 23,052,000 females) and 2,603,000 respectively. The total number of registered aliens (1955) was 360,399. On the basis of the mid-year estimates (1955), it is estimated that the future total pop. of the U.K. will be 51,796,000 in 1960, 53,624,000 in 1970, and 53,270,000 in 1980, with a drop of 179,000 by 1990.

By far the largest concentration of the pop. occurs in the London and SE. region (just under 11 million); next in size comes the NW. region with just under 6½ million. Conurbations, or areas of urb. development where a number of separate tns have grown into each other or become linked by a common interest, often industrial, commercial, or educational, exist in the Greater London, SE. Lancs, W. Midlands, W. Yorks, Merseyside, and Tyneside areas (total estimated pop. at mid-1955, 16,868,000).

Pop. elements include, besides native ones, Asiatic, African, and West Indian (the latter more especially since 1956 when numbers of West Indians arrived to swell the pops. of the larger centres). These elements have been drawn by trade, particularly to those occupations carried on in or near coastal industrial centres, such as shipbuilding and the processing of imports. Continental Europeans, many of whom took up residence in the U.K. as a result of racial or political persecutions in their respective native countries, may also be regarded as constituting a further element.

EMPLOYMENT.—In 1955 distribution of the total manpower of Great Britain in civil employment (i.e. not including members of Her Majesty's Forces and the Women's Services) was among some 24 forms of profession or occupation (as distinguished by the Standard Industrial Classification). The following 13 indus-

tries, arranged in order of total manpower employed, claimed the largest numbers of workers:

Distributive trades	2,811,000
Engineering, shipbuilding, and electrical goods	2,081,000
Miscellaneous services	1,850,000
Professional	1,786,000
Transport and communications	1,715,000
Building and contracting	1,486,000
Public administration (national and local gov. services)	1,289,000
Vehicles	1,231,000
Agriculture, forestry, fishing	1,066,000
Textiles	955,000
Food, drink and tobacco	901,000
Mining and quarrying	862,000
Clothing, including footwear	675,000

(figures to the nearest thousand).

The steel and vehicle and machinery industries, with the other metal and metal-using industries, account for half the total of Brit. exports and employ half of all workers in manufacturing industry.

INDUSTRY.—The U.K. supports a mixed economy (public and private enterprise) and is highly industrialised, the ratio of persons in the mining, manufacturing, and building industries to those engaged in agriculture being 10 to 1. England's natural resources include coal (principally in the W. Riding of Yorks, Manchester area, Northumberland and Durham, and N. Staffordshire) and iron (in the Cleveland Hills, Yorks, W. Midlands, W. Cumberland, and elsewhere), though much of the latter is imported. Clay in Staffordshire gives rise to the industrial area known as the Potteries (q.v.); china clay is found in Cornwall, where formerly copper and tin were also mined. Lead, once found in Derbyshire, is also no longer important commercially. Slate is mined in the Lake Dist.; salt occurring in Cheshire and S. Durham has given rise to the chemical and alkali industries centred in that region. But a great number of raw materials have to be imported (cotton, wool, foodstuffs for processing, industrial metals, etc.). Industry in England is concentrated in London, the Midlands, Yorks, Lancs (SE. Lancs and Merseyside conurbations), and on Tyneside. London is a centre for the clothing, building, food and drink, printing, furniture, precision instrument, and other highly specialised industries; light and heavy engineering are also carried on. The industries of the W. Midlands conurbation (Birmingham and Wolverhampton area) include electrical goods, engineering, vehicle building, jewellery, precision instruments, chemicals, rubber goods, and hardware. The N. Staffordshire industrial area (centred on Stoke-on-Trent) produces pottery and china, and coal is mined to the N. and E. of Derby and Nottingham. Leicester and Coventry are the other important centres in the W. Midlands industrial region. In W. and S. Yorks the woollen and worsted industry is largely carried on in and around Bradford, Halifax, and Huddersfield, Leeds now being principally a

centre for clothing manuf., though it also has steel and engineering industries. The steel industry of Sheffield is famous, and cutlery, plate, and tools are made there, and heavy engineering carried on. Coal is extensively mined in this area. In Lancs cotton spinning (around Manchester) and weaving (around Blackburn, Burnley, Colne, and Nelson) are carried on; Manchester itself has electrical and heavy engineering industries and coal is mined nearby. On Merseyside the port of Liverpool carries on ship repairing and food processing; Birkenhead has ship-building and repairing industries (the district is scheduled as a development area). On Tyneside there is an extensive coalfield; the 2nd largest shipbuilding area in the U.K. (the largest being in Scotland on Clydeside) is located near the mouth of the Tyne, Tees, and Wear rvs. Steel and engineering are subsidiary industries; new light industries are being introduced in a development area. Fishing (by steam trawlers) is carried on in the North Sea, principally from Hull, Grimsby, Yarmouth, Lowestoft, and Ramsgate (qq.v.); off the SW. coast, principally from Brixham and Plymouth (qq.v.); and off the NW. coast, principally from Tenby, Whitehaven, Fleetwood, Blackpool, Southport, and Liverpool (qq.v.). See FISHERIES.

Other specialised Eng. industrial centres are Northampton (boots and shoes), Leicester (boots and shoes, and hosiery), Nottingham (hosiery, tobacco, bicycles), St Helens, Smethwick, and Stourbridge (glass), Kidderminster and Halifax (carpets), Bristol (tobacco and confectionery), York (chocolate and confectionery), Reading (biscuits). Chemicals are produced on Merseyside and Tees-side; cement is made at centres along the Thames, Medway, and Humber rvs.

Certain essential services and industries are under national ownership and are administered by public corporations; they include coal-mining, inland transport, gas supply, electricity generation and supply, civil air transport, and telecommunications. The Bank of England (q.v.) is governed by a court of directors, 16 in number. The U.K. Atomic Energy Authority is responsible for atomic energy research and development; the first Brit. atomic power station was opened (Oct. 1956) at Calder Hall (see CALDER-BRIDGE), Cumberland. Labour relations rest on the principle of joint consultation between management and workers, mainly through the machinery of employers' associations and trade unions (q.v.).

HISTORICAL MONUMENTS, PLACES OF INTEREST.—England has many attractions for the tourist and traveller, and the prin. places of historic and scenic interest are to be found described in any good guide book. In a short introductory article, only the briefest indications of some of these places can be given; they include monuments and structures dating from prehistoric times, such as the stone circles at Stonehenge and Avebury (qq.v.), neolithic camps like that at Windmill Hill

(q.v.), or later camps such as the Early Iron Age Maiden Castle, and remains of tns, roads, villas, and baths from the period of Rom. occupation (see ROMAN REMAINS IN BRITAIN). Few monuments survive from the A.-S. period, though churches at Bradwell, Bradford-on-Avon, and Canterbury (St Martin's) are among examples of building in stone (see also ENGLISH ARCHITECTURE), and stone crosses include those at Ruthwell and Bewcastle (qq.v.). But from the time of the Conquest England is rich in historical monuments, eccles. and secular, of all periods. Cathedrals of beauty and interest include those at Canterbury (q.v.), Winchester, Chichester, Salisbury (q.v.), Exeter, Wells, Lincoln, Ely, Southwell, Gloucester, Hereford, Chester, Durham, and York (see articles on these cities and YORK MINSTER). Alongside these may fittingly be placed the great ruined abbeys of the N. (Fountains, Rievaulx, Jervaulx, Bolton (qq.v.) and others), and the ruins of Tintern (Monmouth), together with the many historic churches to be found in Eng. tns of all sizes. Among secular buildings, castles may vary from fortified manors such as those at Acton Burnell and Stokesay to the elaborate castle at Windsor; among many may be mentioned Bodiam, Hastings, Tintagel, Warwick, Kenilworth, Corfe, Colchester, Durham, York, Scarborough, Sheriff Hutton, Bamburgh, Alnwick, Warkworth, and the Tower of London (q.v.), in a class by itself. Among great historic houses are the mansions of Blenheim, Longleat, Chatsworth, and Knowle (qq.v.); and houses such as Penshurst Place, Compton Wynyates, the smaller Sulgrave Manor, home of the Washingtons, and Haddon Hall (qq.v.) have their own charm. The smaller Eng. tns too are often most interesting and attractive, and Bourton-on-the-Water, Burford, Lavenham, Ludlow, King's Lynn may be cited among very many other possible choices; such larger centres as Bath, Winchester, Chichester, Lincoln, Norwich, Shrewsbury, Chester, York, the univ. tns of Oxford and Cambridge, Stratford upon Avon (and the Shakespeare vils.) all commend themselves to the visitor. Scenic beauties vary from Kentish apple orchards in spring and hopfields in summer, from the Lincs. bullfields, the fruit-blossom in the vale of Evesham, and the pastoral heart of England, to the wilder beauties of the Eng. Lake Dist. and the moorlands of the SW. (Dartmoor and Exmoor) and the N. cos. Eng. scenery is particularly varied and there are many opportunities for visits to historic buildings and anc. sites, which may be protected by the Ministry of Works, or by the National Trust (q.v.), which also cares for some of the most beautiful parts of the Eng. landscape.

WILD LIFE IN ENGLAND.—*Fauna.*—Despite increasing building and the spread of industry, a considerable number of wild animals may still be observed about the countryside, in fields, woods, and rvs., and (notably in the case of

birds) even in urb. areas. Red deer are to be seen in the Lake Dist. and in Devon and Cornwall, and roe and fallow deer are also found. The ponies of the New Forest are now only semi-wild and the same may be said of the white cattle of Chillingham; among the smaller mammals, otters, badgers, stoats, weasels, foxes, squirrels, hares, and rabbits are to be seen, particularly in the Midlands, though badgers are decreasing in number and rabbits, since the myxomatosis (q.v.) epidemic of 1955, are much less common. Smaller animals still include hedgehogs, moles, voles, mice, shrews, and rats. Eagles, largest of Brit. birds, are no longer seen in England, but game birds include grouse, pheasant, partridge, woodcock, and snipe; many varieties of duck and geese are also seen. Over 420 distinct species of Brit. birds have been listed, of which blackbirds, chaffinches, and robins are the most commonly found; other birds include sparrows, thrushes, starlings, pipits, crows, rooks, swallows, swifts, chiffchaffs, tits, martins, warblers, wrens, larks, peewits, cuckoos, and kingfishers. Only a few marsh birds are found, mostly on the marshland and saltings of E. Anglia. The chalk downs of S.E. England are rich in insect life, as is also the Cheshire plain where many kinds are to be observed. Only 75 kinds of butterflies are found in Britain, though there are some hundreds of different moths and about 5000 beetles. Three snakes, the adder (poisonous) and the grass- and ringed snakes (harmless), are found. Lizards, frogs, toads, and newts number only 8 species between them. Fish abound in most Eng. rivs.; trout, salmon, roach, bream, dace, carp, occasionally pike, are all found.

Flora.—The trees of England, though no longer so numerous as once they were, are still a feature of the Eng. landscape. The great oak forests of former days are now diminished, but oaks are still found in considerable quantity, along with ash, thorn (hawthorn, blackthorn, etc.), elm, beech, horse- and sweet chestnut, sycamore, hornbeam, walnut, lime, cedar, yew, spruce, fir and pine, willow, and alder. Hedgerows are usually of thorn or hazel and are a conspicuous feature of the landscape in the more fertile dists., being replaced on the wilder uplands by dry stone walling; often blackberries are found in Eng. hedges, together with a variety of climbing plants. Other wild fruits include strawberries and bilberries (also known as whinberries), and a number of edible fungi are found, the most popular being the mushroom. Since only a very few plants are confined to Britain, Eng. flowers must be looked upon as part of a common European flora. Common flowers are bluebells, wood anemones, primroses, violets, wild roses, honey-suckle, found in hedgerow and wood; willow-herb, foxglove, field geranium, loose-strife, rest-harrow, harebells, scabious, celandine, coltsfoot, bugle, the various vetches, campons, daffodils, daisies, and buttercups are found in

many places, though the varieties of flowers found differ from dist. to dist. and from one geographical div. to another throughout the country. A very few rare plants are peculiar to E., among them the Cheddar pink; in some of the valleys of the N. country alpine flowers are found.

BIBLIOGRAPHY, which comprises only a selection of the many books pub.; additional reading is suggested in the bibliographies of articles cross-referred from the entry GREAT BRITAIN.

England, Church of, a title which, as *Ecclesia Anglicana*, first appears in Magna Carta, 1215, to describe the Catholic Church in Britain. For the hist. of *Ecclesia Anglicana* up to the time of the Reformation see CHURCH HISTORY. Though some protestant ideas were circulating in England before 1530, England's

break with Rome was basically the result of political events arising from Henry VIII's desire for a male heir and his infatuation with Anne Boleyn. Pope Clement VII was unable to grant the annulment of Henry's marriage with Catherine of Aragon. Henry, relying on national patriotism, proceeded to limit the papal power in England. Convocation was compelled (1531) to acknowledge the king as 'supreme head of the English Church and clergy,' but added 'so far as the law of Christ will allow.' Acts forbidding the payment of Annates, appeals to Rome, payment of papal fees, and applications for papal dispensations quickly followed. The royal supremacy was embodied in an act of 1534. Meanwhile Cranmer (q.v.), archbishop of Canterbury, declared null the marriage with Catherine, and Henry married Anne Boleyn. Henry's lust for power was fed by success and his greed led to the indiscriminate suppression of the monasteries. Yet he did not intend any alteration of Catholic doctrine. To deny Transubstantiation was as dangerous under him as to deny his supremacy. Under Edward VI reformation went on apace. Prayer Books (q.v.) in English were produced (that of 1549 conservative, that of 1552 more radical) and fastened on the nation by Acts of Uniformity. Under Mary the realm was reconciled with Rome; but Mary's Sp. marriage, and the numerous executions of recalcitrant reformers, alienated even conservatives. Elizabeth came to the throne (1558) determined to unify the nation. Her Act of Supremacy avoided the term 'supreme head,' asserting her merely to be 'supreme governor.' The Act of Uniformity (1559) restored the 1552 Prayer Book but with significant Catholic amendments. Elizabeth's settlement was opposed by the Puritans, who objected to the vestments and ceremony still allowed by the Prayer Book, and by those who still clung to the papacy. The latter were treated tolerantly until in 1570 Pius V misguidedly pub. a bull excommunicating and deposing the Queen. Jesuits were secretly sent to England, and conspiracies against the Queen were formed. Her policy was then reversed. Penal statutes visited papists with fines and imprisonment, and some 200 were executed on charges of treason. At the same time non-conforming Puritans were imprisoned or banished. By the end of Elizabeth's reign, the Church, for which Richard Hooker (q.v.) was the great apologist, and the Prayer Book had gained the allegiance of the majority of the people.

After the Civil war, the C. of E., identified too closely under Archbishop Laud (q.v.) with the royal tyranny, came near extinction. But England found a small taste of Puritanism sufficient and welcomed the restoration of the monarchy, 1660, the re-estab. of episcopacy, and the return of the clergy to their par. The Savoy Conference, 1661, rejected Puritan demands for radical Prayer Book changes, and the book as revised by the Convocations and annexed to the Act of Unifor-

mity, 1662, made no concessions to them. This is regarded as the last stage of the Reformation Settlement. The C. of E. claims to be reformed on scriptural and primitive catholic lines, to be Protestant against papal claims and late accretions in doctrine and practice, but Catholic in retaining the ancient creeds, ministry, and sacraments, and the appeal to scripture: no new Church was founded, but the ancient C. of E. reformed herself.

But she was no longer the church of the whole people. Non-conformists, Rom. Catholic and Protestant, were organised outside her. Legislation against them (e.g. the Conventicle Act, 1664, the Five Mile Act, 1666, and the Test Act, 1673) was but slowly relaxed. Yet toleration gradually was estab., the last stage being the Rom. Catholic Relief Act, 1829.

After the Restoration those schools of thought emerge which exist today in the C. of E. In the latter part of the 17th and the early 18th cents., High Churchmen (q.v.) like Jeremy Taylor, Cosin, John Pearson, Ken, Sancroft, and Thomas Bray were among her leaders. Some of the best were lost to the Non-juring Schism (*see* NON-JURORS). As the 18th cent. advanced, religious and moral standards declined, but the Church yet produced John Wesley, Joseph Butler, Samuel Johnson, John Venn, and Charles Simeon. In high places Latitudinarians held sway, children of the 'age of reason,' who asserted the reasonableness of Christianity against the prevailing agnosticism and atheism. Disliking enthusiasm, they were indifferent to church order and dignity in worship, but usually men of intellect and moral integrity. Their failures were worldliness and place-seeking; they were not inspiring leaders. Reaction followed, and the Wesleys and George Whitfield, whose preaching aimed at individual conversion and personal devotion to Christ, initiated the Evangelical revival. John Wesley remained in the C. of E., but after his death the Methodists separated from her. Among the many evangelicals who remained in the fold, Venn, Simeon, John Newton, and Wm Wilberforce were outstanding, zealous in charitable works, eager for the conversion of the heathen, and for social righteousness. They founded the Church Missionary Society (q.v.), 1799, the Brit. and Foreign Bible Society, 1804, and many Sunday Schools. They are the forerunners of the 20th-cent. Evangelicals or Low Churchmen, as the Latitudinarians are of the Modern Churchmen.

But in the early 19th cent. the Church remained generally apathetic. Exceptions were the Evangelical par., some clergy in whom High Church principles were still cherished, and the group which Dr Thomas Arnold inspired. He hoped for a National Church which, by excluding all but a few central doctrines, would include all Christians, and bring religion into the people's daily life. But this impracticable scheme was overshadowed by the Oxford Movement (q.v.). John Keble's assize sermon at Oxford, 1833,

on 'National Apostasy' was occasioned by Parliament's proposal to suppress 10 Irish bishoprics. Other Oxford churchmen rallied to the call. R. H. Froude, J. H. Newman, and E. B. Pusey. They began to issue their 'Tracts for the Times' (hence the name 'Tractarian') recalling the Church to its belief in itself as divinely founded, and appealing especially to the Fathers and the Creeds. Newman, in Tract 90, argued that the 39 Articles (q.v.) were susceptible of a Catholic interpretation. This aroused antagonism. His secession to Rome (1845), followed by others, accentuated the fear that the movement was a papist conspiracy, and the establishing of a Rom. hierarchy in England, 1850, did nothing to allay it. But the movement progressed. Religious communities were founded for women, and later for men, and colleges at the univs. and public schools. Choral services with surpliced choirs were introduced, more frequent Holy Communion, the opening of churches on weekdays, long-neglected vestments and ceremonial. The Puseyites, or Ritualists as they were called, denied the spiritual authority of the Judicial Committee of the Privy Council, which since 1833 had been the court of appeal in eccles. cases, and preferred imprisonment to accepting its decisions, thus gaining public sympathy.

The events of the 18th cent. showed the need for adjustment in Church and State relations, and the Life and Liberty Movement, led by William Temple (q.v.), secured the Enabling Act, 1919, setting up the National Assembly of the C. of E. (q.v.), to prepare measures for parl. assent in matters concerning the Church. In 1927 the new Assembly put forward a completely revised Prayer Book, but the House of Commons narrowly rejected it. Alterations were made but again in 1928 the Commons rejected the book. The Upper Houses of Convocation however agreed not to prevent its use, and parts of it have been generally adopted. The question had been raised in an acute form of the right of a parliament, many of whose members were not churchmen, nor even necessarily Christian, to determine the public worship of the Church. This quickened the demand for disestablishment (q.v.). Many, however, even outside the Church, thought that it would be a retrograde step, with repercussions far beyond this country, for the State to withdraw official recognition from the historic Church of the land, and this kept the problem in the background. The Convocations (q.v.) and Church Assembly, in the decade following the Second World War, began a revision of the Canon Law (q.v.) and a reconstruction of the Eccles. courts, to ease and stabilise the Church's position *vis-à-vis* the State.

The 20th cent. saw a growing movement for union with other Christian bodies, and with this the Lambeth Conferences (q.v.) of 1920 and 1930 were largely concerned. Hopeful conversations with Rom. theologians under Cardinal Mercier at Mâlnes (1921-25) were forbidden after 1926 by

the Vatican. But exploratory discussions with Methodists and with the Church of Scotland (Presbyterian) in the 2nd half of the 20th cent. showed how the climate of opinion has changed since the 19th cent. (See UNION OF THE CHURCHES.)

The report of the Archbishop's Commission on Doctrine, pub. 1938, frankly set out variations in doctrinal opinion held within the C. of E., which are often considerable though held by men who believe themselves loyal to the Christian tradition. This apparent disunity leads some to seek refuge in the infallibility of Rome, or in Protestant fundamentalist sects. But a Church which attempts to keep Catholic, Evangelical, and Liberal within one fellowship and holds that Christianity must have room for more than a single intellectual outlook or devotional temper attracts people of many kinds to find in her their spiritual home.

The strength of the C. of E. is hard to estimate. Nominally it is enormous. But in 1953 there were 2,068,829 Easter communicants, not including the armed forces, Cathedrals, schools, hospitals, and similar bodies. There were just under three million on the electoral rolls of par. In the same year 408,769 persons were baptised, and 154,543 confirmed. 49.6 per cent of the country's marriages were solemnised in the C. of E. in 1952.

The C. of E. strictly comprises two provs. only: Canterbury (29 dioceses) and York (14 dioceses). The Welsh sees ceased to belong to the former in 1920, when they were disestablished and disendowed and became a separate self-governing prov. (see WALES, CHURCH IN). The Episcopal Church of Scotland, under its Primus, has been an independent prov. since the Civil war. See also IRELAND, CHURCH OF. For the growth of Anglicanism overseas, see ANGLICANISM. See also H. Wakeman, *Introduction to the History of the Church of England*, 1898; H. Henson, *The Church of England*, 1939; C. M. Ady, *The Church of England and How it Works*, 1940; C. F. Garbett, *The Claims of the Church of England*, 1947; R. Lloyd, *The Church of England in the Twentieth Century*, 2 vols., 1946, 1950; J. R. H. Moorman, *A History of the Church of England*, 1953.

England, New, see NEW ENGLAND.

Englewood, city of Bergen co., New Jersey, U.S.A., 1 m. W. of the Palisades of the Hudson R. It is a residential suburb of New York, from which it is 14 m. distant. It manufactures leather goods, lighting fixtures, drugs, elevators, and metal products. Pop. 23,145.

English Architecture. This article, like those on the architecture of other countries, deals only with the special national characteristics of the various periods; with typical buildings in each, and the names of their architects where those are known. For the general characteristics of the various periods, see ARCHITECTURE (ROMAN, ROMANESQUE, GOTHIC, RENAISSANCE, NINETEENTH CENTURY, TWENTIETH CENTURY); also ARCHITECT; CASTLE;

CATHEDRAL; CHURCH; HOUSE; MONASTERY; RESTORATION; TEMPLE; TOWN-PLANNING; and on structural details: BUTTRESS; COLUMN; DOOR; TRACERY; VAULT. (Separate articles describe IRISH and SCOTTISH ARCHITECTURE.)

Excluding primitive hut-dwellings, and such prehistoric monuments as Stonehenge and Maiden Castle, the oldest buildings in England that merit the name of architecture were erected during the Rom. occupation of Britain, terminating c. AD 410. They resemble Rom. architecture of other provinces of the Empire, and are somewhat less ambitious and elaborate than those of the city of Rome itself. Most of them are to be found in certain of the larger Rom. tns.—Camulodunum (Colchester), Verulamium (St Albans), Aquae Sulis (Bath), Calleva Atrebatum (Silchester), Viriconium (Wroxeter), and Isca Silurum (Caerwent). Other important tns.—e.g. Londinium (London), Eboracum (York), Ratae (Leicester), Lindum (Lincoln), Glevum (Gloucester), and Corinium (Cirencester)—have yielded comparatively few remains; usually because later building has smothered or destroyed the Rom. work, or because they have not yet been thoroughly excavated.

Rom. buildings in Britain comprise (i) amphitheatres (an especially fine example is at Caerwent, Mon.); (ii) theatres (the best being at Verulamium); (iii) secular basilicas, including a large one under Gracechurch Street, London, and smaller examples at Cirencester, Silchester, Wroxeter, and Caerwent; (iv) public baths, especially at Bath, but also at Leicester, Silchester, and Wroxeter; (v) temples; none now remaining above ground-level but foundations of a large one at Colchester, also numerous temples to the oriental deity, Mithras, also the remarkable example recently discovered in Walbrook, London; (vi) Christian churches, the only survivor being a fragment of a small basilican church at Silchester, c. 410 (public buildings were generally grouped round the forum or *mrkt*-place, as at Verulamium); (vii) *in*-houses, best studied at Verulamium, where the streets form a chess-board pattern, with houses centrally heated by hot air, equipped with baths, and provided with mosaic floors; (viii) villas or country-houses from which farming was carried on, some of them having over fifty rooms, and most having central heating, baths, and mosaic floors. They are chiefly situated S. and E. of a line from York to Exeter, the best examples being at Bignor (Sussex), Brading (Is. of Wight), Chedworth (Glos), Folkestone (Kent), Northleigh (Oxon), and Woodchester (Oxon).

Little evidence remains of the buildings which the first Anglo-Saxon settlers must have erected during the period c. 410–597. The next phase began with the landing of St Augustine in Kent in 597. His speedy conversion of the Kentish king resulted in the erection of Christian churches in Canterbury (SS. Peter and Paul, 597; St Pancras, c. 600; St Mary, c. 620); also

St Andrew, Rochester, 604; St Mary, Lyminge, c. 633; St Mary, Reculver, 669—all these in Kent. St Peter, Bradwell (Essex), was built c. 660; and at Brixworth (Northants) was erected a large church, c. 670, which still survives, and has been described by a leading authority as 'perhaps the most imposing monument of the 7th century yet surviving north of the Alps.' It has a long aisled nave with semicircular brick arches, a small apsidal chancel, and a timber roof.

Only a few years later, a 2nd group of Christian churches was erected in the former 'kingdom of Northumbria,' as a result of missionary activity by Benedict Biscop, who had studied in Rome. His 3 churches, all very small and roughly built, are at Monkwearmouth (674), Jarrow (chancel only, 682), and Escomb (about the same date). In Hexham Abbey and Ripon Cathedral are crypts of this period, built c. 675 by St Wilfrid, Archbishop of York.

During the 8th and 9th cents., mainly because of Dan. invasions, there was another lull in church-building. The next phase began early in the 10th cent.

Between that date and the Norman conquest of England in 1066 a number of churches were erected. They used to be called 'Saxon,' but, because they represent only a ruder form of Continental 'Romanesque,' they are now generally classified under that head as 'Pre-Conquest Romanesque,' whereas those built after 1066 are 'Post-Conquest Romanesque,' (not 'Norman' as they were commonly called a generation ago). Nothing remains to-day of Pre-Conquest domestic architecture, and the following are the chief surviving Pre-Conquest Romanesque churches.

10th century. Deerhurst (Gloucestershire); Bradford-on-Avon (Wilts); Wing (Buckinghamshire); Worth (Sussex); Earl's Barton (Northants); Barton-on-Humber (Leicestershire); St Benet, Cambridge; Wittering (Northants); Breamore (Hants). (St Mary-in-Castro, Dover, may be of either the 10th or the 11th cent.)

11th century. Rosham (Sussex); Sompting (Sussex); the foundations of Elmham Cathedral, Norfolk, and of St Augustine's Abbey, Canterbury; also possibly the curious little timber church at Greenstead, near Ongar in Essex. The first abbey-church at Westminster was begun c. 1050 and dedicated in 1065.

Surviving buildings of the Post-Conquest Romanesque (or 'Norman') period, 1066–c. 1200, consist almost entirely of churches and castles. The feudal lords lived in castles, the peasantry in wretched shacks of wood, or of wattle-and-daub, which have perished long ago, and there were hardly any middle-class people requiring houses. The so-called 'Jews' Houses at Lincoln, built of stone, are among the few that remain.

Of the various types of castle (see CASTLE), the chief Eng. examples are: (i) *Motte* type, Thetford in Norfolk; (ii) *Shell-keep* type: Arundel, Carisbrooke, Clifford, Exeter, Ludlow, Peak; (iii) *Rec-*

tangular keep: London ('the Tower'), Castle Rising, Dover, Heddingham, Middleham, Newcastle upon Tyne, Norwich, Portchester, Rochester, Scarborough; (iv) *Twelve-sided keep*, Orford in Suffolk; (v) *Round keep*: Conisborough, Pembroke, and Windsor (but the so-called 'Round Tower' at Windsor was considerably raised in height during the 19th cent.).

Post-Conquest Romanesque may be studied in the following cathedrals:

not until the 11th cent. that they began to produce architecture of any importance in Normandy. Hence the progress of Romanesque architecture in England and Normandy moved on parallel lines until the end of the 12th cent.; when, in both countries, the pointed arch was introduced and the Gothic period began. From that date fundamental differences began to appear between Fr. architecture (q.v.) and Eng.; these differences becoming

EXETER CATHEDRAL: WEST FRONT

Chichester, Durham, Ely, Exeter, Gloucester, Hereford, Norwich, Oxford, Peterborough, St Albans, Winchester; in Tewkesbury and Waltham Abbeys; and in par. churches at Adel (Yorks), Barfreston (Kent), Ilfley (Oxon), Kilpeck (Herefordshire), Melbourne (Derbyshire), St Peter at Northampton, Stewkley (Buckinghamshire); also in the wonderful little Chapel of St John in the Tower of London.

In England, as elsewhere, round arches were invariably used throughout the Romanesque period. The flow of architectural influence into England continued to be from France, as it had been before the Conquest; but the Normans had only recently become skilful builders and designers. When they invaded Normandy from Scandinavia in the 9th cent. they were barbarous pirates like the Danes who ravaged England; and it was

progressively more marked up to the end of the Gothic period (c. 1540 in England).

The successive stages of Eng. Gothic architecture may be classified as: (i) Early Eng., or Early Pointed, c. 1200-c. 1300; (ii) Decorated, or Middle Pointed, c. 1300-c. 1370; (iii) Perpendicular, or Late Pointed, c. 1370-c. 1540. There was no abrupt line of change between these various periods; each merged into the next by a gradual transition, as new structural or decorative features were introduced; and sometimes they overlapped. One of the simplest ways of distinguishing them is by the design of their windows (*see* TRACERY); but more important is the gradual development of vaulting and buttressing, whereby the thick walls and heavy barrel-vaults, the flat buttresses, and the narrow windows of the 12th cent.

came to be replaced by bolder buttresses, thinner walls between them, thinner vaults supported on stone ribs, and much larger windows filled with tracery; until, in such late examples as King's College Chapel at Cambridge (1446-1515) and Henry VII's Chapel at Westminster (1500-12), the walls have become a more paneled screen, mostly filled with glass—all the weight of the thin vaulted roof being carried by stone ribs converging on to very bold buttresses, capped with tall pinnacles which help to neutralise the downwards and outwards 'thrust' of the vaulting ribs, or (if there is no vaulting) of the timber roof-trusses.

Following are the chief examples of the 3 Gothic periods.

(1) *Early English*. Cathedrals: most of Salisbury; most of Lincoln except the choir and W. front; the W. fronts of Peterborough and Ripon; the choirs of Lichfield, Southwark, Southwell, and Worcester; most of Wells including the W. front; the nave of York; the 'Chapel of the Nine Altars' at Durham. Other buildings: the choirs of Westminster Abbey and of the Temple Church in London; the choir and transepts of Beverley Minster.

(2) *Decorated*. Cathedrals: the naves of Exeter and Lichfield; the choirs of Bristol, Lincoln, and St Albans; the choir, W. front, and chapter-house of York; the chapter-houses of Salisbury, Southwell, and Wells. Other buildings: the nave of Beverley Minster, the par. church of Heckington, Lincs.

(3) *Perpendicular*. Cathedrals: the naves of Canterbury, Manchester, and Winchester; the choirs of Gloucester and York; the cloisters of Gloucester; the W. fronts of Winchester and Gloucester. Other buildings: Sherborne Abbey; the W. front of Beverley Minster; St George's Chapel, Windsor; King's College Chapel, Cambridge; Henry VII's Chapel, Westminster; the roof of Westminster Hall; sev. of the older colleges at Oxford and Cambridge.

The Renaissance movement in Italy began to influence E. A. early in the 16th cent., but at first was confined to small ornamental details imported from Italy (e.g. the terracotta busts of Rom. emperors at Hampton Court, c. 1520) or carried out by imported It. craftsmen (e.g. Torrigiano's tomb for Henry VII in Westminster Abbey, 1512). It. ornamental features soon came to be copied by Eng. craftsmen, and books of engravings of the 'Orders' (q.v.) and other Rom. architectural details were compiled, mainly in Germany and the Netherlands, and were studied in England. The first stage of transition from Gothic to Renaissance is sometimes called 'Tudor,' the period 1558-1603 is commonly known as 'Elizabethan,' and that from 1603 to c. 1630 as 'Jacobean.'

Church-building was almost in abeyance from c. 1540 to c. 1660, owing to religious turmoil and to the existence of a surplus of medieval churches—partly the result of over-building during the 'Age of Faith,' partly owing to the dissolution of the

monasteries. The most important example is St John's Church, Leeds (1634), which is entirely Gothic in structure and general design, but contains magnificent 'Jacobean' (strictly 'Carolean') interior woodwork fittings. The Tudor, Elizabethan, and Jacobean periods, however, saw a great boom and revolution in the building of houses and of grammar schools and colleges. An extreme example of the application of Rom. features is the 'Tower of the Five Orders' (1613-18) at the Bodleian Library, Oxford; where the classic Orders are applied as mere decoration to a building with mullioned windows, battlements, and pinnacles, erected at the same time.

A sudden and violent change to full-blown It. Renaissance architecture occurred early in the 17th cent., when Inigo Jones (q.v.) appeared upon the scene, and designed the Queen's House at Greenwich, 1617-35, and the Banqueting House in Whitehall, 1619-22. Gothic architecture died very slowly, especially in Oxford: but, from c. 1640 onwards up to c. 1830, all E. A. was based on that of Rome, save for a few exceptions that led to the 'Greek Revival' and the 'Gothic Revival' towards the end of that period. The 'Georgian Period' lasted from 1714 to 1820, strictly speaking, and therefore includes the 'Regency Period' of 1810-20; but both are commonly extended to 1830 or even to 1837.

'Palladian' architecture includes not only the work of Inigo Jones (q.v.), but also that of many architects of the 18th cent. who followed Palladio (q.v.) rather than Wren (q.v.). Buildings of the period include many vast aristocratic mansions, such as Blenheim, Castle Howard, Holkham, Kedleston, Harewood, Kenwood, and Chatsworth; many charming Georgian houses; St Paul's Cathedral, many churches of the new 'Protestant' type, and Nonconformist meeting-houses; important public buildings such as Greenwich Hospital, Chelsea Hospital, and Somerset House. For the leading architects of the period and their works (in addition to JONES and WREN already mentioned) see ADAM (J. and R.); ALDRICH; ARCHER, T.; BOYLE, R. (Lord Burlington); BROWN, L.; BURTON, D.; CARR, J.; CHAMBERS, SIR W.; COCKERELL, C. R.; DANCE, G.; ESSEX, J.; GANDON, J.; GIBBS, J.; HAWKESMOOR, N.; HOLLAND, H.; KENT, W.; NASH, J.; SOANE, SIR J.; VANBRUGH, SIR J.; WEBB, J.; WILKINS, W.; WOOD, J.; WYATT, J.; WYATVILLE, SIR J.

The period c. 1830 to c. 1900 may be called the 'Victorian' phase, and was notable for a continuous struggle between the supporters of revived Classic (i.e. Greek and Rom.) and revived Gothic architecture, as explained in the article ARCHITECTURE: VIII. For the leading architects of the Victorian period and their buildings, see BARRY, SIR C.; BASEVI; BELCHER, J.; BENTLEY, J.; BLOMFIELD, SIR A. and SIR R.; BODLEY, G.; BURGESS, W.; BUTTERFIELD, W.; ELMES, H. L.; GEORGE, SIR E.; JACKSON, SIR T. G.; PEARSON, J. L.; PUGIN,

A. W. N.; SCOTT, SIR G. G. (Senior); SHAW, R. N.; STREET, G. E.; TITE, SIR W.; WATERHOUSE, A. (See also GRIMTHORPE, LORD and PAXTON, SIR J.)

The movement towards less imitative and more 'functional' architecture is described in ARCHITECTURE: IX. For leading architects of the cent. 20th and their buildings, see ABERCROMBIE, SIR P.; BAKER, SIR H.; BURNET, SIR J.; COLLICUTT, T. E.; COOPER, SIR E.; EASTON, J. M.; FRY, E. M.; GIBBERD, F.; HARRIS, E. V.; HOLDEN, C. H.; HOLFORD, SIR W.; KNOTT, R.; LANCHESTER, H. V.; LETHBRIDGE, W. R.; LORIMER, SIR R.; LUTYENS, SIR E.; MACKINTOSH, C. R.; MAUFE, SIR E.; RICHARDSON, SIR A. E.; ROBERTSON, SIR H. M.; SCOTT, SIR GILES; SPENCE, B.; UNWIN, SIR R.; VOYSEY, C. F. A.; WEBB, SIR A.

English Art. Medieval Art.—Medieval E. A. finds expression chiefly in Gothic architecture, and in sculpture as applied to eccles. buildings. The Fr. Gothic style spread throughout Europe through the monasteries, and it was natural that the variety of historical conditions and ideals, no less than of climate and materials, in the different countries into which the style spread should lead to the formation of a new national style in each, though all manifest a common origin. (See ARCHITECTURE: VI.)

English Painting.—Few examples survive of Eng. medieval painting. It is known that in England, as elsewhere in Europe, painting flourished under the aegis of the Church. National characteristics did not begin to emerge until the 7th and 8th cents., and found expression particularly in the illuminated manuscripts of the period. The schools of Winchester and Canterbury produced manuscripts which were esteemed throughout Christendom. The decoration of churches encouraged wall painting and panel painting. In the 13th cent. painting flourished under the patronage of Henry III, who made London a centre of art. The mural paintings of the Palace of Westminster, now destroyed, were outstanding examples of Eng. painting of this period. In the 14th cent. E. A. declined as a result of the Wars of the Roses, and the decline was

further hastened by the Reformation. Many early works of art were destroyed, and this iconoclasm continued into the 17th cent. The reign of Henry VIII virtually put an end to church painting, and it may be said that painting, particularly portrait painting, survived only through the influence and example of Hans Holbein (q.v.). The best artists of the time were, like Holbein, visitors from the Continent. In Elizabeth's reign, however, Eng. painting gained a native excellence in the work of the miniaturists, notably Nicolas Hilliard (1537-1616), Isaac Oliver (1564-1617), and his son, Peter Oliver (1594-1646) (qq.v.).

W. F. Mansell

HANS HOLBEIN, A SELF-PORTRAIT

In the Stuart period Eng. painting again owed its renewed impetus to the influence of a foreigner, Sir Anthony Van Dyck (q.v.), who settled in England after a preliminary visit in 1620, becoming court painter to Charles I. Among his successors were William Dobson (1610-46), the Cavalier painter (q.v.), and Robert Walker (1600-59), who painted portraits of Oliver Cromwell and other Puritan leaders. During the Commonwealth and after the Restoration the influence of foreign artists working in England continued. First among them was the Dutchman, Sir Peter Lely (q.v.), and later Sir Godfrey Kneller (q.v.) who came to England from Germany in 1674. There are few Eng. painters of the period to put beside Lely, except John Riley (1646-91) and Robert Streater (1624-80), whose mural paintings were notable in an age of portraiture. In 1711 Kneller founded a school which was the precursor of the

Royal Academy, founded nearly 50 years later when, in 1760, Sir Joshua Reynolds (q.v.) became its first president. Kneller's facile production debased the tradition of Van Dyck, but the ascendancy of fashionable portrait painting was challenged by the genius of Wm Hogarth (1697-1764) (q.v.), who by the realism and sincerity of his descriptive scenes from contemporary life strongly influenced the development of indigenous art at a time when it had sunk to shallowness and artificiality. His axiom that the only school was that of nature needs no

tion of natural subjects, but also a delicate touch as a painter and great power as a colourist. Reynolds was greatly influenced by It. painting, and his visit to Italy in 1749 was a landmark in his life. Gainsborough, who never left England, was influenced more by the Dutch painters and by Rubens. A successful follower of Gainsborough was George Morland (1763-1804) (q.v.), best known as a landscape painter. He also painted sporting and animal pictures, a genre which with the outstanding example of (George Stubbs (1724-1826) (q.v.) enjoyed

CONSTABLE'S 'FLATFORD MILL'

emphasis to-day. Though it was scarcely recognised in his time, it was destined to become the very keynote of E. A., and the measure of the debt to his work is to be gauged accordingly.

Gainsborough (1727-88) (q.v.) is regarded as the 'father of modern Eng. painting.' A rival of his great contemporary, Reynolds, as a fashionable portrait painter, he excelled in landscape painting. Landscape, which is the great glory of Eng. painting, was estab. in England by the work of foreign artists, but Richard Wilson (1713-82) (q.v.), who studied for some years in Rome, gained a reputation abroad which brought greater recognition to landscape painting in his own country although he himself was on the whole neglected. Whereas Wilson painted nature in the grand manner, Gainsborough brought to his landscapes a more personal and romantic feeling. He had not only a deep and intimate knowledge and percep-

tion of natural subjects, but also a delicate touch as a painter and great power as a colourist. Reynolds was greatly influenced by It. painting, and his visit to Italy in 1749 was a landmark in his life. Gainsborough, who never left England, was influenced more by the Dutch painters and by Rubens. A successful follower of Gainsborough was George Morland (1763-1804) (q.v.), best known as a landscape painter. He also painted sporting and animal pictures, a genre which with the outstanding example of (George Stubbs (1724-1826) (q.v.) enjoyed

With Gainsborough, Constable (1776-1837) (q.v.) and Turner (1775-1851) (q.v.) stand at the beginning of modern art in England. The influence of Constable as landscape painter was profound, and made itself felt on the Continent, especially in France, where he may be said to have been the true inspiration of the Barbizon school (see BARBIZON) led by Millet and Corot. All through the Victorian period of E. A. academic and classic subject matter vied with nature in favour, and it would be difficult to say whether the realism of Constable was more highly favoured than the idealism of Turner or the pseudo-classicism or romanticism of Lord Leighton (1830-96)

With Gainsborough, Constable (1776-1837) (q.v.) and Turner (1775-1851) (q.v.) stand at the beginning of modern art in England. The influence of Constable as landscape painter was profound, and made itself felt on the Continent, especially in France, where he may be said to have been the true inspiration of the Barbizon school (see BARBIZON) led by Millet and Corot. All through the Victorian period of E. A. academic and classic subject matter vied with nature in favour, and it would be difficult to say whether the realism of Constable was more highly favoured than the idealism of Turner or the pseudo-classicism or romanticism of Lord Leighton (1830-96)

(q.v.). Certainly the landscape painters have endowed Eng. painting with a more permanent heritage than have the great portrait painters of the 18th cent., whose classicism was not followed by their successors. Constable was the first painter to see that nature ignores conventions of beauty and propriety—a negative principle which lies at the root of all naturalistic art to-day. His cloudy skies and leaves glittering in sunlight reveal the innovator in light effects. Turner (q.v.), who doubtless gained much from others, stands alone as the most significant figure in Eng. painting. He is aptly regarded as being in E. A. what Shakespeare is in Eng. literature. His exemplar was (Jaude Lorraine, but he surpassed the Fr. artist in atmosphere and in breadth of conception, however inferior he was in technique and the qualities of form. Turner's dreams of classic Italy and Greece are for many the only Italy and Greece of old. As a colourist, he has been called the 'father of Impressionism.' Among nature painters Turner is unique, conveying through a novel and marvellous use of colour his individual vision of light; in him E. A. has affinities with Rembrandt before him and with Monet after. Mention may also be made here of Richard Parkes Bonington (1801-28) (q.v.), a painter of great promise whose style, learnt in France, was itself an influence on Fr. painting. Of the same period as Constable and Turner was John Crome (q.v.), who founded the Norwich Society of Artists in 1803. The dominant characteristic of this school of painting was sincerity and freshness of outlook. If Eng. painting owes less to him in the new naturalistic and impressionist interpretation of familiar nature than to Constable and Turner, there are beauty and meaning in his work, and more of poetic quality in it than in his master, Hobbema, whose traditions he carried on, however unconsciously, in England. Associated with Crome are the younger Crome (1794-1842), John Sell Cotman (1782-1842) (q.v.), James Stark (1794-1859), George Vincent (1790-1836), and John Ladbroke (1803-79). Of these, Cotman is especially noteworthy for his influence in the development of the art of water-colour painting in England, his work in this medium being supplemented by a group of contemporary Eng. artists including John Robert Cozens (1752-87) (q.v.), Thomas Girtin (1775-1802) (q.v.), Copley Fielding (1787-1855) (q.v.) in marine studies, Samuel Prout (1783-1852) in architectural work, and David Cox (1793-1859) (q.v.), the group being famous as 'the English School' and attaining its furthest point in the work of Turner. In the strange visions of the 'other world' of William Blake (1757-1827) (q.v.) we have an original vein of imaginative art, and so inimitable as to make him the great pictorial mystic of the world. Though in form he is often grotesque, the reverse of naturalistic, even to inaccuracy of outline as in his picture of the Resurrection, he is the first of Eng. poet painters.

Of the same great period of E. A., striking an equally distinctive note, are James Gillray (1757-1815) (q.v.) and Thomas Rowlandson (1766-1827) (q.v.), caricaturists of manners and customs, whose tradition was carried on by George Cruikshank (1792-1878) (q.v.). In portrait painting Reynolds is the Eng. classic. He had a wide knowledge of It. painting, and from the work of Crespi and others he no doubt formulated his maxim that 'it is not the eye but the mind which the painter of genius desires to address.' Hence he painted his sitters not in fashionable dresses, as being 'too particular and individual,' but in non-committal costume: thus his portrait of Mrs Siddons is in some ways reminiscent of Michelangelo's 'Isaiah.' Besides Reynolds, the great names in E. portraiture are those of Romney (1734-1802) (q.v.), John Hoppner (1758-1810) (q.v.), and Sir Thomas Lawrence (1769-1830) (q.v.), whose brilliant work marks an epoch in E. A. and had its influence in France. Other names of this period important in E. A. are those of Sir David Wilkie (1785-1841) (q.v.) and William Etty (1787-1849), both popular genre painters. Mention must also be made of James Northcote (1746-1831) (q.v.) and John Opie (1761-1807) (q.v.), both of whom painted historical pictures in the grand manner which was the vogue in the early 19th cent. Thomas Stothard (1755-1834) (q.v.), in the illustration of the novels of Fielding, Richardson, Sterne and Smollett, initiated a revolution in book illustration which was later to develop into one of the most striking art movements of the cent.

Eng. painting during the second half of the 19th cent. was dominated by the Pre-Raphaelite Movement, named from the Pre-Raphaelite Brotherhood which was formed in 1848 by Dante Gabriel Rossetti (1828-82), William Holman Hunt (1827-1910), and John Everett Millais (1829-96) (q.v.). Other artists later joined the Brotherhood, while from the start Ford Madox Brown (1821-93) was associated with it. (See PRE-RAPHAELITE BROTHERHOOD.) The aim of the movement was a revolt from the 'grand style' and a return to simplicity and accuracy of observation. At first ridiculed, the style of the Pre-Raphaelites produced a host of popular imitators, and later a 'second' movement started in which the names of Sir Edward Burne-Jones (1833-98) (q.v.) and Wm Morris (1834-96) (q.v.) are linked. Millais later in life became a prominent figure in the academic art of the day. G. F. Watts (1817-1904) (q.v.), whose paintings expressed the moral fervour of his ideas, was also accounted one of the foremost painters of his day. He was also a notable portrait painter. Alfred Stevens (1818-75) (q.v.), known in his lifetime more as a sculptor and designer, is now also recognised as a painter of importance. With Millais and his imitators painting was degenerating into a method of storytelling. In pronounced reaction to this came the work of James McNeill Whistler (1834-1903) (q.v.), an Amer.-born artist

who brought to England the influence of Fr. aesthetic aims. His own work with its emphasis on form, colour, and tone affected the course of Eng. painting. Eng. Impressionism, deriving from Constable and Turner as much as from Fr. artists, found expression in the work of the members of the New Eng. Art Club, founded in 1886. Wilson Steer (1860-1942) (q.v.), Sir George Clausen (1852-1944) (q.v.), and Sir Charles Holmes (1868-1936) (q.v.) are three among the many notable names in this connection. They are celebrated particularly for their landscape work, while among portrait painters John Sargent (1856-1925) (q.v.), an Amer. who painted in England, and a romantic impressionist, combined psychological penetration with considerable technical skill. Also under the heading of Impressionism may be classed the work of two other distinguished painters—Walter Sickert (1860-1942) (q.v.) and Augustus John (q.v.). John is a great romantic artist who in his later work has been influenced by and shows affinity with the Fr. Post-Impressionists. Sir Frank Brangwyn (q.v.) gained world-wide fame as a decorative painter. The first Post-Impressionist exhibition in England was held in 1910, and the new sense of form and colour it brought is seen in the work of the Camden Town Group, notably Harold Gilman (1876-1919), also in Duncan Grant (1883-), Sir Matthew Smith (1879-), and others. The new ideas of the Continent were pressed into the service of those painters who wished to express their experience gained in the First World War. C. R. W. Nevinson, William Roberts, Henry Lamb, Stanley Spencer, Eric Kennington, and the brothers Paul and John Nash were not satisfied with representational art, whether romantic or naturalistic, but were intent on using their considerable descriptive powers to portray their moral apprehension of life. Windham Lewis was one of the few Eng. artists to be directly affected by the Cubist movement into which Post-Impressionism on the Continent developed. Many of Paul Nash's formal, structural paintings also show Cubist influence. He was the moving spirit among a number of artists who in 1933 formed themselves into a group, named 'Unit One,' with the aim of making design a 'structural pursuit' and imagination the keynote of Eng. painting. The years between the two world wars produced a flourishing display of talent among Eng. artists, a development which the Second World War has enhanced rather than diminished. Apart from the artists mentioned above, there are numerous painters whose work has influenced the trend of modern Eng. art, and who deserve more detailed reference than can be given here. Among them are Charles Conder, Henry Tonks, Charles Shannon, Charles Ricketts, Glyn Philpot, J. B. Yeats, Sir W. Nicholson, Sir W. Rothenstein, Sir Wm Orpen, Mark Gertler, Christopher Wood, Ben Nicholson, and of a new generation Graham Sutherland, John Piper, Victor Pasmore and

Francis Bacon. To-day painters are divided between abstract tendencies and a form of realism which is to be traced to the great influence of Walter Sickert.

Architecture.—See ENGLISH ARCHITECTURE: LONDON, Architecture.

English Sculpture after the Renaissance.

—The conventional Gothic style in England disappeared under It. influences. Torrigiano introduced the Renaissance manner, as instanced by the tomb of Henry VII in Westminster Abbey. The Chapel of St John the Evangelist in the Abbey has been attributed to Nicholas Stone (1568-1647), the first really notable Eng. sculptor (q.v.). The monument to Sir George Holles in Westminster Abbey is authentic, as is also the statue of Donne in St Paul's Cathedral. These monuments show that Stone's treatment, if somewhat heavy, was essentially classic. (Caus Gabriel Cibber, father of Colley Cibber, and a pupil of Stone, was the sculptor of the fountains and temples of Chatsworth, the famous home of the Devonshire family. Of the same (Baroque) period, too, was Grinling Gibbons (1648-1720) (q.v.), one of the famous names in Eng. sculpture, though perhaps better known for his inimitable wood carving. His figure work is exemplified in St Paul's Cathedral and other London churches, while the statue of James II in St James's Park is one of his best bronzes. Francis Bird (1667-1731) followed the ornate decorative style of Cibber, as in his statue of Queen Anne in St Paul's Churchyard; but by the beginning of the 18th cent. this style had yielded to pseudo-Greek purity which achieved little else but cold formalism. No sculptor of distinction emerges in this period, though John Flaxman (1755-1826) (q.v.), the sculptor of the Mansfield monument in Westminster Abbey, Sir Francis Chantrey (1781-1842) (q.v.), and Joseph Nollekens (q.v.), who executed many good busts, were all well-known. A really great figure in Eng. sculpture is Alfred Stevens (1818-75) (q.v.), some of whose work is not inferior to that of Brunelleschi. His outstanding achievement is the Duke of Wellington's monument in St Paul's Cathedral, but his decorative work in Dorchester House (now razed) was also brilliant, especially the magnificent fireplace in the dining-room, with its stooping figures of two females in support.

Eng. sculpture of the 20th cent. has been influenced by the 2 great Fr. sculptors, Rodin and Maillol. Their influence is seen particularly in 2 of the most distinguished of Eng. sculptors, Jacob Epstein (q.v.) and Frank Dobson (q.v.). Both these sculptors excel in portraiture, but Epstein, who ranks as one of the greatest of Eng. sculptors, is also known for his large allegorical stone figures. A school of modern sculpture devoted to the handling of abstract form has as its leading exponent Henry Moore, and with him may be associated Barbara Hepworth, John Skeaping, particularly in his early work, and Richard Bedford. Modern architecture gives less opportunity for the sculptor

than in former times. All the more outstanding therefore are the figures by Epstein and Eric Gill adorning the London

Membership is open to all, and there are numerous branches in the Commonwealth. London H.Q. are at 8 Cromwell Place, S.W.7.

English Channel (Fr. *La Manche*, the sleeve), dividing England from France. Its length is about 350 m., and the greatest breadth between Ushant and Land's End is about 110 m. The average depth is from 20 to 30 fathoms, reaching 60 fathoms at the entrance to the Strait of Dover and as much as 94 fathoms at Hurds Deep. The tides are peculiar, parts of the E. coast having a double tide, the effect generally being to cause higher tides on the Fr. coast than on the Eng. coast. W. winds are the most prevalent, gales occurring chiefly between Oct. and Jan., and fogs are common throughout the year. Regular shipping services are run between Southampton and St. Malo, Cherbourg, and Le Havre; between Newhaven and Dieppe; and also across the narrower Strait of Dover (q.v.). The prin. is. are the Channel Is. group and the Isle of Wight (qq.v.). See also CHANNEL TUNNEL.

English History. Within the last 30 years much archaeological evidence has been discovered relating to the inhab. of pre-Rom. England, going back as far as the Old Stone Age. About 1800 bc peoples from what is now France and Flanders estab. the culture which gave rise to the religious temples such as Stonehenge (q.v.); and by about 500 bc Celtic invaders had estab. a relatively advanced culture which has left a rich mass of archaeological evidence (see BRITAIN, ANCIENT).

In AD 43 the Rom. invasion of England under Claudius began, and this really marks the beginning of recorded E. H., though throughout the Rom. period the historian must rely very considerably on

the archaeological evidence to supplement the bare recorded facts (*see* BRITAIN, ROMAN HISTORY OF), and, even so, much of the hist. of England under the Romans remains obscure. It is clear that the Romans gave England over 300 years of relatively unbroken peace; before their occupation ended they had introduced Christianity, estab. centres of commerce and gov., built an orderly net-work of roads, and imposed their pattern of life on its native inhab. in varying degrees. But as the 4th cent. progressed Rom. power and influence in England began to decline, a fact emphasised by the archaeological evidence found in recent years. Some time between 417 and 429 the Romans finally abandoned the country, and for the next 150 years the hist. of England is extremely confused.

Even before the Romans left England there is evidence of sporadic coastal attacks by pirate bands of continental origin, as well as of Pictish incursions from the N. After the Rom. withdrawal these attacks became more frequent, and by the middle of the 5th cent. some of the attackers were beginning to establish permanent settlements in England. The Jutish kingdom of Kent was founded about 450; during the next 100 years waves of Germanic invaders gradually conquered virtually the whole of the country now known as England. Tradition lists these tribes of invaders as the Angles, Saxons, and Jutes, and modern historians are inclined to trace the continental origin of all 3 to NW. Germany although there remains some doubt about the Jutes, whose tribal organisation shows marked differences from the other two even in the early days of the settlements. Certainly they were subsequently much more susceptible to European influences, and it was through Kent that Rom. Christianity eventually regained its foothold in England.

The Britons were gradually driven back to the mts of the W., but for sev. years their resistance to the invaders was bitter and, on one occasion at least, effective and organised. Celtic sources of some 50 years later refer to a great warrior leader of the Britons, called Arthur (q.v.), who won sev. battles against the Saxons, inflicting a severe defeat on them at Mons Badonicus (c. 500 AD; the place has never been identified). This defeat apparently halted the invasion, but only temporarily. There must have been a considerable intermingling of the conquered and conquering races, but the positive evidence is slight. What is clear, however, is that the invaders imposed their way of life on the areas they settled in its entirety; their predecessors' language, customs, and religion were eliminated, and the Romans, half-abandoned even before the evacuation, fell into complete decay and in sev. cases were never re-settled.

At the end of the 8th cent. Britain can be divided into the following divs.: Northumbria, Mercia, East Anglia, Kent, and Wessex, with the Brit. isles, Strathclyde, N. Wales, and W. Wales.

constant struggle went on between Northumbria and Strathclyde, Mercia and N. Wales, and Wessex and W. Wales.

The heathen Eng. tribes, before the end of the 6th cent., have left little definite evidence of their internal hist., and customs in Britain, and it is only after the conversion to Christianity, carried out in the S. principally by Augustine (597), and in the N. by the Celtic Church, whose apostle, St. Aidan, did so much, that England's hist. assumes clearer outlines. England was not easily converted and the kings of Kent and Northumbria were for a long time opposed by the heathen king of Mercia. Once Christianity was definitely estab. in the major kingdoms, a constant struggle for supreme power in the country was waged between the various rulers, which was to continue until the rulers of Wessex finally became supreme in the 9th cent. In 663 was held the Synod of Whitby, which finally settled that the Eng. Church should follow the rule of Rome and not of Iona, a notable decision, for it linked England to the streams of continental thought and culture as little else could have done. In the meantime the power of Northumbria, which in the 7th cent. had been the leading Eng. kingdom, had waned, the battle of Nechtansmere had led to the annihilation of the Northumbrian armies, and Mercia under her kings, Ethelbald and Offa (q.v.), sprang into the foremost position. Under Offa Mercia actually took some part in the councils of Europe. Charlemagne recognised Offa's commanding position in England, and there began to be fairly constant intercourse between England and the Continent.

With the death of Offa, however, came the overthrow of Mercia, and Wessex soon assumed the hegemony. Egbert (q.v.) of Wessex may be regarded practically as the first real overlord of England. In turn he conquered or forced to submission all the great kingdoms, and by 825 he had at least laid the foundations of a united England.

The century which followed saw the beginning of the Dan. invasions on a large scale. They had made isolated pirate-raids in the past; now they came in greater numbers, content at first to plunder and retire, but later coming over definitely with a desire to settle in the country. They conquered Northumbria and East Anglia before they actually attacked Wessex. The early life of Alfred the Great (q.v.) was taken up in fighting them; but Alfred realised that it was impossible to drive them out entirely, and after the treaty of Wedmore (878) he divided England up into Wessex and the Danelaw (q.v.), and gave that portion of England, N. and E. of Watling Street, to the Danes, on condition of their adopting Christianity. But he also adopted the only real means of preventing fresh incursions by the Danes. He built a fleet which guarded the Channel and the E. coast, and which succeeded in defeating the Danes before they were able to land. By these means Alfred succeeded in

than in former times. All the more outstanding therefore are the figures by Epstein and Eric Gill adorning the London

At the end of the 6th cent. Britain can be divided into the following divs.: Northumbria, Mercia, East Anglia, Kent, and Wessex, with the Brit. ters. of Strathclyde, N. Wales, and W. Wales. A

constant struggle went on between Northumbria and Strathclyde, Mercia and N. Wales, and Wessex and W. Wales.

The heathen Eng. tribes, before the end of the 6th cent., have left little definite evidence of their internal hist. and customs in Britain, and it is only after the conversion to Christianity, carried out in the S. principally by Augustine (597), and in the N. by the Celtic Church, whose apostle, St Aidan, did so much, that England's hist. assumes clearer outlines. England was not easily converted and the kings of Kent and Northumbria were for a long time opposed by the heathen king of Mercia. Once Christianity was definitely estab. in the major kingdoms, a constant struggle for supreme power in the country was waged between the various rulers, which was to continue until the rulers of Wessex finally became supreme in the 9th cent. In 663 was held the Synod of Whitby, which finally settled that the Eng. Church should follow the rule of Rome and not of Iona, a notable decision, for it linked England to the streams of continental thought and culture as little else could have done. In the meantime the power of Northumbria, which in the 7th cent. had been the leading Eng. kingdom, had waned, the battle of Nechtansmere had led to the annihilation of the Northumbrian armies, and Mercia under her kings, Ethelbald and Offa (q.v.), sprang into the foremost position. Under Offa Mercia actually took some part in the councils of Europe. Charlemagne recognised Offa's commanding position in England, and there began to be fairly constant intercourse between England and the Continent.

With the death of Offa, however, came the overthrow of Mercia, and Wessex soon assumed the hegemony. Egbert (q.v.) of Wessex may be regarded practically as the first real overlord of England. In turn he conquered or forced to submission all the great kingdoms, and by 825 he had at least laid the foundations of a united England.

The century which followed saw the beginning of the Dan. invasions on a large scale. They had made isolated pirate raids in the past; now they came in greater numbers, content at first to plunder and retire, but later coming over definitely with a desire to settle in the country. They conquered Northumbria and East Anglia before they actually attacked Wessex. The early life of Alfred the Great (q.v.) was taken up in fighting them; but Alfred realised that it was impossible to drive them out entirely, and after the Treaty of Wedmore (878) he divided England up into Wessex and the Danelaw (q.v.), and gave that portion of England, N. and E. of Watling Street, to the Danes, on condition of their adopting Christianity. But he also adopted the only real means of preventing fresh incursions by the Danes. He built a fleet which guarded the Channel and the E. coast, and which succeeded in defeating the Danes before they were able to land. By these means Alfred succeeded in

keeping peace in the land during the greater part of his reign, and he was thus able to carry out a great number of internal reforms. But before the end of his reign the attacks of the Danes had again commenced and were continued during the reign of Edward the Elder (q.v.), who succeeded in establishing his supremacy over the Danelaw, and who, in 924, was recognised as the overlord of the whole of England, and whose authority seems to have been acknowledged by the Scots and the Welsh. In 978 Ethelred the Unready succeeded and during his reign the Danes struck again. Time after time the country was invaded. Ethelred, by means of large levies of Danegeld (q.v.), bought off the invaders for a time, but they returned only too ready to gain more money so easily, and finally in 1002 Ethelred caused the massacre of the Danes which called down on him the vengeance of Sweyn, and which helped to lead to the rule, from 1016 to 1042, of the Dan. kings. Ethelred died into exile in Normandy, an exile which had a great effect upon the ultimate hist. of England.

Canute (q.v.), the first and the best of the Dan. kings, ruled wisely and well. His 2 sons, Harold and Harthacnut, are notorious principally for their evil lives, and in 1042, on the death of Harthacnut, the old Saxon dynasty was restored in the person of Edward the Confessor (q.v.), the son of Ethelred. Edward was much more fitted to be priest than king, and during much of his reign the power lay in the hands of Godwin, earl of Wessex, and later of his son Harold (q.v.). Edward, who had no children, was largely Norman by training, and on his death Wm, duke of Normandy, declared that Edward had promised him the crown, and that Harold had in the past sworn an oath making himself Wm's vassal. Harold, however, was confirmed king of England by the witan, and took up arms in the defence of the kingdom. His brother, Tostig, deprived of his earldom of Northumbria, invaded England and fought together with Harold of Norway against Harold of England, at Stamford Bridge. The latter was victorious, and turned with his men to confront the Normans who had landed in the S. In Oct. 1066 was fought the battle of Hastings (q.v.), in which Harold perished, and on 25 Dec. of the same year Wm was crowned king of England.

The Norman conquest (q.v.) was the beginning of the final process in the welding of the Eng. nation into one compact body. The end was still a long way off. William I (q.v.) brought in his train numerous Normans, all of whom had to be rewarded by the king with Saxon lands. In general, therefore, the Saxons tended to sink to the bottom of the social scale, and for many years there was little fusion of the races. Wm was occupied for sev. years with the completion of the conquest of England, and when this had been done he turned his attention to the gov. of the country. He was not only a great warrior but also a great king. He

had seen limitations in feudalism on the Continent and he seems to have been determined to remedy, as far as possible, these defects, although many of his innovations to Eng. feudalism were probably unconscious. The estates of his followers were scattered throughout the length and breadth of the land. Further, by the Oath of Salisbury, tenants had to swear allegiance directly to the king, and finally the Domesday Book (q.v.), afforded him an unprecedented body of information, which made his grip on the country firmer and more easily maintained.

When Wm d. England and Normandy were temporarily separated but were reunited under his youngest son Henry I (q.v.). Henry I was the first of the Norman kings actively to encourage the fusion of the races, he himself marrying a princess of Saxon descent. In 1120 his only son Wm was drowned in the wreck of the *White Ship*, and the greater part of the rest of Henry's life was taken up in the attempt to get his daughter Maud recognised as the heir to the throne. Previous to his death in 1135 he had coerced the barons into promises to recognise Maud, but subsequently Stephen of Blois was acclaimed king.

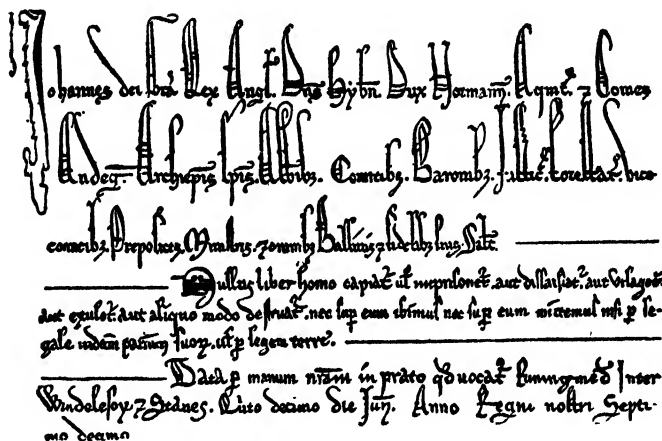

With the accession of Stephen (q.v.) in 1135, civil war broke out and continued practically during the whole of his reign. The barons were able to exercise their power unchecked and the people, crushed between the forces of the king and of Queen Maud, suffered a great deal.

Finally, in 1153, the treaty of Wallingford was signed by Stephen and Henry, son of Maud. By the terms of this treaty, Stephen was to reign until his death, when he was to be succeeded by Henry. Henry II (q.v.) was one of the greatest kings of England. He ruled not only England, but Normandy, Maine, Anjou, Touraine, and Aquitaine. He was acknowledged overlord of Scotland, Ireland, and Wales; he practically ruled Brittany—in fact his dominions may be regarded as stretching from the Pyrenees to the Orkneys. He curbed the power of the baronage, and by judicious reforms he obtained the support of the people, but he failed when he attacked the Church. The point at which he had been aiming, the subordination of eccles. law to the Crown, failed when it had almost succeeded, by the murder of Becket (q.v.) in 1170. During his reign, Strongbow (Richard de Clare, earl of Pembroke, d. 1176) crossed over into Ireland and began the conquest of that country. The latter part of Henry II's reign was darkened by quarrels with his sons. His eldest son had died virtually fighting against him: Richard was a source of constant trouble, whilst John, the darling of his old age, was untrustworthy. The last days of the king were passed in a war with his arch-enemy, Philip Augustus of France, and with his sons, and in 1189, after being compelled to give in, he d.

He was succeeded by his son Richard (q.v.), who, however, spent the greater part

of his time out of England, either on crusade or in France, during which time his brother John plotted against him. Richard died in 1199 and was succeeded by John (q.v.). John had energy which he did not use and ability and intelligence which he usually misapplied, though his reign was probably not as catastrophic to the mass of his subjects as has often been suggested. The early years of his reign were occupied in a struggle for the Fr.

the powerful barons. Gradually he saw himself beset on every side; France threatened, the barons negotiated, the Church thundered. Eventually the barons resolved to force the king to issue a charter which would safeguard their liberties. After a struggle John at Runnymede, on 15 June 1215, signed the Magna Carta (q.v.) intending to keep it as little as he had kept most other oaths. Magna Carta was a document drawn up by the magnates

EXTRACTS FROM MAGNA CARTA

A translation of the Latin

John by the Grace of God, King of England, Lord of Ireland, Duke of Normandy and Aquitaine, and Earl of Anjou:

To the Archbishops, Bishops, Abbots, Earls, Barons, Justiciaries of the Forests, Sheriffs, Governors, Officers, and to all Bailiffs and other his faithful Subjects, Greeting.

No Freeman shall be taken, or imprisoned or disseised, or out-law'd or banish'd or any ways destroyed, nor will we pass upon him, or commit him to prison, unless by the legal judgment of his Peers, or by the law of the Land.

Given under our hand, in the Presence of the Witnesses above-named, and many others, in the Meadow, called Runnymede, between Winteclesore and Stanes the 15th Day of June, in the 17th year of our Reign.

possessions. In 1204 the Château-Gallard was lost, and Normandy passed into the hands of the Fr. John did not give up hope, and struggled constantly against the Fr., forming league after league. He, however, soon found himself in difficulties at home. In 1205 the barons refused to fight for the recovery of Normandy; in the following year, in spite of the violent opposition of John, Stephen Langton (q.v.) was appointed archbishop of Canterbury. John refused to recognise him, and in 1208 England was laid under an interdict and later the king excommunicated. During this period John's extortions had alienated the sympathies of

with the prime object of confirming their own privileges: but it was to become one of the cornerstones of Eng. liberties. The signing of it reconciled a number of the barons, and John thereafter had more support. He attempted to punish the N. barons who had been chiefly responsible for the Charter, and they in turn invited the Dauphin Louis to England as king. War was still raging in 1216 when John died, leaving the throne to his son, Henry III, aged 9. The Charter was confirmed, the baronage reconciled, and Louis finally left the country (1217). From 1217-32 the land was ruled by Wm Marshall, and on his death by Hubert de

Burgh. In 1232, however, began the personal rule of Henry III (q.v.), a period which is noted for the domination of foreign favourites. Henry was a pious weakling, who had but little mind of his own, but who could on occasion be extremely obstinate. He was continually exacting money, and many expedients were attempted by the baronage to obtain control of the purse. The most outstanding personage of the reign was Simon de Montfort (q.v.) who came to England as a favourite of the king and remained to uphold the rights and privileges of the barons. In 1248 he was appointed governor of Gascony, and shortly afterwards was deprived of this post owing to complaints by the Gascons of his severity. He remained out of England until 1253, when he returned to place himself at the head of the baronage. In 1258 the king agreed to the Provisions of Oxford, but in 1264 civil war broke out between the barons, led by de Montfort, and the Royalists, whose prin. leader was Prince Edward. The Royalists were defeated at the battle of Lewes, and the king and prince became prisoners. Later in the year Prince Edward escaped, defeated the barons' army, now much weakened by desertion, and killed de Montfort. The remainder of the reign passed quietly, the chief power up to 1270 being in the hands of Prince Edward, who in that year departed to the E. on crusade. In 1272 Henry III died, and although it was two years before Edward returned to this country, there was no dispute over the succession.

Edward I (q.v.) was one of the greatest Eng. kings, and as a law-maker and organiser ranks with Henry II and Wm I. Part of his policy was to construct a united England and Scotland, and the Scottish war which raged practically from 1294 to 1307 was a result of this policy. He died in 1307, with the Scots in open rebellion, and just after Robert Bruce (q.v.) had been crowned king. Meanwhile Wales had been finally subjugated. Edward II (q.v.) succeeded his father, but his rule was influenced throughout by his favourites, Gaveston and the Despencers. During his reign the lords ordainers at one point took practically all the power from him, but again there was a reaction in his favour, and for a time he ruled with his favourites and with the support of the people. In 1314 he gathered the largest army which had ever been sent into Scotland, and attempted to relieve Stirling, then besieged by Bruce. He fought the battle of Bannockburn and met with the greatest defeat ever inflicted upon the Eng. by the Scots. In 1327 the conspiracy of the queen and her lover, Mortimer, caused him to be deposed, and in the following year he was murdered in Berkeley Castle. He was succeeded by his son Edward III (q.v.) who, in 1330, asserted his position and became sole ruler. The early part of his reign was taken up with a Scottish war, and then finally, in 1337, Edward claimed the throne of France in right of his mother. The claim

was largely a pretence, since Edward had previously recognised the king of France and done homage to him for Guienne. Edward's desire to attack France was based partly on economic and defensive reasons, but probably primarily dictated by personal ambition. (See HUNDRED YEARS WAR.) He attacked France from two points, through Guienne and from the N. In 1346 he won the battle of Crécy, and in the following year besieged and captured Calais. In 1346 Neville's Cross had been won, and the Scottish king taken prisoner. The Fr. war ceased in 1349 owing to the outbreak of the Black Death, a plague which helped very largely in the social revolution which followed. In 1356 the Black Prince won the battle of Poitiers. This was the last great victory of Edward's reign. The rest of his life was spent in dissoluteness and under the influence of Alice Perrers, his mistress. During his reign, however, unconscious strides were made in the constitutional gov. of the country, and the power of parliament increased rapidly. This was due to the fact that Edward, in order to wage war, was in constant need of supplies, and was prepared to grant certain privileges in order to obtain them. He died in 1377, preceded by his son the Black Prince. He was succeeded by his grandson, Richard II (q.v.). Richard had ability but succeeded to a crown already much weakened by the demands of the Fr. war. The period of his personal rule was tyrannical, and Henry Bolingbroke, returning from exile in 1399, was easily able to depose him. He was imprisoned and finally murdered in Pontefract Castle. During his reign Wycliffe (q.v.) the great religious reformer d., and just at the end of the reign Chaucer (q.v.), the first of the great Eng. poets, also d.

Bolingbroke, who succeeded as Henry IV (q.v.) was the eldest son of John of Gaunt, the third son of Edward III. He claimed the throne, not by conquest, but by parl. election, and was the founder of the House of Lancaster. Though he was never personally popular, he at least kept the country generally at peace. In 1403 Henry Percy, early of Northumberland, nicknamed 'Hotspur,' rebelled against him, and was supported by Owen Glendower both of whom were overthrown by Henry IV at the battle of Shrewsbury. Henry also persecuted the Lollards (q.v.), a name first given to those who adopted the new religious teaching of Wycliffe. Henry V (q.v.), who succeeded in 1413, renewed the war with France. In 1415 he achieved a notable victory at Agincourt. France was at this time divided into factions, and taking advantage of this fact, by judicious alliances Henry succeeded, in 1420, in forcing the Fr. king to sign the Treaty of Troyes, which gave Henry the Fr. king's daughter's hand in marriage, the regency of the country, and the ultimate succession to the throne of France. In 1422, just after the birth of his heir, he d. He was succeeded on the thrones of both France and England by his young son,

Henry VI (q.v.) for whom the regents, his uncles the dukes of Bedford and Gloucester administered the country. During the early part of the reign the Eng. still continued to win victories, but finally the Fr. settled their differences and after the appearance of Joan of Arc (q.v.) went from victory to victory, finally, in 1454, driving the Eng. out of everywhere save Calais. Meanwhile, the king had suffered lapses from sanity, and the supporters of the house of York began to claim the throne, alleging that their candidate, Richard, duke of York, was the more direct descendant of Edward III. In 1455 war broke out, and lasted up to 1471. The Yorkists were at first successful at St Albans, and the king fell a prisoner into their hands. In 1460 York was defeated and slain at Wakefield by Margaret of Anjou, but the earl of March, coming up from the W., entered London, was proclaimed king as Edward IV (q.v.) and marching N. defeated Margaret at Towton (1461).

For some time the country remained more or less at peace. Richard Neville, earl of Warwick (q.v.), and Salisbury, called the 'king-maker,' dictated the policy of the country. But the king flouted the great earl and drove him into the camp of the Lancastrians. Warwick landed from France and forced Edward into exile, proclaiming Henry VI again. Edward, however, returned unexpectedly from exile, defeated and killed Warwick at Barnet (1471), crushed the last hope of the Lancastrians at Tewkesbury three weeks later, and again estab. himself firmly as king. He ruled as a despot, and may be regarded as the first of the new monarchy. He was a patron of the new learning and of the art of printing—typically a prince of the Renaissance. He caused great jealousy by the promotion of some of his wife's relations; he d. in 1483. His son, Edward V (q.v.), succeeded him, to be murdered in the Tower of London after a two months' reign, probably by his uncle, Richard of Gloucester, who on the death of the prince and his brother caused himself to be proclaimed as Richard III (q.v.). He was personally brave but soon became unpopular, and gradually the rumour of the murder of the princes increased this unpopularity. A conspiracy was made against him by Henry Tudor, earl of Richmond, who came over from France, met Richard at Bosworth Field (1485), and there defeated and killed him, owing principally to the wholesale desertions of Richard by the nobles. Henry was crowned on the battlefield.

Henry VII (q.v.) was descended on his father's side from the Tudors, on his mother's from John of Gaunt, and was therefore hailed by the Lancastrians as the representative of their line. He claimed the throne by descent and by election, and finally put an end to the rival claims by marrying Elizabeth of York, the daughter of Edward IV, thus uniting the two lines. He crushed the remaining power of the baronage, and he

ruled despotically, but he restored commerce and raised England again to the rank of a European power. He was miserly, but to him the possession of money meant the possession of power. The attempts of Lambert Simnel and Perkin Warbeck were defeated, and Henry's position was strengthened by the marriage of his son to Catherine of Aragon, and his daughter to James IV of Scotland, both marriages of vital importance to England. He died in 1509, leaving Henry VIII (q.v.) with a secure hold on the throne and affection of the people.

The reign of Henry is notable chiefly for the separation of the Eng. Church from Rome. At the beginning of his reign there was some slight trouble with France and Scotland, the Scottish war being ended in 1513 by the battle of Flodden. Wolsey (q.v.), Henry's chief minister during the early part of his reign, remained firm to the policy of preserving the Balance of Power, the Emperor Charles V and the Fr. constantly bidding one against the other for the friendship of England. Henry's attitude towards the doctrines of the Church may be judged from the fact that he pub. a book against the teachings of Luther, and received from the pope the title 'Defender of the Faith.' By 1528, however, he had grown tired of his wife, Catherine of Aragon, and posed as having religious scruples as to the validity of the marriage. He demanded, through Wolsey, a decree of nullity from the pope, Clement VII. When the papal legate sent to England to hear the case adjourned the court to Rome, Henry dismissed Wolsey, and taking the advice of Crommer (q.v.) and Thomas Cromwell (q.v.) he broke away from Rome and forced the Eng. Church to obey him as its supreme head. There was no change in doctrine save in a few minor points; nevertheless Henry was now head of the Church and not the pope. In order to have fuller control over the Church and to glut the greed of Henry and his supporters, the monasteries were dissolved. In 1536 the smaller ones went; in 1539 the larger monasteries suffered also. Their lands enriched the king and the nobility. These changes provoked abortive rebellions which were put down with great cruelty. During the later years of the reign a tendency towards Protestantism became more apparent in the country as a whole, but especially in London and the SE. In his old age Henry became merely a brutal tyrant; he d. in 1547, having married six times. By his will he had left the throne to Edward VI (q.v.) to be followed, if he d. without children, by Mary, daughter of Catherine of Aragon; she in turn to be followed by Elizabeth, daughter of Anne Boleyn. Edward VI was only 9 years of age when he succeeded; the country was ruled for him by the protectors, the dukes of Somerset and Northumberland. During this reign Protestantism first really gained a secure footing in the country. The churches were stripped of images, the Catholic service was stopped, and the first

Eng. Prayer Book was issued. In 1553 Edward VI *d.* He left a will which set aside that of his father and gave the throne to the Lady Jane Grey (q.v.). Mary, however, found no difficulty in obtaining recognition, and Northumberland, Dudley, his son, and the Lady Jane Grey were committed to the Tower and later beheaded.

Mary (q.v.) had always been a fervent Catholic; she now restored the Catholic religion, and for a time England reverted

men of ability cannot be denied, but much must be allowed to her own personality and genius. She tried to provide the Church of England with a 'via media,' a compromise of doctrine which should reconcile Catholic and Calvinist. Her great dangers, externally, came from Scotland and Spain. Scotland was disturbed by the religious quarrels, and, finally, Mary Queen of Scots (q.v.), Elizabeth's greatest rival, was driven a fugitive into England, where she remained

John H. Stone

PLYMOUTH HOE

to the papacy. She married Philip II, King of Spain, and this, together with the religious persecutions which took place, did much to make her unpopular. Further, the alliance with Spain involved a war with France, and during that war England lost her last Fr. possession, Calais. Amongst the heretics burned during this reign were Latimer, Ridley, and Cranmer. Mary *d.* in 1558; she was succeeded by her half-sister, Elizabeth I (q.v.). One of the most complex figures in Eng. hist., Elizabeth lived in a period when one false step would have meant ruin, or at least great national danger. She was beset on every side by enemies, and was regarded even by some of her own subjects as a usurper, and yet she managed to steer the ship of state safely for 45 years. That she was helped by circumstances there is no doubt, that her ministers were

a prisoner until her execution in 1587. The following year came the great Armada (q.v.). Eng. seamanship and the elements combined to wreck the hopes of Spain, and the pathetic remnants of the shattered Armada returned home, defeated. This was the crowning victory of Elizabeth's reign; no longer need she dread the power of Spain; England was at last one of the great powers.

The most significant feature of Elizabeth's reign is that series of events which may best be described as the Eng. Renaissance. The sea rovers plundered the Sp. Main, discovered new lands, and made a name for themselves throughout the world. In every dept of national life there were fresh developments. She *d.* in 1603 after a reign which will always be remembered as one of the greatest in the hist. of the Eng. nation. She was suc-

ceeded by James VI of Scotland and I (q.v.) of England. Thus the united Great Britain of Edward I was accomplished through the marriage schemes of Henry VII. The early events of the reign were the attempts to reconcile Puritanism within Anglicanism, which failed, and the Gunpowder Plot (q.v.) of 1605. During this reign can be found all the essential causes of the Civil war (q.v.) which broke out during the next reign: the mistaken foreign policy, the unpopularity of the king, the unjust taxation, and the desire to rule despotically, this time by divine right. It was in the struggle against Puritanism (both religious and political in character) that divine right and passive obedience were to be overthrown.

During the reign of James, the Thirty Years' War broke out in Europe, and the king tried to act for a time, unsuccessfully, as the arbiter of Europe. Charles I came to the throne in 1625. His reign can be described as one series of blunders, though, as the reign advanced, the faults were far from being exclusively on Charles's side. Parliament attacked his favourites, refused him supplies, and, finally, in 1628, forced the Petition of Right upon him. From 1629 to 1640 he ruled without a parliament. During this period occurred the ship-money cases, and continual breaches of the law. But it was on the rock of the Church in Scotland that Charles finally foundered. His attempts to imitate his father and force Episcopacy on the Scots roused anger in Scotland, the introduction of the Prayer Book of Laud led to open rebellion, and the first Bishops' war broke out (*see* SCOTLAND). The Short Parliament (1610) was summoned and dissolved within 3 weeks. Then followed the Long Parliament, which undid the work of the 11 years' tyranny, but which at the same time did much that was unconstitutional. Strafford (q.v.) was executed; Laud (q.v.) met with the same fate later. Ship-money was declared illegal, the Star Chamber abolished, and finally the king was forced to consent to the reading of the Grand Remonstrance. He then made his fatal mistake: he attempted to arrest 5 members, and failing, left London. Finally, in 1642, he raised his standard at Nottingham. At first the Royalists (q.v.) were successful, but later came the formation of the New Model Army, and the Royalist defeats at Marston Moor and Naseby. The king surrendered to the Scots, and was finally handed over to the Eng., by whom, after prolonged negotiations and the outbreak of the 2nd Civil war, he was executed (Jan. 1649).

For the next 11 years England was a commonwealth—for the first 4 years a rep., for the remaining 7 a protectorate. The execution of the king roused horror throughout Europe; Scotland and Ireland rose in revolt, and Charles II (q.v.) was crowned in Scotland, but the Scots were routed at Dunbar and Worcester, and the Irish at Wexford and Drogheda. For a short time England, Scotland, and

Ireland were united. In 1653 Oliver Cromwell (q.v.) became Protector, ultimately ruling as arbitrarily as Charles I had tried to do. His foreign policy was spirited and popular, and placed England high in the councils of Europe. In 1658 Cromwell d., and there was chaos for a time in England. Richard Cromwell was inefficient, and finally Monk, marching from Scotland with the army, declared in favour of a free parliament which restored Charles II.

The Restoration (q.v.) was hailed with enthusiasm by the vast majority of the nation. The sombreness of the Puritan era had sickened them, and was also partly responsible for the excesses of Charles II's reign. The reign of Charles is marked by a reaction from the dreary morality of Puritanism; Charles himself ruled with great skill, though entirely unscrupulously, trusting in secret Fr. subsidies and his personal popularity to keep him independent of parliament. In some ways it was a period of national disaster and shame; the guns of the Dutch were heard on the Thames from the City of London. In 1665 the Great Plague broke out and in the following year the Great Fire destroyed London. The Popish Plot, fabricated by Titus Oates, led to the introduction of the Exclusion Bill, and the Petitioners and Abhorers formed the nucleus of the Whigs (q.v.) and Tories (q.v.) of the following century. But Charles succeeded in his prin. aims: to keep his throne, and to keep internal peace, and the latter years of his reign were years of personal triumph. He d. in 1685, witty and cynical to the end. James II (q.v.), who succeeded him, inherited far more of the faults of his father, Charles I. His obstinacy led him into difficulties which his brother would have avoided, and his open avowal of the Catholic faith, whilst it did not at first alienate the majority of his subjects, prepared the way for the Revolution. James openly attempted to restore freedom for the Catholic faith. Catholics were introduced into the army and the univs., the penal laws against them were dispensed with, and the king finally issued a Declaration of Indulgence (1687). Seven bishops petitioned against this, but they were imprisoned and tried for seditious libel. They were acquitted amidst the applause of the people. At the same time an heir was born to James, and this made speedy Protestant action necessary. Hitherto the next heir to the throne had been Mary, his daughter, a Protestant, and the wife of William of Orange. Now it was certain that the new heir would be educ. in the Catholic faith. Messengers were despatched to William of Orange. Wm landed at Brixham; before the end of the year he was in London, and by that time James had fled, had been recaptured, and permitted to escape again. Wm III (q.v.) and Mary (q.v.) signed the Declaration of Right and were declared joint sovereigns, whilst Catholics or any who should marry a Catholic were barred from succession to the Eng. throne. The

actual Revolution had been bloodless, though it was really the culmination of the 6 years' Civil war which had ended in the execution of Charles I. Rebellions broke out in Scotland and Ireland, but were speedily crushed. In 1692 the Massacre of Glencoe took place, and Ireland, after the treaty of Limerick, was to give no more trouble until the end of the century.

England in the meantime engaged with Holland in the war of the Protestant Succession against Louis XIV, terminated by the treaty of Ryswick in 1697. Both sides, however, now prepared for the greater struggle which they saw must come. The question of the Sp. Succession must soon be settled, and both Wm and Louis were interested in that settlement (see SPAIN—History). The Partition Treaties were drawn up and agreed to, but finally Louis accepted the will of the Sp. king which left Spain to the Fr. king's grandson, and England and France again prepared for war. But even now the Eng. were not prepared to go to war on the point of the Sp. Succession—only when Louis made the second of his great blunders. James II d., and he acknowledged the Old Pretender as James III. England immediately clamoured for war, and during the preparations Wm III d. (1702). He had already been preceded by Mary, who d. 1694, and since they had no children was succeeded by Anne (q.v.), the 2nd daughter of James II.

The war of the Sp. Succession broke out at the beginning of the reign. It was fought in order to preserve the Balance of Power in Europe and prevent France from dominating the whole of the Continent. John Churchill, duke of Marlborough (q.v.), the Eng. commander, won the victories of Blenheim (1704), Ramillies (1706), Oudenarde (1708), Malplaquet (1709). Gibraltar was captured by the allies and Louis was forced to acknowledge defeat, but the allies pressed terms too heavily upon him and he made another desperate effort to free himself, succeeding certainly in mitigating the terms imposed on him. Meanwhile at home the Tories had become powerful and were desirous of peace, and so in 1713 was signed the treaty of Utrecht, which gave England the beginning of her colonial empire.

In 1707 the Act of Union between England and Scotland had been passed and had come into force (see SCOTLAND—History), and towards the end of the reign the question of succession had to be settled. The last child of Anne had d. in 1700, and the Act of Settlement had vested the crown in the nearest Protestant heirs of Sophia, electress of Hanover, and her descendants. But the Tory ministers, Bolingbroke and Harley, plotted the restoration of the Stuarts, and it was well known that the queen favoured the restoration of her half-brother, but the sudden death of the queen and the swift measures adopted by the Whigs prevented any serious steps from being taken, and in 1714, on the death of Anne, George I (q.v.).

was proclaimed without resistance. The Act of Union of 1707 had made England and Scotland one under the name of Great Britain, and from the accession of George I the hist. of both countries is treated under the heading GREAT BRITAIN. (For more detailed accounts of the reigns referred to in the above resumé, see under separate articles of the individual events, monarchs, and statesmen, etc.)

English Horn, see COR ANGLIN.

English Language, member of the W. (Germanic branch of the Teutonic or Germanic div. of the great Aryan or Indo-European family of languages, to which family belong also the classical and romance tongues. The Germanic group divides into 3 smaller groups: the E. Germanic, of which the Gothic is the only literary representative; the N. Germanic, to which belong the Swedish, Norse, and Icelandic; the W. Germanic, to which belong High German, Old Saxon, Frisian, and all the dialects of O.E. There were originally no great differences of vocabulary and syntax between these groups.

The original inhab. of England were Celts, but during the first centuries of our era the land was conquered and occupied by the Romans. After their departure the Picts and Scots so harassed the helpless Britons that they are traditionally credited with having called in the aid of heathen tribes from N. Germany (see also

ENGLAND). Bede tells us that they were 'from three powerful German peoples, the Saxons, Angles, and Jutes,' that the Saxons came from what was called Old Saxony in his day; and that the Angles came from a country which bore their name, and lay between the land of the Saxons and that of the Jutes. He says in effect that the Jutes settled in Kent, the Isle of Wight, and S. Hants; the Saxons in Essex, Sussex, and Wessex; the Angles in the Midlands and along the N. and E. coastline. It was probably only after the settlement that the speech of these people developed characteristic differences in dialect.

The development of Eng. is divided into 3 periods: *Old English* (O.E.) from the beginnings, usually placed at the year AD 700, until 1100. *Middle English* (M.E.) dates from 1100 to 1500, and *New or Modern English* (Mod. E.) from 1500 to the present day. O.E. is also known as A.-S., but it is important to notice that its writers themselves always spoke of their language as 'Englisc'. Since the hist. of the language is perfectly continuous, there is little reason to give it a different name at different stages of its development. There is, of course, no clear div. between O.E. and M.E., or between M.E. and Mod. E. The transition is gradual, but so great that the 'Englisc' of Alfred would be unintelligible to a man of the present day.

1. *Old English* is divided into 4 dialects: (1) *Northumbrian* and (2) *Merician*, which are grouped together under the name *Anglum*; (3) *West Saxon*, and (4) *Kentish*. Northumbrian was spoken from the Humber to the Lowlands of Scotland; Merician from the Humber southward to Essex and the Thames. W. Saxon from Kent westward. The 2 Anglian dialects were very similar, but what has survived is insufficient to allow us to differentiate between them. The most valuable remains of the Kentish dialect are some charters concerning the disposal of property; and since charters are things which no one would copy, it is certain that we possess them in the original form, showing the exact dialect of the dist. where the charter was made. The first dialect to rise to literary prominence was the Northumbrian, and during the early O.E. period the Northumbrian schools were the most learned in Christendom. From them came Alcuin (AD 735), confidant and adviser of Charlemagne. It is probable that poetry and prose in the vernacular was written in Northumbria at this time, but all, with the exception of a few fragments, such as a riddle, Bede's death-song, some glosses, and Caedmon's Hymn, preserved in the vernacula in some MSS. of Bede's *Ecclesiastical History*, 731, have perished. The invasions of the Danes during the 8th and 9th cents. destroyed the Northumbrian culture. A new literature arose in the S. under the guidance of Alfred, and a large number of the works produced in the following period are extant in transcripts. Thus, most of our knowledge of O.E. rests

upon W. Saxon, and this dialect is regarded as the norm, and all the others as variations from it.

O.E. was a synthetic language, that is to say, it expressed case, tense, and mood by inflection rather than by prepositions or auxiliaries. Nouns had five cases, nominative, accusative, genitive, dative, and instrumental. There were two declensions, strong and weak. Much levelling went on among the declensions of the strong nouns, so that the separate 5 strong declensions are not easily distinguishable. The masculine word *dōm* (judgment) will show the typical form: *sing.*, nom. and acc. *dōm*, gen. *dōmes*, dat. *dōm*; *plur.*, nom. and acc. *dōmas*, gen. *dōma*, dat. *dōmum*; neuters of these declensions with a short stem vowel add *u* in the nom. and acc. plural. The strong feminine ends in a consonant or *u*, and is declined thus: *sing.*, nom. and acc. *giefu* (gift), gen. and dat. *giefe*; *plur.*, nom. and acc. *giefa* (or *giefe*) gen. *giefena* or *giefa*, dat. *giefum*. The weak declension nouns make their oblique cases in the singular by adding *-a*; the plural forms are (of the noun *nama*, a name), nom. and acc. *naman*, gen. *namena*, dat. *namum*. A certain number of nouns, such as *bōc*, *fæder*, *mann*, are declined in special ways, and are generally grouped together as consonant stems. The grammatical gender of O.E. is not necessarily connected with the natural gender. Thus, as we have seen, the noun *dōm* is masc. and *giefu* is fem., similarly we have *dæg* (day), masc., and *ār* (honour) fem. As in Modern Ger., *child* (child) was neuter, as also was *wif*, (woman). Adjectives were inflected according to both strong and weak declensions, and had separate forms for each of the genders. The weak form of the adjective was used in particular positions, of which the most common is after the definite article. If the noun had the article in front of the qualifying adjective, the adjective was weak; without the article, the adjective was strong. The definite article had also its three genders, masc. *se*, fem. *seo*, neut. *þæt*; it was used as a demonstrative as well as an article. The verbs, as in Modern Eng., were both strong and weak. The strong verbs made their past tense by an internal vowel change, and their past participle by the addition of *-en* and, by vowel change. The vowel in the preterite plural and second sing. differed from that in the rest of the singular. The parts of an O.E. verb which are useful to know are thus the infinitive, the first person singular of the preterite, the first person plural preterite, and the past participle, and these four are known as the 'principal parts' of the verb. The following prin. parts of a few verbs show the method of variation: *drifan* (to drive), *drif*, *drifon*, *drifen*; *hiddan* (to pray), *bied*, *bædon*, *beden*; *ceosan* (to choose), *ceas*, *curen*, *coren*. Weak verbs did not vary the preterite vowel, and so the plural preterite is not given as a 'principal part.' They formed their preterites either in *-(e)de* or *-(e)ode*, and their past participles either in *-ed* or *-od*. Thus, we have

lustan (to love), *lufode*, *gelufod*; *hieran* (to hear, obey), *hierde gehiered*. Some few weak verbs have also a change of vowel, thus, *þencan* (to think) *þöhte*, *geþöht*. The O.E. verb had only two proper tenses, the present and the preterite, the former of these being normally used to express future as well as present time. The use of the auxiliaries (*wille*, *hæfde*, etc.) is early seen, though it does not become common until towards the end of the O.E. period. The order of words is less fixed than in Mod. Eng., on account of the abundance of inflections. The general order closely resembles that of Modern Ger., Not only was the grammar and syntax of O.E. purely Teutonic, but its vocabulary also was practically pure. Cognates of the words found in our old texts, are found in Gothic, Old Norse, Icelandic, Old High Ger., Old Saxon, etc., and the development of the science of philology in recent years has made the relations between them comparatively clear. The regularity of these relations was broken when foreign words were introduced into Eng. A certain number of words borrowed from Lat. are found in O.E. documents. As would be expected, these relate to eccles. services, ornaments, and practices for which no Germanic word existed. A few others were brought over by the Saxons from the Continent, having been borrowed in earlier intercourse with the Romans. Such a word is *stræt* (street).

A word must be said as to the spelling and pronunciation of the early Eng. and their scribes. The Germanic tribes used a method of writing magical formulae and short inscriptions called 'runes'; the runic alphabet consisted of twenty-four letters shaped for cutting easily on wood or stone. This alphabet was used at an early date in N. England for inscriptions on crosses, but it was entirely unsuitable for any kind of continuous writing in MSS. The introduction of the Lat. alphabet came with the Christianising of the country, being brought in slightly differing forms by the missionaries both from Ireland and from Rome. The Celtic form was generally adopted, with certain modifications from the Runic alphabet. From this the Runic letter for *w*, *p* (called 'wynn'), was used to replace the Lat. *u* (*v*). The sign *þ* (called 'thorn') was also taken to signify the voiceless *th* as in 'thin'; and in order to denote the voiced *th* as in 'there,' a crossed *d* was used in the form *ð*. These two signs came to be confused at an early date, and there is no clear distinction between them in existing MSS. But their origin shows the attempt to render the spelling phonetic, an aim which was attempted with a greater or less degree of success until the invention of printing caused the gradual fixing of the spelling. During the O.E. period, however, we may regard the spelling as phonetic, except for a few defects, one of which, the lack of distinction between hard and soft *th*, has been already mentioned. Moreover, *f* had to do duty for both the voiced and the voiceless sounds, being pronounced voiceless except be-

tween two vowels. The letter *y* had the sound of Ger. *ü*, while initial *c* was often pronounced *ch*. The letter *g* was often soft when it commenced a word and in certain other cases, *i* has been substituted for it. Thus *iung* and *geong* are both forms of the word for *young*. The combination *cg* as in *hrycg* (back) is pronounced as *dg* (in *bridge*). Medial *h* was a guttural sound, similar to the Modern Scot. *ch* in *loch*. Double consonants were not slurred as in N.E., but each was given its full value.

2. *Middle English*.—Though it is true that the Norman Conquest accelerated the decay of the O.E. grammar and syntax, yet it was not the cause of this decay. The action had set in a good many years before, and for a long while the Fr. court had very little influence on the native language. Layamon's *Brut* shows surprisingly few borrowings from Norman Fr., and this is indicative of the general state of affairs. The loss of its synthetic character weakened the syntax of the language, for the rigid order of an analytic language had not yet been made, and frequent ambiguity results. The best monument of this transition period is the entry for the year 1137 dealing with the reign of Stephen, in the *Anglo-Saxon Chronicle*. In the M.E. period the dialects are found somewhat differently distributed, and so receive different names. (1) The *Northern* corresponds roughly to the old Northumbrian, and still includes Lowland Scot., of which language in its modern form it is the ancestor. (2) The *Midland*, roughly equivalent to the old Mercian, is divided again into E. and W. Midland, sometimes with further subdivisions into N. and S.E. Midland, N. and S.W. Midland. (3) *Southern*, the descendant of the old W. Saxon, with an admixture of Mercian. The dialects of the W. country, as shown, for example, in W. Barnes's *Dorsetshire Farmer* show this dialect at a later stage. (4) *Kentish*, which, from its proximity to London, and the fact that both Chaucer and Caxton were Kentish men, has had a considerable influence on the development of the language.

But this div., though it probably accords with the facts in a general way, does not carry us very far when we come to an examination of M.E. MSS. Nor is it quite so complete and satisfactory a div. as was the O.E. one. In O.E. there was a standard literary W. Saxon dialect, and the MSS. which we possess show considerable agreement in their spelling systems and pronunciation. This is not so in M.E. Almost every dist. may be said to have developed its dialect as earlier forms died out, and the survival of a literary language was impossible during the period of Fr. dominance. Another difficulty then arose for the scribes. Most of them were educ. in the writings of the centuries past, and here they found a system of spelling which did not adequately represent the changed sounds of the new era. Many of them, by copying the old texts, introduced an arbitrary spelling into Eng. Hence begins the

commencement of the decay of the old phonetic spelling. This will, perhaps, be the best place to speak of a curious spelling experiment which was made by a writer of the name of Orm or Ormin. He wrote a lengthy metrical version of the Gospel known as the *Ormulum*, in which he employed an elaborate orthographic system to indicate the quantity of vowels and syllables. It relies largely on the doubling of consonants, but there are also other devices, such as 2 or 3 strokes over a vowel. Orm charged all his scribes to retain his forms intact; but there is no trace of any other writer having adopted his scheme. From the end of the 8th cent. onwards the N. and E. of the country was invaded by Vikings from Scandinavia, and in the years following the great Dan. invasion of 866 they almost conquered the whole country, but were finally driven out of the S. by the military genius of King Alfred. In his reign and for many years subsequently, the N.E. half of the country was in the hands of the Scandinavians whose language closely resembled the Anglian dialect, differing from it chiefly in its inflections. The result of intercourse between Anglians and Danes is, therefore, easy to see. The stems of the words became important, the inflections were useless, and hence the process of getting rid of them went on fastest in the N. Later M.E. pieces in N. dialect, such as the *Cursor Mundi*, are characterised by a surprising modernity, for not only have the inflections almost all disappeared, but the syntax shows many modern characteristics. A N. MS. of the beginning of the 13th cent. is easier than Chaucer for a modern reader to understand. The S. dialect is the least modern of the 3, and the most difficult to read. The Midland dialect is the ancestor of Mod. E. This is accounted for by its position; since it lay between the N. and S. dialects it was the means of communication between them. Moreover, both the univs. of Oxford and Cambridge lay within the Midland area. Most important of all was the fact that it contained London, already the great metropolis of the kingdom. Here the Midland dialect was spoken and intercourse between people speaking all kinds of dialects led to much levelling. It is this London dialect that forms the source of Chaucer's 'English undefled.' But though the basis of Mod. E. is Midland, many words, spellings, and pronunciations were borrowed from the other dialects. The most important borrowings were made from Scandinavia. We have already mentioned something of the influence of the Scandinavian invasions on the N. dialect in hastening its inflectional disintegration. The influence is also seen in vocabulary. Many of the commonest and most useful Eng. words were borrowed at this period. Among pronouns, both *she* and *they* are Scandinavian, the original Eng. forms being *heo* and *hi*. In the S. these forms survive almost to the end of the M.E. period. *Egg* is another example of borrowing, for the Eng. form,

frequent in M.E. is *ei* (plural *eyren*). It is not easy for the novice to recognise the dialect of a M.E. text. The chief reason for this is the frequent copying of MSS. A scribe copied them or wrote them from dictation in the dialect to which he was himself accustomed, and if this dialect was different from that of the original MS., some confusion resulted. Since this process of copying occurred not once but many times in the case of popular poems, such as *Havelok*, rhyme is a good test, but even this is rendered uncertain by the fact that the poet himself might well have used a form from another dialect in order to effect rhyme.

We have said that the influence of the Norman Conquest on vocabulary worked but slowly. Its influence on the spelling, however, very soon took effect, as all writing was in the hands either of the Normans or of those trained by them. It will be as well to mention one or two of the changes thus brought about: (1) *ou* was written for O.E. *ū*, as for example, in mouse for O.E. *mūs*, house for O.E. *hūs*; (2) *qu-* replaced O.E. *cw-*, e.g. *queen* for *cuēn*; (3) in many words where confusion was likely to occur in writing on account of the number of down strokes, *o* replaced *u*, e.g. *comen* for O.E. *cuman*; (4) *w* and *th* replaced *p* (wynn) and *þ*; *k* also became more common; (5) O.E. *y* was written *u*, e.g. *synne* (e) appears as *sunne*. This becomes a characteristic feature of the S. dialect. In inflection the chief change from O.E. to M.E. is in the direction of simplification. All the O.E. diphthongs disappeared, and all vowels in unaccented syllables tended to level as *e*. *M* in inflectional syllables also became *n*. Thus *an*, *on*, and *um* all appear as *en*. There was also a regular series of vowel changes and lengthenings. Only one or two can be mentioned here; S. of the Humber O.E. long *ā* became *ō*, pronounced as the *au* in *aught*. Thus *slān* became *stōn*. In the N. dialect alone does the original *a* remain, and its pronunciation of *stone* as *stane*, etc., is still one of its characteristics. In all but the S., O.E. *ī* (= Ger. *i*) coalesced with original *i*. New diphthongs were formed by the union of vowels with the guttural 3 (*g*) or *h*. Thus O.E. *dæg* becomes *dai* or *day*, but plural *dagas* generally appears as *dawes*. O.E. *weg* becomes *wet* (= way), *fægn* becomes *faen*, and so on. Initial *g*, probably soft even in O.E., became *y*, as in *yard*, *young*, *youth*, from O.E. *geard*, *geong*, *gioguð*. Initial *h* followed by another consonant was generally dropped, as in *ring*, *lauerd* (lord), from *hring* and *hlaford*. In the combination *hu-*, however, metathesis takes place, though the original pronunciation generally remains. The verbs simplified considerably, and in M.E. the pres. plur. indicative ending forms a useful dialect test. Here the S. had the old *-ap*, Midland has *-en* and N. *-es* or no inflection at all. Cases almost entirely disappear, the genitive singular being the only one which retains its original inflection. The word order gradually becomes fixed as this process goes on.

3. *Modern English*.—About a hundred years after the London dialect had first been raised to literary eminence by the poet Chaucer, its orthography was finally cast into a mould by Caxton, who about 1477 introduced printing into England. Some trimming would be needed in the century and a half that was to follow, but in no material point does the grammar of Caxton differ from that of 20th-cent. Eng., and his spelling is still easily intelligible. The following are the most important of the few grammatical differences: (1) The use of the plural *-eth*; (2) the infinitive ending *-en*, also found sometimes in the plural; (3) occasional retention of imperative plural in *-eth*; (4) genitive singular in *-es* and *-is*. Spelling was very variable, and with the revival of learning many men attempted to re-spell old words according to their real or supposed etymology. *Subtle* had the *b* inserted on account of its derivation from Lat. *subtilis*. The *b*, however, had never been pronounced since the derivation was through the Fr. *sutl*. An example of mistaken etymology is seen in the word *rime* (from O.E. *rim*), which was misspelt *rhyme* on account of its supposed connection with Gk *rhuthmos*, rhythm. The spellings *ea* and *ee* denoted different sounds, *ea* as in *sea* represented the open *e* sound (pronounced somewhat as *a* in *made*), while *ee* denoted the closed *e*. The difference is still shown by an Irishman. The open *o* (*au* in *ought*) was frequently written *oa*, and in one word, *broad*, the Elizabethan pronunciation is retained. An *e* as in *stone* was added to denote a long vowel, while the doubling of a consonant, e.g. *penny*, showed a preceding short vowel. Thus a standard orthography was attained; and the first folio ed. of Shakespeare's works (1623) can be read quite easily by one almost destitute of training. But we should comprehend little if their author were to read them to us, for the pronunciation has undergone a series of gradual changes which in sum amounts to a revolution. This revolution has resulted in our vowel system being a European curiosity, while in Shakespearean times it was in accord with that of the Continent. Thus *a* was pronounced as in *father*, and except at court, where it had its present sound, the *ɔ* was pronounced as in German. Long *ē*, usually written *ea*, *ee*, or *ie*, was pronounced as *a* in *made*. In some cases, such as *head* and *feather*, shortening has since taken place. There has been no considerable change in *ē*. Long *i* was then pronounced as *ee* in *meet*, but has since diphthongised into *ai*, but *i* has remained constant, as has also *o*. Long *ō*, as we have seen, was pronounced as in *broad*, and this sound later became represented by *au* or *aw* as in *saw*. Short *u* was pronounced as in Mod. E. *put*. Long *ū* was pronounced in the Continental manner, and has since diphthongised into *ju*. Gutturals still proved a fertile source of diversity in pronunciation and spelling, and hence the famous diversity in Mod. E. between the various pronunciations of *-ough*. In the 18th cent. drama

we frequently find *through* pronounced *thrus*, and dialectical *new* may still be heard for enough. Generally speaking, it may be said that the guttural either disappeared or turned into *f*. This shows briefly the chief changes in the vowel system of Mod. E., though it is impossible to show here the steps by which it took place. It is not by any means to be supposed that there was any sudden and conscious change. The greatest point, however, in which the Eng. of our own century differs from that of Caxton is in its vocabulary. M.E. was still comparatively a pure language, but since the invention of printing there has been a steady influx of words borrowed from all parts of the globe. Borrowings from Lat. had been made even before the arrival of the Eng. in the land. Fr. borrowings were frequent during the M.E. period, as were also incorporations from the Scandinavian tongue. The Renaissance saw an immense number of borrowings from Greek, and more especially Lat., and vast numbers of these were never incorporated into the language. Many, indeed, of the Elizabethans definitely aimed at the Latinising of their vocabulary. Fr. again gave us many words during the Restoration period, and here again a perusal of such writers as Dryden will show us that only a proportion of the borrowings became naturalised. At other times we have borrowed from Dutch, Italian, Portuguese, Turkish, Chinese, and in fact from almost every language with which we have come in contact. In general, it will be found that the borrowings from these languages can be variously classified. Thus Greek, from its clearness and accuracy of thought, has been called on to supply mathematical and scientific terms. The Dutch, once a great naval power, supply nautical terms and sev. for painting. Italy supplies musical terms. It will generally be found that our borrowings from Asiatic languages were the names of articles for which we had no Eng. equivalent, such as *junk*, *bungalow*, etc. The extent of our borrowings from the classical languages has given the Eng. language a large number of doublets; and these, assuming slightly different meanings, add greatly to the richness of the language, so much so, indeed, that its varying shades and tones can be adequately expressed in no other language.

Eng. is spoken as mother-tongue by about 200 million people in the Commonwealth and the U.S.A., and as a second language by at least as many, especially in the E. (India, China, Japan). Outside England, the sounds and vocabulary are more or less altered especially in Scotland, Ireland, U.S.A.; and in China (Pidgin Eng.). Deriving as it does from many tongues, it is the most international language, and in a selected vocabulary such as offered in Basic Eng. (q.v.) its use may spread even further as an auxiliary language. See also SAXON LANGUAGE AND LITERATURE; AMERICANISM.

E. L. begins, naturally, with the invasion of the country by A.-S. tribes after the withdrawal of the Romans. From then till the Norman conquest, roughly from 500 to 1100, is known as the O.E. period. Two points are apt to be overlooked in connection with this age. In the first place, it lasted 6 centuries, a very considerable time, about equivalent to the duration of modern E. L. from Chaucer to the present day. In the second, though the language is unintelligible to modern readers who have not studied it, it was by no means the product of a barbarous or primitive culture. E. civilisation was among the first to develop after the fall of the Roman empire. In the 10th cent. epic of *Beowulf* it possessed the earliest considerable poem in any modern language, and the *Anglo-Saxon Chronicle*, 9th-12th cent., was the first vernacular hist. of any W. nation. The school of Northumbria, to which the Venerable Bede (c. 627-735) belonged, was famous all over Europe, and one of its scholars, Alcuin, became Charlemagne's minister of education and transmitted Northumbrian culture to the Continent when it was obliterated here by the Dan. invasions. In England the torch of learning was taken up by Wessex, and Alfred the Great (849-99) at his court of Winchester maintained it, his kingdom being eventually overwhelmed in turn by the Norman invasion. Only a few fragments remain of what must have been a rich L., the most interesting being the elegiac pieces such as *Widsith*, *The Wanderer*, *The Seafarer*, *The Ruin*, and 2 fine war poems, *Brunanburh*, and *The Battle of Maldon*. The poetic technique of all these was entirely different from ours, for in place of rhyme they employ

short rhythmical lines marked by strong alliteration, or 'head-rhyme' as it is sometimes called. O.E. poets whose names are preserved are Caedmon (7th cent.), an inspired cowherd belonging to Bede's monastery, and Cynewulf (9th cent.), who wrote a number of religious poems. In prose the work of King Alfred's school of writers was carried on by Ælfric (c. 955-c. 1022), abbot of Eynsham, who wrote religious works in E. as well as in Lat.

With the Norman conquest in the 11th cent. A.-S. culture came to an end, for Norman-Fr. replaced E. at the court and among the upper class, though E., of course, remained the speech of the common people. For more than a century there was little or no vernacular L.; but about 1200 Layamon wrote *The Brut*, a metrical hist. of England which contains the stories of King Arthur, Lear, Cymbeline, and other legendary Brit. heroes. Of about the same date are *The Owl and the Nightingale*, a graceful allegorical poem, the *Ormulum*, an E. paraphrase of the Gospels with a homily on each, and the *Averne Bible*, a prose manual of devotion. The 12th cent. saw the cult of the troubadour poetry in France, and England soon produced similar metrical romances, telling the story of King Arthur, as in *Sir Tristram and Yvain and Gawain*; relating E. tales, as in *The Seven Wise Masters*; following Dan. originals, as in *Havelok and King Horn*; or based on E. folk tales, as in *Guy of Warwick*. For the most part the poetry of this M.E. period used rhyme, not alliteration, but in the middle of the 14th cent. there was a remarkable alliterative revival with the poems *Gawain and the Green Knight*, *Pearl*, *Cleanness*, and *Patience*. It is uncertain whether these are all by the same author, who is in any case unknown, but they represent poetry of a very high order. *Pearl*, an elegy for a lost child, which uses a complicated rhyme scheme along with elaborate alliteration with a skill that Swinburne might have envied, is one of the loveliest poems in the E. language, while *Gawain*, a romantic poem of long, swinging lines, is a most spirited piece of work. Meanwhile lyric form had developed, and such poems as the well-known 'Sumer is Icaunen' appeared as early as about 1250, to be followed by a great wealth of songs and carols.

The 14th cent. was the first great period in the development of E. L., with the appearance of Langland, Gower, and, above all, Chaucer. The L. of the country was multilingual, as is shown by the fact that John Gower (c. 1330-1408) wrote his 3 main works in 3 different languages. His *Vox Clamantis* (Voice of One Crying), a political satire, is in Lat., then and for 2 more centuries the language of learning; his *Speculum Meditantis* (Mirror of One Meditating), which won him the name of 'Moral Gower,' is in Fr., the language of the court; and only his *Confessio Amantis* (Lover's Confession), a series of popular tales, is in E., the language of the common people. Gower's

reputation has suffered because he is overshadowed by Chaucer, but he was a good narrative poet, with an easy pleasant style. Geoffrey Chaucer (c. 1340-1400) writes in E. throughout, but his early poems follow Fr. models, while his middle period shows the influence of Dante and Boccaccio; and it is only in his last work, the 2 dozen '*untransluted Tales*', that he becomes entirely E. The importance of this work can hardly be exaggerated. It is, in its own right, one of the finest series of poems in E. L., with its broad humanity, its clear simplicity, its close power of observation, and its delightful humour. But it is also of supreme importance for its influence on the E. language. Chaucer welded together the E. and Fr. elements in the native tongue, and was the first master, almost the creator, of Mod. E., well named 'Dan Chaucer, well of English undefiled.' To realise by contrast the greatness of his achievement we have only to look at the 3rd main poet of this century. Wm Langland (c. 1332-c. 1400) represents the early traditions of E. poetry. His *Vision Concerning Piers the Plowman* is an allegorical satire, written in the old alliterative verse. It remained a popular source of inspiration for 2 centuries, but in its vocabulary and literary technique it looks back instead of forward. A prose work of this century which deserves mention is the *Voyage and Travel of Sir John Mandeville*, c. 1370.

Chaucer had many followers but no successor. The 15th cent. is, indeed, a barren literary period, the whole country suffering in its latter part from the disastrous Wars of the Roses. Among the E. Chaucerians, John Lydgate (c. 1370-c. 1451), a monk of Bury, was a versatile and voluminous but mediocre poet; his works include *The Troy Book* and *The Fall of Princes*. Thomas Hoccleve or Hoccleve (c. 1370-c. 1450) also wrote dull verse on noble subjects; his *De Regimine Principum*, 1411-12, was written as a guide to duty for Shakespeare's 'madcap Prince of Wales,' afterwards Henry V. Stephen Hawes (1474-c. 1523), groom of the chamber to Henry VII, wrote *The Pastyme of Pleasure*. Far more spirited work was that of the so-called Scottish Chaucerians, King James I, Henryson, and Dunbar (see SCOTTISH LITERATURE). An Eng. poet who defies classification is John Skelton (c. 1460-c. 1529), who wrote satires in a short irregular metre not far removed from doggerel. But the 15th cent. was notable for one supreme development. Caxton, who had learned the art of printing on the Continent, came to England in 1476 and set up his press in Westminster. One of the earliest books to be printed was the *Morte d'Arthur* of Sir Thomas Malory (c. 1400-70); trans. from the Fr. with additions, it is one of the best examples of early E. prose. The 15th cent. was also the great period of the ballad. Such poems as *The Nutbrown Maid*, the Robin Hood ballads, *Cherry Chase*, and *Sir Patrick Spens* show the wealth of folk poetry at this time.

In the 16th cent. the impact of the Renaissance was apparent in E. L. The end of the Eastern Empire, signalised by the fall of Constantinople in 1453, had caused the exodus of a vast body of scholars from there to Europe, and the result was a great revival of classical learning in the W. Italy had led the way in this development, and it was by following it, models that England first took part in it. The cult of the sonnet, an It. verse form, was introduced by Sir Thomas Wyatt (1503-42) and Henry Howard, earl of Surrey (1516-47). The latter, a more accomplished versifier, abandoned the Petrarchan sonnet for a form of his own, with 3 quatrains and a rhyming couplet, which was later employed by Shakespeare; in his trans. from Virgil Surrey was also the first to make use of blank verse. The work of these 2 poets appeared in *Tottel's Miscellany*, 1537, one of many anthologies pub. at this time. Among their flowery titles are *A Mirror for Magistrates*, 1559, *The Paradise of Dainty Devises*, 1576, *A Gorgeous Gallery of Gallant Inventions*, 1578, and *A Handful of Pleasant Delites*, 1584. Meanwhile Edmund Spenser (c. 1552-99), the chief poet of the Elizabethan age, made his appearance. Spenser is England's 2nd great poet. His *Shepherd's Calendar* and *Epithalamion* mark him as of high rank, but his greatest work was his allegorical epic *The Faerie Queene*, a poem of rare imaginative power and beauty which reflected the ideals of the passing age of chivalry and had a great influence on succeeding writers from Milton to Tennyson.

The L. of the Elizabethan age shows extraordinary richness and variety. Famed above all for its drama, it saw the beginnings of a great many other types of L. Trans., as might be expected, was early inspired by the Renaissance, among the more influential works being Phaer's Virgil, 1652. Golding's Ovid, 1565-7, North's Plutarch, 1579, Florio's Montaigne, 1603, and Chapman's Homer, 1611-16. A typical Elizabethan was Sir Philip Sidney (1554-86), who during his short life as courtier, diplomat, and soldier found time to be a pioneer in three types of L. His *Astrophel and Stella* was the first and, apart from Shakespeare's the best, of the sonnet sequences which then became so fashionable. Other series of this type were Henry Constable's *Diana*, 1592, Samuel Daniel's *Delia*, 1592, and Thomas Lodge's *Phyllis*, 1593. Sidney's *Apologie for Poetrie*, written before 1583 and later called the *Defence of Poesie*, was the first serious work of literary criticism in the E. language; other treatises on this subject were Wm Webbe's *Discourse of English Poetrie*, 1586, which advocates the use of classical metres, *The Arte of English Poetrie*, 1589, attributes to Puttenham, and Daniel's *Defence of Ryme*, 1603. Finally, in Sidney's *Arcadia*, written for his sister, the countess of Pembroke, we have the finest of those prose romances that were the nearest the

Elizabethans got to the modern novel; other works of this type are John Lyly's *Euphues*, 1578, which started a whole fashion of style; and Greene's *Pandosto* and Lodge's *Rosalynde*, which Shakespeare used as the sources for the plots of *The Winter's Tale* and *As You Like It* respectively. An early example of the picaresque novel is Thomas Nashe's *Unfortunate Traveller*, 1594. In 1597 Francis Bacon initiated a new type of composition with the pub. of his *Essays*. Throughout the reign there were pub. innumerable pamphlets, with such striking titles as Nash's *Pierce Penitence his Supplication to the Dircll*, 1592, Greene's *A Groatworth of W't Bought with a Million of Repentance*, 1592, Marston's *Scourge of Villanie*, 1599, and Dekker's *News from Hell*, 1606.

The term 'Elizabethan' is often loosely applied to the whole group of playwrights from about 1590 to 1642, though of course a great part of this half-century is Jacobean or Carolean, much of the work, including Shakespeare's finest plays, appearing after the death of Elizabeth I in 1603. The earliest origins of E. drama lie in the medieval miracle plays and moralities, but Elizabethan drama was mainly modelled on classical types, tragedy following the 'revenge' plays of the younger Seneca. It is usually counted that the first Eng. comedy was *Ralph Roister Doister*, 1533, and the first tragedy *Gorboduc* or *Perrez* and *Porrez*, 1561. Elizabethan drama began with the plays of the University Wits, John Lyly (c. 1554-1606), George Peele (c. 1558-c. 1597), Robert Greene (c. 1560-1592), and Christopher Marlowe (1564-93). Of these Marlowe is much the most important. In his *Tamburlaine*, 1590, he made a great advance in the handling of blank verse, and his historical play, *Edward II*, shows considerable power of character-drawing. He had also a great command of language. All these writers were eclipsed by Wm Shakespeare (1564-1616), whose powers as playwright and poet are so far in advance of his fellows that comparison is futile. Alike in tragedy, where his *Hamlet* shows to what sublime heights the Senecan revenge plot could rise; in the romantic comedy of *As You Like It*, the fairy fantasy of *The Tempest*, or the pagantry of *Henry IV* and other historical plays, he shows himself supreme. Great as he was, the other Elizabethan playwrights form a galaxy which must be reckoned brilliant even though he overshadows them. Most noteworthy was his friend, the learned Ben Jonson (1572-1637), who wrote clever plots round characters each dominated by a particular trait or 'humour'; typical of this 'comedy of humours' are *Every Man in his Humour*, *Volpone*, and *The Alchemist*. Other contemporary dramatists were long-lived George Chapman (c. 1559-1634), who wrote some ponderous historical plays, while Thomas Dekker (c. 1570-c. 1632) and Thomas Heywood (c. 1573-1641) wrote 'domestic dramas' of London life, the former's *Shoemaker's*

Holiday being one of the finest of this type. Sombre plays of horror or melancholy were characteristic of John Marston (c. 1575-1634), Cyril Tourneur (c. 1575-1626), John Webster (c. 1580-c. 1625), and John Ford (1586-c. 1640). Shakespeare's chief successors in popularity were Francis Beaumont (1584-1616) and John Fletcher (1579-1625), who wrote in such close collaboration that experts are still uncertain how to apportion the authorship of the plays claimed for them. Fletcher probably wrote a great part of the Shakespearian *Henry VIII*, and his vivid sense of beauty is shown in his pastoral comedy *The Faithful Shepherdess*. With Philip Massinger (1583-1640), best known for his comedy *A New Way to Pay Old Debts*, and James Shirley (1596-1666) this period of the drama

course the greatest figure of the period. He is essentially an artificial poet, even in his early works such as the delightful *L'Allegro* and *Il Penseroso*. Gov. secretary during the Commonwealth, he was free after the Restoration to develop his life work, the greatest religious poem of the E. language, *Paradise Lost*, which is unsurpassed for grandeur and sublimity. One of the greatest of all artificial epics, it challenges comparison with the work of Virgil. In prose too the 17th cent. was pre-eminently religious, from the A.V. of the Bible, 1611, to John Bunyan's *Pilgrim's Progress*, 1678, which did for the humbler classes what Milton did for the more learned. Other notable religious works were Sir Thomas Browne's *Religio Medici*, 1643, and Jeremy Taylor's *Holy*

WILLIAM SHAKESPEARE

JOHN DRYDEN

comes to an end, the playhouses being closed by the Puritan parliament in 1642.

Literary development in the 17th cent. is broken into 2 parts by the years of the Commonwealth, 1649-60. The earlier part is commonly styled the age of Milton, though his greatest work was after 1660, while the later part, in which Dryden is the leading figure, began that great Augustan age which was to stretch to the end of the 18th cent. Early 17th-cent. lyric poetry is a continuation of Elizabethan, and the graceful short poems of Robert Herrick (1591-1634) were later to find an echo in the elegant love lyrics of the group of Cavalier poets, Thomas Carew (1598-1638), Sir John Suckling (1609-42), and Richard Lovelace (1618-1658). But the general trend of the century was religious, and there was much verse of a curiously artificial and mannered cast to which the name 'metaphysical' has been given. Its chief exponent was John Donne (1573-1631), dean of St Paul's, who wrote harsh but powerful poems. Others were George Herbert (1593-1633), Henry Vaughan (1622-95), styled the Silurist because he came from Wales, and Richard Crashaw (1612-49), one of the greatest E. Rom. Catholic poets and an inspired mystic. John Milton (1608-74) is of

Living, 1650, and *Holy Dying*, 1651, which did much to mould Eng. prose. A work that has always defied classification is Robert Burton's *Anatomy of Melancholy*, 1621, an extraordinary miscellany of learning and philosophy.

In the latter part of the 17th cent. John Dryden (1631-1700), by adopting the heroic couplet for his poems, set a fashion which was to last for over a century. He is chiefly remembered for his satires such as *Absalom and Achitophel*, 1681, and for his Pindaric odes, but he was in fact one of the greatest all-round writers in our l. His plays were among the best of his time, his *All for Love* being able to stand comparison with Shakespeare's *Antony and Cleopatra* on the same theme, while his *Essay on Dramatic Poesy*, 1668, shows his ability as a critic. With Dryden may be grouped the poets Abraham Cowley (1618-67) and Edmund Waller (1606-87). Samuel Butler (1612-1680) produced in *Hudibras* a mock epic which makes merciless fun of the Puritans. But perhaps the most noteworthy reaction observable in Restoration l. was in the drama, where a notorious collection of witty but extremely indecent plays were written by Wm Wycherley

(1640-1716), Wm Congreve (1670-1730), Sir John Vanbrugh (1664-1726), and George Farquhar (1678-1707). Their indecency was condemned by Jeremy Collier in his *Short View of the Immorality and Profaneness of the English Stage*, 1698, but the Comedy of Manners, as it has been termed, set a lasting fashion in witty dialogue. To this period belong also the diarists John Evelyn (1620-1706) and Samuel Pepys (1633-1703), most famous of all, who gives a vivid picture both of his times and of his own personality.

In the early part of the 18th cent. the leading poet was Alexander Pope (1688-1744), who took over the heroic couplet from Dryden and made of it an even more perfect instrument for polished satire and philosophical reflection. In his *Rape of the Lock*, 1712, he wrote the most exquisite mock-heroic poem in our literature; in the *Dunciad*, 1728, he pilloried all his poetical rivals; and in his *Essay on Man*, 1733-4, he clothed common-place moralising in a series of brilliant verse epigrams. He also trans. Homer into faultless if quite incongruous Augustan verse. In Pope's day correctness and adherence to classical rules, by which were meant those of the Lat. poets, who were themselves artificial and derivative, were considered the ideal to follow, and poetry was fettered by conventions that made free expression impossible. The reign of Queen Anne was also the age of the periodical essay, of which Joseph Addison (1672-1719) and Richard Steele (1672-1729) were masters, the *Tatler*, 1709-11, being followed by the more famous *Spectator*, 1711-12. Other leading prose writers of the period were Daniel Defoe (c. 1660-1731), journalist and fiction writer, famous for his *Robinson Crusoe*, 1719, and Jonathan Swift (1667-1745), Dean of St Patrick's, Dublin, whose bitterly misanthropical satire *Gulliver's Travels*, 1726, has by a strange turn of irony become in its expurgated form a popular book for children.

The 2nd half of the 18th cent. is often termed the age of Johnson. Critic, essayist, poet, and compiler of the first authoritative E. dictionary, Samuel Johnson (1709-84) was the dominant literary figure of his time, and his personality has been vividly reproduced through his conversations, reported by James Boswell (1740-95) in the greatest of all E. biographies. Another member of Johnson's circle was Oliver Goldsmith (1730-74), a versatile writer noted for his successful comedy *The Sloopers to Conquer*, his poem *The Deserted Village*, with its idealised picture of rural life, and his sedate novel, *The Vicar of Wakefield*. The latter 18th cent. saw the first flowering of the E. novel. Samuel Richardson (1689-1761) in 1740 pub. *Pamela*, commonly accepted as the first genuine novel in the language, and followed it with two others. Henry Fielding (1707-54) started his *Joseph Andrews*, 1742, as a skit on *Pamela*, but it developed into a successful story in its own right, and was followed by *Tom Jones*, 1748, his greatest work.

Richardson, who cast his stories in the form of letters, was the first psychological novelist, while Fielding claimed that his new literary type was 'a comic epic poem in prose.' Laurence Sterne (1713-68) produced in *Tristram Shandy* an eccentric rambling composition made up mainly of asides and digressions; with no plot and practically no story it was nevertheless highly popular. Tobias Smollett (1721-1771) pub. the lively picaresque tales *Roderick Random*, *Humphrey Clinker*, and others. An early woman novelist was Fanny Burney (1752-1840), whose *Evelina*, 1778, caused a great sensation. Meanwhile there was a gradual movement in poetry away from the classical correctness of the Augustans. James Thomson (1700-48) in his *Seasons* was one of the earliest to describe the beauty of nature. Wm Collins (1721-59) wrote an unrhymed *Ode to Evening* which shows a similar feeling, and Thomas Gray (1716-71), though most famous for his classically correct *Elegy in a Country Churchyard*, showed in his letters a strong feeling for nature. Wm Cowper (1731-1800) wrote of the charm of country scenes, while George Crabbe (1754-1832) proceeded in realist verse to 'debunk' the false pastoral idealism of the Augustan school. At the same time an antiquarian spirit was shown in *Percy's Reliques*, 1765, in the prose poems attributed to Ossian, and in the extraordinary medieval imitations of ill-fated Thomas Chatterton (1752-70). A mystical poet who in some respects forms a link between this period and the next was William Blake (1757-1827).

With the 19th cent. began the Romantic Revival, a literary movement second in importance only to the Renaissance. In Europe this revolution in thought caused political upheaval, while in England it brought the end of the genteel neo-classical standards which had ruled L. for more than a century. The beginning of the movement is generally dated from the pub. of *Lyrical Ballads*, 1798, the joint work of Wordsworth and Coleridge. Wm Wordsworth (1770-1850) lived right through the Romantic movement and was in many ways its most important and characteristic Eng. champion. He maintained that poetry should use ordinary speech and tell of ordinary people. His philosophy of life is set out in the long *Prelude*, but he was above all the poet of outdoor nature, finding greatest inspiration in birds and flowers. His friend Samuel Taylor Coleridge (1772-1834) developed in *The Ancient Mariner* and *Christabel* a vein of imaginative romance, but after 1802 was known mainly for his philosophy and criticism. Third of the so-called Lake School of poets was Robert Southey (1774-1843), whose poetical E. romances have been forgotten while his life of Nelson is still admired. With Percy Bysshe Shelley (1792-1822) and John Keats (1795-1821) the Romantic movement entered on a second phase. Shelley, a champion of freedom like the hero of his drama *Prometheus Unbound*,

had an ear for verse music which has rarely been equalled, and is one of our greatest lyric poets. Keats was in some ways the most perfect poet of them all. Although he knew no Greek, his great poems, *Endymion* and *Hyperion*, are on Gk subjects and reproduce the Gk spirit, while his lyrics have a sensuous beauty surpassing even those of the ethereal Shelley. Both of these poets *d.* young, as did also the third of this group, Lord Byron (1788-1824), who not merely preached the gospel of freedom but gave his life for it in Greece. Byron, like Southey, wrote many E. romances. He gave a poetical account of his European wanderings under the title *Childe Harold's Pilgrimage*, but was most successful with a satirical epic, *Don Juan*, which reveals him to be as much an Augustan as a Romantic.

The Romantic movement revolutionised prose as much as it did poetry. Towards the end of the 18th cent. there had been a fashion for tales of mystery and horror, of which Ann Radcliffe's *Mysteries of Udolpho*, 1794, and Matthew Lewis's *The Monk*, 1796, are typical; Mary Shelley's *Frankenstein*, 1817, and Charles Maturin's *Melmoth the Wanderer*, 1820, show the later development of the Gothic Revival. These tales were burlesqued by Jane Austen (1775-1817) in *Northanger Abbey*, but *Pride and Prejudice* and her other delightful books belong rather in spirit to the previous century; the greatest of our women novelists was uninfluenced by the events of her times. It was left for Sir Walter Scott (1771-1832) to develop the prose aspect of the romantic movement in historical novels like *Ivanhoe* and *Quentin Durward*, though Scottish tales like *The Heart of Midlothian*, in which he could show his power of character-drawing, were the most successful artistically. Scott had already worked the historical vein in his poems *Marmion* and *The Lady of the Lake*, but was eclipsed in popularity by Byron. A later writer of historical romance was Bulwer Lytton (1803-73), whose *Last Days of Pompeii* and *Last of the Barons* still have popularity. Meanwhile Charles Lamb (1775-1834), writing as 'Elia,' had developed the essay in an inconsequent but fascinating form which transformed it and started a new style. Lamb was also a fine literary critic, but in this he was surpassed by Wm Hazlitt (1778-1830), often reckoned the greatest critic in E. L. Other essayists were Leigh Hunt (1784-1859), who developed its lighter side, and Thomas De Quincey (1785-1859), noted for his ornate prose style.

The Victorian age lasted from 1837 to 1901 and saw an efflorescence of literary work comparable to that of the Elizabethan age. Modern critics writing in a time of disillusionment have affected to despise the Victorians for their respectability and self-satisfaction, but the greatness of their work is unquestioned. Coincident with the great queen's reign and representing it in every important respect, was Lord Tennyson (1809-92),

Poet Laureate. One of the greatest masters of verse technique, Tennyson excelled as a lyric poet. Profundity, which he often lacked, is shown in his great elegy *In Memoriam* and in such short pieces as 'Crossing the Bar.' A contrast to him was Robert Browning (1812-89), the supreme advocate of self-development as Tennyson was of self-discipline. Browning was greatest in psychological studies and in dramatic monologues, his longest poem being *The Ring and the Book*. Criticised as obscure and tortuous, he is clear and simple in his lyrics. With Browning may be considered his wife, Elizabeth Barrett (1806-61), who when they married was more celebrated than he. In spite of manifest faults she has a claim to be counted our greatest poetess, and her *Sonnets from the Portuguese* are among the most moving expressions of love from a woman's standpoint. Matthew Arnold (1822-88), in poetry a disciple of Wordsworth who followed classical models, wielded great influence with his *Essays in Criticism*.

The Victorian age was also a great age of prose, providing in Thomas Carlyle (1795-1881) and Lord Macaulay (1800-59) two of our greatest historians and essayists. It saw too the second flourishing period of the Eng. novel in the work of Charles Dickens (1812-70) and Wm Makepeace Thackeray (1811-63). Dickens is still the most popular of all E. novelists, and the only one whose main works, especially the *Pickwick Papers*, are quoted freely. A member of the lower classes, with an imperfect education, he excelled in depicting common people. But his characters are unique, for they are formed rather in the manner of Jonson's comedy of humours, to display in each case some particular trait; they are in fact caricatures, and very delightful ones. Thackeray, by contrast, belonged to the upper classes, and even his *Vanity Fair* and *Henry Esmond* have a share of snobbery. Like Dickens he had a close insight into human nature and great powers of observation, but he lacked Dickens's richness and variety. Contemporary with these two were a number of women novelists. First, there was that remarkable group, the Brontë sisters. Charlotte (1816-55) was the most successful of the three, and in *Shirley* and *Fillette* showed herself a pioneer in that introspective type of fiction for which women writers are particularly fitted. *Wuthering Heights*, the one novel written by Emily Brontë (1818-48), is a morbid but powerful piece of work, and Emily was also the poet of the family. Lastly we come to George Eliot (1819-80), as Mary Ann Evans chose to be called. In *Adam Bede*, *The Mill on the Floss*, and her other novels she wrote moral studies linked to effective descriptions of E. country life. A Victorian writer who attained great popularity in the 20th cent. was Anthony Trollope (1815-82), who in his *Barchester* novels described with fidelity and humour the life of an Eng. cathedral city.

In the latter part of the 19th cent. an important poetical development was the formation of the Pro-Raphaelite brotherhood. It was primarily an artistic fraternity, but on the literary side the chief members were Dante Gabriel Rossetti (1828-82), his sister Christina Rossetti (1830-94), and Wm Morris (1834-96). As its name implies, the group aimed at reviving the simple beauties of medieval art, and its poetry had the same glowing colour and gorgeousness as its painting. Morris, a many-sided genius, was one of the leaders of the Socialist movement, and Christina Rossetti disputes with Mrs Browning the title of greatest E. poetess, her work showing

THOMAS HARDY

passionate intensity with strong devotional feeling. Associated with this school was Algernon Charles Swinburne (1837-1909), a supreme master of verse melody whose poetry charms by sheer beauty of sound; the choruses from his *Atalanta in Calydon* have a perfection of cadence that has never been surpassed. In many members of this group there was a tendency for sensuousness to degenerate into sensuality, and their followers, the 'aesthetic poets' of the 90's, seemed to pursue decadence with deliberate intent. This later movement was finally brought into disrepute through the disgrace of Oscar Wilde (1856-1900). The 90's also witnessed the cult of the small exquisite poem, which led a critic to style it 'the age of Bovril.' Of this type of work the finest example was A. E. Housman's *Shropshire Lad*, 1896, which, apart from its pessimism caught the spirit of the writers in the Gk Anthology.

The fiction of the end of the Victorian age requires a section to itself. George

Meredith (1828-1909) wrote his novels in an affected style which led Wilde to call him 'a prose Browning,' but he ranks high through the knowledge of human motives shown in such novels as *The Egoist*. Thomas Hardy (1840-1928) preached a dreary pessimism, and in spite of their undoubted power the sordid realism of *Jess of the D'Urbervilles* and *Jude the Obscure* roused so much hostile criticism that he abandoned fiction for poetry. It has been maintained that Hardy and Meredith are both better poets than novelists, Meredith being one of our finest poets of nature. Robert Louis Stevenson (1850-94) a very finished stylist, produced many romances of adventure, *Kidnapped* being perhaps the most famous, but is at least as well remembered for his boys' book *Treasure Island*, which is a children's classic. Rudyard Kipling (1865-1936), our most brilliant writer of short stories, also wrote sev. books for children, including the 2 *Jungle Books* and *Just So Stories*. The late 19th cent. was a golden age of boys' books, R. M. Ballantyne (1825-94) and G. A. Henty (1832-1902) being the chief writers of adventure stories, while T. Hughes's *Tom Brown's Schooldays*, 1856, and F. W. Farrar's *Erie*, 1858, started the fashion in school stories. Most successful of writers for children of all ages was Lewis Carroll (1832-98), whose fairy-tale absurdities *Alice in Wonderland* and *Through the Looking Glass* are more often quoted than any books except Shakespeare and the novels of Dickens.

From the start the 20th cent. was critical of the previous age. All the leading authors were devoted to one phase or another of social reform. George Bernard Shaw (1856-1950) wrote brilliantly witty plays which held the mirror up not to nature but to the national weaknesses. In such works as *Plays Pleasant and Unpleasant*, *Man and Superman*, *Heartbreak House*, and *Saint Joan* he dealt with all questions from religion to phonetics and from marriage to militarism. H. G. Wells (1866-1946) began with science fiction as in *The Time Machine*. 1895, went on to sympathetic novels of the lower classes, of which *Kipps*, 1905, is the most famous, but later wrote thinly disguised propaganda and utopias of the future. Even John Galsworthy (1867-1933), spokesman in the *Forsyte Saga* of a ruling class that has now vanished, took the part of the underdog in such plays as *Strife* and *Justice*. In poetry a reaction against the over-luxuriance of recent writers was seen in Kipling's virile verse and the similar work of Henry Newbolt (1862-1938) and John Masefield (1878-), who became Poet Laureate. The vivid word-painting of Masefield's early sea poems reappeared in the stark realism of such pieces as *The Everlasting Mercy*, 1911. A revolt of a different kind was that of the Imagist group of poets formed just before the First World War. Abandoning rhyme as a distraction, they aimed at conciseness and objectivity, seeking always the

perfect phrase. Nearly all the members of the group finally developed along other lines, but the impetus they gave to unrhymed verse was nevertheless considerable, and it is from this period that its general use is dated. In 1918 were pub. the works of Gerard Manly Hopkins (1844-89), a gifted poet of an earlier generation whose innovations in rhythm were much in advance of his time. At the time of the First World War there were a number of poets, loosely termed Georgian, producing work of diverse types. In a later reaction against their style 'Georgian' has become almost a term of reproach. But such poets as Walter de la Mare (1873-1956), writer of exquisite verse and for children, Alfred Noyes (1880-), who produced the finest fairy poetry seen since the Elizabethans, and Edmund Blunden (1896-), a placid writer of nature poetry, were still admired by later generations. Rupert Brooke (1887-1915) earned a briefer fame by his sensuous verse, his magnificent war sonnets, and his tragic death on active service. The essay was a highly popular form at this time and was used with great skill by Sir Max Beerbohm (1872-1956), G. K. Chesterton (1874-1936), Hilaire Belloc (1870-1953), E. V. Lucas (1868-1938), and Robert Lynd (1879-1949).

From the outbreak of the First World War to the Second was a time of revolt and innovation. D. H. Lawrence (1885-1930), attacking Victorian conventions, exploited the sex motif to excess in his novels, and had a number of imitators. An entirely new technique of fiction was introduced by Dorothy Richardson (1873-1957), who initiated the 'stream of consciousness' school, reconstructing reality as a series of images running through the mind of one person. A somewhat similar technique was used with more artistry by Virginia Woolf (1882-1941), while James Joyce (1882-1941), her exact contemporary, carried experiment still further in his *Ulysses*, a sort of modern *Tristram Shandy*, which describes in minute detail a day in the life of 3 characters, sometimes employing a vocabulary specially coined by the author. Novelists who began earlier but attained their fuller powers in this period were Somerset Maugham (1874-), K. M. Forster (1879-), Sir Compton Mackenzie (1883-), and Sir Hugh Walpole (1884-1941). Brilliant satirists among the younger generation were Aldous Huxley (1894-), Alec Waugh (1898-), and Evelyn Waugh (1903-), while writers of more orthodox fiction were J. B. Priestley (1894-) and A. J. Cronin (1896-). An outstanding fashion in popular fiction was the insatiable demand for detective stories, a genre started in this country by Sir A. Conan Doyle (1859-1930) with his Sherlock Holmes series. Writers vied in providing ingenious plots, two of the best being women, Agatha Christie (1891-) and Dorothy Sayers (1893-). Of the straightforward thriller of action Edgar Wallace (1875-1932) was the prolific provider. In hist., G. Lytton Strachey

(1880-1932) started the vogue of the 'debunking' biography in 1913 with his *Eminent Victorians*, which showed up those weaknesses that more reticent biographers had been accustomed to omit or gloss over. In poetry, T. S. Eliot's remarkable *Waste Land*, 1922, was said to mark an epoch. It did so in the sense its title indicates, as a confession of the barrenness of the times. By its erudition, obscurity, and pessimism it was characteristic of much verse of the period. Followers of Eliot who formed the most important group of the period between the wars were C. Day Lewis (1904-), W. H. Auden (1907-), and Stephen Spender (1909-), all of whom wrote verse during the 30's on sociological or political subjects and leaned towards Communism in the days before it was discredited. Their work fell short of being great poetry, but the prestige they enjoyed is shown by the fact that the first two were elected in succession to the Chair of Poetry at Oxford. A poetess of a highly individual cast was Dame Edith Sitwell (1887-) who, like her famous brothers, made novel experiments in imagery.

The period since the Second World War is too short and too recent to be viewed in proper perspective. Noteworthy novelists are Graham Greene (1904-), a master of sinister fiction, and George Orwell (1903-50), author of the brilliant political satires *Animal Farm* and *1984*. In Dylan Thomas (1914-53) it had a poet of genius whose striking imagery and original phrasing showed affinities with Hopkins. A hopeful sign was the revival of verse drama in the work of T. S. Eliot and Christopher Fry (1907-). But compared with other periods it has been weak in creative work. Even the fount of the detective novel is running dry, and for escapist L. we are offered science fiction or, what is escapist in a literal sense, accounts of flights from prison camps during the war. Hist., biography, and memoirs bulk highest in the works of the time, with Sir Winston Churchill (1874-) setting an example in his accounts of his own great period of statesmanship. Autobiographies have now grown to such proportions that authors take a whole series of vols. to relate the events of their lives. It seems likely that the 20th cent., like the 18th, will go down to posterity as an age of prose and reason, and indeed some of the younger writers are already claiming kinship with the Augustans. In reference works the period has been particularly rich, from the great *Oxford English Dictionary*, finished in 1928, and the various Cambridge hist., literary, and medieval, and modern, to the innumerable dictionaries and encyclopaedias that have been pub. in recent years. If not a productive age in the fullest sense, it has provided the writer with a very complete set of the tools of his trade.

English Music, see **BRITISH MUSIC**.

'English Review, The', started by John Murray (q.v.), the celebrated publisher. It first appeared as an ann. register, entitled *The London Mercury*. A 2s. 6d. review of the same name was founded by Chapman & Hall in 1908. Noteworthy for its high literary qualities, it devoted itself to the pub. of such articles, essays, belles lettres, short stories, and poems, as it considered remarkable for intrinsic merit.

Englishry, term used during the Norman rule in England. It was used to show contempt, for if the hundred could prove that a murdered person was Eng., that is to say, make a 'presentment of E.' it escaped without punishment. This was abolished in the first half of the 14th cent.

Engraving, primarily the art of drawing on a substance by means of an incised line. The term was early applied to the work produced by that process and later to the impression of the engraved work upon a sheet of paper. This article deals with E. on metals. From very early times gems have been engraved with ornaments or signets, and commemorative inscriptions have been cut into metal tablets; but technically the word E. is confined to the incision of a design upon a plate of metal or a wooden block, for the purpose of producing upon paper by the aid of ink a series of reproductions of that design. Copper plate and steel E. was introduced at the end of the 15th cent. On metals, E.s are usually in intaglio, that is, the lines are sunk in and possess a positive value in that they actually trace the design. In woodcuts and wood-engraving (q.v.) the lines are negative, their object being to leave the true design projecting in relief. Copper and steel are the favourite metals of engravers, but zinc, brass, silver, and iron have also been employed. Steel is much harder to work with than copper, but on the other hand its very toughness makes it possible to take off a greater number of good impres-

sions. By means of electrolysis, it is now possible for the engraver to protect his copper plate by a thick coating of steel; the result of this has been almost to do away with steel plates altogether. Copper has always been preferred where the aim of the artist is to produce a highly finished and delicate reproduction of the design.

Line Engraving.—Implies the use of a tool called the graver or burin. This consists of a steel rod some 4 in. long, with a square or lozenge-shaped section, a sharp edge being secured by cutting the section obliquely. The engraver controls the rod by grasping a wooden handle, and in making his strokes varies the pressure in accordance with the thickness of the line

AN ENGRAVING BY DÜRER:
'Christ on the Cross'

desired. When his work is finished he covers the plate with printer's ink, presses it into the incisions by the aid of a dabber, rubs away the superfluous ink with a piece of muslin and then carefully lays a sheet of moistened paper on the engraved surface. The plate, with the paper thus attached, is placed on a board which slides between 2 rollers in what is called the copperplate press, blankets softening the contact of paper and roller. The design is reproduced by the transference of the ink from plate to paper. **Etching** (q.v.) involves the use of a mordant to eat into the plate. An etching-ground is spread over the copper surface and the lines are opened up with an etching needle.

Dry-point is a method of E. akin to the processes already described. The implement used is a steel point stronger and more tapering than the etching needle. When this is firmly drawn across the metal surface, quite a distinct burr—like a

miniature thorn—is produced, the effect of which is to leave a semi-luminous ridge of tone at the side of each line, and thus to impart to the whole print an attractive richness of tone. Skilful engravers often blend these 3 processes in the one plate.

Tone-processes aim at achieving a result on the plate similar to that produced by a colour wash in painting. If the artist uses the 'crayon or chalk-manner,' he first perforates his etching-ground with special needles like the mace-head or roulette, his aim being to suggest the rough texture of crayon strokes. If he follows the 'stipple method,' he imitates broad tone surfaces by covering the etching-ground with dots and short strokes, using the curved stipple engraver, the dry-point, or the roulette for the purpose. The essential distinction of the *mezzotint* process is that the craftsman begins with a dark ground and proceeds to create his lights by a negative and scraping device. With the assistance of a kind of chisel, called the 'cradle' or 'rocker,' he roughens the plate by raising metal points or burrs. At this stage the copper would print a rich black, but the mezzotinter removes the burrs with his 'scraper' in proportion to the tone he wishes to produce. Thus, if he scrapes down to the bottom of the indentation, he will get a smooth surface, which will not be able to hold any ink and will therefore print white. For *aquatints* the plate is prepared for E. by a porous coating of sand or resinous gum. Bitten by acid, a granular surface results. This method produces E.s not unlike mezzotints, but less rich in quality and depth.

Not more than 25 good mezzotints or dry-points can be obtained from 1 plate, as the brilliancy of the impression depends on the delicacy of the burr. A steel facing, however, increases the number to a hundred, whilst with this protection as many as 3000 line E.s may safely be taken off. The value of a print depends on the engraver and the fineness of the impression, which decreases, naturally, with the number taken. 'Artist's proofs' are treasured, as they bear the signature of the painter or engraver, or of both. The signature is considered a guarantee of the quality of the print and may imply retouchings by the artist.

History of line-engraving and etching.

Line-engraving.—E. is an art of comparatively recent development and the earliest known illustration, with metal as the medium, is the 'Flagellation,' which is dated 1446, and is the work of a German who lived in the neighbourhood of Cologne or Basel. In Italy the art grew side by side with painting, and arose, as some think, from that of niello (q.v.), which was a process of incising a pattern on gold or silver and then filling in the groove with a black compound (nigellum). The work of Maso Finiguerra (1426-64), with its plentiful cross hatchings illustrates the 'Fine Manner,' whilst that remarkably fine achievement of the Florentine Antonio Pollaiuolo (1429-98), 'The Battle of the Nudes,' exhibits the broad and simple

lines of parallel shading which characterises the exponents of the so-called 'Broad Manner.' Somewhat similar in style is 'The Virgin and Child' of Andrea Mantegna (1431-1506). Albrecht Dürer, the German (1471-1528), Marcantonio Raimondi, the Bolognese (1475-1530), and Lucas van Leyden, the Netherlander (1494-1533), form a conspicuous triumvirate of engravers. Formal dignity, refinement of touch, and unremitting care are a few of the merits of Dürer's portrait of Albrecht of Brandenburg and his 'St Jerome in the Wilderness.' Marcantonio is famous for his reproductions of Raphael's work. According to Vasari it was the engraver's magnificent 'Death of Lucretia' which was responsible for his long association with that painter. Lucas's skill may well be studied in his 'David playing before Saul.' The first Fr. engraver of note was Jean Duvel (1185-1561), whose 'Apocalypse' series emphasises his mysticism and at the same time his somewhat heavy, overloaded style. In England the same distinction must be reserved for Wm Rogers (fl. 1580-1610), who executed sev. portraits of Queen Elizabeth, all of which, however, are stiff and too ornate. Professional print-sellers, ready to provide portraits for historians and maps for discoverers, first began to flourish in the latter half of the 16th cent. The pioneers were mostly Netherlanders, like Hieronymus Cock and Philippe Galle (1551-1612), many of whom migrated to Italy and Germany and thus popularised commercial E.s abroad. Robert Nanteuil (1623-78), who was engraver at the court of Louis XIV., stands easily at the head of all Fr. engravers of portraits, and a similar honour among his own countrymen is with justice claimed for Wm Faithorne (1616-91). Faithorne was the first great master of line E. and raised E. to its place in art in England, equal to any work being done on the Continent. To quote his own words: 'The result of air, the symmetry of parts, the exact harmony of proportions, of lights and shadows, may be performed to the height in Graving.' Wm Sherwin was initiated in the art of mezzotint E. by Prince Rupert and a dated mezzotint portrait of Charles II (1669) establishes him as the first Englishman to practise the art. John Smith (b. 1652) was a master of his period. He engraved over 100 portraits by Sir Godfrey Kneller and he also engraved after Correggio and Titian. John Faber (c. 1695-1756), who was b. in Holland, the son of a mezzotint engraver, engraved hundreds of plates after contemporary artists from Kneller and Reynolds to Hogarth and Frans Hals. Among the more notable of Eng. line-engravers were: George Vertue (1684-1756), engraver of portrait plates, appointed engraver to the Society of Antiquaries, and buried in Westminster Abbey; Wm Hogarth (q.v.); Ravenet, who came from France in 1750, and blended line-E. and etching; John Hall (1739-97), historical engraver to the king, one of whose works is 'Oliver

Cromwell dissolving the Long Parliament'; François Vivares (1709-80), the first landscape engraver in England and founder of a school of engravers in line; Lupton (Goff (1791-1873), mezzotint engraver, estab. the use of steel for copper; Sir Robert Strange (q.v.), who pub. (1757) the famous plates 'Caesar repudiating Pompeia,' 'Romulus and Remus,' after Cortona, and 'Charles I's Three Children' after Van Dyck, and whose masterpiece 'Charles I,' also after Van Dyck, confirmed his European reputation as an engraver of genius; Wm Woollett (1735-85), who engraved in line

AN ENGRAVING BY BLAKE:

'And my Servant Job shall pray for you'

and etching, his best plates being landscapes after Claude Lorraine and Richard Wilson, but the most famous of his works are the 'Death of General Wolfe' and 'The Battle of La Hogue,' after Benjamin West; and Wm Sharp (1749-1824), the last of the great copper-plate engravers, who executed many fine portraits after Reynolds and Romney and historical subjects. Wm Blake (1757-1827) was an engraver of peculiar merit in this period. There is true inspiration in his 'Illustrations of the Book of Job,' which have been rarely surpassed in purity of line, harmony of composition and independence of convention, whether in design or execution. In the late 18th and early 19th cents. the efforts to imitate tone in reproductive line-E. produced marvels of delicate craft, e.g. by the engravers of Turner's work, Cooke, Goodall, and others. The 19th and 20th cents., however, have seen a decline in metal E. as a handicraft, partly because

it has been superseded for practical purposes as a commercial form of reproduction and partly because artists have preferred freer modes of expression. Etching, from Whistler to Muirhead Bone, has kept its popularity with artists, and wood-E. still has its place in special forms of book illustration, but only a few artists, among whom Stephen Gooden is notable, still favour the burin. See also COLOUR PRINTING; ETCHING; MEZZOTINT; NIELLO WORK; PHOTOGRAPHURE; PROCESS WORK; WOODCUTS. See M. C. Salaman, *Old Engravers of England*, 1906 (with bibliography); A. M. Hind, *History of Engraving and Etching* (new ed.), 1923.

Enguinegatte, see GUINEGATTE.

Enharmonic, term in music, originally the name of one of the genera of *anct* (1k music, now applied to modulations made by changes of sharps to corresponding flats and vice versa, e.g. C \sharp to D \flat , E \sharp to D \sharp , etc. On the piano or other keyboard instrument tuned to the tempered scale there is no change in sound, but on string or wind instruments there is a minute difference, discernible to the trained ear.

Enid, city of Oklahoma, U.S.A., with Vance Air Force base, and an airport. The leading grain market of the state, and the trade centre for a large agric. dist. and for gas and oil fields. It is an important railway junction, has railroad shops, oil refineries, flour mills, and meat-packing plants, and makes agric. implements and wire. It is the seat of Phillips Univ. Pop. 36,017.

Enkhuizen, small tn in the prov. of N. Holland, Netherlands; it is one of the so-called dead cities of the IJsselmeer (Zuider Zee), and a delight to every visitor. In the 16th cent. E. was a prosperous tn and had a big herring fleet, but later the pop. of nearly 40,000 gradually fell to about 10,000. The great Dromedaris Tower (1540), a splendid relic of the old fortifications, stands guardian over a curious little harbour. There are many interesting buildings, the chief being the Westerkerk (Protestant Church) with a wood steeple (1519), the orphanage or Weeshuis (1616), and the tn hall (1688) containing a museum of local antiquities. The new Zuider Zee museum has an interesting collection of remains from the former Zuider Zee shores. Paul Potter (1625-1654), the Dutch painter, was b. at E.

Enkianthus, a genus of deciduous shrubs from Japan and China, family Ericaceae; sev. species are valued for gardens with lime-free soil.

Enlil, or **Ellil**, deity of the Sumerians and Babylonians, lord of the land and winds, prin. deity of Nippur (q.v.) where he was worshipped from earliest times until the end of the pre-Christian era. With Anu and Ea (qq.v.) E. formed the oldest and supreme triad of gods. In later Babylonian astronomy 'the way of Enlil' is identified with the Plough star.

Enlistment, method by which the army is recruited in countries which do not have a form of conscription. Most of the European countries have some form of

conscription, but in the case of Great Britain and America E. traditionally takes its place. Up to the beginning of the 18th cent. E. took place through an official who had no definite recognition by the army authorities, but who received a commission for every recruit. The period of service for which a soldier enlisted was not determined, in fact he served as long as he was physically fit. At the beginning of the 19th cent. recruiting was taken over by the army authorities, and since that time many changes have been made. A man on enlisting nowadays must make declaration before a magistrate or before the commanding officer. He then takes the oath, signs a declaration, and is then, and only then, held to have enlisted. Punishment for false declarations can be made either in a civil court or by means of a dist. court-martial. A soldier is at liberty to purchase a discharge under certain conditions, but never when the country is at war. In ordinary peacetime engagements soldiers enlist for 3 years with the colours and 4 with the reserve. Alternatively soldiers can enlist for a full 22 years, with the option to leave at the end of every 3rd year. A volunteer for 22 years' service can be accepted at any age between 17½ and 30.

Enna: 1. Prov. of Italy, in central Sicily (q.v.). It is generally mountainous, with many high valleys formed by the Simeto, Salso, Gela, and other rivs. The prin. tns include E., Agrig., Nicosia, and Leonforte (qq.v.). Area 990 sq. m.; pop. 249,000.

2. (Formerly **Castrogiovanni**), tn in Sicily, cap. of the prov. of M., 62 m. SE. of Palermo (q.v.). It is 3000 ft above sea-level, in a fertile plateau. In the neighbourhood is Lake Pergusa, which is associated with the Proserpine (q.v.) myth, and the ruined citadel of E. is said to be on the site of a temple of Demeter (q.v.). There is a cathedral (13th–17th cents.) with a baroque facade. The chief trade is in rock-salt and sulphur. Pop. 27,000.

Ennerdale, rural dist. (88,000 ac.) of SW. Cumberland, England, comprising 19 pars., lying between the sea and the main group of Lake Dist. mts. There are 2 lakes, Wastwater, and E. Water with the vil. of E. situated just above it. Main industries are coal and iron-ore mining, quarrying, and 2 atomic energy works. Pop. 29,676.

Ennis: 1. Co. tn of co. Clare, Rep. of Ireland, situated on the R. Fergus, about 22 m. NW. of Limerick. In the tn are the remains of a Franciscan friary, also a Rom. Catholic cathedral and college. Shannon airport (q.v.), an international airport, is 16 m. from E. The port is Clare Castle. Pop. 6100.

2. Tn in Ellis co., Texas, U.S.A. It lies to the SE. of Dallas, with cotton gins and compresses and cotton seed oil mills. Pop. 7800.

Enniscorthy, tn of co. Wexford, Rep. of Ireland, situated on the Slaney, 14 m. NW. of Wexford. It has a beautiful situation, the land around being very

fertile. Below E. the riv. is navigable for barges. The castle, now partially destroyed, is an interesting old building. Pop. 6000.

Enniscorney, popular seaside resort, 33 m. W. of Sligo, Rep. of Ireland. Pop. 500.

Inniskillen, co. tn of Fermanagh, N. Ireland, 115 m. from Dublin and 88 m. from Belfast. Situated on an is. between Upper and Lower Lough Erne, it has suburbs on both sides. E. was granted its first charter in the 17th cent., and was a noted Protestant centre in the time of Wm III. It gave its name to 2 regiments of the Brit. Army, the 28th Foot, known as the Royal Inniskilling Fusiliers (q.v.), and the Royal Inniskilling Dragoons. Portora Royal School (1618) is by the lake shore; among its pupils were Rev. H. F. Lyte, author of 'Abide With Me'; and Oscar Wilde. It has an agric. trade, and secondary industries are the manuf. of nylon hose and bacon curing. Pop. 7500; (of rural dist. 16,000).

Ennistymon, tn of co. Clare, Rep. of Ireland, 17 m. NW. of Ennis; the famous cliffs of Moher are 7 m. to the W. Pop. 1200.

Ennius, Quintus (c. 239–169 BC), one of the first Rom. poets, b. Rudiae in Calabria. Although little is known of his hist., he seems at first to have pursued a military career. At about the age of 38 he became acquainted with M. Porcius Cato and accompanied him to Rome, where he supported himself by teaching Greek. Through the influence of Scipio Africanus, E. obtained Rom. citizenship in 184 BC, and on his death was buried in the Scipios' tomb. Though his writings included drama, satire, and didactic poems, his fame rested chiefly upon the *Annales*, an epic of Rom. hist. in 18 books of hexameters, of which about 550 lines have survived. These, however, are enough to convey some idea of the poet's rugged style which exercised enormous influence upon Lat. literature. See E. H. Warmington, *Remains of Old Latin I* (text and trans., Loeb Library), 1935; W. Y. Sellar, *The Roman Poets of the Republic*, 3rd ed., 1899.

Enns: 1. Austrian tn (Rom. *Lauriacum*) in the prov. of Upper Austria, on the R. E. In the Middle Ages it was a prosperous commercial tn. The adjoining vil. of Lorch was the seat of an anct. bishopric. Pop. 7600.

2. Riv. of Austria which rises S. of Radstadt, and flows into the Danube. Chief trib. is the Steier. Length 160 m.

Enoch (Hanoeh): (1) A son of Cain (Gen. iv. 17); (2) a grandson of Abraham (Gen. xxv. 4); (3) a son of Reuben (Gen. xli. 9); (4) the son of Jared and grandson of E. I (Gen. v. 18–24) who 'walked with God' (i.e. 'pleased God') and, after a life of 365 years, was 'translated' or assumed to heaven.—He was not, for God took him. Cf. Eccles. xlv. 16; Wisd. of Sol. iv. 10–14; Heb. xi. 5. The number 365 with its obvious connection with the terrestrial years is symbolical in some way. Berossus, in his hist. of ante-diluvian

Babylonian kings, places *Enedorachus* 7th. Both names may be corruptions of a Babylonian original. Jewish legend makes E. the inventor of writing, arithmetic, and astronomy, and the apocalyptic *Book of Enoch* (quoted in Jude xiv.) was ascribed to him. Among the Arabians he is known as *Idris* (the learned one). He and Elijah are usually understood to be the 2 witnesses of Rev. xi. The 'St Enoch' of Glasgow is a corruption of St Thenaw, the mother of St Kentigern.

Enoch, The 1st Book of, or The Ethiopian Enoch, composite apocalyptic work the various parts of which belong to 200–c. 1 BC. It has 6 sections: (1) The Angelic Book, which embroiders on Gen. vi. 1–4 to explain the evil in the world. (2) The Book of Parables, 3 similitudes concerning Heaven, the Messiah, and the Judgment. It has a remarkable description of the Messiah as the Pre-existent Son of Man. (3) The Book of Astronomy, about the heavenly bodies. (4) The Book of Visions, concerning the Flood and Israel's hist. (5) The Book of Exhortation, concerning rewards and punishments. (6) The Apocalypse of Weeks, concerning Heaven and Hell. The B. of E. was originally written in Hebrew, in the Palestinian region, and then trans. into Greek. It was well known to the early Christians, by many of whom it was held in high esteem. St Jude in his general epistle quotes from E. in v. 14. The work was lost about the 7th cent. and only quotations could be obtained until 1773, when James Bruce, the traveller, brought back from Abyssinia 2 Ethiopic copies of it, made from the Gk version. A trans. was pub. by Archbishop Lawrence in 1821, and the Ethiopic text followed in 1838. See R. H. Charles, *Book of Enoch*, 1906.

Enoch, The 2nd Book of (the Secrets of), or 'the Slavonic Enoch', because the MSS. of it, only recently discovered, are in that language. It seems, however, to have been originally written in Greek during the course of the 1st cent. AD. and in Egypt. This book, which is entirely independent of the 1st Book of Enoch (q.v.) describes how Enoch was taken up into the heavens, 7 in number, and his visions there, followed by an account of his subsequent experiences. See R. H. Charles (ed.), *The Book of the Secrets of Enoch* (trans. by W. I. Morfill), 1896.

Enos, see **ENEZ**.

Enschede, industrial tn in the prov. of Overijssel, Netherlands, near the Ger. border. It is one of the prin. centres of the cotton industry and has parks, a trade school, and an industrial museum. The tn suffered heavily from bombs during the Second World War. Pop. (1954) 115,227.

Ense, Karl August Varnhagen von, see **VARNHAGEN**.

Ensete, Abyssinian banana, *Musa ensete*, which has the largest leaf on any known land plant, the size being as much as 17 ft by 3 ft. The flower-stem is eaten by natives, but the fruit is not edible. The plant is cultivated in tubs as a decorative plant in sub-tropical horticulture.

Ensign: 1. Originally the name applied to the lowest rank of infantry commissioned officer in the Brit. Army. He obtained this name from the fact that it was his duty to carry the colours or E., but after the custom died out the title was changed in 1871 to that of 2nd lieutenant.

2. See **FLAG**.

Ensilage, see **HAY** and **ENSILAGE**.

Ensisal, textile manufacturing tn on the R. Vesdre, SW. of Verviers, in the prov. of Liège, Belgium. Pop. 5700.

Ensor, James (1860–1947). Belgian painter, b. at Ostend of an Eng. father and Flem. mother. He studied at the Brussels academy, and returned to settle in Ostend, where he worked without appreciation, his early pictures being rejected with contempt. His ability was first recognised by Emile Vorhaeren in 1908; his reputation, estab. by an exhibition in 1929 at the Palais des Beaux-Arts, Brussels, has since become worldwide. Rich colour and a fantastic imagination that sometimes recalls his Flem. forerunners Bosch and Brueghel characterise his paintings, drawings, and etchings. 'The Skate' and 'Strange Masks' (Brussels) are examples. See L. Schwob, *Ensor*, 1926; L. Van Puyvelde, *L'ardente peinture d'Ensor*, 1939; P. Fierens, *James Ensor*, 1943.

Enstatite, silicate of magnosium, is translucent and white in colour, or sometimes has a greenish hue. It has been found in Moravia, Prussia, and other parts of Europe.

Entablature, in classical (i.e. Gk, Rom., and Renaissance) architecture, the superstructure crowning a range of columns or a building. When used above columns, this superstructure or arrangement of horizontal members forms, together with the columns, one of the 3 'Orders of Architecture'—Doric, Ionic, and Corinthian—the correct relative proportions of which were standardised by Vitruvius (q.v.) (1st cent. BC). An E. consists of 3 stages: architrave (lowest), frieze (middle), and cornice (top stage). Although the rules of Vitruvius assume these 3 stages to be built of stone, they originated in timber construction, and represent in stone the various timber beams of the superstructure. In the Gk Doric E. illustrated here, the various members are named. The illustration of the 3 'Orders' (see **COLUMN**) shows the E. of each of the other Gk and Rom. 'Orders.'

Entail. An entailed estate or estate tail is an estate of inheritance in land settled on sev. persons successively in a strict line of devolution, such persons being exclusively the heirs male or female of the grantee or grantees. The word E. is derived from Fr. *tailler*, 'to cut,' because the succession to the estate was cut down to the grantee for his life and then to his issue. Estates tail are either *general*, i.e. are granted 'to A and the heirs of his body' without restriction as to sex or maternity; or *special*, i.e. restricted in one or other of the above ways, e.g. 'to A and the heirs male of his body,' or 'to A and the heirs female of his body,' or 'to

A and the heirs of his body by his wife B.' The history of the development of estates tail may be said to be intimately bound up with the traditions and associations of our families; the whole object of their legal creation being to tie up property in strict family settlements so as to ensure that the estates should devolve from father to son for ever. The old common law judges always construed a gift 'to A and the heirs of his body' as a gift of the full disposable estate of inheritance or fee simple (q.v.) (see also *DE DONIS*), conditional on

ENTABLATURE OF THE GREEK DORIC ORDER, FROM THE PARTHENON AT ATHENS

issue actually being born to A. Consequently when issue was born A could sell the estate and bar his own issue. Though it is now theoretically impossible to tie up lands in a family for ever, and though the tenant-in-tail can bar the rights of everyone by executing and enrolling a *disentailing deed* within 6 months of obtaining possession, the custom is for the eldest son of the grantee, on coming of age, to execute a deed with the consent of his father barring the E., and for the father and son then to enter into a deed of re-settlement by which they re-settle the land on the father for life, with remainder to the son for life, and then after the death of the son to the son's eldest son in tail; this process being repeated every time an eldest son reaches 21. The efficacy of this compromise in thus preserving the posthumous pride of ancestors depends

entirely on the continuous desire of each father to tie up the lands in the family and on the continuous obedience of each eldest son on attaining 21. If, however, the son prove disobedient, the father can, in theory, deprive him of all income while he (the father) remains alive, and so it came about that the son generally abstained from his right to bar his own issue (which he can do without the consent of his father) and 'surrendered his birth-right for a financial mess of pottage.' In this connection must be noticed the meaning of the term 'protector of the settlement.' A protector is a statutory creation, and denotes the tenant of the first life estate under the deed creating the E. (usually, of course, the eldest surviving ancestor), or some person or persons appointed by the deed itself to act as protectors. The existence of the 'protector' prevents a tenant-in-tail *not yet in possession* from barring the whole E. unless he obtains the consent of such protector, though, as seen above, he may bar his own issue. In modern times the system of E. has, by a succession of acts of parliament (particularly the *Cairns Act*, 1882, and the *Law of Property Act*, 1925), been greatly modified, and greater powers given to the actual owner of alienating the estates to which he has succeeded, a process which is called 'breaking the entail.'

Entamoeba, see AMOEBÆ.

Entasis, in architecture, a slight and subtle curve in the tapering of a classical column, to correct the optical illusion of concavity produced by normal tapering. (See *ORDERS OF ARCHITECTURE*.)

Entebbe, administrative centre of the Uganda Protectorate, on the NW. of Lake Victoria. There are botanical gardens and a cotton ginnery, and cotton, cocoa, rubber, etc., are grown in the dist. Sleeping sickness has entirely disappeared. The H.Q. of the commission appointed by the League of Nations for the study of tropical diseases is here, as also the new European hospital, Gov. House, and Court House. E. is an international airport where there is a meteorological station. Area (dist.) 2446 sq. m. (land and swamp 1980, open water 466). Pop. (dist.) (1931 census) 186,500 (natives 182,200, Indians 780, Europeans 330).

Entellus Monkey, *Langur*, or *Hanuman*, the *Semnopithecus entellus* of India. Its body is from 2 to 4 ft long, and the non-prehensile tail is longer than the body. The general colour is a dirty yellow, but the face is grey. In character it is mischievous, noisy, and quarrelsome.

Entente Cordiale (literally means 'cordial understanding'), term applied to friendly relations existing between Powers, most often used of the friendship between Great Britain and France that began early in the 20th cent. and resulted in the alliance that carried on the First World War.

Enteric Fever, acute infectious fever caused by the species of bacteria known as the *Bacterium typhosum*. Of the species *B. typhosum* there are 2 main types—the

Salmonella typhi and the *Salmonella paratyphi*. These 2 are responsible for the E. F.'s known as typhoid fever and paratyphoid fever. *S. paratyphi* has 3 main sub-types known as *S. paratyphi* A, B, and C. Any of these types or sub-types may be the cause of an attack of E. F., and generally speaking the paratyphoids are clinically less severe than typhoid. In Britain typhoid and paratyphoid B are the E. F.'s most commonly seen. Paratyphoid A and C are rare but may be introduced by a patient returning from overseas. E. F. causes inflammation of the small intestine with ulceration, enlargement of the spleen, and the infection may spread to other organs and cause pneumonia, nephritis, or meningitis. The incubation period is about 2 to 3 weeks. At about the 8th day of the disease a fleeting eruption of rose-coloured spots occurs, mostly on the trunk. The symptoms are vague; headache is usual, the patient feels more prostrated than the symptoms would seem to warrant, there is vague abdominal pain, and constipation is more usual than diarrhoea. The temp. rises gradually but the pulse in the early stages tends to remain slower than is usual with a rising fever. The tongue is coated. Dangerous complications of E. F. are intestinal hæmorrhage, perforation of the intestine, and pneumonia. Gruber and Durham showed in 1896 that the serum of patients suffering from typhoid fever would agglutinate typhoid bacilli, and in the same year Widal and Seiard showed that a patient's serum could be tested with bacteria of a known type for the purpose of identifying the disease. The Gruber-Widal agglutination reaction is now the standard method of diagnosing E. F., as well as many other infections. The disease runs a slow course of from 4 to 6 weeks and convalescence is slow. Bacteria may remain in the intestinal tract of a patient after the clinical attack has resolved, and symptomless carriers of the infection are the source of many outbreaks of the disease. Carriers excrete bacteria in the faeces and in the urine and contamination of a vector (*see* INFECTION) easily occurs. E. F. is usually a food- or water-borne infection. Water supplies may be infected from faulty sanitation or directly from a carrier. Shell-fish may be infected from sewage effluent. Foods of any kind may be contaminated from the hands of a carrier, and milk and cream are media particularly favourable to the growth of the bacteria. Ice-cream has been the cause of many epidemics. Refrigeration does not kill *B. typhosum*, but boiling does. Flies are known to be vectors of E. F. Owing to better sanitation and more hygienic methods of preparing and handling food, E. F. is now uncommon in this country. Naturally enough it occurs more often in countries where standards of sanitation and hygiene are poor. The ravages of E. F. during wars was a stimulus to the discovery of therapeutic preventive measures. Almoth Wright developed from 1895 onwards his conception of active immunisation by

the use of vaccines made up of killed organisms. He satisfied himself that the inoculation of killed vaccine made the blood highly bactericidal to the *typhosum* bacillus and he urged that our armies overseas should be actively immunised. The War Office rejected his proposal, but a royal commission reversed this decision and typhoid inoculation became standard practice for the Brit. Army. The benefit was reaped in the First World War when the incidence of E. F. per 1000 men was 2.35 compared with 105 in the Boer War. Known as T.A.B. vaccine, it grants a high degree of immunity against typhoid and paratyphoid fevers A and B for about 2 years. Those living in countries where E. F. is endemic should be re-vaccinated at regular intervals, and those proceeding to such countries for the first time should also be vaccinated. Chloramphenicol, one of the antibiotic drugs (q.v.), is highly effective against typhoid and paratyphoid, with the result that for the first time the medical profession now has a specific treatment for E. F. Unfortunately, however, although curative of the disease, chloramphenicol does not appear to be effective in eradicating the infection in carriers. A register of typhoid carriers in this country is maintained by the Central Enteric Reference Laboratory.

Enteritis, inflammation of the intestine, i.e. of the small intestine. The inflammation may be caused by bacterial infections, as in typhoid fever (q.v.), or by bacterial toxins, as in food poisoning (q.v.), or by toxins produced by abnormal digestive fermentations, or by chemical irritants such as arsenic (q.v.). Offensive diarrhoea is a usual symptom of E.

Entertainments Duty. This duty, introduced in 1916, was charged on payments for admission to any entertainment, the only exemptions being in respect of schools, educational and scientific institutions, and charitable purposes.

The Finance Act, 1953, exempted amateur sport and cricket. It introduced 3 scales of duty: (1) live performances such as stage plays, ballet, concerts, etc.; where the payment for admission excluding the duty exceeded 1s. and did not exceed 1s. 5½d. the duty was ½d. with an additional 1d. for every 5d. or part of 5d. over 1s. 5½d.; (2) racing, games, sports, and other entertainments to which neither of the other 2 scales applied; where the payment exceeded 1s. and not 1s. 2d., the duty was 1d. with an additional ½d. for every 1d. or part of 1d. over 1s. 2d.; (3) entertainments where performers were not actually present, e.g. cinema, ½d. where the payment did not exceed 9½d., 4d. where it was 1s., 1s. 10d. where it was 2s. 6d., and so on. The yield from the E. D. was £40 million in 1950-7.

In 1957 the E. D.s on the theatre and sport were removed; the former had produced £2½ million a year, the latter £2½ million. The duty on the cinema was reduced by £6½ million (it yielded £34 million in 1956-7). A new excise duty of £1 was levied on the combined radio and

television licence, to yield £8 million a year. The cinema tax was also simplified: it was to be 50 per cent of the amount by which the total admission price exceeded 11d. The reduction in the cinema duty and the new television duty were justified by the Chancellor on the ground that they would apportion the tax on competing entertainments more fairly. Certainly the cinema has suffered from the competition of television (as have other entertainments and social amenities, such as the public house), and many cinemas were closed in the mid-1950's. But the remaining cinema duty may have been too large and the new television duty too small to produce conditions of equal competition.

Entomology (Gk *entoma*, insects; *logos*, a discourse), the science that treats of insects. The term is often loosely used to include the study of other small animals, such as centipedes and spiders. The science began with Aristotle, who differentiated a class of animals, *entoma*, and included in it the true insects, arachnids (spiders, scorpions, etc.), and myriapods (centipedes and millipedes). His grouping was followed for 2000 years. Modern E. has sev. branches, the chief being: (1) classification; (2) anatomy and physiology; (3) bionomics, or the study of habits and life-hist.; (4) embryology, or the study of development; (5) cytology, or the study of cells; (6) ecology, i.e. the relation to the habitat; (7) palaeoentomology, or the study of fossil insects. It had its beginning in the splendid work done in the 17th and 18th cents. Mention must be made of Malpighi's work on the silk-worm (1669), Swammerdam's *Biblia naturae*, in which he showed the true nature of the larva of an insect, and of Redi, the Italian, who disproved the theory of the spontaneous generation of maggots. At the same time John Ray was working on the classification of insects, and was the first to reach the modern lines of arrangement. In 1735 Linnaeus, working on the lines laid down by Ray, made a new classification of insects, which is the foundation of all modern work. The work of classification has been carried on by workers of all nationalities, and is now very complex and accurate. The anatomical work of Malpighi and Swammerdam has had many followers, the field becoming so large that workers at the present time have to specialise very strictly. The most famous work is perhaps that of Lavigny, who estab. the homology of the jaws of all insects in 1816, showing that in every species the mouth parts consisted of 3 pairs of jaws, more or less modified, namely mandibles, first maxillae, and second maxillae (the last pair fused to form the labrum or lip). Amongst Eng. workers in insect bionomics should be mentioned W. Kirby, W. Spence, Lord Avebury, and Miall. Much useful work was done by the Amer. C. U. Riley on the habits of locusts and in his victory over the Phylloxera insect. The embryology, cytology, and ecology of insects and

palaeoentomology are essentially products of the last century, but already great strides have been made in these branches. Most of the recent embryological work has been done in Germany and the U.S.A. Brit., colonial, and Amer. entomologists have made considerable contributions to entomological cytology and ecology. Recognition of the economic importance of insects with regard to diseases of plants and animals has led to the appointment of gov. entomologists in the U.S.A., Canada, and Great Britain, and applied E. has made rapid progress during the present century.

As a result of the researches of many workers, notably Emin Pasha, Grassi, Laveran, Manson, and Ross, the mosquito was recognised in 1898 as a carrier of the malaria parasite. Subsequently mosquitoes have been proved to carry organisms causing elephantiasis, yellow fever, and Dengue fever. The most effective method of extermination is to render uninhabitable the swamps which form the breeding-places of the insect. In England, extensive work on mosquito control is being carried out at Hayling Is.

House-flies are other active agents in spreading disease. In feeding on refuse, they collect on their mouth parts and legs organisms which they deposit, when walking or feeding, on the food of man. In addition to various bacteria causing tuberculosis, typhoid fever, and other diseases, flies may carry eggs of the hook-worm and of other worms parasitic in man. The gad-fly and tsetse fly transmit disease directly to horses and cattle.

The irritation and disease caused by flies to the troops in the First World War stimulated efforts to exterminate these pests. The methods used include the exclusion of air from the eggs by closely trapping the larvae; the addition of borax or of powdered hellebore to the breeding-grounds; and the preventive measure of the immediate destruction of all refuse. In America, Africa, and Asia investigations are being made on the habits of insects injurious to cotton and tobacco plants, fruit trees, and forest trees of economic value. In many cases, spraying with appropriate solutions, or the introduction into the dist. of an animal which preys on the insect pest, is beneficial. Good results have recently been obtained with new insecticides, notably 'D.D.T.' and 'gammaxene.' In the Second World War the battle dress worn by Brit. troops was impregnated with D.D.T. as a protection against body lice, and similar methods enabled an outbreak of typhus amongst the civilian pop. of Italy to be brought quickly under control.

As a further instance, showing how a knowledge of insect habits and ecology has enabled control to be effected, reference may be made to the locusts, which have been famous for hundreds of years as agents of destruction and which occur in over 80 countries of all 5 continents. There are 8 or so species of locusts; in each of them (according to the theory first put forward in 1921 by Uvarov) there exist

various phases. In the *solitary phase* the insect lives isolated as a short-horned grasshopper; if however a number of these solitary forms breed under crowded conditions, they develop into the *gregarious phase*, which is the true locust and which migrates in swarms. The 2 phases may differ widely in appearance as well as in habits, and between the 2 extremes are numerous intermediate phases. The attention of entomologists is directed to preventing the development of the gregarious phase, or to destroying it when detected before migration can take place. The 'hoppers' (immature individuals with rudimentary wings) can be dealt with by driving them into pits or trenches, or by the use of poison bait containing arsenic, sodium silicofluoride or 'gammexane'; the latter substance is particularly useful, since it is rapid in its action and does not harm cattle. Flame throwers and dusting from aeroplanes are also used. For destroying the adult winged individuals there is at present no effective method available. These activities are controlled and co-ordinated by the govts. of the countries concerned, and by the Anti-locust Research Centre estab. in 1930 at the Natural Hist. Museum in S. Kensington.

Morgan and Bridges's work on the cytology and genetics of *Drosophila*, and Goldschmidt's investigations on the gypsy moth, have led to new developments in the relation of cytology to genetics and to the problems of heredity.

Attention has also been directed to the problems of insect physiology, e.g., the mechanism of flight, the process of respiration, insect behaviour and the working of the sense organs, especially the compound eyes. It has been shown also that metamorphosis is initiated by a hormone produced in the head and transported by the blood stream to the organs concerned.

E., beyond all other sciences, affords an opportunity for the amateur worker. The Société Entomologique de France and the Royal Entomological Society of London admit professional and amateur members. The insects when collected are best killed by prussic acid in some form. When they are relaxed they must be set. *Setting* consists of pinning the insect on to cork, the body of the insect lying in a groove in the cork, the wings and other parts being arranged in the best possible manner by means of needles or *setting bristles*. Paper braces are then put on to keep the whole in position, and the insect is thoroughly dried. It is then ready to put in the collection. See A. T. Gillander, *Forest Entomology*, 1912; J. H. Fabre, *The Life and Love of the Insect*, 1918; H. G. Feinold, *Applied Entomology*, 1921; A. Balochowsky and L. Meunier, *Insectes nuisibles*, 1936; M. Burr, *The Insect Legion*, 1939; V. B. Wigglesworth, *The Principles of Insect Physiology*, 1939, 1942; R. Frost, *General Entomology*, 1942; A. D. Imms, *General Textbook of Entomology*, 1925, and *Insect Natural History*, 1947. See also articles under industrial insects. For locusts see articles in

Endeavour, 1943, II., 56 and 1947, VI., 24. See also INSECTS.

Entomostrea (Gk *entomon*, insect; *ostrakon*, shell), name given to a sub-class of Crustaceans, most of whose species are enclosed in a delicate, transparent, bivalve shell which can be opened or closed at the will of the animal. Many of them are very small, and are found in great numbers in stagnant, fresh, and salt water; some are parasitic. The E. comprise many thousand species which fall under 4 great orders, Phyllopoda or Branchiopoda (q.v.), Ostracoda, Copepoda, and Cirripedia (Barnacles).

Entophytes (Gk *entos*, within; *phuton*, plant), the term applied to certain plants, generally parasitic, which live inside other plants or inside animals. These are frequently harmless, but some have fatal results in animals, as is the case with many bacteria.

Entre Douro-e-Minho, former prov. of Portugal, bounded on the N. by the Minho and on the S. by the Douro (qq.v.). It is now divided between the provs. of Minho and Douro Litoral (qq.v.).

Entre Rios, prov. of the Argentine Rep., lying between the 2 rivs. Paraná and Uruguay. Some parts of this dist. are low-lying and marshy, but others are well-watered and fertile, so that the inhab. are chiefly engaged in cattle-rearing and agric. pursuits. Large tracts of the country are also covered with forests. Cap., Paraná (q.v.). Area 28,500 sq. m.; pop. 790,000.

Entrecasteaux, see D'ENTRECASTEAUX.

Entremont, valley of the canton of Valais, Switzerland.

Entrenchment, general term applied to any earthwork which is thrown up to protect soldiers against an enemy. Es may be made very hastily and simply, as in the case of the ordinary shelter trenches or slit-trenches, or they may be of a much more complicated and permanent nature. In the case of the former troops are provided with implements so that they can easily and quickly dig up the earth to form a parapet behind which they can take shelter and over which they can fire. Es are also so constructed that they do not form any obstruction to the artillery who may want to drive over the ground. See FORTIFICATION.

Entresol, in architecture, a low storey or part of a storey in a building, between 2 higher ones. The E. consists of a low apartment usually placed above the 1st floor; frequently between the ground floor and the 1st floor. Also called the mezzanine floor.

Eotropion, curving in of the eyelids, the opposite of ectropion. It causes constant irritation by the eyelashes coming in contact with the eye, with resulting interference with vision. E. is often the result of chronic inflammation of the eyelids (see BLEPHARITIS).

Entropy, see THERMODYNAMICS.

Entry: 1. Taking possession by the legal owner of lands and tenements when another person is wrongfully in possession of them. Formerly E. could be effected

by force, but as this self-redress led to great abuses, forcible entries were, by 2 acts of Richard II, made punishable by fine and imprisonment. To establish forcible E. it must be proved that the E. was accomplished under circumstances of actual violence or terror, as e.g. by the aid of unusual weapons, by a considerable number of persons, or with menace to life. Mere violence without such exceptional circumstances would amount to no more than trespass, giving rise to an action for damages. It is to be noted, however, that where possession has been obtained by a trespasser (as distinct from the position of a person who was rightfully in possession in the first instance but who subsequently became technically a trespasser through some default) the rightful owner, according to one decision, may use reasonable force in ejecting him, and need not appeal to the law for assistance. The remedy for forcible E. is either an action for damages, an indictment, or an information before justices of the peace. A forcible E. by more than 3 persons acting in concert might amount to and be punishable as a riot (q.v.). The Conveyancing Act, 1881, gives to a person entitled to any rent charge, or other ann. sum charged upon or payable out of land, power, if the sum or any part is unpaid for 40 days after falling due, to enter into possession of the land and take the income of it until all the arrears due at the time of E. and incidental expenses are paid. If he cannot enter peaceably his appropriate remedy is an action of ejectment (which has taken the place of the old remedy by *writ of entry*) to try the question of title. A valid E. to give possession must be upon some part of the property claimed, and it is safer for the person entering formally to declare that he takes possession of the whole.

2. In leases: Formerly, E. was necessary to complete the tenancy, and till E. a tenant had no more than what was called an *interesse termini* (a right to have the lands), which, however, was a transferable right, though it could be surrendered or released. But the doctrine of *interesse termini* was abolished by the Law of Property Act, 1925, and now all terms of years take effect from the commencement of the term without actual E. E. is also not necessary to complete a freehold title. As to a sheriff's power of E., see EXECUTION.

Enugu, tn of S. Nigeria, situated 151 m. from Port Harcourt. Notable as a coal-mining centre. The mine began to yield coal in 1915 and is owned and worked by the gov. Ann. production about 700,000 tons. E. has been the scene of serious riots. Pop. 51,000.

Enver Pasha (1881-1922). Turkish politician and leader of the 'Young Turks'. b. Constantinople. He early triumphed over Abdul Hamid (q.v.) in his agitation for the restoration of the Constitution of 1876, and was then sent to Berlin as military attaché. He was in command of an army corps in the Balkan War, 1913 (q.v.), and during the peace

negotiations brought about the assassination of the war minister, which office he then filled himself, and placed his adherents in the other important state offices, his purpose being to override any possibility of interference by the W. Powers. In the First World War he became the virtual ruler of Turkey so far as domestic affairs were concerned. After the collapse of Turkey he was condemned to death, but had already fled the country. In 1921 he joined the Basmachi movement directed against the Soviet regime in Central Asia and was killed near Stalinabad in 1922.

Environment, term applied to all conditions which are not part of the individual self of a person, and which tend to alter each individual, thus forming certain varieties and species. The E. may be physical, including such things as geographical or chemical conditions, the latter including the state of the air, the conditions of food, and many other such influences. There is also a social E. showing the influence of one individual upon another. This leads also to the estab. of new customs and new institutions, thus bringing about a new type of individual. See also EVOLUTION.

Envoy, see DIPLOMATIC SERVICE; PLÉNIPOTENTIARY.

Enzeli, see PAHLAVI.

Enzina, Juan del, see ENCINA.

Enzio (c. 1224-72), king of Sardinia and natural son of Frederick II. C. 1238 the title of King of Sardinia was conferred on him by his father, as well as that of vicar-imperial in Italy. In 1241 he was victorious over the Genoese fleet, but in 1249 was himself defeated and taken prisoner, spending the rest of his life in captivity at Bologna.

Enzymes, catalytic substances produced by the cells in vegetable and animal tissues which accelerate specific conversion of more or less complex organic material. E. are not living organisms but, though lifeless, they are made only from living matter. They are colloidal, nitrogenous substances. The number of individual E. is not known as every species of plant and animal possesses its own kind which do not correspond exactly to those in other species. Their main catalytic action is on carbohydrates, fats and proteins, breaking these up into simpler substances capable of being absorbed and used by the body. It was between 1860 and 1870 that Pasteur (q.v.) was working on the diseases of wine and discovered that alcoholic fermentation depended on the action of living yeast cells—an action which was later found to be due to an E. One of the earliest E. to be recognised was diastase, an extract of malt, which could change starch into dextrin and sugar. Other E. act by adding the elements of water to the substance being converted—a process known as hydrolysis. Some of these are concerned in the process of digestion (q.v.). Proteins are changed into peptones, tyrosin, and leucine by E. (pepsin and trypsin) of the gastric glands and pancreas; the fats are changed into

Eoanthropus

fatty acids and glycerine, or emulsified, and saponified by the steapsin of the pancreas; carbohydrates are changed into glucose with or without intermediate states by the ptyalin of the salivary glands, the amyllopsin of the pancreas, and invertase, maltase, and lactase of the intestinal glands.

Another class of E., the oxydases, have the property of effecting oxidation in the tissues and act as part of the process of respiration. E. are formed from precursors which in themselves are inactive. These precursors are known as zymogens. Thus pepsin comes from pepsinogen, trypsin from trypsinogen, etc. Under certain conditions, peculiar to each one, zymogens become active. This wise provision of Nature prevents tissues from being attacked by their own E. The clotting of blood, for instance, is brought about under certain conditions by an E., thrombin (q.v.), acting on fibrinogen to convert it into fibrin (*see* BLOOD). The precursor of thrombin is prothrombin or thrombinogen. If it were not for the special conditions governing activation of the E., the blood would clot within the blood vessels. Not only do zymogens require special conditions to become active but also, to make doubly sure, there appear to be antagonistic substances, or anti-E., which neutralise the action of E. Thus the inactivator of prothrombin is anti-prothrombin, and that of pepsin anti-pepsin, and that of trypsin, anti-trypsin, and so on. It is thought that the antibodies and antitoxins developed in the process of acquired immunity (*see* under PATHOLOGY) may also be of the nature of anti-E. Certain E. actions are reversible so that the change can proceed in either direction. In this way a balance is kept, the process being checked from going too far. How E. work is not known, but their action is certainly powerful. They each cause changes which can only be brought about by the chemist in the laboratory with the greatest difficulty. *See* under BIOCHEMISTRY: DIGESTION: FERMENTATION. *See* R. Clements, *Modern Chemical Discoveries*, 1954.

Eoanthropus Dawsoni, *see* PILTDOWN MAN.

Eocene, in geology, is the lowest of the 3 groups into which Lyell divided the Tertiary system. His classification, based on the relative percentages of recent species of mollusca contained, has been

Eocene

modified by Beyrich, who inserted the Oligocene group, to include strata formerly classed as Upper E. and partly Miocene. The E. and Oligocene are sometimes classed together as the Palaeogene or Older Tertiary. In W. Europe the E. follows the Cretaceous so abruptly as to suggest that a break existed between the Cretaceous and Tertiary periods. In Europe, and in America and New Zealand, the deposits merge into one another, and no sharp line can be drawn between Cretaceous and E. rocks. During E. and Oligocene times, the floor of the Cretaceous sea was upraised into low lands with lakes and estuaries. The colossal disturbances of the earth's crust, by means of which this upheaval occurred, continued throughout Tertiary time, great mt chains such as the Alps and Himalaya being formed. The Brit. E. strata are confined to the SE. of England, where they occupy 2 synclinal depressions in the chalk, viz. the London and Hampshire Basins. The deposits are marine and estuarine, consisting of clays, sands, and marls, and have been arranged in the sequence shown in the table below. Outside the typical area the E. rocks occur in patches. The deposits of Bovey Tracy in Devonshire have been referred by some geologists to the E., and by others to the Oligocene. In Antrim and the Inner Hebrides occurs a magnificent development of Tertiary volcanic rocks. These consist of sheets of basaltic lava into which granite and gabbro intrusions were emplaced, the whole being cut by families of doleritic dykes. Plants preserved between certain lavas indicate the Tertiary age of the igneous rocks.

Two great E. regions may be distinguished in the European area. The first, termed the Anglo-Gallic prov., includes the E. of the Eng. area, of N. France and of Belgium, and the similarity of the deposits points to the fact that this was one great tract of sedimentation. The second, the S. European or Alpine E. area, is much more extensive. It includes the whole of S. Europe, extends southwards into N. Africa, to the Sahara and Egypt, and stretches eastwards to the Himalayas, and through Java and Sumatra to the Philippines. There existed, then, over this great area, a huge sea (of which the Mediterranean is a remnant) connecting the Atlantic and Pacific Oceans, and out of which the Alps, the Pennines, and part of the Carpathians rose as is. In the

Upper Eocene	Upper Bagshot Sands	Barton Sands Barton Clays

Lower Eocene	Lower Bagshot Sands (part) London Clay Oldhaven Beds Woolwich and Reading Bed Thanet Sands	Bognor Series (equivalent of London Clay) Plastic Clays (similar to Woolwich and Reading Beds)

LONDON BASIN

HAMPSHIRE BASIN

water of this sea, the 'Mittelmeer,' massive systems of limestone were formed by Nummulites, a genus of gigantic disk-shaped Foraminifera, which attained a great development in early E. time. The nummulitic formations of N. Africa and India are very rich in fossils, yielding large corals of the reef-building type, molluscs, and echinoderms. The problematical 'Flysch' of the Swiss Alps or 'Macigno' of the Maritime Alps consists of thick grey sandstones and shales with scarcely any organic remains, and was formed by the wearing away of the mts raised early in the Alpine orogeny. Both 'Flysch' and 'Macigno' were folded and uplifted in mt chains formed later in the Alpine movements. The E. rocks of the Libyan desert, as well as being remarkably fossiliferous, are of special interest, since they show a perfect petrographical and

as representatives of which we may mention the 'Palaeotherium,' and the 'anthracotherium.' The Carnivores were represented by the primitive Creodonts, and Rodents and Insectivores have been found. Regarding the fossils of Invertebrates, we find that the Ammonoidea and Belemnites, which fl. in Cretaceous time, have wholly disappeared, and with them the sponges and the Hippuritidae. The great reptilian families which fl. from Triassic time onward are practically extinct during E. time. The Molluscoidea are represented by forms which exist at the present day and the Coelenterata by reef-building corals. The flora of the E. consisted mainly of Dicotyledons (tropical and subtropical forms), Monocotyledons (such as the Palms), and Conifers. See M. Gignoux, *Géologie stratigraphique*, 1923; C. Nevin, *Principles of Structural Geology*, 1931; R. Field, *Historical Geology*, 1933; S. Shand, *Earth Lore*, 1933; K. Mather and C. Roy, *Physical and Historical Geology*, 1934. See also EARTH; GEOLOGY; TERTIARY.

A FOSSIL OF THE EOCENE PERIOD
Palaeotherium magnum

palaeontological passage from the Cretaceous into the Tertiary beds in question. In N. America the E. rocks are mainly of the fresh-water type. The marine deposits are represented by the Alabama beds, and occur in the valley of the Mississippi from the Gulf of Mexico to beyond the mouth of the Ohio. On the Californian coast these marine E. rocks attain a thickness of 3000 ft. Over the Rocky Mt region, from Mexico to Brit. Columbia, is found the lignite-bearing, fresh and brackish water formation known as the Laramie beds. Deposits of a similar type are found between the Rockies and the Wahsatch Mts. i.e. in the waste known as the bad lands. In the Rockies these beds attain a thickness of 13,000 ft, and have been subdivided into the following divs.: (1) Wahsatch group; (2) Green R. group; (3) Bridger group; and (4) Uinta group. These rocks are of great geological importance because of their extraordinary richness in vertebrate and mammalian remains. The mammals suddenly developed during E. time, and are chiefly of the placental group, which preponderate at the present day. Preceding them, and making possible their rise, had come the flowering plants which emerged in the preceding Cretaceous period. The hoofed beasts or Ungulates were dominant, and were divided into 2 groups with paired and unpaired hoofs,

Eon de Beaumont, Charles Geneviève Louise Auguste André Timothée d' (Chevalier d'Eon) (1728-1810), Fr. diplomat, and trusted agent in Louis XV's secret service, serving him in Russia (1757), and in England (1762-5). In 1759 he fought bravely as captain of the Fr. forces in Germany. He had assumed woman's dress on his first mission to Russia, and after his return to France in 1777 lived as a woman, his true sex becoming a society wager, and E. doing nothing to dispel the gossip. He revisited England (1785), and lived there permanently after the Fr. Revolution. He d. in London. His political and historical essays appeared (1775) as *Loisirs du Chevalier d'Eon*. . . . See J. B. Telfer, *Strange Career of the Chevalier d'Eon*, 1885; A. Lang, *Historical Mysteries*, 1904; his *Life and Times* by O. Homberg and F. Jungsellin, 1911; M. Coryn, *The Chevalier D'Eon*, 1932.

Eos, Gk goddess of the dawn (Lat. *Aurora*), daughter of Hyperion and wife of Tithonus.

Eosuchia, a primitive group of diapsidan crocodile-like reptiles from the Upper Permian and Triassic.

Eötvös, József, Baron (1813-71), Hungarian statesman and author, b. Buda, leader of the Liberal party (1844), and a supporter of Kossuth. He wrote the comedies *Kritikusok* and *Idzasulók*, and the tragedy *Bosznó*, 1830-3. Of his novels, *Karthausi*, 1842, *A falu jegyzője* ('The Village Notary'), 1844-6, and *Magyarország 1514-ben*, 1847-8, are the most famous. He was minister of public instruction in 1848, and again in 1867, and did much to establish a national system of elementary education in Hungary.

Eötvös, Roland, Baron (1848-1919), Hungarian statesman and physicist, b. at Budapest, son of Baron József E. Educ. at Königsberg and Heidelberg. At Budapest: 1871, lecturer; 1873, prot. of experimental physics. From 1873 connected with Hungarian Academy of

Sciences; president from 1889. He made many curious discoveries with regard to gravitation and capillary attraction. He also constructed the double-armed torsion balance named after him, by means of which local variations in gravity can be detected. Life member of Hungarian House of Magnates. Minister of public worship and education, 1895-6.

Eozoon, peculiar structures first found in Pre-Cambrian limestones in Canada, and subsequently elsewhere. Thought to be organic in origin, and thus of great interest, as identifiable fossils are not generally found in rocks earlier than the Cambrian. Although E. structures resemble the Stromatopora, it is not certain whether they are organic, or concretionary structures unrelated to any form of life.

Eparidaceae, a family of dicotyledonous plants closely allied to the Ericaceae (heather family) with the small-leaved genera of which they agree in habit, and from which they are scarcely distinguishable. They are to be found wild in Australia as shrubs with alternate or occasionally opposite leaves, and in Brit. greenhouses are cultivated for their showy flowers. Two of the chief genera are *Epacris* and *Dracophyllum*.

Epaot. The synodic month—the period from new moon to new moon—is 29.530588 days (see MONTH), so that 12 synodic months are 354.36706 days, which is nearly 11 days less than an average solar year. For this reason the age of the moon on 1 Jan. becomes 11 days greater from one year to another. This age has been called the E. and it is important in calculating the date of Easter. The Roman Missal and the Book of Common Prayer give rules for finding this date (see GOLDEN NUMBER).

Epaminondas (c. 418-362 BC), Theban gen. and statesman, of a poor but noble family. After the Thebans had recovered the 'Cadmeia' and expelled the Spartans (379), he speedily became a democratic leader, and was sent to represent Thebes at the Spartan Congress (371). He refused to surrender the Boeotian cities, aiming at a Boeotian confederacy under Thebes. War followed, and the Spartan supremacy was crushed at Leuctra (371). With Pelopidas he invaded the Peloponnese, restored Messenia's independence, and founded Megalopolis (Arcadia) (369). During a fourth invasion of the Peloponnese E. was slain in the Theban victory at Mantinea (362). E. was renowned for his integrity in both public and private life, and made important innovations in military tactics.

Epaulement, a part of siege-works or a covering mass in military fortifications, raised to protect the troops from the enemy's fire. It differs from a parapet in making no provision for firing over it by the defenders. Siege batteries are usually shielded by one so constructed as to form an obtuse angle with the main line of battery, protecting the gunners from flank fire. It is used in general of any screen designed to protect the troops.

Epaulette, or **Epaulet**, a fringed shoulder-piece or ornamental badge of rank worn as part of a uniform, especially naval or military. It was adopted by commissioned officers in the Brit. Navy (1795), and is usually of gold bullion with various devices and embroidered designs to mark the degree of rank. Formerly E.s were worn by nearly all armies and navies, but after 1855 they were no longer worn in the Brit. Army by all ranks, and in U.S.A. only general officers of the army wore them after 1872. After the Russian Revolution of 1917 E.s were discontinued in the Red Army, but were restored before the Second World War. See UNIFORMS.

Epée, **Charles Michel, Abbé de l'** (1712-1789), Fr. Jansenist and educationalist, b. Versailles. One of the founders of the system for instructing deaf-mutes largely by means of the manual alphabet and signs. He founded a school for the purpose (1755). His *Dictionnaire général des signes* was completed by Abbé Sicard. See LIVES by Morel, 1833; Berthier, 1852; and Valette, 1857; and P. Schumann, *Geschichte des Taubstummenwesens*, 1940.

Epéhy, **Battle of**, see FRANCE AND FLANDERS, FIRST WORLD WAR CAMPAIGN IN—1918.

Eperjes, see PREŠOV.

Epemay (**Aquae Perennes**), Fr. tn. cap. of an arron., in the dept of Marne, on the Marne. It suffered in the Hundred Years War, was burnt by Francis I in 1544, and was badly damaged in the First World War. It is an important entrepôt for champagne wines, and has famous wine cellars 30 m. long hollowed out of the hillsides. Nearby is the ruined monastery of Dom Perignon, reputed inventor of sparkling champagne (see CHAMPAGNE WINES). E. has textile and sugar manufs. Pop. 19,800.

Ephemeris, a table stating for successive days, or sometimes shorter or longer intervals, the predicted position of, and other particulars concerning, heavenly bodies. The *Astronomical Ephemeris*, or *Nautical Almanac* of the U.K. is pub. annually, containing ephemerides of the chief stars and planets, and data of eclipses. France, Germany, Russia, Spain, U.S.A., and other countries issue similar almanacs.

Ephemeroptera, an order of insects, often known as Day-flies or May-flies, which somewhat resemble dragon flies, and as adults live only for 1 day. They have a nymph phase in water, sometimes lasting for 2 or 3 years. The insect as it emerges from the water is called the 'sub-imago,' and after shedding its delicate covering becomes a full-grown 'imago.' They haunt riv. banks and ponds on summer evenings. The sub-imago and imago are used as baits by anglers, and called 'green drakes,' and 'grey drakes' respectively. *E. vulgata* is the best-known species. Other genera of May-flies are *Palingenia*, *Cloë*, *Caenis*, and *Heptagenia* or *Baëtis*.

Ephesians, **Epistle to the**, a letter bearing the name of St Paul, addressed to the Christians at Ephesus, one of the chief cities of Asia Minor, at which the Apostle

had spent 2 years (Acts xix. 8 ff.) on an earlier occasion. The tone of the epistle, however, shows no restriction to a local church, and this, coupled with the facts that the words 'at Ephesus' in the first verse are omitted in some MSS., and that there is no reference to individual Ephesians, has led to the hypothesis that the letter is indeed a general epistle, an encyclical, cf. Col. iv. 16. The date of the epistle is usually placed during St Paul's imprisonment at Rome, about AD 60-65, and there is now substantial agreement as to its authenticity. The subject of the letter, the mystic unity of the Church in Christ, closely resembles that of the Epistle to the Colossians, a fact which supports the theory which makes them almost contemporary. See J. Robinson, *Ephesians*, 1914; H. Bate, *Guide to the Epistles of St Paul*, 1926; E. Goodspeed, *The Meaning of the Ephesians*, 1933; L. Chafer, *The Ephesian Letter*, 1935; F. Syngo, *St Paul's Epistle to the Ephesians*, 1941.

Ephesus, anct city of W. Asia Minor, probably founded about the 11th cent. bc. Its ruins still exist on the banks of the Cayster, near the Gulf of Scula Nova, 35 m. from Izmir (Smyrna). It was chief of the 12 ionic colonies from Greece, situated in Lydia. E. was subject in turn to Croesus (560 bc), the Persians (479-387), Athenians, Macedonians, and Romans. It was noted for its temple and worship of Artemis. This temple, built in the 6th cent. bc, was burnt down by Herostatus on the night of Alexander's birth. Restored by the Ionian states, it was considered one of the wonders of the world; it was destroyed by the Goths (AD 263). Besides its ruins, there are interesting remains of a fine theatre, odeum, and stadium. Excavations have been systematically carried on only since the 19th cent. (c. 1874) by the Austrian Archaeological Institute, and by Wood and Hogarth for England. E. was the bp. of Heraclitus, scene of the Legend of the Seven Sleepers, and seat of the Ionian school of painting. St Paul visited it sev. times (see Acts xviii. xix.). The railway from Smyrna to Aidin passes the anct site, and Ayasuluk is the chief vil. near it. See E. Falkner, *Ephesus and the Temple of Diana*, 1862; J. T. Wood, *Discoveries at Ephesus*, 1877; J. Ferguson, *Temple of Diana*, 1883; D. Hogarth, *Excavations at Ephesus*, 1908; G. Cummins, *The Great Days of Ephesus*, 1933.

Ephesus, Councils of. The 3rd ecumenical council, convoked by Theodosius II, under the presidency of Cyril of Alexandria, AD 431, was notable for the attendance of papal delegates from Rome, who were instructed to adjudicate on the opinions of the Council, but to abstain from debate. This Council condemned the heresy of Nestorius, but did not itself explicitly define the orthodox doctrine. Theodosius also convoked the 'Robber' Council of AD 449 held under Eutychus of Alexandria, which restored Eutyches as archimandrite and priest, from which

office he had been driven by the Synod of Constantinople, and deposed Flavian, the Patriarch.

Ephialtes: 1. The Malian traitor, who showed the Persians the mt defile of Anopaea. Following this, they came up behind Leonidas and his Spartan band and overcame them at the Pass of Thermopylae (480 bc).

2. Athenian statesman, political friend of Pericles, and opponent of Cimon. He helped to pass democratic reforms (c. 462 bc), and limited the power of the Areopagus (461).

3. A son of Poseidon and Iphimedia, one of the giants who revolted against Zeus, piling Pelion upon Ossa to invade heaven. See ALIODEAE.

Ephod (perhaps from Heb. *aphad*, to put on, clothe): 1. A Jewish priestly vestment. That worn by the high-priest was of blue, purple, scarlet, and fine linen (byssus) interwoven with gold. The garment was of blue, with embroidery in the colours around the bottom; the neck was round and bound with material. The E. was sleeveless, with buckles of onyx stone on the shoulder-straps, the names of the 12 tribes being inscribed, 6 on each buckle. In front the high-priests wore a jewelled breastplate of the same material as the E., containing a pouch for the Urim and Thummim; gold chains were threaded through gold rings on the breastplate to bind it to the rings on the shoulder-straps of the E. Similar garments of plain linen were apparently worn by any servant of the temple. See Exod. xxviii. 1; 1 Sam. ii. 18, xxii. 18; 2 Sam. vi. 14.

2. Apparently an image, part of the equipment of a sanctuary. See Judges viii. 27, xvii. 5, xviii. 17; 1 Sam. xxi. 9, xxiii. 6.

Ephori, or **Ephors**, chief magistrates of the anct state of Sparta. They were 5 in number, and were elected by and from the people without any qualification of age or property. Their authority gradually widened until it included a superintendence over the whole commonwealth, including the kings, and they had the right of calling them to account for their actions and of punishing them with fines and reprimands, and even of prosecuting them before the gerousia.

Ephorus (fl. c. 340 bc), Gk historian, b. Cyme, Asia Minor. He was the author of a universal hist., which treated the hist. of the Gk and barbarian world, during a period of 750 years, ending in 340 bc. It was much read, and in spite of hostile criticism was used by many later historians, among them Polybius. See J. Jacoby, *Fragmente der griechischen Historiker*, vol. II, 1926.

Ephraem Syrus, St (fl. 370), b. Nisibis, and spent the early years of his life there in study, but after its surrender to the Persians by Jovian in 363 went to Edessa. Here he apparently lived as a hermit outside the city, teaching and writing. Ordained deacon, he refused any further promotion. During the famine in Edessa he urged the rich to deny themselves for their brethren's good. He wrote in

Syriac theological treatises, epistles and addresses to monks, apophthegms, homilies on Scripture and O.T. characters, and hymns. They were highly esteemed and most of them were trans. into Lat. and Greek. The standard ed. of his works is that of Assemani (Rome, 1732-46). An Eng. trans. of some of his pieces was pub. by H. Burgess in 1853. Rom. Catholics count him among the Doctors of the Church. See J. B. Morris, *Select Works of St. Ephraem*, 1847; H. Burgess, *St. Ephraem's Republic of Nineveh*, 1853; C. Emereau, *St. Ephraem le Syrien*, 1919; F. C. Conybeare, *St. Ephraem's Commentary on Acts*, 1926.

Ephraim, younger son of Joseph, blessed by his father above his elder brother Manasseh, and ancestor of the tribe of E., which with the tribe of Manasseh formed the 'house of Joseph' (Joshua xvii. 14; 2 Sam. xix. 20). The tribe of Benjamin earlier separated from them. E. was the chief of the tribes of the N. kingdom, and its name is often used for all Israel. The tribe was warlike (Judges viii. 1, and xii. 1 ff.), and produced Joshua.

Epiblast, see EMBRYOLOGY.

Epic (Gk *epos*, word, song), a long poem that celebrates in the form of a continuous narrative the achievements of a heroic personage of hist. or legend. E. poetry is typical of the early stages of literature. In Greek the *Iliad* and *Odyssey*, in Lat. the *Annals* of Ennius, in Eng. *Beowulf*, are among the earliest substantial compositions that have survived. Homer's poems were the choicest part of a vast collection termed the Cyclic Poems and comprising many works on the story of Troy and the almost equally famous story of Thebes. Greatest of all E.s of any age, the *Iliad* and *Odyssey* have been accepted as models for this type of literature. They possess what have come to be regarded as the essential E. qualities—unity of action, rapidity of movement, the use of the supernatural and, above all, an inherent dignity and grandeur of conception and narration. Among the Greeks Homer's poems were regarded with something of the reverence that the O.T. commands with us. Later and inferior Gk E. poets were Apollonius of Rhodes (3rd cent. bc) who wrote the *Argonautica*, and Quintus of Smyrna (4th cent. ad) whose *Posthomerica* deals with part of the Troy story between the *Iliad* and the *Odyssey*.

Rom. E., derivative like nearly all Rom. poetry, began with Livius Andronicus, who trans. the *Odyssey* in the 3rd cent. bc. Contemporary with him was Naevius, who wrote in Saturnian metre on the Punic Wars, and was followed by Ennius (239-169 bc), who composed a hist. of Rome in E. verse. In Lat. E. Virgil (70-19 bc) stands supreme, as great a master of the artificial or literary E. as Homer was of the original type. In the Silver Age of Lat. literature the cult of rhetoric gave rise to a number of E.s, of which the most important are Lucan's *Pharsalia* on the Rom. civil wars, the *Argonautica* of

Valerius Flaccus, the *Thebaid* and *Achilleid* of Statius, which were greatly admired in the Middle Ages, and the *Punica* of Silius Italicus, which tells of Rome's wars with Hannibal. All these writers belonged to the 1st cent. ad.

The golden age of Indian E. falls in the 4th and 5th cents. with the composition of the Hindu *Mahabharata* and *Ramayana*. Later, in medieval Europe, legends clustering round the names of historical personages like Alexander or Charlemagne or of national and sometimes mythical heroes such as Siegfried or King Arthur, became in many instances moulded into poems of E. type. Of the Teuton lays the *Nibelungenlied*, telling the story of Siegfried, takes rank as one of the greatest of poetic romances, and has even been compared with the *Iliad*, not for beauty of style, but for human interest and effectiveness as a narrative. Among the greatest of Icelandic sagas, which in unrhymed poetry related early Norse hist. and legend, are the stories of *Burnt Njal*, *Grettir the Strong*, and *King Olaf*. France also had its E. song cycles telling of national heroes, the *Geste du Roi*, for example, relating the legends of Charlemagne and his followers. To this set belong the *Chanson de Roland*, *Ogier the Dane*, and other great lays. The great E. of Spain is the *Poem of the Cid*, written in the 12th cent. about a national hero who lived in the 11th cent.

Italy was very rich in E., beginning with Dante's magnificent *Divina Commedia*, 1320, written in terza rima and carrying on, in its 3 divs., *Inferno*, *Purgatorio*, and *Paradiso*, the tradition of Virgil, who appears as a character in its pages; it is the first Renaissance composition that can bear comparison with the classical E.s. Later It. writers created a romantic type of E., seen at its best in Ariosto's *Orlando Furioso*, 1516. A more orthodox and powerful example of E. was Tasso's *Gerusalemme Liberata* (Jerusalem Delivered), 1575, which was for long the most popular work in It. literature. About the same time Camoens wrote *Os Lusitacos*, 1572, the great Portuguese E. describing the discovery by Vasco da Gama of the sea route to India, and celebrating by narrative and prophecy the whole hist. of Portugal.

Eng. literature has the distinction of possessing in *Beowulf*, which belongs to about the 7th cent., the earliest E. in any modern language. As a poem it cannot compare with the *Iliad*, but it has this in common with Homer's work, that it is a natural production, not an artificial work of scholarship and study. After it there is a gap of many centuries before we come to Spenser's *Faerie Queene*, 1590, which, if not an E. in the strictest sense, possesses many E. qualities. In Milton's *Paradise Lost*, 1667, Eng. E. reaches its supreme height; no other Eng. poem can compare with it in loftiness of theme and magnificence of diction. The 17th cent. produced sev. other E.s, such as Davenant's *Gondibert*, 1651, and Cowley's *Davidis*, 1656, but they are now mercifully

forgotten. In the 18th cent. *Fingal*, 1762, a prose E. claimed to be the work of Ossian, gained temporary celebrity. The Romantic Revival produced in Keats's *Hyperion*, 1818, an E. fragment of great power, while later in the same century Matthew Arnold's *Balder Dead*, 1853, and Morris's *Sigurd the Volsung*, 1876, reproduced the spirit of Norse E. The 20th cent. may claim Hardy's drama *The Dynasts*, 1908, which, though not strictly an E., belongs to the same genre.

Clark, *History of Epic Poetry*, 1900; W. M. Dixon, *English Epic and Heroic Poetry*, 1912; L. Abercrombie, *The Epic*, 1914; and E. M. Tillyard, *English Epic Tradition*, 1926. For burlesque E. see MOCK-HEROIC POETRY.

Epicharmus (c. 530-440 BC), Gk writer of comedies, b. in the is. of Cos. He spent the earlier part of his life in the study of philosophy, and did not begin writing comedies until his removal to Syracuse in 484. Of these 35 are extant, written in the Doric dialect, and to him is due the literary form of the Sicilian comedy. He introduced a regular plot and did away with the low buffoonery then current for comedy in Sicily. He took his subjects from the stories of gods and heroes as well as from life, and his plots seem to have been simple and the action rapid. See G. Norwood, *Greek Comedy*, 1931.

Epictetus (c. AD 55-c. 135), Gk philosopher, b. Hierapolis in Phrygia. He lived a long time in Rome as a slave in the house of Epaphroditus, a favourite of Nero. Receiving his freedom, he became a prof. of the Stoical system, which he learned from the lectures of Musonius Rufus. He taught first at Rome, but after the expulsion of the philosophers by Domitian in AD 94, went to Nicopolis in Epirus. Here he appears to have spent the rest of his life, for the discourses which Arrian took down in writing were delivered by E. when an old man at Nicopolis. He was favoured by the Emperor Hadrian, but little else is known of his life, except that he was lame and very poor. He formed numerous disciples by free conversations after the manner of Socrates, and one of these, Arrian, compiled the short manual *Enchiridion*, which bears the name of E. He also wrote the philosophical lectures of his master in 8 books, from which some account of his doctrine may be gathered. The main point on which he laid stress was the independence of the human mind of all external circumstances, such being not in our power. This freedom is to be attained by patience and renunciation. The duty of man is to find all his happiness within himself, and the power of which he should be most sure is the deity in his own breast. For an account of his teaching, see E. A. Abbott, *Silvanus the Christian*, 1906. The chief ed. of the works of E. is that of J. Schweighäuser (6 vols., 1799-1800; Eng. trans. by Elizabeth Carter, 1758, and G. Long, 1877). See also eds.

by H. Schenkl, 1894, 1898, and by P. Matheson, 1917. There are studies by A. Bonhöffer, 1890-1911, and T. Colardeau, *Étude sur Épicète*, 1903.

Epicureanism, system of philosophy in which human happiness was regarded as the highest good. It was founded by Epicurus, who claimed to be independent of all his predecessors, but he was in reality indebted both to the Cyrenaics and to Democritus. His system, however, differed from that of the Cyrenaics in his conception of pleasure. This he regarded as something lasting and imperishable, consisting in pure and noble mental enjoyments, i.e. in the freedom from all influences which disturb our peace of mind, and thereby our happiness. His *summum bonum* was peace of mind, and this he based upon *phronesis*, which he described as the beginning of all good and the origin of all virtues. In his physics he followed the materialistic system of Democritus, and his views are set forth in the *De Rerum Natura* of Lucretius. According to him we obtain our knowledge of things from *eidōla* or images of things which are reflected from them and pass through our senses into our minds. Of the gods, too, he considers we obtain our knowledge in the same way, and he regards them as enjoying perfect happiness which would be interrupted if they took part in the gov. of the world, therefore they exercise no influence upon the world of man. Epicurus had numerous pupils who propagated his doctrines, and yet no system of philosophy has been so much attacked as his. This was probably owing to a great extent to the conduct of the men who called themselves Epicureans, and gave themselves up to the enjoyment of sensual pleasures. The word 'epicurean' survives in the speech of modern Palestinian Jews in the form of *Epikoris*, a term of opprobrium applied to apostates from the ancestral faith. See J. Watson, *Hedonistic Theories*, 1895; W. Pater, *Marius the Epicurean*, 1913 (Everyman's Library, 1934); A. Kelm, *L'Epicurisme*, 1924.

Epicurus (341-270 BC), Gk philosopher, founder of the Epicurean school, which was named after him (see EPICUREANISM), b. Samos, where he spent the first 18 years of his life. He began the study of philosophy at an early age, and in 310 began to teach first in Mytilene and afterwards in Lampascus. In 306 he went to Athens and purchased a garden, the famous *Kēpoi Epikourou*, in which he estab. his philosophical school. Here, surrounded by his friends and pupils, and 3 brothers, Neocles, Charidemus, and Aristobulus, he spent the rest of his life engaged in the study of philosophy. E. was a materialist. He taught that man's duty was to attain personal happiness and peace of heart by overcoming irrational desires and fears. Although he appears to have been a prolific writer and, according to Diogenes Laërtius, was the author of 300 vols., all that remains of them are some fragments of his great work *On Nature*, 3 letters, besides his will and a

compendium of his doctrine in 44 short propositions, written for his scholars to learn by heart. The extant remains have been ed. with a trans. by C. Bailey, 1926. See C. Bailey, *The Greek Atomists and Epicurus*, 1928; E. Zeller, *Stoics, Epicureans, and Sceptics*, 1880; W. Wallace, *Epicureanism*, 1902.

Epicycle, in unct astronomy, a small circle the centre of which was supposed to move on the circumference of a larger one called the 'deferent.' It was used for representing the motions of the planets as well as of the sun and moon, the deferents of which were circles, the earth being their centre. See PTOLEMAIC SYSTEM.

Epidamnus, see DURAZZO.

Epidauros: 1. Tn of anct Greece, situated on the Saronic Gulf, on the E. coast of Peloponnesus in a dist. called Argolis

E.N.A.

EPIDAUROS: THE THEATRE

under the Roms. It was famous as the chief seat of the worship of Aesculapius. The temple of this god lay on the highway to Argos, 5 m. W. of E., and was frequented by patients from all parts of the Hellenic world. A few ruins are still extant, and the sacred enclosure is even now called Hieron or the Sanctuary. The remains of the theatre (4th cent. bc) are well preserved.

2. See DUBROVNIK.

Epidemic, general term signifying common to, or affecting, a whole people, or many people; prevalent; general. It

is applied to mental, moral, social, and physical phenomena, as an E. of suicide, E. folly. Technically, in sanitary science, it means a contagious disease, or generally a wide-spread disease. The term E. is equally applicable to disease occurring both in men and in animals. It has the advantage of directing attention to the fact that a disease affecting but few individuals in any one locality may have a very wide distribution, as E. meningitis and other diseases, which require administrative measures for limiting and eradicating a disease. Diseases caused by lack of vitamins, such as scurvy and beriberi, often assume E. forms. The term E. is a disease coming on a people, and is used in contradistinction to endemic (q.v.), a disease in a community. When an E. spreads quickly over whole countries or expanses of the earth, affecting large numbers of the pop., it is known as a *pandemic*. Such were the influenza E.s of 1918 and 1957.

Epidemic Haemoglobinuria, see BLACK-WATER FEVER.

Epidemiology, the science of epidemics, and concerned with the cause, infectivity, epidemic, and pandemic manifestations of infective diseases, and their prevention; Epidemics and pandemics result from the conjunction of 3 essential factors: (1) an available store of organisms causing the disease; (2) effective transmission of these organisms in sufficient numbers; (3) other individuals with tissues susceptible to the organisms. Many secondary factors also operate, and the effect of an infective disease on individuals may depend on age, sex, relative immunity, climate, and other conditions. The co-operation of doctors, bacteriologists, pathologists, and statisticians is essential to advancement of E. Observations on the interaction of host and parasite (see PARASITE) are made, and the discovery that healthy people may act as carriers and may distribute organisms causing infectious diseases was one of the most important during the present century. The scientist who observes the life hist. and reactions of these organisms contributes facts on which preventive measures can be based, and the statistician analyses such large numbers of results that he can detect, and sometimes correct, possible errors in observations and records. Curves obtained by graphing statistics sometimes make it possible to predict the probable course of an epidemic and its probable periods of recrudescence. Application of the results of E. have always made it possible to prevent the occurrence of many infective diseases, and have led to the virtual disappearance of some infectious diseases in civilised countries. The World Health Organisation (q.v.) carries out epidemiological research and transmits epidemiological information on a world-wide scale. See C. O. Stallybrass, *The Principles of Epidemiology*, 1931; M. Greenwood, *Epidemiology: historical and experimental*, 1932; *Epidemiological Report* (League of Nations), 1934; C.-E. A. Winslow, *The Conquest of*

Epidemic Disease, 1943; *Official Records of World Health Organisation* (W.H.O., Geneva).

Epidermis, see SKIN.

Epidiascope, a magic lantern combined with an **episcope** which can project opaque as well as translucent pictures. An **episcope** projects only opaque pictures.

Epidote, mineral of a green or grey colour, which is composed of silica, alumina, lime, oxide of iron, and oxide of manganese. Fine crystals, 3 in. in length, are found at Arendale in Norway, and also in Sweden and at Franconia in New Hampshire; and some good specimens come from Piedmont.

Epiglottis, leaf-like lid of yellow fibro-elastic tissue which covers the glottis (the opening of the larynx) during the act of swallowing. A long stalklike ligament (the *thyro-epiglottidean*) connects it inside the larynx with the thyroid cartilages.

Epigoni, descendants of the seven who d. before Thebes. Ten years later the E., attacking Thebes to avenge their fathers, took the city and razed it to the ground. Their names are not identical in all accounts, but usually include Alcmaeon, Aegialeus, Diomedes, Promachus, Sthenelus, Thersander, and Euryalus. See SEVEN AGAINST THEBES.

Epigram (Gk *epi*, upon; *graphein*, to write), originally meant an inscription, such as was put upon a tomb or a statue. Among the earliest are those of the Gk Simonides of Ceos, who wrote epitaphs in elegiac couplets for the Greeks who fell in the Persian wars, a typical example being his couplet on the battle of Marathon: 'Fighting for Greece, the Athenians at Marathon laid low the might of the gilded Medes.' From this early use E. came to mean a miniature poem summing up in pointed phraseology a single thought or situation. The famous *Palatine Anthology* contains some 4000 Gk E.s ranging in date from 700 BC to AD 1000. In Rom. literature the witty or satirical turn which appears frequently in Gk E.s became almost the rule, reaching its height in the clever but often scurrilous E.s of Martial. Among Eng. poets the richest in E.s is Pope; they commonly form a part of longer poems, but some stand by themselves, such as:

'You beat your pate and fancy wit will come:

Knock as you please, there's nobody at home.'

Eng. E. may be said to have begun with John Heywood, who was followed by Ben Jonson, Donne, Herrick, and others. In the Augustan age Prior, who shows skill comparable with Pope's, Swift, Goldsmith, and Garrick all used the E. effectively. In the 19th cent. may be mentioned Byron, Thomas Hood, Moore, and Coleridge, who hit off the E. itself in a neat couplet:

'What is an epigram? A dwarfish whole,
Its body brevity, and wit its soul.'

The highest poetical level in Eng. E. may be claimed for Landor, who attained something approaching the telling simplicity of the Greeks in such pieces as:

'I strove with none, for none was worth
my strife;

Nature I loved; and next to Nature,
Art;

I warm'd both hands before the fire of
life;

It sinks, and I am ready to depart.'

Among modern writers who have used the form effectively have been Sir Win Watson, Kipling, Belloc, and Sir John Squire.

As a rhetorical term E. is used of a short, pointed saying which arrests attention by its cleverness; often it is based on antithesis, as in Pope's line 'For fools rush in where angels fear to tread.' As examples of modern E.s we may quote Oscar Wilde's saying, 'Experience is the name everyone gives to his mistakes,' and Bernard Shaw's 'Home is the girl's prison and the woman's workhouse.'

See J. W. Mackail, *Select Epigrams from the Greek Anthology*, with trans., 1890; W. D. Adams, *The Book of English Epigrams*, 1878; also **FIGURE OF SPEECH**.

Epigraphy, a science dealing with the study of ancient inscriptions, including their decipherment and interpretation. It is mostly concerned with inscriptions on hard materials, such as stone, metal, bone, shell, and wood, or materials which may become hard, e.g. clay. It may include incidental scratchings, such as *graffiti* like those on the walls of Pompeii; but writings on flexible materials such as parchment and paper are the prov. of **palaeography** (q.v.). E. is subdivided into Greek, Lat., Semitic, and other branches.

Epilepsy, recurring attacks of loss of consciousness accompanied by generalised convulsions. The convulsions are first of the tonic, rigid type (lasting a few sec.) followed by the clonic, jerking type (lasting for a few min.). The face is congested and blue in the tonic stage, due to temporary inhibition of respiration, and there is frothing at the mouth. Unconsciousness or a stuporous state may last for some time after the fit is over. The patient when he comes round is often unaware that anything untoward has happened. A fit is often preceded by an aura (q.v.). Incontinence of urine frequently occurs. E. as a rule first shows itself in childhood or adolescence. It may be hereditary. The cause is unknown but liability to fits depends upon some innate or constitutional flaw in the brain as a result of which the nerve cells are apt to discharge in an explosive way without apparent reason. In most cases the liability to fits is slight and may be kept under control by drugs, although the constitutional flaw cannot be eradicated or cured. In other cases the fits may continue but, with treatment, are infrequent and interfere little with the patient's life. The proportion of serious cases in which, despite treatment, the fits continue to be frequent is small. *Petit mal* or *minor E.* is a very mild form of E. in which the loss of consciousness is momentary, amounting to no more than a fleeting vacancy of expression and irresponsiveness to conversation, or whatever

may be happening, and sometimes faint twitching of the face or limbs. The epileptic so far as possible should lead a normal life. Those around him should be aware of the nature of the complaint and the successful management of a case depends a great deal on their sensible co-operation. Epileptics should not be in a position to harm themselves or others should they have a fit. They should not drive cars or public transport vehicles for obvious reasons, and for their own sake they should not ride bicycles or swim unless carefully watched. Naturally the choice of work open to epileptics is limited by their disability. Shortage of sugar is apt to precipitate an attack and epileptics should not go too long without food and should carry sweets or sugar in their pockets. Too much fluid and particularly alcohol is apt to precipitate a fit. Likewise overtiredness is a predisposing cause. E. should always be treated under medical direction and with the modern drugs (troxidone, 'epanutin,' and phenobarbitone) now available there is every prospect of controlling the fits in most cases and for the patient to lead a useful and full life within certain limits already referred to. Patients severely handicapped by the disease may be better admitted to an epileptic colony (q.v.). Anti-convulsant drugs given in epilepsy do not cause mental deterioration beyond an occasional drowsiness. Severe E., however, is apt in the course of time to cause some damage to the brain and dulling of mental acuity. Also, in the stage of post-convulsive stupor, patients sometimes perform automatic acts outside their knowledge or conscious control. E. is sometimes put forward as a defence in criminal proceedings. The risk of transmitting E. to children is serious only if there is an inherited tendency on both sides of the marriage. By means of an electrical recording of the brain impulses with a machine known as the electroencephalograph it is usually possible to tell whether a person is liable to transmit the tendency even though not having any personal or family hist. of the disease. Persons liable to transmit the tendency, or who are epileptics themselves, show an abnormal tracing on the electroencephalograph. *Jacksonian E.* is the term used to describe epileptic seizures due to a lesion of the cortex of the brain causing irritation to the motor cells. Brain tumours, displaced fragments of fractured skull and gunshot wounds are common causes of Jacksonian E. If the cause can be removed cure results.

Epileptic Colonies. C. for the care and training of E.s. The idea was first conceived in 1887, and since that date numerous C. have been formed in various countries. The first distinct attempt to provide for E.s was inaugurated by a Lutheran pastor, Friedrich von Bodelschwingh, who founded at Bielefeld in Westphalia, Germany, the Bethel Colony, which has grown to be a vil. inhabited solely by E.s. Here everything has been provided to meet their special needs. There are

schools and industrial teachers, and physicians to study and treat their cases. Outdoor occupations are provided, special diet is arranged for, and there are all sorts of recreations and amusements. The first colony founded in England was at Chalfont in 1893; there are others at Liverpool, Godalming, and Croydon.

Epilobium, family Onagraceae, genus of 160 species of herbs of temperate and cold regions; commonly called willow-herb in Britain, fireweed in Canada. *E. hirsutum* is 'Coddins and Cream.' The Rose-bay willow-herb is now *Chamaenerion angustifolium*.

Epilogue (Gk *epilogos*, peroration of a speech) is now generally applied to a piece appended to the conclusion of a literary work, more particularly of a drama. As a literary form it has mostly been employed by Eng. writers; indeed, Ben Jonson made it a particular feature of his dramas, using it either to apologise for the defects of his play or to assert its merits. Later on the E. became very fashionable, and dealt with other subjects besides the preceding play, e.g. with politics, criticism, etc., and at the time of the Restoration hardly a play was produced on the Eng. stage which did not finish with one. Dryden even wrote a *Defence of the Epilogue*.

Epimedium, see BARRENWORT.

Epimenides (6th cent. BC), Cretan poet and prophet, b. at Phaestus. Though his story includes a wealth of legend, he is known to have visited Athens at the invitation of Solon (c. 596 BC) in order to purify the city after a pestilence said to have been due to the murder of Cylon (q.v.). E. is believed to be the 'prophet' alluded to by St Paul in *Titus* i. 12. See H. Demoulin, *Epiménide de Crète*, 1901.

Epimetheus ('afterthought'), brother of Prometheus ('forethought'). Zeus, to punish mortals, gave him Pandora (q.v.), who brought disease and suffering upon mankind.

Epinal, Fr. fort. tn. cap. of the dept of Vosges, on the Moselle, at the foot of the Vosges Mts (q.v.). The church of St-Maurice is partly 13th cent., and there are a museum, a library, and a ruined château. It is the centre of a cotton-spinning dist., and makes cotton, embroidery, and machinery. It also prints coloured pictures of the saints—*images d'Epinal*. Pop. 24,000.

Epinau, Louise Florence Pétronille Tardieu des Clavelles d' (1726-83), Fr. writer, b. Valenciennes. She was acquainted with the Fr. men of letters of her day, including Voltaire, Diderot, Duclos, and Holbach, and was on an intimate footing with Rousseau (for whom she furnished a cottage in the valley of Montmorency) and afterwards with Grimm. Her pubs. include *Mes Moments Heureux*, 1752, *Lettres à mon Fils*, 1758, *Conversations d'Emilie*, 1774, which was crowned by the Fr. Academy; and *Mémoires et Correspondance*, her chief work, pub. in 1818.

Epiphanius, St (c. 315-402), a father of the Church, b. in Palestine of Jewish

parents, founded a monastery near Besanducan, his native vill., and in 367 was made bishop of Constantia (formerly Salamis), in Cyprus. Jerome called him 'Five-tongued,' for his linguistic powers, others deem him ignorant, but all find his *Panarion* (ed. Paris, 1622)—a hist. of 80 sects and heresies—the work of a bigot and his accusations ill-considered. He condemned the doctrines of Origen in a council of Cyprus, 402.

Epiphany. This word, in Greek, means an apparition of a divine being. The feast of the E. is held by the Rom. Catholic and Anglican Churches on 6 Jan. to commemorate the manifestation of Christ by 3 different events, the adoration of the Magi, the baptism of Christ, and the miracle of Cana. Many special observances were connected with the day, which under the name of Twelfth Night, in England, closed the Christmas festivities. Formerly the date of Easter for the year was on this day solemnly announced to the faithful. The sovereign of England still observes the day of the E. in the Chapel Royal by offerings of gold, frankincense, and myrrh at the altar. In both E. and W. the E. has always been a festival of the highest rank. It is older, in fact, than Christmas. In Italy gifts are given at E. in commemoration of the gifts of the Magi, rather than at Christmas.

Epiphyllum, family Cactaceae, a genus of 16 species, chiefly Mexican and S. American. *E. ackermannii*, and *E. oxypetalum* with night-opening, scented flowers, are popular indoor plants.

Epiphytes, plants which grow on others but do not absorb nourishment from them as is the case with parasitic plants. Common examples are lichens, mosses, and ferns on trees. In forests, especially in the tropics, E. form quite a feature of the vegetation, and many orchids, bromella, araceae, gentians, and some cacti and rhododendrons are E. E. often have aerial roots which grow downwards, but never reach the ground, and which enable them to absorb nourishment and moisture from the air. See also PARASITE.

Epirus, div. of anc. Greece, corresponding to the S. of modern Albania, bounded by Illyria, Macedonia, and Thessaly, and stretching southward along the Ionian Sea to the Ambracian Gulf. The Greeks regarded the inhab. as semi-barbaric, but frequented the oracle of Dodona. The chief tns were Ambracia (a colony from Corinth) and Phoenice. For a little over 2 centuries from 450 BC E. was ruled by Molossian princes, the most famous of whom was Pyrrhus (q.v.). Aemilius Paulus ravaged 70 Epirote tns in 168 BC, in retaliation for their having assisted Perseus of Macedonia in his bid for independence. Henceforward their hist. is a blank apart from their modern struggle for possession of N. E. At the Peace Conference in Paris (1946) Tsaldaris, prime minister of Greece, claimed that N. E., given to Albania after the First World War, must be restored to Greece. Before the First World War, the Greeks of N. E. had estab. more than 200 schools in that

prov. The pop. of the 5000 sq. km. of N. E. is about 200,000, of whom 60 per cent are Greeks; but a great many others had been forced to emigrate between the 2 world wars. The pop. of the rest of E. before the Second World War was 363,000.

Nancy Jenkins

CHILDREN OF EPIRUS

Episcopacy (from Lat. *episcopatus*, office of a bishop, Gk *episkopos*), the term applied to the system of Church organisation, where a bishop possesses the chief eccles. authority within a defined dist. or diocese. In this way it differs from both Presbyterianism and Congregationalism. The former has a gov. by presbyters, or elders, and in the latter each community of worshippers is autonomous. The bishop, in his own person, sums up the collective powers of the Church in his diocese, by divinely bestowed authority. Thus, both individually and collectively, the bishops are the essential ties of Catholic unity. Since the Reformation, the word is more especially connected with those churches which have an episcopal system but are not in communion with Rome. The Church of England is by far the most important of these, and, since the Reformation, has been the chief champion of simple E. against the Papal, Presbyterian, and Congregational systems. Anglican opinion is considerably divided as to the divine origin of E. The episcopal office in its essentials has practically disappeared from the Protestant communities of the Continent, though the Lutheran churches of Denmark, Norway, and Sweden still preserve it in something of its historical sense. In England the Reformation, being guided by the king's own hand, began on a conservative note; and although E. was abolished by law under the Commonwealth, the bishops were restored at the Restoration, and in the

thought of the time the monarchy was closely connected with them. In the Protestant Episcopal Church of the U.S.A., which is Anglican, the functions of the bishops are similar to those of Eng. prelates. The bishops of the Methodist Episcopal Church of America derive their orders from Thomas Colne, a presbyter of the Church of England, who was ordained by John Wesley in 1784 as 'superintendent' of the Methodist Society in America. See also APOSTOLIC SUCCESSION; and C. Jenkins and K. Mackenzie, *Episcopacy, ancient and modern*, 1939.

Episcopius, Simon (1583-1643), or Simon Bisshop, Dutch theologian, b. Amsterdam; gave form and system to the doctrines of Arminius and bravely endured a life of persecution rather than stifle his protest against the excessive dogmatism of the extreme Calvinists.

Episode, an incident in the life of an individual or people which is irrelevant to the broad march of events, that is, a deviation or, to use another metaphor, an excrescence. It is a Gk word (*episodes*) meaning 'after-entrance,' and, as Aristotle explains in his *Poetics*, was descriptive in the drama of all that happened between the choric songs. From the fact of their later origin, the scenes between the actors were, theoretically at least, subordinate to the performance of the chorus, and a rift in their continuity.

Epistaxis, bleeding from the nose. The causes may be local or general. A blow is the commonest local cause, while internal damage may occur from the introduction of a foreign body. Congestion of the already very vascular nasal mucous membrane, as in a cold, is a frequent cause of slight E. The blood vessels of the mucous membrane of the nasal septum are often varicose, and these may ulcerate from time to time causing brisk haemorrhage. Among general causes of E., hypertension in the elderly is the most usual. Repeated E. may also be a sign of a serious blood disorder, such as leukaemia, or of any condition in which the normal blood clotting mechanism is interfered with. E. is often salutary, and does no more harm than the mess it makes and the alarm it causes. As a first-aid measure it may be stopped by placing steady pressure on the affected side for about 15 minutes. Any clot formation should not be disturbed by blowing or sniffing.

Epistemology, that part of philosophy which treats of the possibility, nature, and limits of human knowledge. Among the predecessors of Plato (q.v.) it is possible to distinguish 3 main theories of knowledge, set forth by Plato himself. It appears that the sophists, following Heraclitus, taught that knowledge is no more than sense perception. Another view was that it was true belief, i.e. judgment founded on the impressions derived through sense. Finally the Cynic Antisthenes maintained that only compounds are knowable. Against the first of these theories Socrates affirmed that the truth of things is attained by general

notions reached through deduction and definition. Thus we consider a number of instances, e.g. 20 books, omit all that is peculiar to each, define what is common to each, and thereby arrive at a general notion of the essence, book. Plato accepted the Socratic view, rejected the other 2 current opinions, and constructed his theory of ideas which dominated the whole of W. thought for 2000 years, and still influences a large part of mankind. According to Plato it is necessary to distinguish between knowledge and belief, and to admit 2 classes of objects, the real and the phenomenal. The former he called ideas. They are permanent unchanging entities, existing in themselves and not as mere products of thought. These ideas in their totality make up intelligible reality. They are what we know, and all particular or phenomenal things, which are the objects of sense perception, somehow participate in them. They are the essence of particulars. These ideas are apprehended by the intellect (*nous*), a pure and unmixed act of the soul. Belief or opinion is the fruit of pure thought and perception combined. With Aristotle (q.v.) the ideas of Plato are not existing entities, but products of thought, universal concepts. The essences of particular things are in them according to reason as well as according to time. Aristotle taught that reality is an unbroken chain of being ranging from the purely indeterminate (first matter, *prôtê hulé*) to complete actuality (God). Every individual thing in nature is compounded of this matter and form (*morphê*) which gives to it qualities, its intelligible essence. He also discusses the various forms of cognitive activity, the process by which knowledge is acquired, and distinguishes sense perception, memory, experience, active and passive intellect. The scholastic philosophers, notably St Thomas Aquinas and Duns Scotus (qq.v.), accepted and developed the teaching of Aristotle. William of Ockham was the precursor of conceptualism according to which the only existent realities are individual things, universals being mere products of the mind. This led to nominalism (q.v.) which stated that universals are mere names since generalisation and indeed thought itself are impossible without words.

There are 3 prin. schools of modern E.: rationalist, empirical, and critical. Representative of the first school are Spinoza and Leibniz (qq.v.). Spinoza denies the existence of reality outside God, of whose eternal and infinite essence he says man has an adequate knowledge. Man is part of the world of phenomena, but can escape from its finiteness through 'salvation.' This theory is illogical inasmuch as it purports to reconcile reality and appearance while recognising the existence of the world of appearance. Leibniz does not regard the mind as a mere recipient of ideas. He takes into account the mind's reaction in knowledge, and thus opposes the view of Locke (q.v.), the first of the empirical school. Locke holds that all

our knowledge comes from sense experience and from that alone. Berkeley (q.v.) develops this view, asserting the non-existence of unthinking matter, a paradox which has had a considerable influence on E. and on philosophy in general. He postulates the falsity of all abstract ideas and argues that all possible ideas must be particular concrete facts of consciousness possessing characteristics or images which we can discover and describe. But he also allows that we have knowledge of other reality than that of our ideas, for we 'may be said to have some knowledge or *notion* of our own minds, of spirits and active beings, whereof, in a strict sense, we have no ideas.' This admission led him almost to go back on sensations, emphasising the intellectual apparatus of experience which enables us to rise to truth and to God. Hume (q.v.) further supplemented the empiricism of his predecessors in his analysis of knowledge which reduces every positive object of knowledge either to an impression or an idea. The former term comprises sensations and emotions, the latter the faint images of these livelier perceptions in thinking and reasoning. Kant (q.v.) stands at the head of the critical school. He taught that the intelligible world is explained by the unity of the self or of consciousness. This self is not merely an individual but is universal, and this consciousness has a rational validity and significance. We create the world, which is the product of our own understanding. Fichte (q.v.) goes further, regarding reality as wholly constructed by the ego. Since the death of Hegel (q.v.) modern E. has been represented by 2 schools. Spiritualists, theists, and idealists maintain that matter and spirit can be reconciled by rational insight. This is denied by positivists, agnostics, and Kantians. Modern epistemological research, however, is chiefly concerned with the nature of the act of cognition. The neo-scholastics accept in principle the doctrine of Aristotle as expounded by St Thomas Aquinas. Others, though differing at many points, appear to accept 4 common propositions: (1) Perception is a complex act involving more than the apprehension of sense qualities; (2) there is a distinction between the act of thinking and the thought; (3) thoughts or sense qualities are not identical with the physical object nor, necessarily, with any of that object's qualities; (4) what is known through sense perception is based on the apprehension of sense qualities and the perception of the relations between those sense qualities. Epistle and Epistolary Writing, see LETTERS.

Epistolae Obscurorum Virorum ('Letters of Unknown Men') appeared in 1516, and were followed the next year by a second part, the work of Ulrich von Hutten. In feeling they were intensely Protestant, and thus spurred on the Reformation. As they were full of vehement denunciations of monks and scholastics, it is natural that fear of persecution should have induced the author to conceal his name. He has been variously identified with Grotius Rubianus, Hutten, Erasmus, and Reuchlin.

Epistyle (Lat. *epistylum*), in architecture, the E. is the lowest div. of the entablature (q.v.), consisting of the main beam that rests immediately upon the abacus, i.e. the upper member of the cap. of a column, supporting the architrave.

Epitaph (Gk *epi*, upon; *taphos*, tomb), an inscription engraved upon a tombstone, or written ostensibly for that purpose. Anct (Gk E.s are of great literary interest: they form an important section of the Palatine Anthology, and derive their effectiveness from their simplicity. Typical is the famous couplet of Simonides on the Spartan dead at Thermopylae: 'Stranger, tell the Laedaemonians that we lie here obedient to their orders.' Rom. E.s were mostly short and prosaic by comparison. They commonly begin 'Siste, viator' (Stay, traveller), a natural invocation when burial places were usually by the road side, and ask for the wayfarer's prayers. An Eng. one on this classical model is that written by Coleridge for himself:

'Stop, Christian passer-by!—Stop, child of God,
And read with gentle breast. Beneath
this sod
A poet lies, or that which once seem'd
he.

O, lift one thought in prayer for S.T.C.' Another common classical phrase is 'Sit tibi terra levis' (Light be the earth upon thee). This sentiment is copied in the well-known E. by the Australian R. Richardson (1850-1901):

'Warm summer sun, shine friendly here;
Warm western wind, blow kindly here;
Green sod above, rest light, rest light—
Good-night, Annette! Sweetheart, good-night!'

Types of E.s show immense variety; they may be light-hearted, cynical, malicious, or frivolous and using all sorts of word-play. Self-written E.s vary from the dignified words of Keats, 'Here lies one whose name was writ in water' to the jocular resignation of these lines by A. Newland (1730-1807):

'Beneath this stone old Abraham lies;
Nobody laughs and nobody cries.
Where he is gone, and how he fares,
Nobody knows, and nobody cares.'

During the Victorian age long florid E.s containing a pompous catalogue of the deceased's supposed virtues were for a time the fashion, but in modern times the inscriptions are usually confined to name and date, with perhaps a single brief phrase. The Christian faith looks forward to eternal life, and Christian E.s most frequently conclude with the letters R.I.P. (Lat. *requiescat in pace*, may he [she] rest in peace). See S. Tissington, *Epitaphs*, 1857; H. J. Loaring, *Quaint, Curious, and Elegant Epitaphs*, 1872; J. R. Kippax, *Churchyard Literature*, 1876.

Epithalamium, or **Epithalamion** (Gk) was the song invoking all blessings and happiness which boys and girls of ancient Greece used to sing to the bride and bridegroom on their marriage. Sappho, Anacreon, and Pindar wrote epithalamia, which thus became an established form in literature. The finest of these nuptial hymns that have survived from the classics are Theocritus's 18th idyll, and Catullus's *Marriage of Thetis and Peleus*. Spenser's *Epithalamion* is one of the best examples in Eng. verse.

Epithelioma, see CANCER.

Epithelium, or **Epithelial Tissue** covers the surfaces and lines the internal cavities of the body. Its most important situations are: (1) On the surface of the skin; (2) on mucous membranes; (3) on the inner or free surface of serous membranes; (4) on the inner surface of the heart, blood vessels, and lymphatics. Every E. T. is formed entirely of cells united together with cohesive matter, and the mass thus formed closely invests the surface on which it is situated. It contains no blood-vessels, though plasma may diffuse through the minute channels sometimes existing between the cells. Nervous fibrils are usually abundant. The component cells vary in structure and shape, hence the most convenient classification of E. cells is according to shape and arrangement, viz.: (1) Simple epithelia, subdivided into (a) pavement or scaly, as in such a serous membrane as the peritoneum; (b) columnar, e.g. lining the mucous membrane of intestines. 'Chalice or goblet' cells are columnar cells distended with mucus; (c) spheroidal or glandular, e.g. in the liver; (d) ciliated, i.e. bearing spontaneously-moving filaments on their basal ends, as in nasal membrane. (2) Stratified E. of various types having cells in layers, the deeper usually columnar and the superficial ones flattened as in the E. of the front of the cornea. (3) Transitional E. of sev. types, but intermediate in character between (1) and (2), e.g. lining the ureters.

Epoch (Gk *epochē*, a pause) has a special astronomical meaning. It is impossible to determine the position of a planet or other body in its orbit unless its place at a given point of time is known. This given moment is called the 'epoch.'

Epode, an essential part of the chorus in Gk drama. It followed the strophe and antistrophe (qq.v.), being sung when the choir had returned to its original place. The term was also applied to a form of

lyric invented by Archilochus and finely handled by Stesichorus. Horace imitated Archilochus's metre in his 5th book of lyrics, which he accordingly named *Epodes*. In these, iambic trimeters and dimeters alternate.

Eponym (Gk *onoma*, a name), the mythical individual who has given his name to a people sprung from his descendants. Legend says that Pelops begat the Peloponnesians; Dorus, the Dorians; and Italus, the Italians.

Epping, par. and tn of Essex, England, situated to the N. of E. Forest, about 16 m. NNE. of London. It has an elevation of 380 ft above sea level. The forest was once part of the ancient forest of Waltham, and originally covered the whole of Essex co. What remains of it now is preserved by the city of London, and forms one of the largest and most frequented pleasure grounds of the country. It was for many years the constituency of Sir Winston Churchill, (q.v.). Pop. 6968. See W. Addison, *Epping Forest: Its Literary and Historical Associations*, 1948.

Epsom (a corruption of Ebbisham, the local manor), mkt tn, 14½ m. SSW. of London, in Surrey, England. The Royal Medical College on the Downs was founded in 1851 as a school for doctors' sons. There are sculptures by Flaxman and Chantrey in the Gothic church (rebuilt in 1824). In 1618 the springs containing sulphate of magnesia were discovered, and it seemed likely that E. would become a fashionable inland spa. To-day, however, the waters are forgotten, and E. is famous because the Derby (q.v.) and Oaks are run on the race-course on the Downs near Tattenham Corner. E. urb. dist. was enlarged in 1933 by the addition of the pars. of Ewell and Cuddington. It was incorporated in 1937. Pop. 68,055 (1954).

Epsom Salts were called because they were first manuf. by evaporating the water of the mineral springs at E. But they occur also in sea water, in the mineral springs of Pullna and Seidlitz, etc., in the Stassfurt mines (as reichardtite), and in America are procurable from limestone beds. The chemical formula is $MgSO_4 \cdot 7H_2O$, and they are therefore described as hepta-hydrated magnesium sulphate. Their needle-like crystals belong to the orthorhombic system. In medicine E. S. are commonly used as a purgative: the intensely bitter taste can be disguised.

Epsomite, or **Sulphate of Magnesia**, used as a fertiliser, also in dyeing cotton goods.

Epstein, Sir Jacob (1880-), Russo-Polish sculptor, b. New York, educ. at the School of Art Students' League, New York. Later he completed his training at the École des Beaux Arts, Paris. He migrated in 1904, and has become the most criticised sculptor of the present day. One of his first works in England, the series of figures on the frieze of the Brit. Medical Association's building, now Rhodesia House, in the Strand, London (1908), provoked controversy which became acute later with his W. H. Hudson memorial 'Rima' in Hyde Park (1925).

His Oscar Wilde memorial in the cemetery of Père Lachaise in Paris (1911), and his figures of 'Night' and 'Day' on the London Transport premises in Broadway, Westminster (1928-9) are other much-discussed works. Other famous works are his 'Two Doves' and 'Marble Venus,' executed in 1913 and 1914 respectively. The cry of 'immoral' has been raised, notably over the Strand figures and the Wilde memorial which is the figure of a nude man whose sphinx-like face twists in a smile of mingled despair and tragic bitterness. In some beholders it evokes horror and resentment, in others wonder at the strength of realistic suggestion. Probably his loftiest contribution to art is the noble and dignified 'The Visitation' in the Tate Gallery (1926). There is a dual character in E.'s art, his carvings are distinct from his modelled portraits in which there is a trace of Rodin's spirit. The portraits, including the splendid 'Joseph Conrad,' 1924, form an impressive record of men and women of the age. One of his most recent bronzes is the 'Madonna and Child,' in which there is revealed 'a great emotional and formal suavity' in the movement of the arms of the 2 figures, while the general impression of the faces and figures visualised in the group is that of 'intense vexation of soul coupled with a spiritual recognition of the obstacles to be encountered in reaching happiness.' E. has also produced a number of drawings, the most characteristic of which are the neurotic 'The Sisters,' and the 'Mother and Son' series. His 'Genesis,' 1931, is a bold conception which produced the usual storm of criticism as well as imitations by other sculptors. In retrospect now, it is difficult to understand the outcry which his early work caused. The novelty has worn off and the world has learnt to expect the sudden dynamic assault of his powerful personality. Yet the controversy was not merely one between the Philistines and the enlightened; for Roger Fry denied that E. was a master of sculpture, and both Paul Nash and Eric Gill criticised him adversely; but among his influential champions were G. B. Shaw, Sickert (who resigned from the Academy because the president would not sign a petition against the removal of E.'s figures on the former Brit. Medical Association's building), Ricketts, Modigliani, and Matthew Smith. There is a sense in which it seems that E.'s vision has its origin in all that is greatest in the Jewish character. His 'Genesis' is a striking apocalyptic comment on our times, in which mankind is brought forth as a monster, swollen with a lust for destruction, and his 'Adam,' 1939, has the same quality—man steeling himself to resist a universe which threatens his existence. The 'Lucifer' of 1945, 'Lazarus,' 1949 (New College, Oxford), the 'Madonna and Child' for the Convent of the Holy Child Jesus, London, 1951, and 'Christ for Llandaf Cathedral, 1957, show no lessening of power. The artist was knighted in 1954. His autobiography,

Let There be Sculpture, appeared in 1949. See studies by B. van Dieren, 1920, and H. Wellington, 1925; L. B. Powell, *Life of Epstein*, 1932.

Epworth, vil. and par., and the bp. of John Wesley (b. 1703), 10 m. NNW. of Gainsborough in Lincs, England. Pop. 2000.

Equal-Area Projection, see MAPS.

'Equality State', see WYOMING.

Equation, a statement in mathematical form of equality between known and unknown numbers which is true only for certain values of the unknown but not for all. To solve an E. means to find the value or values of the unknown number which satisfy the E., e.g. $x + 4 = 7$ is true when x is 3. An E. that is true for all values of the unknown is called an *identity*, e.g., $x + x = 2x$. Simple E.s are of the type $2x + 1 = 100 - 7x$, and the general method of solution of a simple E. is to transpose all the terms containing the unknown x on to the left-hand side and the numerical quantities on to the right-hand side. This may be done by using the property of an E. that if any term is taken from one side to the other its sign must be changed. All the x 's, then, are added together, and the right-hand divided by the coefficient of the x , whence the value of x , 11 in the above E., is obtained. It is important to remember that the symbol x stands for a *numerical quantity*. When an E. contains 2 or more unknowns, e.g. $2x + 3y + 4z = 6$, it is called *indeterminate*. To get a definite solution of this E. 2 other relations between x, y, z must be given. The number of E.s required to get a definite solution of any E. containing 2 or more unknowns is the same as the number of unknowns. Such a group of E.s is called *simultaneous E.s*. All the E.s cited above are called E.s of the *first degree*. The *degree* of an E. is determined from the highest power of the unknown occurring in the E. Thus $3x^2 - 2x - 21 = 0$ is one of the 2nd degree, or a quadratic, the roots of which are 3 and $-2\frac{1}{2}$. $x^3 - 3x^2 - x + 3 = 0$ is one of the 3rd degree, or a cubic, the roots of which are 1, 3, and -1 , and so on. A quadratic E. (q.v.), has 2 solutions or roots, which are either both *real* or both *imaginary*, e.g. the E. $x^2 - 5x + 4 = 0$ has roots $x = 1$ or 4 (*real*), and the E. $x^2 + 1 = 0$ has roots $\pm\sqrt{-1}$ (*imaginary*). In general an E. of the n th degree has n roots, but some of these may be imaginary, and some may be equal. Imaginary roots always occur in pairs. The solution of E.s of higher degree than the quadratic E.s opens up the large subject of the *Theory of Equations*. This subject embraces all questions connected with the solution of every type of E. The cubic was first solved in 1505 by Scipio Ferro, although the general method of solution is known as Cardan's method. This solution is, however, not due to Cardan, but was obtained by him from Tartaglia. The solution of the biquadratic, that is, an E. of the 4th degree, was first obtained by Ferrari, who was a pupil of Cardan. Abel has shown, to the satisfaction of

mathematicians, that it is impossible to obtain a general solution of E.s higher than those of the 4th degree. An example of a biquadratic is $2x^4 + x^3 + x^2 + x - 1 = 0$, the roots of which are $-1, \frac{1}{2}, \pm\sqrt{-1}$. Notice that the imaginary roots $\pm\sqrt{-1}$ and $-\sqrt{-1}$ occur in pairs, as intimated above. It may be pointed out that by means of the relations between the solutions or roots of the E. and the coefficients of the terms of the E., E.s of a higher order may be obtained provided some other relations are also known, e.g. a relation between the roots themselves. But this obviously is a particular type of E., and is not embraced by Abel's demonstration. Approximate values of the roots of E.s in which the coefficients are numerical may be found by employing *Horner's method of approximation* to any degree of accuracy. See W. S. Burnside and A. Panton, *Theory of Equations*, 1881; H. W. Turnbull, *The Theory of Equations*, 1939.

Differential equations (q.v.), are of a special type involving differential coefficients. They have proved to be an invaluable tool in mathematics as applied to engineering, electricity and radio, and in the development of Relativity (q.v.), and Quantum Theory (q.v.); N. Miller, *Differential Equations*, 1935.

A *Binomial equation* is an algebraical E. consisting of only 2 terms. Its most general form is $a_1x^p \pm a_2x^q = 0$. This may be reduced to the form $x^r \pm a = 0$, where $p - q = r$ and $\frac{a_1}{a_2} = a$. The solution of this would be $x = \sqrt[r]{\pm a}$, showing that $x^r + a = 0$ has imaginary roots and $x^r - a$ has real roots.

Equation to a curve.—A curve may be viewed as the path traced out by a point moving under a given condition. See GRAPHICAL METHODS; QUADRATIC EQUATIONS.

Equation, Chemical. A C. E. represents both qualitatively and quantitatively the substances which react together and those which are produced. Every reaction must obey the law of the conservation of mass; and, therefore, the masses of each element shown on the left-hand side of the E. must be equal to those shown on the right-hand side. The E. $\text{CaCO}_3 + 2\text{HCl} = \text{CaCl}_2 + \text{H}_2\text{O} + \text{CO}_2$, expresses the fact that 100 grams of calcium carbonate (CaCO_3) react with 73 grams of hydrochloric acid (HCl), producing 111 grams of calcium chloride (CaCl_2), 44 grams of carbon dioxide (CO_2) and 18 grams of water (H_2O) (atomic weights $\text{Ca} = 40, \text{C} = 12, \text{O} = 16, \text{H} = 1, \text{Cl} = 35.5$). The E. further shows the relative vols. of the reacting gases and of the products. Since a gram molecule of any gas (e.g. $\text{HCl} = 1 + 35.5 = 36.5$ grams) occupies 22.4 litres under standard conditions of temp. and pressure, the E. shows that 44.8 litres of hydrogen chloride gas would produce, from sufficient calcium carbonate, 22.4 litres of carbon dioxide. In these respects a C. E. is very useful, but it has certain defects.

As ordinarily written it does not show the physical states of the substances, whether solids, liquids, or gases; it does not deal adequately with the many cases of balanced action, nor show the thermal changes which accompany reactions, though many of these points can be indicated by the use of additional symbols or figures.

Equation of Energy. The general form of this E. can be expressed as follows: $T - T_0 + V - V_0 = W$, where T_0 and V_0 denote the kinetic and potential energies in the initial position of a system acted on by external or internal forces, and subject to any constraints or mutual connexions, and T and V denote those in the position at the instant under consideration. W denotes the work done by the external forces and also by the internal stresses arising from the action of the particles in the body. On this E. is based the important theory of the action of forces on a connected system.

Equation of Time, see DAY.

Equator (from Late Lat. *aequator*, from *aequare*, to equalise), imaginary great circle drawn on the earth's surface in a plane at right angles to its axis, and equidistant from either pole. It is the dividing line between the N. and S. hemispheres. This E. is often called 'terrestrial' or 'geographical' to distinguish it from the 'celestial equator.' See EQUINOCTIAL.

When a ship crosses the E. or the 'line' it is customary for the crew to stage a mock ceremony on deck. Those who are making the passage for the first time, after making obeisance to King Neptune and his court, are lathered, shaved, and tossed into a bath of water; after which they receive 'Davy Jones's Certificate' in the form of a passport upon the high seas and conferring the 'Freedom of the Raging Main.' This now good-natured horse-play was once accompanied by much brutality.

Equator, Magnetic, line joining all places on the earth's surface for which the dip (q.v.) is zero. It follows an irregular course in the neighbourhood of the geographical E.

Equatorial Current, see ATLANTIC OCEAN.

Equerry, see HOUSEHOLD, ROYAL, ad fn.

Equidae. The horse family; in zoology a family of odd-toed (perissodactyl) hoofed animals. Middle digit and hoof enlarged, and alone support the body; lateral more or less reduced in size and functionless. The 1st and 5th digits and corresponding metapodials, in living genera, are wanting; also the 2nd and 4th, but the metapodials are present, though they are mere splint bones. The shaft of the ulna is atrophied; its extremity being consolidated with the radius; fibula rudimentary and ankylosed with the tibia. The skull is very elongated; the cranial cavity is small, and the bones of the face are well developed.

Equidistant Projection, see MAPS.

Equilibrium, in mechanics, is the state of rest of a body under the action of 2 or more forces. The E. may be *neutral, stable, or unstable.*

Neutral equilibrium.—If a body or a

material system is balanced by the forces which act upon it in any position in which it may be placed, its E. is *neutral*. This is the case with a sphere or a circular cylinder of uniform material with its curved surface placed on a horizontal plane. Any body whose centre of gravity is at the fixed point of support, or is always at the same height above the point of support, is in neutral E.

Stable equilibrium.—If a body, displaced a small distance from its E. position, oscillates about that position its E. is said to be *stable*. This is the case with a pendulum, or with a sphere loaded in its lowest part.

Unstable equilibrium.—If, on the other hand, the system can be displaced in any way from a position of E., so that when left to itself it will not vibrate within very small limits about the position of E., but will move farther and farther away from it, the E. is said to be *unstable*. Thus an egg or a billiard cue standing on end presents a case of unstable E. In many cases the E. varies with the direction of displacement. If it is unstable for any one displacement, the body as a whole is said to be unstable. Thus a coin standing on its edge is in neutral E. for displacements in its plane, but is in unstable E. for those perpendicular to its plane or even at small angles to its plane. It is, therefore, practically in unstable E.

The conditions required for E. vary according to the number of forces and according as to whether the forces are acting in the same plane or not. Thus 2 co-planar forces can only balance when they are equal in magnitude and directly opposed to each other. 3 co-planar forces acting at a point will be in E. if they can be represented in magnitude and direction by the 3 sides of a triangle taken in order.

In the figure the forces of 20 lb. weight, 30 lb. weight, and 13.75 lb. weight will

balance, for they can be represented by the sides of the triangle EFG, EF, FG, and GE being in the ratio 30 : 13.75 : 20. Any number of co-planar forces acting at a point will be in E. if they can be represented in magnitude and direction by the sides of a closed polygon taken in order. If the forces lie in one plane, but do not meet in a point, the conditions for E. are: (1) The sums of all the resolved parts of all the forces in any 2 directions, oblique or at right angles, must be separately zero; (2) the sum of the moments of all the forces (or of their components) about any point must be zero. The condition (1) must be satisfied if there is to be no trans.; and the condition (2) must be satisfied if there is to be no rotation. If the forces do not act in one plane, we may make use of the Principle of Virtual Work. (See VIRTUAL DISPLACEMENT and VIRTUAL WORK.) If the points of application of the forces receive any very small displacements consistent with the mechanical connections, the total work done will be zero, when the forces are in E.

Equimultiples (from Lat. *aequus*, equal, and *multiplex*, manifold), products obtained by multiplying quantities by the same quantity. Thus 15 and 85 are E. of 3 and 17, and a^2bc and bc^2a are E. of a^2 and c .

Equinoctial, another name for the 'celestial equator,' which is the imaginary great circle traced by the points of intersection of the plane of the terrestrial equator and the celestial sphere. The 'equinoctial points' are the points of intersection of the ecliptic and terrestrial equator, this intersection indicating that the sun is exactly on the equator. Astronomers therefore choose one of these points as a convenient point from which to reckon the co-ordinates of the heavenly bodies, and the vernal equinox has been selected for this purpose. See EQUINOXES.

Equinoctial Gales, popular superstition to which science lends no support. Storms are not more prevalent at the equinoxes than at other seasons.

Equinoxes (from Lat. *aequus*, equal, and *nox*, night) are the 2 days in the year, about 21 Mar. and 22 Sept., when the days are equal to the nights all over the world. Owing to the inclination of the earth's axis of rotation to the ecliptic, as it journeys round the sun, the portion of its surface which is lightened by the sun's rays, the circle of illumination, varies; but at the E. the sun apparently describes the equatorial circle, and exactly half of each hemisphere at any instant is illuminated. At the vernal E. (in Mar.) the sun passes from S. to N., which results in the days lengthening in the N. hemisphere, and from N. to S. in the autumnal, when the days shorten.

Equisetales, or 'horse-tails', a group of large bamboo-like trees which were common in Coal Measure times. They bore whorls of leaves at regular intervals on the stem, as in the typical genus *Calamites*. The leaves are called *Annularia*, *Asterophyllites*, etc., and the sporangia *Calamostachys*, etc. The plants probably lived in waterlogged soil. See also Equisetum.

Equisetum, genus of plants, popularly known as horsetails, of the family Equisetaceae. Of the 20 species of the genus, about half are Brit. In general habit they all bear a strong family likeness to each other, all having stiff, upright, jointed stems, with whorls of little-developed leaves, those of each whorl being united to form a sheath around the stem. They have a creeping, much-branched rootstock which penetrates the ground to a great depth. The fructification is in the form of cones, each of which is borne at the end of an upright stem or branch. The commonest wild species is *E. arvense*. The rough stems of some species, rich in silica, are sometimes used for polishing woods or metals. See also Equisetales.

Equitable Charge. An E. C. or mortgage arises either: (1) from the mortgage of an E. as distinct from a legal interest, e.g. where a *cestui que* trust (i.e. beneficiary of an estate in real or personal property held by trustees) charges his property as security for a loan; or (2) by reason of the form of mortgage being recognised by equity and not at common law. A common law mortgage implies the conveyance by deed of the mortgagor's legal interest to the mortgagee; equity allows the creation of an E. C. (a) by mere deposit of title deeds, or (b) by an unsealed written agreement to deposit without actual deposit of deeds. Generally speaking, the incidents in both legal mortgages and E. Cs are the same, but where property has been mortgaged by deed, whether before or after the creation of an E. C. on the same property, the legal has priority over the E. mortgagee.

Equitable Estates, see ESTATE.

Equites (from Lat. *equus*, horse), horse-men or knights of ant. Rome. At first they formed part of the army. Servius Tullius increased the number of 'centuriae' (hundreds), into which they were divided, from 6 to 18. The first 6 were purely patrician; the latter 12, plebeian. But beside the 'equites equo publico,' who received money for their mount from the state treasury, there were 'equites equo privato,' volunteers providing their own horse. After the second Punic war the knights exerted a political influence second only in importance to that of the senate. They farmed the prov. taxes and constituted the capitalist class. The democrat, Gaius Gracchus (q.v.), used them as a foil to the aristocracy, a policy imitated without intermission up to imperial times, and guaranteed their support by granting them control of the jury courts, as well as the revenues of Asia. Under Augustus many civil posts of honour, such as the prefecture of the corn supply, were open to them after military service. Once more, however, they became primarily soldiers instead of financiers.

Equity. In England E. popularly means natural justice or fair play. Lawyers use the term in a more technical sense as that system of law which has been evolved in the chancery court to provide

relief for wrongs for which the common law offered no remedy. The lord chancellor's court was regarded as a 'court of conscience' which would dispense justice to suitors denied it by the common law courts because of rigid procedural difficulties. These equitable remedies were at first entirely discretionary and, indeed, haphazard, hence the significance of Selden's aphorism that 'equity varies with the length of the chancellor's foot.' By the 18th cent., however, E. had crystallised into a clearly defined system of rules based on judicial precedents. Until the passing of the Judicature Act, 1873, there were 2 systems of law, common law and E., which were respectively administered by the common law courts and the court of chancery. That Act set up the Supreme Court of Judicature which administered both systems. For administrative convenience, however, E. matters are assigned to the Chancery Division of the High Court. (See CHANCERY, COURT OF.)

The administration of E. has been built on a number of maxims which guide the courts in reaching their decisions. These maxims include: (1) E. follows the law (i.e. E. will not interfere with the common law (see LAW) unless there is some important circumstance which it has disregarded); (2) E. will not suffer a wrong to be without a remedy by reason of a mere technical defect; (3) he who seeks E. must do E.; (4) he who seeks E. must come with clean hands; (5) E. looks to the intention rather than the form; (6) E. acts *in personam*; i.e. equitable rights were originally enforced by decrees (q.v.) against persons who could be attached for contempt (q.v.), for disobedience; in modern chancery practice, the court makes orders affecting property (i.e. 'in rem'), e.g. foreclosure orders (q.v.); (7) E. imputes an intention to fulfil an obligation, e.g. it will enforce a covenant; (8) E. looks on that as done which ought to be done (to use a homely phrase, it will see fair play); (9) equality is E. (see COMMON, TENANTS IN); (10) where there are equal E.s (equitable rights), the first in time shall prevail, e.g. a purchaser for value of a house which, unknown to him, is subject to a mortgage, nevertheless, takes it subject to the mortgagee's interest; (11) where there are equal E.s the law shall prevail, e.g. A mortgages his land to B by depositing the title deeds (i.e. equitable mortgage), then later, without disclosing that fact, executes a legal mortgage in favour of C. On the sale of the property, the repayment of C's loan out of the proceeds will have priority, although made subsequently, as he has not only as good an E. as B but also the legal estate; (12) delay defeats E. (see LACHES).

In its widest sense, E. may be described as the ethical notion of fair treatment. In the administration of law, it is effectuated by the principles of judicial impartiality and uniform and consistent interpretation of legislation and case law within the limits of human fallibility

See H. G. Haabury, *Modern Equity*, 6th ed. 1952; G. W. Keeton, *An Introduction to Equity*, 3rd ed. 1952; E. H. T. Snell, *Principles of Equity*, 24th ed. 1954.

Equity, Bill in. see BILL.

Equivalent (of an element), see COMBINING WEIGHT.

Equivalent Circuit, in electrical engineering, a diagram of an electric C. consisting of combinations of resistance, inductance, and capacitance (*R.L.C.*) representing apparatus such as a machine or a transformer as far as its behaviour in a network under different load conditions is concerned.

Equivalents, Chemical, see COMBINING WEIGHT.

Equuleus, constellation, near Aquarius, in the N. hemisphere. The name means 'colt,' and Ptolemy called it 'hippopotamus.' It contains a remarkable double star (δ Equulei) which has the shortest period of revolution, 5.7 years, of any known visual binary. *Equuleus Pictoris* (Painter's Easel) is near Canopus in the S. hemisphere, and is usually called Pictor.

Er Rif, see RIF.

Era, see CHRONOLOGY.

Eran, see IRAN.

Eranthis, genus of tuberous perennials, family Ranunculaceae, 7 species; see ACONITE.

Erard, Sébastien (1752-1831), Fr. maker of musical instruments, constructed his first piano in Paris in 1780. During the Revolution he was in London, and again from 1808-12. He invented the harp with double pedals and the grand piano with double escapement. His instruments won high commendation from the foremost musicians of the day. He was succeeded by his nephew Pierre (1790-1855).

Erasistratus (c. 310-250 BC), famous physician and physiologist, b. at Iulis in the is. of Chios. He was the son of Cleombrotus and Cretoxene, and became a pupil of Chrysippus. About 294 BC he was physician at the court of Nicator, king of Syria, but he later settled in Samos and founded a school of medicine. E. discovered the difference between sensory and motor nerves, and believed the heart to be the origin of veins and arteries. He is called the father of physiology. His works only remain in fragments. See Hieronymus, *Erasistrati et Erasistratorum Historia*, 1790; and Fuohs, 'De Erasistrato Capita Selecta' in *Hermes*, vol. xxix, 1897.

Erasmus, Desiderius (1466-1536), Dutch scholar and theologian, the illegitimate son of Gerard de Praet of Gouda. He styled himself 'Roterodamus,' a native of Rotterdam, though a contemporary document states that he was b. in his father's native tn. He was educ. at St Lebuin's church, Leuven (1475-84), and was a chorister at Utrecht. (On the death of his father in 1484, he went to a seminary at 's-Hertogenbosch, and later joined a religious order in the house of St Gregory's at Steyn, being ordained priest in 1492. Shortly before this he had become secretary to Henry, bishop of Cambrai, and in 1485 entered the college of Montaigne, in

the univ. of Paris, where he won great fame as a scholar. He eked out his living by taking pupils, one of whom, Wm Blount, Lord Mountjoy, persuaded him to visit England in 1498. At Oxford he discussed theology with John Colet and began his friendship with Grocyne, Linacre, Thomas More, and others, but returned to Paris in 1500. In this year he brought out his *Collectanea Adagiorum*, which contained extracts from the Classics and from the Fathers. E. travelled about the Continent considerably, teaching privately and studying wherever he went. In 1506 he went to Italy as the tutor of the 2 sons of Baptista Boerio, Henry VII's physician. There

DESIDERIUS ERASMUS

Engraving after a painting by G. Penn

he made new friendships with such men as Aldus Manutius, the Venetian printer, who pub. for him a new and enlarged ed. of his *Adagia*, entitled *Chiliades Adagiorum*. In 1509 he again came to London and stayed with his friend More. At this time he wrote his brilliant satire called *Encomium Moriae*, in which kings, popes, bishops, and the like, all came under his lash. He now visited Cambridge, where he finished his work on the Gk N.T., and on Seneca and St Jerome, and where he taught Gk and lectured on divinity. E. had now a large circle of disciples, both on the Continent and in England. In 1511 he pub. *De Duplici Copia Verborum et Rerum*, a text-book of rhetoric, and his N.T. appeared in 1516. From 1516 to 1521 he lived chiefly at Louvain, near the court, though he often journeyed to Brussels or to Basel and in 1517 went for the last time to England. At Louvain he prepared his ed. of the *Christian Fathers*. About this time he formed a friendship with Johann Froben, a publisher of Basel,

and in 1521 E. settled permanently in that tn to become Froben's general literary adviser. Between 1516 and 1536 Froben's press issued a remarkable series of the Fathers, including Jerome (1516), Hilarius (1523), Ambrose (1527), Augustine (1528), and Origen (1536), which was largely the work of E., though he had many coadjutors. Froben d. in 1527, and 2 years later E. moved to Freiburg to avoid the religious dissensions that were disturbing Basel, but he returned to the latter tn in 1535, where he d. of dysentery in the following year. E. never left the Catholic Church. The Lutherans he ridiculed in his *Diatriba de Libro Arbitrio*, 1526, and Ulrich von Hutten in his *Sponsia*, 1523; but the papists suffered equally in his *Colloquia*, pub. between 1516 and 1536. He was accused of indifference and of wavering, but it was only natural that such a hard and sure critic should make enemies. E. was a great scholar and humanist, and in no sense a religious reformer. He was fully conscious that many abuses existed in the Church; but he was also more alive than many of his contemporaries to the theological dangers which were the logical conclusion of many of the reformers' policies. There are numerous Eng. trans. of his colloquies and other writings. Complete eds. have been pub. by the Froben Press, Basel, 1540, and J. Le Clerc (ed.), Leyden, 1703-8; F. M. Nichols (ed.), *The Epistles of Erasmus from his Earliest Letters to his Fifty-First Year*, 1801-18; and P. S. and H. M. Allen (ed.), *Opus Epistolarum Des. Erasmi Rotterodami*, 1906-34. See lives and studies by J. Jorten, 1758-60; R. B. Drummond, 1873; J. A. Froude, 1894; P. S. Allen (*The Ages of Erasmus*), 1914; R. H. Murray (*Erasmus and Luther*), 1920; J. Huizinga, (*Erasmus*), 1924; J. A. K. Thomson (*Erasmus in England*), 1930-1.

Erastus, Thomas (1524-83), Swiss theologian, surnamed Liebler, Lieber, or Lüber, b. at Baden, Switzerland, of a poor family. He studied theology at Basel (1540), and later philosophy and medicine at Padua. In 1558 he became prof. of Medicine at Heidelberg and private physician to the Elector Palatine, Otto Heinrich. He was elected privy councillor and a member of the Church Consistory (1559), and prof. of ethics at Basel in the last year of his life. E. was chiefly renowned as a theologian. At the conferences of Heidelberg (1560) and Maulbronn (1564) he upheld the Zwinglian doctrine of the Sacrament of the Lord's Supper as a merely symbolical ordinance, and, through the influence of the Calvinists, he was excommunicated on a charge of Socinianism. His most important work, written 1568, pub. posthumously 1589, was entitled *Explicatio gravissimae quaestiois utrum excommunicatio, quatenus religionem intelligentes et amplectentes, a sacramentorum usu, propter admissum facinus arceat, mandato militatur divino, an excoigata sit ab hominibus*, and upheld the right of the state to punish eccles. offenders. Hence, 'Erastianism' denotes the doctrine of the supremacy of the state in eccles. matters,

though this was supported by Grotius rather than by E. He denied the right of the Church to inflict civil penalties, or to exercise discipline, that appertaining, he maintained, to the province of the civil magistrate. E. also pub. treatises on the theories of Paracelsus, astrology, alchemy, medicine, etc.

Erasure, or **Rasure** (Lat. *radere*, to scrape or shave), the alteration or interlineation of a deed, will, or other formal writing. According to Eng. law, an E. is presumed to have been made at or before execution in the case of a deed or other document. In the case of a will, however, the writing stands without the alteration, unless the witnesses have initialled such alteration and have made a note of it at the end of the will. An alteration made in a deed by a stranger without consent of the parties does not prevent its contents from having effect; if altered by a defendant it may be given in evidence by him, but if by a plaintiff he cannot enforce any benefit that may thereby accrue to himself. In Scotland, the law presumes that the E. was made after execution. If it is desired to make any alteration, addition, or deletion in a deed, such E. must be 'noticed in the body of writ' and must be 'subscribed by the attesting witnesses.'

Erato, Gk goddess of erotic poetry and music, see MUSES.

Eratosthenes (c. 276-c. 194 BC), Gk mathematician and scientific writer, b. at Cyrene. He was a pupil of Callimachus at Alexandria, and subsequently studied philosophy with Aristotle and Arcesilaus at Athens. About 235 BC he returned to Alexandria and succeeded Callimachus as chief librarian. His most famous work was a systematic treatise on geography, of which Strabo made great use. Strabo says that E.'s primary object in geography was to reform the *Map of the World*. E. invented a scientific chronology, fixing the conquest of Troy as the basis of his calculations. He also invented a 'sieve' by means of which prime numbers might be discovered. He measured the earth, and calculated that its circumference measured 252,000 stadia. His book on mathematics is lost, but fragments remain of his astronomical poems, *Hermes* and *Erigone*.

Erbium (symbol Er, atomic weight 168, atomic number 68), a metallic element of the rare earths (q.v.). The rare earth metals are present in the minerals gadolinite, samarskite, euxenite, fergusonite, and cerite. It forms rose-coloured salts and a rose-coloured oxide, the former of which possess a characteristic absorption spectrum.

Erceidounne, Thomas of (c. 1220-c. 1297), also known as Thomas the Rhymer or Thomas Learmont, Scottish poet and seer. From 2 charters of the 13th cent. it appears that he had lands at E., now Earlston, in Berwickshire. A great number of prophetic sayings were attributed to him, from which he got the name of True Thomas; he was said in 1286 to have predicted the death of Alexander III. A

semi-legendary figure like the Eng. Merlin, he was supposed to have been carried off to Elfand by the fairies but allowed to revisit the earth for a time. Sir Walter Scott believed him to be the author of the poem *Sir Tristram*, based on a Fr. original. See J. A. H. Murray (ed.), *The Romance and Prophecies of Thomas of Erceldoune*, 1875; and a study by A. Brandl, 1880.

Erceldoune, or **Ercildoune**, see **EARLSTON**.

Ercilla y Zúñiga, Alonso de (1533-94), Sp. soldier and poet, b. at Madrid. He was attached to the train of Philip II, with whom he came to England in 1554. Soon afterwards he joined a small company who sailed for Chile to crush the revolted Araucanians. Having suffered imprisonment at the hands of his comrades, he was released, and returned to Spain in 1562. His fame rests on his epic poem, *La Araucana*, 1569-89, which has been highly praised by Cervantes and Voltaire. See J. T. Medina, *Vida de Ercilla*, 1948.

Ereckmann-Chatrlian, literary signature of 2 Fr. writers who collaborated in their work. Emile E. (1822-99) was b. at Phalsbourg. He practised law from 1842-1858. Louis Gratien Charles Alexandre C. (1826-90) was b. at Soldatenthal, in Lorraine. He was first a teacher and afterwards a clerk in a railway office. The partnership dates from 1847, and continued till 1889. Their best known novels, often describing life in Alsace, are: *Histoires et contes fantastiques*, 1849; *L'illustre Docteur Mathews*, 1859; *Madame Thérèse*, 1863; *Histoire d'un conscript de 1813*, 1864; *Waterloo*, 1865; *Le Biorus*, 1867; *Le Grandpère Lébique*, 1886. They also wrote dramas: *Le Juif polonais*, 1869; *L'ami Fritz*, 1876; *Les Rantzau*, 1882. See lives by J. Claretie, 1883; E. Hinzlin, 1922; L. Shoumacker, *Ereckmann-Chatrlian*, 1933.

Erdmann, Otto Linné (1804-69), Ger. chemist, b. Dresden; prof. of chem. at Leipzig Univ. from 1827. He devoted much time to the chemical analysis of indigo and other dyestuffs. His *Manual of Chemistry and Principles of Drugs* went through sev. eds. In 1827 he pub. an instructive treatise on nickel, and in 1861 a brochure on the study of chem., which was trans. into sev. languages. In collaboration with Wetherill he directed the *Ger. Journal of Practical Chemistry*.

Erebus, in Gk mythology, son of Chaos, and the father of Aether (upper air) and Hemera (day) by his sister Nyx (night). The word denotes utter darkness, and is used by poets with regard to the gloomy subterranean region through which the departed shades must pass on their way to Hades.

Erebus, Mount, volcano in Victoria Land, Antarctica, discovered by Capt. (afterwards Sir) James Ross in 1841, and named after one of the vessels in the expedition. The volcano is active, and is 13,500 ft in height. Much painted by Edward Wilson (q.v.).

Erechtheum, temple dedicated to the worship of Erechtheus (q.v.), on the Acropolis at Athens. The present remains,

which are of great beauty, date from about 400 BC.

Erechtheus, or **Erichthonius**: 1. An Athenian hero, the son of Hephaestus and Aththis, daughter of Cranaus, secretly reared by Athena, who concealed him in a chest which she entrusted to Agraules, Pandrosos, and Hecse. They opened the chest, though forbidden to do so, and saw a large serpent twined round the child. Filled with fear they committed suicide by hurling themselves from the Acropolis. E. was said to have become king of Athens, and first introduced there the worship of Athena (q.v.), erecting her temple on the Acropolis. He arbitrated between Athena and Poseidon for the patronage of Attica, choosing the former. After death he was placed among the stars, and was worshipped in the Erechtheum on the Acropolis. See **ATHENA**.

2. The grandson of (1) and son of Pandion, whom he succeeded as king of Athens. He fought against Eleusis, and killed Eumolpus, Poseidon's son; whereupon Zeus slew him with a thunderbolt, at Poseidon's request. In ancient mythology these two were one person, but distinguished as two by later writers.

Erembodegem, tn in the prov. of E. Flanders, Belgium, on the R. Dender, S. of Alost. It manufs. lace and cotton. Pop. 10,100.

Eremurus, genus of herbaceous perennials, family Liliaceae, 30 species, of Persia and Turkestan, remarkable for their tall, stately, flowering spikes of white or yellow in summer.

Eretria (modern **Aletria**), ancient seaport of Euboea, Greece, on the Euripus, about 15 m. N.E. of Chalcis. It was of great commercial importance, and had numerous colonies. In 490 BC it was destroyed by the Persians before the battle of Marathon, for its interference in the Ionic revolt (498). During the 5th cent. BC it was subject to Athens, but regained its independence under Philip of Macedon through its leader Phocion (354). It was the bp. of Achaëus and Menedemus. At the modern vil., sometimes known as Nea Psarà, the Amer. School of Athens carried out archeological investigations from 1890 to 1893.

Erfurt: 1. Dist. (*Besirk*) of the Ger. Democratic Rep. (E. Germany), bounded W. by the *Länder* of Hessen and Lower Saxony, N. by Halle, E. by Gera, and S. by Suhl (qq.v.). It was formerly part of Thuringia (q.v.). Area 1378 sq. m.; pop. 1,285,000.

2. Ger. city, cap. of the dist. of E., on the Gera, 145 m. SW. of Berlin. It became a bishopric in 741. In late medieval times it was an important textile manufacturing city and a member of the Hanseatic League (q.v.). During the Thirty Years War (q.v.) it was in the hands of the Swedes; in 1648 it was ceded to the Elector of Mainz, but, refusing to submit, had to be forcibly taken in 1664. It was incorporated with Prussia in 1802. In the 19th cent. its fortifications were demolished, and its limits extended greatly as it developed

into a busy industrial centre. During the Second World War, in April, 1945, following the trapping of the Ger. Army Group B. in the Ruhr, an easy advance was offered to the Allies from Kassel through E. and Leipzig to Dresden; and when this was accomplished, the Allies held the richest industrial area still remaining to the Germans after the loss of the Ruhr and Silesia. E. fell on 12 April. The city has a beautiful cathedral, *Beatae Mariae Virginis*, which dates from the 12th-15th cents., and sev. other fine Romanesque and Gothic churches. In the former monastery of St Augustine, Luther (q.v.) lived as a friar 1505-8. The univ. was suppressed in 1816. There are engineering, textile, and footwear manufs., and there is a trade in flowers, vegetables, and seeds. Pop. 190,000.

Erg, in dynamics, is the unit of energy or work, and is the work done by 1 dyne (q.v.), in moving its point of application through 1 cm. The power of machinery may be measured by the number of Es per sec. of which it is capable. The E. is also equal to the energy of 2 grams moving with a unit speed. See MECHANICS; METROLOGY.

Ergasteria, see LAURION.

Ergoti, see ARGYRO-KASTRO.

Ergosterol, a sterol, so named from its occurrence in ergot of rye. Also found in yeast. It is present in very small quantities as an impurity of cholesterol found in animal cells. When irradiated by sunlight, E. in superficial tissue cells yields up the anti-rachitic vitamin D, vital to health. E. in solution, irradiated by ultra-violet rays, is used to supply deficiencies in vitamin D. Sterols are a class of monohydroxyalcohols which are widely distributed in nature. Their solubilities are similar to fats.

Ergot, or **Spurred Rye**, a diseased condition or fermentation of R. and of other cereals. A sweet yellowish mucus exudes from the ears of the corn on its first appearance. The ears then lose their starch and the ovaries show a whitish tissue of the mycelium of the fungus. Bread that has been made of such infected R. often gives rise to certain nervous complaints, known as ergotism (or, in medieval times, St Anthony's Fire). A serious outbreak of ergotism occurred at the vil. of Pont St Esprit, France, in Aug. 1951. See MATERIA MEDICA.

Erie, name of sev. Dan. and Swedish kings, of whom the best-known is E. XIV (1533-77), king of Sweden (1561-8), son of Gustavus Vasa. Though a cruel and capricious ruler, his acquisition of Estonia marked the beginning of Sweden's overseas expansion. E. limited the power of the nobility in 1561, but after his murder of the Stures in 1567 the nobility rose against him and he was deposed in 1568, his brother John succeeding him. E. at various times considered marriage with Elizabeth I of England and Mary Queen of Scots; but he finally married his mistress, Katrina Månsdotter, a peasant, who alone seems to have been able to control him in his fits of insane temper. He is

believed to have d. from poisoning (1577), administered on his brother's orders.

Erie the Red, Norwegian chief who discovered Greenland in the 10th cent. and sent out expeditions to N. America.

Erica, the typical genus of Ericaceae, containing over 500 evergreen shrubs, some trees, natives of Africa and Europe; up to 470 species of S. Africa. The plants have bell-shaped, 4-parted, hanging flowers, and linear leaves. Brit. species include *E. cinerea*, Bell-heather; *E. ciliaris*, Dorset Heath; *E. tetralix*, Cross-leaved Heath; and *E. vagans*, Cornish Heath. *E. mediterranea* is found in Ireland. The above and their varieties are grown in gardens together with the winter-flowering *E. carnea*, of S. Europe; *E. australis*, Sp. Heath; *E. arborea*, Tree Heath; and *E. scoparia*, the Besom Heath; succeeding best in well-drained, peaty soils. The Cape Heaths, *E. campanulata*, *E. canaliculata*, *E. gracilis*, and hybrids, are popular greenhouse plants.

Ericaceae, family of dicotyledonous shrubs or small trees, about 1500 species of cold, temperate, and alpine regions. Leaves usually alternate, flowers 4- or 5-parted. Plants have strong preferences for lime-free, acid soils. Genera include *Andromeda*, *Arbutus*, *Arctostaphylos*, *Calluna*, *Cassiope*, *Erica*, *Daboecia*, *Gaultheria*, *Gaylussacia*, *Kalmia*, *Pernettya*, *Pieris*, *Rhododendron*, *Vaccinium*, *Zenobia*, etc.

Eriose, see ERYX.

Ericht, **Loch**, lake (14 m. long and from 1 m. to 1 m. broad; greatest depth c. 512 ft), situated partly in Inverness-shire and partly in Perthshire, Scotland, in the dist. of Badenoch on the N., and Rannoch on the S. It lies 1153 ft above sea-level. The lake is drained by the R. Ericht into Loch Rannoch. The neighbouring scenery is wild and rugged; the overhanging mt on the W. side of the lake is Ben Alder (3757 ft). There is good salmon and trout fishing.

Ericsson, **John** (1803-89), Swedish naval engineer, b. Langbanshyttan, Wermland, Sweden. He was first employed as a draughtsman by the Swedish Canal Company (1815), but entered the army in 1820 and served for 6 years. From 1826 to 1839 he lived in England, where, in conjunction with John Braithwaite, he constructed a locomotive engine for the Liverpool and Manchester Railway (1829). He also invented the caloric engine (1833), a screw propeller (1836), and improved appliances for naval steam engines. In 1839 he sailed for the U.S.A., where he became a naturalised citizen in 1848. He built the first Amer. armoured turret ship, the *Monitor*, which was launched in 1862 and fought a month later with the Confederate ram, the *Merrimack*. E. also studied torpedo boats and sun motors and pub. *Solar Investigations*, 1875; and *Contributions to the Centennial Exhibition*, 1877. See life by W. C. Church, 1890.

Ericsson, **Lelf**, son of Erie the Red (q.v.), is said to have furthered the explorations made by his father in Greenland. According to a Norse saga he is said to

have been blown off his course in about AD 1090 and found an unknown land to the W. Some say that this land included Helluland (Labrador), Markland or Woodland (possibly intended for Nova Scotia), and Vinland or New England. However that may be, other voyages followed, and apparently Norsemen got as far S. as the gulf of St Lawrence, perhaps even farther. Eric the Red's Greenland settlement as a result, mysteriously disappeared in the 13th cent., and only with the voyage of Columbus did Europe really discover the New World. See VINLAND. See also A. Williams, *Romance of Early Exploration*, 1904-6; J. Winsor, *History of America, Arctic Exploration and Greenland*, 1886-9.

Eridanos, see Po.

Eridu, ancient city, 5 m. SW. of Ur (S. Iraq). After preliminary investigations by Loftus in 1850 the site, modern Abu Shahrain, was excavated by Thompson and Hall (1918-19) and by the Iraqi Directorate of Antiquities (1938-41) revealing a *ziggurat* (q.v.), and a series of superimposed temples dating from prehistoric to Neo-Babylonian times during which the city was occupied as the seat of the worship of the god of the deep, Ea (Enki). See EA.

Erie, co. seat of Erie co., Pennsylvania, U.S.A., on Lake Erie, 148 m. N. of Pittsburgh and 80 m. SW. of Buffalo. It is situated on many railway lines. It has an excellent harbour, and is a well-built city. Its chief products are lumber, coal, iron-ore, petroleum, fish, and the city's varied manufactures. Foundry and machine shop products, engines, silk goods, and washing machines are shipped. One of its parks is the site of a Fr. fort erected in 1749. This fort was built on Presque Is. by which the fine natural harbour is formed. Pop. 130,803.

Erie, Lake, the most southerly of the Great L.s. forming the St Lawrence system in N. America, lying between Canada and the U.S.A. It is bounded on the N. by Ontario, on the S. and SE. by Ohio, Pennsylvania, and New York, and on the W. by Michigan. It is connected with L. Ontario by the Niagara R., and with L. Huron by the Detroit and St Clair R.s. It is 341 m. long by 30 to 60 m. broad, its area being 9940 sq. m. It is 573 ft above mean sea-level. Its waters are shallow, the greatest depth being 210 ft. On the Amer. side of the L. are the cities of Buffalo and Cleveland.

Erie Canal (now New York State Barge C.), in New York, U.S.A., connects Lake E. at Buffalo with the Hudson R. at Albany and Troy and passes Utica, Syracuse, and Rochester. It was begun in 1817 and completed in 1825, at a cost of over 7 million dollars, the construction being superintended by De Witt Clinton. The length of the system is 525 m., and there are 24 locks. E. C. functioned as a toll waterway until 1882; later railroad competition, its inadequate navigability, and disclosure of a fraudulent canal administration brought about plans for its conversion, with its branches, into the nt Barge C. system. The original

width and depth were 70 ft by an average of about 9 ft, but much money has been expended upon further improvement, in order to allow a shipping-way for vessels of 1000 tons and upwards, and it is now 150 ft broad and has an average depth of 12 ft. Together with the Champlain, Oswego, and Cayuga-Seneca C.s it constitutes the New York State Barge C. System, which is the main route by which grain is brought to New York.

Erie Railroad Company operates a main railway route between New York (New Jersey) and Chicago, Illinois, with branches to Buffalo, Cleveland, Dayton, etc. It holds the capital stock of a number of subsidiary railway C.s and of 4 coal C.s. The latter are the source of much of its fuel supply, and their output forms a large portion of the coal-carrying trade.

Eries, Iroquoian tribe of N. America, now extinct, who formerly occupied the E. and S. shores of Lake Erie. They were nearly exterminated by the Iroquois league in 1656, the survivors of the struggle afterwards joining the Senecas.

Erigena, Johannes Scotus (c. 815-c. 877), medieval philosopher and theologian, probably a native of Ireland. His real name was J. S., E. or Ierigena being an adopted surname, apparently connected with the word Erin (q.v.), and signifying Irishman. Nothing definite is known about his early life. About 846 he visited the court of Charles the Bald, where he became the head of the *schola palatina*. His earliest work that has come to us is *De divina praedestinatione*, which was vehemently attacked on account of its unorthodoxy, and was censured at the councils of Valence (855) and Langres (859). At the request of Charles the Bald, he then trans. the writings of Dionysius the Areopagite. His greatest work was *De divisione naturae*, which was described by Honorius III (1225) as 'swarming with worms of heretical perversity.' E. argues that Universe or God is the ultimate unity of all things, and that all things are worked out through the divine processes. Revelation or religion forms a prominent part in the divine process, while reason or *intellectualis visio* is the prime faculty of man. Haméau fixes E.'s death at about 877, the date of the death of Charles the Bald. There is a most improbable story that about 882 he visited Oxford at the request of Alfred the Great and became the abbot of a monastic school at Malmesbury, where he was stabbed to death by his pupils. The complete ed. of his works was pub. by Migne in 1853 in *Patrologiae cursus completus*, vol. cxxii. *De divisione naturae* has been ed. by Thomas Gale (1861) and C. B. Schlüter (1838). The *De divina praedestinatione* was pub. in Mauguin's *Veterum auctorum . . . opera et fragmenta* (1650) and his poems in L. Traube's *Poetae Latini aevi Carolini* (vol. II, 1896). See St René Tallandier, *Scotus Erigena et la philosophie scolastique*, 1843; T. Christlieb, *Leben und Lehre des Johannes Scotus*, 1860; Alice Gardiner, *Studies in John the Scot*, 1900; and H. Bett, *Johannes Scotus Erigena*, 1925.

Erigeron, large genus of the Compositae; most of the species are indigenous to N. America. *E. philadelphicus* is found in the U.S.A., where it is used as a medicine, possessing stimulant and diuretic properties. *E. acris* occurs in Great Britain, and with sev. other plants is known as fleabane; it has a strong scent which is said to keep away these insects.

Erin, anct name for Ireland. The form was originally Eriu, of which Erinn was the dative case. Eriu later became a dissyllable, Elre. It has been suggested that the word originated from Elre, the wife of MacCool, one of the kings reigning in Ireland at the time of the coming of the Milesians. The name gained popularity through the writings of Thomas Moore.

Erinaceus, see HEDGEHOG.

Erinite (arsenate of copper), occurring in concentric and mammillated layers, is bright green in colour, with a sp. gr. of 4.0 to 4.1. It is found near Limerick.

Erinna (4th cent. BC), Gk poetess, b. at Telos. The belief that she was contemporary with Sappho has now been abandoned. Only fragments of her poems remain, but these were held by the Greeks to rank with those of Homer. Her best-known poem is the *Distaff* which was written in a mixture of the Aeolic and Doric dialects but of which only 4 lines remain. *E. d.* at the age of 19. See E. Diehl, *Anthologia Lyrica Graeca*, 1949.

Eriayae, see EUMENIDES.

Eriophorum, genus of Cyperaceae, grows in N. lands of temperate climate. The

heaths, and the long cottony tufts of hair are sometimes used for stuffing cushions.

Eriostemon, genus of Rutaceae which flourishes chiefly in Australia. *E. obovatus*, *E. buxifolius*, and others, are evergreen shrubs, cultivated in greenhouses for their pretty pink and white blossoms.

Eriphyle, daughter of Talaua, and the wife of Amphiaraua the seer, who tried to evade joining the Seven against Thebes (g.v.). E., bribed by Polyneices with Harmonia's golden necklace, betrayed Amphiaraua, and was murdered by her son Alcmæon for his father's death.

Eris (Lat. *Discordia*), Gk goddess of strife, the friend and sister of Ares (Mars). She sowed dissensions among the gods, and was expelled from heaven by Zeus. Not invited to the nuptials of Peleus and Thetis, she threw the golden apple, *æter pulchriori*, into the assembly and caused the rivalry between Hera (Juno), Aphrodite (Venus), and Athene (Minerva). Paris awarded it to Venus, who rewarded him with Helen, which caused the Trojan war.

Erith, bor. of NW. Kent, England, situated on the R. Thames, 12 m. E. of London, and formerly an important naval station. E. is now an extensive industrial centre, with wharves, general engineering, and manufs. of cables, electrical instruments, plastics, chemicals, radio and television receivers, asbestos-cement, gypsum, wood-preserved, paint, toys, and moulding sand. There are seed crushing mills and Doulton works. Pop. 48,000 (1934).

Eritrea, official name of ex-It. colony on the African coast of the Red Sea. It extends from Ras Kasar, a cape in 18° 2' N., to Ras Demoira in 12° 42' N., a distance of about 650 m.; now a part of the Federation of Ethiopia and Eritrea. Inland the territories of Sudan, Ethiopia, and Fr. Somaliland form the boundaries; the boundaries towards Egypt were determined by a protocol in 1891, and towards Ethiopia by the treaties of 1889 and 1891. E. consists of a high mountainous hog's-back interposed between the Red Sea and the Sudan flanked on E. and W. by flatter regions. The mts range up to 10,000 ft, and Asmara (the cap.) stands 7800 ft above mean sea level. Three distinct climatic zones are found in the ter.: that of the coastlands, that of the escarpments and valleys, and that of the high plateau and Alpine summits. The first one is characterised by great heat and humidity; the second has a more temperate climate, but considerable variation of temp. occurs owing to nocturnal radiation; a moderately cool climate prevails in the third zone. The flora in the zones is what would be expected from the climate, ranging from a tropical nature in the low country to temperate on the plateau. The lion, civet, leopard, camel, and numerous species of antelope are found. There are no navigable rvs. in E.; the chief streams are the Setit, the Mareb, the Baraka, the Anseba, and the Hadasi. Semi-nomadic shepherds form the pop. of the plains and foothills; Afars and Somalis are found chiefly in the S.; whilst the

ERIOPHORUM: COTTON-GRASS

1. Plant. 2. Inflorescence. 3. Seed.

Brit. species, *E. angustifolium*, *E. latifolium*, are called cotton-grass, or cotton-sedge, and *E. vaginatum*, Hare's-tail. They are to be found in marshy and sedgy

plateau is inhabited by Kthioplans. The nomadic tribes are largely of Arab or Hamitic stock, but include sev. tribes of negro origin. Sheep, goats, and camels are kept by the tribesmen, and the products include palm nuts, hides, and some ostrich feathers. Some gold is mined in Hamasen. There are exports of salt. Pearl fishing is carried on at Massawah and the Dahlak archipelago. The prin. tns on the coast are Massawa, Assab, and Zula; those of the interior, Asmara, Mogolo, Saganetti, and Arrasa. The low country is suitable for pastoral

also then incorporated E. as a state or gov. (See under ETHIOPIA.) After 1 June 1936 the dists. of Tigré, Danakiland, and Hausa, formerly part of Ethiopia, were added to E. The It. seat of gov. was Asmara, with 140,000 inhabitants. The religions of the native pop. are the Christian (Coptic rite) and the Mohammedan, and there are some Roman Catholics and a few Pagans. There are 75 m. of railway from Massawa to Asmara, 64 m. from Asmara to Keren, 53 m. from Keren to Agordat and 140 m. from Asmara to Biscia via Keren and Agordat. The

Imperial Ethiopian Embassy

HAILE SELASSIE I STREET, ASMARA

purposes only, but the intermediate zone and the high plateau are well adapted for the cultivation of crops. Irrigation works were carried on by the Italians in the lower zone in order to help intensive production by It. farmer colonists. Pasture is abundant, and the pastoral pop. is partly nomadic. Massawa is connected with Asmara by railway, with Perim by cable, and with Addis Ababa by telegraph. Before the Second World War E. was governed by a civil governor who was responsible to the Ministry of Foreign Affairs at Rome. Italy took possession of the land in 1885, and it was formed into a colony 4 years later. It was from E. that a great part of Mussolini's effort was directed which resulted in the capture of Adowa (Adua) and finally of Addis Ababa, and the estab. by the act of 1 June 1936 of the new It. colony of It. E. Africa which

Italians made new motor roads from Massawa to Asmara and from Asmara to Keren, Agordat, and Sabderat. Wireless telegraphy stations were opened at Asmara, Massawa, Assab, and elsewhere. The total area of E. is 64,000 sq. m. and the pop. about 810,000 (Europeans 50,000). Massawa (15,000), the chief port, has a good harbour. Other centres are Keren (11,000), where were fought the decisive battles in the Second World War campaign in E., Decameré (9000), Adi Ugri, and Agordat. Asmara was captured by the Allies on 1 April 1941 (for full details see ITALIAN EAST AFRICA, SECOND WORLD WAR CAMPAIGN IN (1941)). Thereafter E., together with the other occupied It. colonies, was administered by the Civil Affairs branch of the Army Staff, under a Chief Civil Affairs Officer with H.Q. at Cairo.

Eriu, see ERIN.

Erivan, see YEREVAN.

Eriza, see ERZINCAN.

Erkel, Ferenc (1810-93), Hungarian musician, studied at Pozsony and became a pianist and theatre conductor. He produced 10 operas with Hungarian librettos with which he estab. a distinctive national operatic style.

Erkko, Elias (1895-), son of J. H. E. Publisher of the Finnish daily newspaper *Helsingin Sanomat*; president of the International Association of Newspaper Editors; Finnish foreign minister at outbreak of Second World War.

Erlangen, Ger. tn in the *Land of Bavaria* (q.v.), in the Regnitz (q.v.), valley, 105 m. NW. of Munich. It has a castle (1704) and other good baroque buildings. The univ. (Protestant) dates from 1743. E. has prosperous industries, which originated in the settlement in the tn of Huguenots (q.v.), after the revocation of the Edict of Nantes (q.v.); textiles, tobacco, glass, and beer are manuf. Pop. 55,000.

Erlanger, Camille (1863-1919), Fr. composer; b. and d. in Paris. At the Conservatoire, he was under various masters and in Léo Delibes's class for composition. In 1888 he won the Prix de Rome with the cantata *Velléda*. During residence in Italy he sketched out *Saint-Julien l'Hospitalier* (a dramatic legend founded on a story by Flaubert), which came to be reckoned among his prin. works. Operas: *Kermaria*, 1897; *Le Juif Polonais*, 1900; *Le Fils de l'Étoile*, 1904; *Aphrodite*, 1906; *Hannele Matern*, 1908; *Noël*, 1911; *La Sorcière*, 1912; *Gioconda*, 1914.

Erlau, see ERLEN.

Erlingsson, Thorsteinn (1858-1914), Icelandic poet who brought into Icelandic poetry not only new ideas in matters of religion and social order, but an unusual softness and melody which set a distinctive stamp on all his work. In his satires he is influenced by Byron.

Erlkönig, Der, or **Erl-King**, mythical character who appeared in Ger. literature towards the end of the 18th cent. He is represented as a bearded giant with a golden crown, who lures little children and others to the unknown land of death. Goethe's ballad on the legend has been trans. into Eng. by Sir Walter Scott. Herder, in his *Stimmen der Völker*, 1778, confuses *elle* (Dan. *elf*) with *erle* (Ger. *alder*) in his trans. of *The Elf King's Daughter*. This error was perpetuated and the E. estab. as an alder wraith.

Ermak, see YERMAK.

Ermenario, see HERMANRIC.

Ermeland (anc. *Warmia*, or *Varmia*), dist. of central Europe, inland from the Frisches Haff (q.v.), now in Poland, in the provs. of Gdansk and Olsztyn (q.v.). In the 13th cent. it was a bishopric of the Teutonic knights (q.v.), with its seat at Frauenburg (now Frombork). It went to Poland in 1466, to Prussia in 1772, and to Poland again in 1945. The chief tn is Braniewo (q.v.). Area about 1700 sq. m.

Ermenonville, Fr. vil. in the dept of Oise, 7 m. from Senlis. Rousseau (q.v.), d. here. Pop. 440.

Erment, see HERMONTHIS.

Ermine, name given to the stoat (*Mustela erminea*) when it puts on its white winter coat. During the summer months the fur is a reddish-brown shading into white underneath, but in winter turns to pure white. The tail is black.

Ermine Street, anc. highway which ran from London via Lincoln to York and Hadrian's Wall (q.v.). It was one of four which were traditionally said to enjoy royal protection, and it coincided in part with the Rom.-Brit. road system.

Erne, Lough and River, situated in N. Ireland. The riv. rises in L. Gowna, in co. Longford, and flows generally northward, through L. Oughter until it enters Upper L. E., which is a shallow piece of water about 13 m. long containing numerous is. The riv. passes Enniskillen, and flows through L. E., finally emptying itself in Donegal Bay. L. E. is 42 m. long, is noted for its beauty, and contains trout and pike.

Erne, or Sea-eagle (*Haliaeetus albicilla*), species of Falconidae widely distributed over the Old World. Its diet consists chiefly of fish, but it will also play much havoc with young lambs. In general character and habit it is much like *Aquila chrysaetus*, the golden eagle, but it is smaller, has a longer beak and fewer leg-feathers. The eyrie is built on sea-cliffs difficult of ascent, and in the early spring contains 2 or 3 white eggs.

Ernest I (the Pious) (1601-75), 1st duke of Saxe-Gotha, was the son of John, duke of Weimar. He served in the Thirty Years War, and in 1640 won possession of the duchy of Saxe-Gotha.

Ernesti, Johann August (1707-81), Ger. philologist and biblical critic, b. at Tennstädt, Thuringia; educ. at the Saxon cloister school of Pforta and the univs. of Wittenberg and Leipzig. He was made prof. extraordinary of anc. literature at the univ. of Leipzig in 1742, prof. of rhetoric in 1756, and doctor of theology. By his erudition and method he paved the way for a revolution in theology. He was the founder of the grammatico-historical school; his best work was in hermeneutics. His influence and example inspired men greater than himself; his numerous works include trans. of the classics, and criticisms and trans. of the Bible.

Ernesti, John Christian Theophilus (1756-1802), Ger. scholar, b. Armstadt. He pub. eds. of Silius Italicus and Aesop, and a Ger. version of the prin. works of Cicero. His *Lexicon Technologiae Graecae Ithoricae*, 1795, and *Lexicon Technologiae Romanorum Ithoriorum*, 1797, are very good works of their kind.

Ernestine Line, branch of the house of Saxe, which was founded by Ernest (1441-1488), the eldest son of Frederick II of Saxony. By the 19th cent. the E. L. survived only in the houses of Weimar, Saxe-Meiningen, Coburg, Gotha, and Altenburg.

Ernie, Rowland Edmund Prothero, 1st Baron (1851-1937), politician and author, b. Clifton-on-Teme, son of a clergyman. Educ. at Marlborough and Balliol College,

Oxford, he was a fellow of All Souls from 1875 to 1891. From 1893 to 1899 he ed. the *Quarterly Review*, and thereafter till 1919 was Agent-in-Chief to the Duke of Bedford. Conservative M.P. for Oxford Univ. from 1914 to 1919, he was president of the Board of Agriculture from 1916 and in 1919 was raised to the peerage. He was president of the M.C.C., 1924-5. His pub. include *Pioneers and Progress of English Farming*, 1887; *Dean Stanley*, 1893; *Letters of Edward Gibbon*, 1896; *H.R.H. Prince Henry of Battenberg*, 1897; *Letters and Journals of Lord Byron*, 1898-1901; *The Psalms in Human Life*, 1903; *Letters of Richard Ford*, 1905; *The Pleasant Land of France*, 1908; *English Farming, Past and Present*, 1912; *The Land and Its People*, 1925; and *The Light Reading of our Ancestors*, 1927.

Ernoldus, see ARNOLD.

Ernulf, or **Arnulf** (1040-1124). Fr. Benedictine monk, educ. at Bec under Lanfranc. He was made prior of Canterbury by Anselm, abbot of Peterborough in 1107, and bishop of Rochester in 1114. He was noted for his legal knowledge and his virtuous life. The reference to him in *Tristram Shandy* as a master of cursing is because of a curse which he mentions in his most famous work, a collection of documents concerning canonical law, etc., known as *Textus Roffensis* (now in Rochester Cathedral library).

Erodium, genus of plants, family Geraniaceae, which grows in temperate lands. Brit. species include *E. cicutarium*, Storksbill, *E. moschatum*, Musk Storksbill, and *E. maritimum*, Sea Storksbill.

Eros, Gk god of love. Hesiod first mentions him, as one of the oldest gods, and as the most powerful. He brought harmony out of chaos by uniting the elements. Cronus laid a world-egg in the bosom of Chaos, according to Orphic mythology, and from this egg sprang E. This conception of E. is early. In later times he was the god of sexual passion, son of Aphrodite by Zeus, Ares, or Hermes. He was a wanton child, tormenting gods and men by his arrows, and often represented as blind. In art E. is a beautiful winged boy; he bears bow and arrows, and a burning torch. See CUPID, PSYCHE.

Eros, minor planet which was discovered by Witt at Berlin on 14 Aug. 1898 and has an orbit between the earth and Mars. Its mean distance from the sun is 1.46 times that of the earth; but as the eccentricity of its orbit is large, on those rare occasions when in opposition near perihelion, it could approach the earth to a distance of 16 million m. or less. It was therefore used for a series of observations for determining the sun's parallax in 1900-1 by Mr R. A. Hinks, and by the Astronomer Royal, Sir Harold Spencer Jones, in 1930-1; their investigations were completed in 1941 from the observations of 24 co-operating observatories in various parts of the world.

Erosion, Soil, see SOIL EROSION.

Erpe, Thomas van, also known as **Erpenius** (1584-1624), Dutch Orientalist, who was prof. of Oriental languages at

Leyden and founder of Dutch Arabic studies. He visited sev. univs. in France, Germany, Switzerland, and Italy. In Venice he studied Turkish, Persian, and Ethiopic. His *Grammatica arabica*, 1613, the 1st pub. in Europe, was for long a standard work. Other works: *Proerbiarum arabicorum centurie II*, 1613; *Locmani sapientis fabulae*, 1615; *Grammatica ebraea generalis*, 1621. He also ed. Arabic historical texts and pub. the Arabic New Testament, 1616, and *Pentateuch*, 1622.

Erpeton, or properly **Herpeton**, name given to a genus of non-venomous serpents native to S. Asia.

Erratics, or **Erratic Boulders**, scattered blocks of rock which have evidently been removed by some agency from their original site. What this agency was for a long time employed the minds of scientists, and sev. theories were evolved. The earliest theory was that they had been dislodged from their original positions and transported by the agency of a flood; this is known as the diluvial hypothesis. This theory is now generally discredited. The next theory was brought forward by Sir C. Lyell, who thought that the transport and distribution had been effected by floating icebergs. A widespread submergence of the land of the European continent must have been necessary before this could have occurred. The third theory, that of glacial action, is now generally held as the result of the investigations which were carried out among the Alps, where such E. abound. According to this theory E. B. are isolated masses of rock which have been borne along by ice-sheets for some distance from their original position; the ground moraine which accompanied them has been washed away in course of time. E. B., or perched blocks, as they are sometimes called, are very familiar objects in Alpine glacier dists., but are also easily recognised in regions where there is now no ice. They bear all the characteristic marks of the action of ice, such as erosion, striation, and smoothness of outline. Not only are E. of hard rock transported by ice, but huge masses of stratified rock have been torn from their beds by the same agency. Thus large blocks of Scandinavian rocks are scattered over the plains of Denmark, Prussia, and N. Germany; the masses of chalk in the cliffs near Cromer are well known, and a mass of chalk of about 2,000,000 cub. ft in bulk has been transported a distance of about 9 m. at Firkenwalk. The statue of Peter the Great at St Petersburg (Leningrad) had for its pedestal an E. B. hewn into shape. The B. at Mouthy in the canton of Valais contains 7063 cub. ft, and is large enough to support a small house on the top; it is known as the 'Pierre de Marnettes.' This huge mass has been transported by the action of ice for a distance of over 30 m. down the valley. E. B. are very numerous on the shores of the Firth of Forth, Scotland. Other well-known examples are the fragments of Shap Granite which have been transported by land ice from the Lake District of England to various parts of the Midlands.

Erroll, Earl of, Scottish title, borne by the Hay family since 1452 when Wm Hay was made E. of E. The E. of E. is hereditary lord high constable of Scotland, an honour given to Sir Gilbert Hay in 1315. The present holder of the title is Diana Denyse Moncreiffe (b. 1926), Countess of E. in her own right, who succeeded to it in 1941.

Erromanga, is. of the New Hebrides (q.v.), about 35 m. long and 25 m. broad. It is well watered and extremely fertile. It has been called 'the Martyrs' Isle' on account of the many missionaries who have laid down their lives there, including John Williams and James Harris, killed in 1839, George and Ellen Gordon, killed in 1861, and James Gordon, killed in 1872. Pop. about 1800.

Error, in law, is any mistake in fact, in law, or in the form of process which needs to be rectified either by the court before which the action is tried or by a court of appeal. Since 1875 all appeals in civil suits must be made to the court of appeal. In criminal procedure, an E. in the indictment may be cured by the court which tries the case, or recourse may be had to the court of criminal appeal.

Errors of Observation. The results of any determination of a physical or chemical quantity are always affected by E. due to the inaccuracy of the O. The sources of E. may be classified broadly as:—(1) Inaccurate methods; (2) defective instruments or impure materials; (3) influence of conditions; (4) defects of the observer resulting in the *personal E.* E. due to the first cause can only be detected by special investigations, but may and can be removed by a modification of the method. Instrumental defects can be detected by special tests and a correction can be applied. Thus a balance may not be correct; but a careful investigation will show how far it is inaccurate, and what correction should be applied, provided the E. is not due to a lack of sensitiveness, for which no allowance can be made. In astronomy the changes of the weather, e.g. fluctuations in temp. or barometric pressure, will disturb the amount of refraction; and in the processes of weighing and measuring alterations of temp. will have a very marked effect. If it is possible to do so, the conditions should be reduced to some standard value, or the conditions should be noted and the necessary corrections calculated from a knowledge of the numerical relation between the quantity required and the conditions. The E. due to the observer are of 2 classes: (1) Mistakes which consist in a wrong registration of the value measured. Such E. are preventable and can be detected by repetition or checking by another observer. (2) Those due to the imperfections of the senses, such as defective vision, lack of ability to seize the exact instant of an occurrence, etc. The E. of an O. are usually very numerous, but they differ in their influence on the final result. Some always affect the result in the same direction (though not to the same extent) and are called *constant E.* Others sometimes

increase and sometimes diminish the result, and are called *accidental or random E.* Mistakes and constant E. can be removed; and it is therefore more advantageous to give time and attention to their removal than to make an effort to allow for these E. by calculation. Constant E. can be detected by change of material, of method, of instruments, or of the observer. When the presence of a constant E. has been detected, its cause must be found and steps must be taken to remove it. Accidental E. are often subdued by making a large number of O.s and taking the arithmetical mean or average of the results obtained; the assumption being made that the number and magnitude of the E. in one direction are equal to the number and magnitude of the E. in the other direction. But this method of subduing accidental E. is not applicable to all cases; and recourse must sometimes be had to the method of least squares (q.v.). Many determinations of physical and chemical quantities involve subsidiary measurements. It is important that the subsidiary measurements should be made in such a way that the E. of those measurements have the least effect on the final result. Thus in experiments involving the use of a tangent compass or galvanometer the E. in making a reading will have the least influence on the result if the deflection is about 45°.

Erse, early Scottish corruption of 'Irish', which was applied to the Gaelic kings and the Gaelic dialect of the Highlanders by the Scottish Lowlanders. The term E. is now obsolete, and is not used by the Irish themselves. See GAELIC LANGUAGE.

Ersekülvár, see NOVÉ ZÁMKY.

Erskine, Ebenezer (1680–1756), founder of the Secession Church in Scotland, b. in Berwickshire. He was preacher at Portmoak in Kinross-shire from 1703. After taking part in the Marrow Controversy (q.v.) on the evangelical side, he was transferred to Stirling in 1731. With three others he was suspended in the patronage dispute for upholding the right of the people to choose their own pastor. He was deposed in 1734, and although the sentence was revoked he would not return, and was finally deposed in 1740. Before this he had formed the Associate Presbytery, the origin of the Secession Church, in 1733. The latter was split up in 1747 into Burghers and Anti-Burghers, of which E. headed the former.

Erskine, Henry (1746–1817), lawyer, b. Edinburgh, 2nd son of the earl of Buchan. After a distinguished career at the Bar he became lord advocate. He was noted both for his wit and his oratorical powers.

Erskine, John (1695–1768), jurist, called to the Bar in 1719. After a distinguished career there he was made prof. of Scots law at the univ. of Edinburgh in 1757, and held this post till 1763, when he resigned. His 2 prin. works are still amongst the authorities on Scots law: *Principles of the Law of Scotland*, 1754, and *Institutes of the Law of Scotland*, 1773.

Erskine, John, of Dun (1509-91), reformer, son of the laird of D., Sir J. E.; was educ. at King's College, Aberdeen. The reformers Wishart and Knox were his personal friends, and all through the reign of Mary Queen of Scots, and part of the following reign, E. was a leader and a reconciling influence in the religious quarrels of the time. He held the office of superintendent of the reformed Church of Scotland for Angus and Mearns from 1560 to 1589, and was sev. times elected moderator of the general assembly, although a layman. He was a member of the king's council from 1579.

Erskine, Thomas, 1st Baron Erskine (1750-1823), lord chancellor, served at sea, first as midshipman and then as lieutenant, from 1764 to 1767, when he retired from the senior service and purchased a commission in the 1st Royal Regiment of Foot. Returning to England in 1772, he studied law at Lord Mansfield's suggestion. Six years later he was called to the Bar, and at once achieved great success. In 1783 he took silk, and within 8 years was earning £10,000 a year, the greatest income hitherto made by any lawyer. He entered parliament in 1783, but lost his seat in the following year. He was again returned to Westminster in 1790, but was too much occupied with his professional duties to take an active part in the proceedings of the House. In the Grenville administration (1806) he became lord chancellor, and he was one of the commissioners appointed to inquire into the charges brought against the Princess of Wales. He retired with the ministry in the next year, and did not again hold office. In 1820 he took an active part in securing a fair trial for the queen. For his biography, see J. C. Campbell, *Lives of the Lord Chancellors and keepers of the Great Seal*, 1845-69.

Erstein, Fr. tn, cap. of an arron., in the dept of Bas-Rhin, on the Ill. It manufs. sugar and textiles. Pop. 5500.

Eruptive Rocks, see IGNEOUS ROCKS.

Ervine, St John Greer (1883-), playwright, critic, and novelist, b. Belfast. Moving to Dublin as a young man, he became manager of the Abbey Theatre in 1915. His best-known plays of this period are *Jane Clegg*, 1911, and *John Ferguson*, 1914. In the First World War he served with the Dublin Fusiliers. After the war he settled in London and wrote *Mary, Mary, Quite Contrary*, 1923, and *The First Mrs Fraser*, 1931, a highly successful comedy; others were *People of Our Class*, 1934, *Robert's Wife*, 1937, *Friends and Relations*, 1940, and *Private Enterprise*, 1947. Among his novels are *Changing Winds*, 1917, *The Wayward Man*, 1927, and *Sophia*, 1941. In 1956 he pub. *Bernard Shaw, his Life, Work, and Friends*, a brilliant study, and he also wrote biographies of Gen. Wm Booth and Viscount Craigavon, as well as sev. books on theatre craft. Dramatic critic for various newspapers, from 1933 to 1936 he was prof. of dramatic literature for the Royal Society of Literature, and he held honorary degrees of Belfast and St Andrew's.

Erymanthus, or **Olonos**, mt of Greece, situated in Arcadia, 20 m. S.W. of Patras, 7283 ft high.

Eryngium, genus of umbelliferous plants, occurs in tropical and temperate lands, and consists principally of perennial spiny herbs with flowers in dense heads. *E. maritimum*, the sea-holly or Eryngo, is a native of sandy sea-shores of Europe, and is found in Great Britain; in England it bears the additional names of sea holver and sea holme. The root is candied as a sweetmeat, and has been used in medicine as a tonic and diuretic.

Erysimum, genus of cruciferous plants, contains herbs with many-flowered racemes, all of which flourish in the N. temperate regions. *E. cheiranthoides*, the treacle-mustard, occurs in Britain. *E. peroffskium* is an orange flowering annual; *E. punctatum* and *E. rupestre*, yellow flowering, and *E. linifolium*, purple flowering perennials grown in gardens.

Erysipelas, see SKIN—Diseases.

Erythema, morbid redness of the skin due to congestion of the capillaries, sometimes inflammatory in origin, and disappearing when pressure is made by the finger or a piece of glass, and promptly re-appearing on removal of pressure. There are many causes of E. It may be due to local causes, as heat or cold, friction, accumulation of sweat, or other local irritants; the result of changes in the blood vessels themselves; to substances absorbed through the alimentary canal, such as special articles of diet, and other causes of alimentary toxemia. After the condition has lasted for some time, pigment is deposited in the skin, and the colour due to this does not disappear on pressure. E. is seen in association with infections particularly measles, scarlet fever, typhus, typhoid, and cholera. The treatment of E. consists in treating the cause and in local applications of cooling lotions, powders, or a bland ointment. The appearance of E. is very variable, both in different individuals and in different parts of the body. *Erythema nodosum* is a special condition, with red, oval, raised spots, chiefly on the lower extremities. The lumps are painful, and run their course in from 2 to 4 weeks. Although painful, they do not suppurate or burst. Rheumatism is a common cause, and should be treated as such.

Erythraea, see CENTAURIUM.

Erythrina, leguminous genus of tropical trees and herbs, with bright red flowers and frequently with prickly stems. *E. caffra*, the Kaffirboom, produces a good timber. *E. cristata-galli*, the Common tree of Brazil, is nearly hardy.

Erythromycin, see ANTIBIOTICS.

Erythronium, see DOG'S TOOTH VIOLET.

Eryx, aetn tn which stood on a hill 10 m. NW. of Trapani (q.v.), in Sicily. It was famous for its magnificent temple of Aphrodite, whence the goddess was called *Erycina*. In the Middle Ages the site was occupied by a tn called Monte San Giuliano, and to-day is occupied by the small tn of Erice.

Eryx, genus of oviparous snakes, closely allied to the genus *Boa* in the family Boidae, but the species of *E.* differ from those of *Boa* in having a very short obtuse tail and narrower ventral plates. They occur in Asia and Africa.

Erzberg, see EISENERZ.

Erzberger, Matthias (1875-1921), Ger. politician, b. Buttenhausen and educ. at Freiburg. A member of the Catholic Centre party, he entered the Reichstag in 1903. As secretary of state, in 1918 he conducted the Armistice negotiations on Germany's behalf with the Allies, the terms of which he signed. In 1919 he became finance minister in the new republican gov. In 1920 he resigned and was assassinated a year later.

Erzerum, see ERZURUM.

ERYTHRINA CRISTA-GALLI

Erzgebirge (Czechoslovak Krušné Hory), chain of mts in central Europe, which separates Bohemia and Saxony (now Bohemia and the dists. of Chemnitz and Dresden). The name means 'Ore Mountains,' and silver, lead, copper, tin, and other metals were formerly mined, but the deposits have been largely worked out. There now are important uranium mines. The *E.* stretches ENE.-WSW. for some 80 m., and is bounded on the SW. by the Thüringerwald and on the NE. by the Sudetic Mts (q.v.). On the N. slopes there are fertile valleys; the central part of the chain forms a plateau, while the S. slopes are very steep, in some places almost perpendicular. The highest summit is the Keilberg (over 4000 ft). During the Second World War, following the loss of Jena and Erfurt (q.v.) in April 1945, the Germans retired SE. into the *E.*, although they still clung to the tn of Chemnitz as a pivot to the N., where the South Saxon armies were still putting up a stiff resistance to the Amer. First Army. On the central Ger. front, although elements of the W. allied forces continued to push forward to meet the Russians at Torgau, it was necessary for the main W. allied armies to halt on the lines of the

Elbe and Mulde, through the *E.* See WESTERN FRONT IN SECOND WORLD WAR.

Erzincan, tn in Turkey, situated on the Kara Su, or the W. upper branch of the Euphrates, about 80 m. WSW. of Erzurum, exports fruit, sheep, oxen, and horses. It was taken by the Russians on 26 July 1916. There are frequent earthquakes. In those of Dec. 1939 which occurred over much of E. and N. Anatolia, *E.* was for the most part destroyed and 10,000 persons are said to have perished. The reconstruction of the tn was begun soon afterwards slightly N. of the old tn. Pop. (tn) 18,000; (il) 216,413.

Erzurum, il and tn of Asiatic Turkey, 110 m. SE. of Trebizond, occupying the centre of the Armenian plateau. The country (pop. 521,836) is mainly agric., though salt and coal are found; there are iron, saline, and sulphur springs. An extensive trade in cattle, horses, mules, furs, wheat, etc., is carried on. The tn has a citadel, founded about AD 415 by the Emperor Theodosius the Younger, many mosques and former Dervish monasteries; the former industries have declined; there is petroleum in the vicinity. The chief industries are iron and copper working. In 1517 it was acquired by the Turks, and the Russians took it in 1829 and again in 1878, but by the treaty of Berlin it was restored to Turkey. During the First World War *E.* was seized by the Russians in Feb. 1916 in their campaign against the Turks. After the Russian revolution the Turks recaptured the place in Mar. 1917. Pop. 69,499.

Esarhaddon, king of Assyria, 681-669 BC, son and successor to Sennacherib (q.v.). He invaded Egypt, reaching Memphis and Thebes. In a series of campaigns he subdued the Median princes, with whom he made treaties designed to ensure their loyalty to his sons Ashurbanipal and Shamash-shum-ukin, whom he chose to succeed him as kings of Assyria and Babylonia respectively. See ASSYRIA.

Esau, 'hairy,' son of Isaac and Rebecca (also called Edom), and elder twin of Jacob, so called because he was red and hairy at birth; he sold his birthright to his brother Jacob for a 'mess of red pottage,' whereupon Jacob impersonated his brother and seized from his blind father the blessing intended for the first-born. *E.* became a hunter, and an ancestor of the Edomites (q.v.), who were for centuries enemies of the Hebrews, inhabiting Mt Seir, S. of the Dead Sea.

Esbjerg, seaport in Denmark on the N. Sea, W. coast of Jutland. A harbour was constructed here in 1868 to give Jutland an export haven in place of Schleswig-Holstein, lost in 1864, and to this it owes its rapid rise. It has valuable fisheries, and is an important export centre, chiefly for fish, eggs, bacon, and cattle. Pop. 50,920.

Escalators, moving stairways for transport of passengers. Owing to the fact that stairways can carry more passengers an hour than lifts, *E.* are rapidly taking

the place of lifts on underground railways. The E. consists of a number of steps fastened to an endless belt which follows the incline of the stairway. Each step consists of a separate small trolley running on 4 rollers, which are staggered at the angle of the stairs; the top of the trolley consists of an inverted L-shaped step, which sinks to level at the top and bottom of the stairway. A hand-rail travels round at the same speed as the stairs and is of flexible composition. Powerful electric motors work the moving stairways, and self-operating brakes are fitted to meet the possibility of a sudden breaking of a coupling or of a gear wheel.

ESCALATORS

One of the standard types of escalator in use on London's Underground system, showing 3 staircases

Escallonia, genus of Saxifragaceae, consists of about 50 shrubs with alternate evergreen leaves and red or white flowers. All the species inhabit S. America, on the high grounds especially in Alpine regions. Garden species are chiefly hybrids; *E.* × 'Donard' varieties.

Escanaba, port and railway centre, co. seat of Delta co., Michigan, U.S.A., 60 m. S. of Marquette on a N. arm of Green Bay, in lumber and resort area with commercial and sport fishing. It ships iron ore and manufs. veneer, paper, and foundry products. The Upper Peninsula State Fair is held here. Pop. 15,200.

Escapement, see CLOCK; WATCH.

Escar, see ASAR.

Escarpment, in geology, a steep slope representing the eroded edge of a hard stratum which is inclined at a low angle to the general slope of the land surface.

Escart, see SCHELDT.

Esch, or **Eschen der Aizette**, tn situated in the grand duchy of Luxembourg, with coal and iron mines. Pop. 25,000.

Eschalot (botanical), the shallot (q.v.). Said to have been brought from Ascalon in Syria by the Crusaders.

Eschatology (from Gk for 'last' and 'a discourse'), general title for the religious doctrines concerning the end of the world, i.e., in Christian teaching, the Resurrection of the Dead, the Second Advent (q.v.) or Parousia of Christ, the General Judgment, Heaven, and Hell. E. existed among all the nations of antiquity, whether dark and ill-defined, as in the Gk, or elaborate as in the Egyptian religion; and with it grew up, more or less definitely, the idea of retribution. The Christian teaching has its roots in the O.T. and Jewish thought, expanded and amplified by Christ, who clearly taught that He was to return as the Final Judge. Jewish teaching was much developed by Messianic prophecy and Apocalyptic teaching, which fl. between the time of the Maccabees and the coming of Christ. A. Schweitzer, in his *Quest of the Historical Jesus*, 1911, argued that Christ was a noble but deluded Apocalyptic prophet, proclaiming an *Interimsethik*. This argument has been refuted as a gross exaggeration, but it exploded the Liberal Protestant conception of Christ as a mere gentle and kindly moralist insisting on the Fatherhood of God. Emphasis has more recently been laid on the eschatological outlook of the whole life and worship of the early Christians. For them the last times had already begun, and in a certain sense they were already risen with Christ who had already come again with the Holy Spirit in the Church. This is known as Realized E. But the teaching of the N.T. and the tradition of the Church cannot be confined or reduced to this (cf. 2 Thess. ii. 2). For those who do not recognise eternal punishment as a scriptural doctrine see UNIVERSALISTS and CONDITIONAL IMMORTALITY, and concerning the intermediate state see PURGATORY; PARADISE. Eschatological speculations are to be found in More's *Utopia* and Plato's *Republic*. See ADVENT; JUDGMENT; RESURRECTION; etc.; see also F. Bennet, *Especto*, 1926; G. Dennis, *The End of the World*, 1931; C. H. Dodd, *The Apostolic Preaching*, 1944; E. Hodous, *The N.T. Teaching on the Second Coming* (in *A Catholic Commentary*), 1953.

Escheat (Fr. *echoir*, from Lat. *cadere*, to fall or happen). This term is applied to an incident of feudal tenure whereby land reverted to the lord when there was no tenant qualified to perform the services. Up till 1870 E. took place in England when the tenant was convicted of a capital felony; after that date this kind of E. was abolished. E. still takes place for want of next of kin when the owner of land dies intestate.

Eschenbach, see WOLFRAM VON ESCHENBACH.

Eschscholtz, or **Escholtz**, Bay, 30 m. long, 7-16 m. wide, name of an inlet of Kotzebue Sound, situated in Bering Strait, Alaska. Through this passes the parallel of lat. 67° N., which is the Arctic Circle boundary.

Eschscholtzia, genus of beautiful annuals, family Papaveraceae, and natives of N. America. *E. californica* is the Californian Poppy (q.v.). *E. caespitosa* is a favourite yellow poppy for gardens.

Eschwege, Ger. tn in the Land of Hessen (q.v.), on the Werra, 112 m. NE. of Wiesbaden (q.v.). It has a soap industry, and there are coal and iron mines in the dist. Pop. 24,000.

Eschweiler, Ger. tn in the Land of North Rhine-Westphalia (q.v.), 37 m. SW. of Düsseldorf (q.v.). During the Second World War it fell to Amer. troops after heavy fighting on 22 Nov. 1944. It has important coal, iron, zinc, and machinery industries. Pop. 35,000.

Esobar y Mendoza, Antonio (1589-1669), Sp. churchman and writer. Educ. by the Jesuits, he entered the Society at the early age of 15. He was famous as a preacher. His writings, which fill 40 folio vols., belong to the field of moral theology, and were not popular with many Catholics, who considered that they tended to inculcate a loose system of morality. His statement that purity of intention may be a justification of actions which are contrary to the moral code and to human laws was much ridiculed in France by Molière, Boileau, La Fontaine, and Pascal.

Escoffier, Auguste (1847-1935). Fr. maître-chef, began his culinary career in his uncle's restaurant in Nice. Later he was in the service of a Russian grand duke, and then *chef de cuisine* to the general staff of the Rhine Army in the Franco-Prussian War, 1871, and to Marshal MacMahon at the Champs Elysées. His career in England began after he had left the Grand Hotel, Monte Carlo, to accompany Mr Ritz to the Savoy, London. The acme of his career was reached at the Carlton, and to him belongs the credit for inventing the *bombe Nero* or flaming ice, *entremets fraises à la Sarah Bernhardt*, and *pêche Melba*. Wrote *The Guide Culinaire*, 1903, and *Ma Cuisine*, 1934.

Escomb, vil. in Bishop Auckland urb. dist., co. Durham, England, with a perfectly preserved 7th cent. Saxon church, built largely of stone from a nearby Roman station (*Vinovia*). Pop. (of par.) 1100.

Escorial, El, or **El Escorial** (probably from Lat. *scoriae*, slag), celebrated Sp. building, situated in the prov. of Madrid, 31 m. NW. of Madrid city. It stands 3000 ft above sea-level on a SE. slope of the Sierra de Guadarrama (q.v.). It was erected (1563-84) by Philip II (q.v.), and dedicated to St Lawrence (q.v.), on whose day (10 Aug.) in 1557 the Spaniards defeated Henry II (q.v.), of France at St Quentin. The immense structure, built of granite and measuring 680 ft by 530 ft, is shaped to resemble the gridiron on which St Lawrence was martyred. It contains a monastery, a basilica, a palace, a pantheon in which are the tombs of the Sp. kings, a library, and splendid collections of paintings and tapestries. The (non-official) univ. of E. is known for its law faculty. The surrounding vil. is called San Lorenzo del E. (pop. 6500).

Escosura, Patricio de la (1807-78), Sp.

novelist and poet, b. Madrid. He wrote sev. plays of very unequal merit, amongst which may be mentioned: *Barbara de Blomberg*, *Las Flores de Don Juan*, and *El Tío Marcelo*. His best-known novel is a tale of Philip II, entitled *Ni Rey ni Roque*.

Escrow, see DEED.

Escuage, or **Scutage** (Lat. *scutum*, shield), in feudal times a money tax frequently levied by the crown as a substitute for the personal service of a knight or vassal. First exacted in 1159 and restricted by Magna Carta. It was quite usual for a knight to pay this fee by way of compensation for his personal service.

Escuintla, tn of Guatemala (q.v.), situated 30 m. SW. of the city of Guatemala, with which it has road and railway communication. It is the cap. of the dept of the same name, carries on a considerable trade in sugar, cotton, coffee, and cattle, and is a popular winter resort. Its port is S. José on the Pacific. Pop. 14,000.

Esculic (**Aesculic**) **Acid**, acid obtained from the bark of horse chestnut (*Aesculus hippocastanum*) and similar trees.

Escorial, see ESCORIAL.

Escutcheon, heraldic term for the shield on which arms are painted. The term inescutcheon is used to denote a shield charged upon the E. either as an ordinary charge or as an augmentation of honour. An inescutcheon of pretence or *en surtout* is placed in the centre of an E. and is charged with the arms of an heraldic heiress married to the bearer of the E.

Esdraelon, or **Emek Jezreel**, noted plain of Israel, lying to the SE. of Acre. It is bounded by Mt Carmel on the W., Gilboa on the SE., and the Galilean highlands on the N., and stretches across central Palestine with an average width of 10 or 12 miles, forming a break between the mts of Galilee on the N. and those of Samaria on the S. Formerly little more than a malarial swamp, it has now been brought to a high state of cultivation. Many battles have been fought here, both in ancient and modern times, including those which ended in Lord Allenby's victories over the Turks in 1918.

Esdra, **The Books of**. There is considerable confusion as to the nomenclature of the various B. of E. According to the A.V., the 1st and 2nd B. of E. appear among the apocryphal books. According to the Septuagint Version, the 1st B. of E. appears as E. A, while under the heading E. B. appear the canonical books of Ezra and Nehemiah. Through the influence of Jerome, this arrangement was not followed in the Vulgate. Here the B. of Ezra is styled E. I.; E. II is the B. of Nehemiah, while E. I and II are re-named E. III and IV. These 2 books are relegated to the appendix of the Catholic Bible as uninspired and entirely apocryphal. The date of E. I is probably the 2nd cent. BC. It is a compilation consisting of: (1) Trans. of part of Ezra, (2) part of Nehemiah, (3) part of Chronicles, and (4) an original portion giving the discussion of Darius and the 3 young men. The trans. is free and in superior Gk to

that of E. B. in the Septuagint. The 2nd B. of E., the most pathetic of the Jewish apocalypses, dates from the last years of the 1st cent. AD. It contains 16 chapters, of which ch. i., ii., xv., xvi. are later additions, the first 2 chapters certainly being by a Christian author. The rest of the book tells of 7 visions shown to the prophet Ezra, the whole being in the extreme pessimistic tone of the school of Shammal. It is not yet settled in what language E. II was originally written. It now survives only in versions in Lat., Syriac, Ethiopic, etc. See C. Torrey, *Ezra Studies*. 1910.

Esfahan, see **ISFAHAN**.

Esh, tn and par., Durham, England, situated on a height 4 m. WNW. of that city. Nearby is the Rom. Catholic college and seminary of St Cuthbert, Ushaw (q.v.). E. colliery is in the vicinity. Pop. (par.) 7140 (1954).

Esher, **Reginald Balliol Brett**, 2nd Viscount (1852-1930). In 1903 he became chairman of the War Office Reconstitution Commission. He acquired some distinction as a writer, having pub. *Footprints of Statesmen*, 1892, *The Correspondence of Queen Victoria*, 1907, and *The Tragedy of Lord Kitchener*, 1921.

Esher, **William Balliol Brett**, Viscount (1815-99), lawyer, b. London, son of the Rev. Joseph B. of Chelsea. Educ. at Westminster and Caius College, Cambridge; called to the Bar, 1840; Q.C., 1861. In the House of Commons he was prominent in promoting bills relating to the administration of law and justice. As a justice of the court of common pleas he provoked criticism for some of his sentences in strike cases. On the reconstruction of the court of appeal he was made a lord justice. He succeeded Jessel as master of the rolls (1883). And retired from the bench in 1897, when he was created a viscount. The Solicitors Act of 1888, which enhanced the powers of the Incorporated Law Society owed much to E.'s influence.

Esher, vil. and urb. dist. in the co. of Surrey, England, about 15 m. SW. of London. A 300-year-old clock is keeping good time in the church. To the east of the vil. is Claremont, built by Clive of India. It was purchased in 1816 for the Princess Charlotte on her marriage with Prince Leopold of Saxe-Coburg, and she d. there on 6 Nov. 1817. Louis Philippe, the exiled Fr. king, d. there in 1850, and his queen in 1866. Claremont Woods were recently acquired for the public by the National Trust, on whose behalf they are managed by E. Urb. Dist. Council, and are open from early morning to dusk, according to season. Cardinal Wolsey lived in a mansion here, of which the gateway remains. Sandown Park race course adjoins the station. Pop. (Ward) 4740; (Urb. Dist.) 51,610 (1953).

Eshowe, small tn of Natal, South Africa, situated about 30 m. NE. of the estuary of the R. Tugela, overlooking the Indian Ocean; unofficial cap. of Zululand (q.v.). Pop.: whites, 1376; Bantu, 1793; others, 437.

Esk, name of numerous Scottish and Eng. rvs. Among the chief are: (1) The

N. Esk flowing through Kincardineshire and Angus, Scotland, rising near Edzell, and flowing into the North Sea, 4 m. from Montrose; length about 30 m. (2) S. Esk, rising in the Grampians, flowing through Strathmore to Montrose harbour, with Brechin and Montrose on its banks; length about 50 m. (3) A riv. of Dumfriesshire, formed by the confluence of the Black and the White E. in Eskdalemuir, flowing 35 m. to the Solway Firth, near Sarkfoot. (4) Two small streams, N. and S. Esk, rising in Peeblesshire, and flowing through Midlothian. They unite at Dalkeith, flowing into the Firth of Forth at Musselburgh. The N. branch passes Roslin Castle, Hawthornden, Habbie's Howe, Melville Castle; the S. branch, Dalhousie Castle and Newbattle Abbey.

Eskdale, valley of the Cumberland Esk, England, which rises between Scafell Pikes and Bowfell, forms the Esk Falls at Throthgarth, turns W. at Butteriket below Hardknott Castle (Rom. fort), and flows between Muncaster Fell and Birkby Fell to Ravenglass. From Ravenglass a narrow-gauge railway runs up the valley to Dalegarth. Part (586 ac.) of the valley is owned by the National Trust and part (827 ac.) is protected against afforestation or other development.

Eskdalemuir, par. of Dumfriesshire, Scotland, about 12 m. from Langholm. There is a National Magnetic Observatory to replace the one which was formerly at Kew. Sheep farming and forestry are carried on. Pop. about 400.

Esker, geological and geographical term applied to certain deposits formed by streams running below glaciers. These subglacial streams run in tunnels at the base of the ice, and being totally confined can cross undulating surfaces provided a sufficient head of water is present. The clays, sands, and gravels deposited by such streams form long sinuous mounds which may extend for sev. m. These Es may remain when the ice retreats to form ridges which cross the irregularities of the countryside as did the streams which laid them down. Es have been used as a foundation for roads and railways, for they often provide a convenient way of crossing hollows left in once glaciated country. (See also GLACIERS and GLACIAL PERIOD.)

Eski-Dzhumaya, see **TARGOVISHTA**.

Eski Zagora, or **Eski Sagra**, see **STARAZAGORA**.

Eskilstuna, tn in Sweden, 57 m. W. of Stockholm. Sometimes called the Sheffield of Sweden on account of its iron, steel, and copper works. Pop. 57,108.

Eskimo, or **Eskimaun Indians** (commonly called **Eskimos** or **Uquesmonds**), race dwelling on the N. coasts of America, from Labrador to Mt St Elias, and also occupying Baffin Land and the shores of Greenland. They are known as Inuits (a word signifying 'man') in their own tongue; the word 'E.' being said to be a term of reproach meaning 'eaters of raw meat', applied to them by some Indian neighbours, the Algonquins, living S. of them. The E. are a race of the yellow type, but of a lighter colour than the Algonquins and

rather smaller in stature. Their sustenance is chiefly derived from the capture of seals, which are their staple food and very valuable to them in numerous other ways, supplying them with dog-food, boots, clothing, tents, light, heat, and harpoon lines. They also procure food by pursuing the chase on land and by fishing. The *kayak*, a small slim boat for 1 man, is their most interesting and best-known invention for hunting. Its framework is covered with skin, and, with the waterproof

New York Times Photos

ESKIMO WOMEN

jacket worn by the man, it completely protects him from the waves, so that even if he capsizes he is able to rise unhurt by means of his paddle. The dog-sledge is in use everywhere amongst the E., except by those in SW. Greenland, and the E. dog is admirably adapted for use in sledge transport, being strong and powerful. The E. are a cheerful and generous race, and are friendly and hospitable to strangers. Their pastimes are athletic sports and dramatic entertainments, and their children mimic the elders on a small scale. Their dwellings are of 2 kinds, tents for summer and houses, huts, or igloos for winter. The tents are generally made of sealskin; but the winter dwellings are usually built of stone, covered with moss and banked up with snow, the entrance consisting of a long passage, only high enough to admit a man crawling on hands and knees; indeed, in some parts, N. Alaska,

for example, the huts are half underground. Some of these winter dwellings shelter as many as 40 or 50 persons. The E. men and women are clad alike in trousers of seal or deer skin, according to the season, and in a loose-fitting shirt, surmounted by a hood, which is enlarged for women and children. The E. are very ingenious in their manufactures, and during the long winter days indoors the men make carvings of walrus ivory, horn, stone, and wood, for use as well as ornament. The women spend most of their time in making the clothing and tents. As to the religion of the E., he believes all things to be ensouled, and innumerable spirits to abound everywhere. The E. pop. of Canada is about 9000, that of Alaska 15,576. Although most E. still live the life pictured above, many of them have been influenced by the presence of new air buses, radar stations, laboratories, etc., erected in N. Greenland, Alaska, and Canada. They often hunt or trade with their own motor schooners and are skilled mechanics. The Dan. and Canadian govts. try to preserve the life, culture, and self-sufficiency of the E. by moving them to better hunting grounds, even, as at Thule (q.v.), by moving a whole vil. away from the air base, but in most of Greenland (q.v.) a mixed race has arisen adapted to modern ways of life, and existing chiefly by cod fishing. See F. Nansen, *Eskimo Life*, 1893; V. Stefansson, *My Life with the Eskimos*, 1913; K. Birket-Smith, *The Eskimo*, 1936; R. Finnie, *Canada Moves North*, 1942, 1948; A. Gilberg, *Eskimo Doctor*, 1947; R. Harrington, *The Face of the Arctic*, 1954; H. Ingstad, *Nanumtut*, 1954; J. Malaurie, *Les Derniers Rois de Thulé*, 1955. See also AMERICAN INDIANS; GREENLAND; RASMUSSEN, K. J. V.; THULE.

Eskimo Dog, sledge-D. used in the Arctic regions. It is broad-chested, with a stout, thick neck, erect ears, and long, sharp muzzle, not unlike the grey wolf of the prairie. It is only half domesticated, and does not bark, but howls like a wolf. E. D.s have a great deal of staying power; they are rarely fed by their E. masters, which perhaps accounts for their sharp

There are 2 breeds. The wolf-like Ostiaks and the Sumoyeds (q.v.).

Eskisehir, tn in Asiatic Turkey. It has celebrated warm springs and valuable deposits of meerschaum in its immediate vicinity, pipes of the material being manuf. in the tn. The Greeks were defeated here by the Turkish Nationalists in April 1921. The Muslims were defeated near here by Godfrey de Bouillon in 1097. Pop. 122,755; (il) 324,614.

Esmeraldas, tn in NW. Ecuador, bordering on Colombia on the riv. of the same name, and cap. of the prov. of E. (area 5800 sq. m.). The name is derived from the old emerald mines in the vicinity. Vessels anchor outside the bar (depth, high tide, 10 ft) and load and discharge by means of launches. E. is the centre of a rich agric. dist., and the H.Q. for a number of merchants and mining

companies. Straw hats are manuf. and gold is mined. There is a customs house and an airfield. Pop. (prov.) 89,300; (tn) 16,000.

Esna, tn of Upper Egypt, 25 to 30 m. S. of the ruins of Thebes, on the l. b. of the Nile. It is celebrated for the ruins of a vast ant. temple to the ram-headed god Khnum, built in the time of the Rom. emperors Claudius and Vespasian and others, and also possesses a Coptic monastery. Its chief manufs. are pottery, shawls, and cotton, in which commodities it carries on an active trade. A barrage was built and opened in 1909 to hold up the Nile water in low floods.

Esop, see AEsOPUS.

Esoteric and **Exoteric** (Gk *esōterikos*, inner, and *exōterikos*, outer), terms originally derived from the ant. 'mysteries,' the first designating doctrines intended only for the initiated, the second those intended for the uninitiated or general public. By analogy these words have been used to mark distinctions thought by some to exist between certain classes of the writings of Aristotle and other philosophers. Aristotle himself uses only the term 'E.' but scholars are not agreed as to his meaning.

Esox, or *Esox lucius*, the generic name of the pike, which belongs to the family *Esocidae*. It is characterised by the absence of scales on the head, by a long narrow body terminating in a forked caudal fin, and by a long, broad, depressed snout in which the upper jaw exceeds the lower in length. The pike inhabits the fresh waters of Europe, America, and Asia, and not uncommonly attains a length of 45 or 46 in., with a weight of 35 or 36 lb. It is the most voracious and greedy of all fresh-water fish, and will devour all kinds of smaller fish, even the young of its own kind.

Espalier (Fr. railing for fruit-trees; It. *spalliera*, from *spalla*, a shoulder), railing on which fruit trees are trained. The term E. is also applied to the system of training plants to grow as E.s on a trellis (E.). E.s may be constructed of wood, iron, or, more cheaply, by means of strong wire, supported by upright wooden or iron posts. E.s have the advantage of protecting the fruits to a great extent from the wind, and thus preventing a large quantity being shaken off before they are properly ripened. The most suitable fruit trees for E.s, commonly grown in Great Britain, are apple and pear trees. Their treatment is usually similar to that of wall trees, but they are generally trained to form horizontal branches. For the raising of E.s, plants of 1 year should be chosen and planted at distances that will allow of each one covering a surface of about 20 sq. yds. The stem should be cut about 12 in. from ground-level in about a year from planting, immediately above 3 buds. Lateral branches will then be formed by 2 of these buds, while the highest one will form the extension of the stem, and these 3 stems must be kept in an equal condition of vigour during the summer. During the 2nd year no more lateral branches must be allowed to grow, but after this a fresh pair

of lateral branches can be allowed to grow each year. The wood of the tree will be fully estab. in about 16 years.

España, see SPAIN.

Espartero, Baldomero (1792-1879), Sp. soldier and politician, b. Granatula, La Mancha, the son of a cartwright. He fought against Napoleon, and later against the rebels in S. America. He played an important part in the Carlist wars, and as commander-in-chief concluded the treaty of Vergara in 1839, which brought the wars to an end. In 1841 he became regent, but he was driven out of Spain 2 years later by a counter-revolution. In 1854 he was recalled to save Isabel II's throne, and ruled as a virtual dictator until his retirement from public life in 1856. He was later created prince of Vergara.

Esparto Grass, *Alfa*, *Halifa*, or *Stipa tenacissima*, species of Gramineae closely allied to the feather-G., and occurs in N. Africa. It is a graceful plant often cultivated in Britain for its beauty, and is largely used in the manuf. of paper. Two other species of G., *Lygeum Spartum* and *Ampelodesma tenax*, both of which are to be found in Africa and round the Mediterranean, serve the same purposes as E. G.

Esperanto, most famous international auxiliary language: It was invented by Dr L. L. Zamenhof, an oculist of Warsaw. Its first grammar was pub. in 1887 under the pseudonym *Doktor E.* (i.e. 'Hopeful'), hence the name of his language. The 1st jour. in the language, *La Esperantisto*, which was issued in 1889 from a press in Nuremberg, was suppressed, as the Russian Gov. forbade its entry into Russia on the ground that the jour. contained contributions by Tolstoy. The language, which in 1895 had spread to France, began an era of rapid progress from the 1st international congress, held in Boulogne in 1905. In construction, E. differs fundamentally from its predecessor, Volapük. Every word, before incorporated into Volapük, underwent a process of mutilation, and the author (Abbé Schleyer) did not even hesitate to create words arbitrarily. ('Volapük,' e.g., is a corruption of 2 Eng. words, 'world' and 'speech'.) On the other hand, E. is based, broadly speaking, on the principle that, with a view to attaining the maximum of internationality, the vocabulary of the international language should consist of root-words which are found to be common to sev. languages of Romance and Germanic origin, due attention being paid to other factors. International words (e.g. theatre, nature, park, character, centre, form, telephone) are incorporated into the language without change, beyond conformity with the orthography. E., too, is strictly phonetic, its 28 letters representing distinct sounds, and there are no digraphs. Each part of speech has a distinct termination, e.g. nouns end in o, adjectives in a, derived adverbs in e; there is only one conjugation to the verb, which has 12 terminations; the prepositions have a clearly defined meaning, and by the aid of some 30 prefixes and suffixes the language assumes a wonderful

flexibility. The 'constitution' of E., according to its protagonists, guards the language from arbitrary or capricious changes, while at the same time allowing great latitude in adaptation of new words to the international setting. The author of E. (see the 'Declaration' of Boulogne, etc.) disclaims any rights of ownership or control of the language. This attitude is of vital importance, as it was on the question of ownership that Volapük came to grief. The evolution of E. is directed by a Linguistic Committee (of 100-120 members) and an Academy (of 18 fellows). The H.Q. of E. in England is the Brit. Esperanto Association, 140 Holland Park Avenue, W. 11. The Universala Esperanto-Asocio (with its H.Q. at Geneva) is an association founded to utilise the auxiliary language for tourist and commercial purposes. The following is the Lord's Prayer in E.: 'Patro nia, kiu estas en la ĉielo: Sankta estu Via nomo: Venu reĝeco Via: Estu volo Via, kiel en la ĉielo, tiel ankaŭ sur la tero: Panon nian ĉiutagan donu al ni hodiaŭ: Kaj pardonu al ni ŝuldojn niajn, kiel ni ankaŭ pardonas al niaj ŝuldantoj: Kaj ne konduku nin en tenton: sed liberigu nin de malbono: ĉar Via estas la regado, la forto, kaj la gloro, eterne. Amen.' E. has a considerable following and has had an experience in use which no other so-called international language has now or ever has had. The League of Nations in 1924 recommended that the States Members should grant to E. 'as a practical auxiliary language for international communication side by side with the national language in use,' the treatment and charges in force for a language *en clair* in telegraphic and wireless communications. In 1925 the International Telegraphic Union accordingly recognised E. as a plain language. Regular broadcasts have been given in E. from a number of radio stations. See IDO. See also A. Zakrzewski, *Historio de Esperanto*, 1913; A. Möbush, *Dokumentoj de Esperanto*, 1921; E. Privat, *Historio de la lingvo*, 2 vols., 1923-7; E. Drezen, *Analiza historio de Esperanto-movado*, 1931; and also P. E. Stojan, *Bibliografio de internacia lingvo*, 1929.

Esperet, Franchet d', see FRANCHET.

Espionage, the organised employment of secret agents by govts. to obtain information concerning other countries which cannot be obtained by open methods. It also includes the dissemination of false information intended to deceive other countries. As the essence of espionage is secrecy, it follows that any treatise upon the subject, purporting to give details of the inner workings of any particular current system, must be regarded with doubt. The value of secret information is immense, because it gives the receiver a definite advantage over the opposite party, and by no one is this appreciated more than by military commanders. An early example of spying is to be found in the O.T. where Moses sent men to 'spy out the land of Canaan.' One novel method of conveying information to the authority concerned is that employed by Histiaeus

when at the court of Darius, king of Persia. He was watched so minutely that he hit upon the idea of shaving his servant's head, writing a message on the head, and then, when the hair had grown again, sending him to the person concerned.

Before the First World War Germany had a well-developed secret service, and it is estimated that over 20,000 of her agents were in France in various occupations. There is always a note of picturesqueness connected with spying, mainly owing to the fact that it appeals only to the more adventurous spirits who have the dual gift of caution and boldness. Among the First World War spies Colonel T. E. Lawrence and Mata Hari will be remembered. The former was Brit. and operated in Egypt and Palestine; whilst the latter was a Javanese woman who operated in France on behalf of Germany. She was caught and executed.

In Great Britain the organisation entrusted with the security of the state is Military Intelligence No. 5 (M.I.5), part of the War Office. Its task is to stop agents of foreign powers, or even misguided Brit. subjects, from knowingly or unknowingly transmitting the secrets of Britain to any country abroad, whether that country be hostile, neutral, or even friendly. The chief function of M.I.5 is counter-espionage. Foreign agents, or terrorists, who operate in this country with a fixed plan of campaign, are usually foiled by M.I.5 sooner or later. On such occasions M.I.5 normally co-operates with the Special Branch of Scotland Yard.

Prior to the outbreak of the Second World War German secret service agents or Nazi spies were actively engaged in undermining public allegiance in most countries of the world, and securing bands of Nazi sympathisers ready to co-operate with Germany as soon as any particular country was invaded. This wholesale system of E. was, to some extent, responsible for the rapid military collapse of Poland; it was even more effective in the downfall of Norway and Holland, in both of which cases Norwegian and Dutch collaborators helped to bring about the collapse of their countries' resistance to invasion. During the invasions of all these countries the Gers. adopted the practice of dropping in parachutes soldiers, persons disguised in the uniforms of the Allies, and persons habited as civilians behind the invaded country's battle lines and even in the heart of the country itself. In international law there can be no doubt that parachutists, if not regular soldiers, should be treated as spies. Since the war there has been sensational evidence of the activities of Soviet agents all over the world, especially in U.S.A. and Canada in connection with the atom bomb. See M. Richings, *Espionage: The Secret Service of the English Crown*, 1935; J. Thompson and S. Padover, *Espionage: Secret Diplomacy, 1800-1815, 1937*; R. Hirsch, *The Soviet Spies*, 1947; I. Gouzenko, *This was my Choice*, 1948. See also FIFTH COLUMN.

companies. Straw hats are manuf. and gold is mined. There is a customs house and an airfield. Pop. (prov.) 89,300; (tn) 18,000.

Eena, tn of Upper Egypt, 25 to 30 m. S. of the ruins of Thebes, on the l. b. of the Nile. It is celebrated for the ruins of a vast anct temple to the ram-headed god Khnum, built in the time of the Rom. emperors Claudius and Vespasian and others, and also possesses a Coptic monastery. Its chief manufs. are pottery, shawls, and cotton, in which commodities it carries on an active trade. A barrage was built and opened in 1909 to hold up the Nile water in low floods.

Esoo, see **AKSOPUS**.

Esoteric and **Exoteric** (Gk *esōterikos*, inner, and *exōterikos*, outer), terms originally derived from the anct 'mysteries,' the first designating doctrines intended only for the initiated, the second those intended for the uninitiated or general public. By analogy these words have been used to mark distinctions thought by some to exist between certain classes of the writings of Aristotle and other philosophers. Aristotle himself uses only the term 'E.' but scholars are not agreed as to his meaning.

Gouzenko, *This was my Choice*, 1948. See also FIFTH COLUMN.

Espírito Santo, maritime state of Brazil, first occupied by the Portuguese in 1535. It is bounded N. by Bala, W. by Minas Gerais, S. by Rio de Janeiro, E. by the Atlantic. There are tropical forests on the slopes of the Serras dos Aimorés and Negra. It is swampy near the coast. Rio Doce, the chief riv., divides it into two; the Paraliba do Sul is on the S. boundary. The area is about 15,735 sq. m. The cap., Vitória (q.v.), on E. S. Bay, is the best harbour. E. S. is well watered and very fertile, and produces coffee, sugar, fruit, corn, and timber. There are iron-ore deposits in the state, which is well served by the central group of railways. There are Ger. colonists with their own schools and churches, and also many Italians. Pop. 861,000.

Espiritu Santo, or **Santo**, largest is. of the New Hebrides (q.v.), 75 m. by 45 m., heavily wooded and well watered. There are a number of Brit. and Fr. settlers. Coconuts, cotton, cocoon, and maize are grown. Pop. 4000.

Espólin, Jón (1769–1836), Icelandic administrator, historian, and poet. His *Arðakur Íslands* is indispensable for the student of the hist. of Iceland.

Espronceda, José de (1808–42), Sp. poet and revolutionary politician. He was early imprisoned by the gov. for his radical views (c. 1825), and banished shortly afterwards. E. wrote the historical romance, *Don Sancho Saldaña ó el Castellano de Cuellar*, 1834. Returning to Madrid, he took part in the revolutionary contests (1835–6). He was a romanticist, and Byron's influence in his writings is very marked. His best work was lyrical poetry, such as *El Diabolo Mundo*, *El Estudiante de Salamanca*, *A la Patria*, and *El Mendigo*. See J. Cascales Muñoz, *Don J. de Espronceda: su época, su vida y sus obras*, 1914; E. Pujals, *Espronceda y Lord Byron*, 1951.

Esquimalt, seaport tn of Vancouver Is., Canada, important as a naval station on the Pacific. It contains a naval yard, dry dock, arsenal, and hospital. There are a salmon cannery and a ship-building yard and an extensive harbour on the Juan de Fuca Strait. Pop. 10,174.

Esquire (Old Fr. *escuyer*, from Lat. *scutarius*, shield-bearer), originally the attendant on a knight and bearer of his shield or armour. He ranked below the knight bachelor, and his office served as the apprentice-stage of knighthood. The title was one of function, not birth, and was not hereditary. It came to be a title of honour, implying a rank between that of knight and valet. According to Coke (2 *Institutes*, 688), anyone may be called E. (usually written Eq.) who has a legal right to call himself a 'gentleman,' i.e. one who lawfully bears a coat-of-arms. The title is widely used now by courtesy for men of all ranks, and almost without discrimination. Those legally entitled to bear it include sons of peers or knights and their eldest sons, officers of the army and navy, and members of the Bar. E. has followed much the same course as the word 'gentleman.' See also SQUIRE.

Esquiros, Henri François Alphonse (c. 1812–76), Fr. poet, politician, and historian. He wrote both poems and novels of a strong socialistic tendency, and was imprisoned for his *L'évangile du peuple*, 1840. E. went to Holland and then to England, sending studies to the *Revue des deux Mondes*, afterwards known as *L'Angleterre et la vie anglaise*, 1859–70. Other works are: *Les Hirondelles*, 1834; *Charlotte Corday* (a novel), 1840; *Chants d'un prisonnier*, 1841; *Les Vierges martyres, les Vierges folles, les Vierges sages*, 1841 2; *Histoire des Montagnards*, 1847; *La Morale universelle*, 1859; *L'Émile du XIX^e Siècle*, 1870.

Essad, Ahmed Pasha (c. 1875–1920), Albanian chieftain who, during the Balkan War (1912–13), defended Scutari against the combined Montenegrin and Serb forces. The family of E., the Toptanis, came from Tirana, near Durazzo, and was of considerable wealth and power—E.'s brother, Gani, being the special friend of, and executioner to, the Sultan Abdul Hamid. When the Sultan had Gani put to death, E. became the sworn foe of the Hamidean régime. He joined the Young Turk revolution in 1908, and from then till 1912 represented Durazzo in the Turkish parliament. When Prince Wilhelm of Wied became Mpret in 1914, E. became his minister of war and of the interior and virtually ruled the country. After Wilhelm left Albania E. made himself head of the Albanian Provisional Gov., 5 Oct. 1914, and sided with the Allies in the First World War. When enemy forces drove him from Albania, he retired to Salonika. His Serbian sympathies made him unpopular with the Italians and he was not allowed to return to Albania. He was murdered in Paris by an Albanian student.

Essay (Fr. *essai*, attempt). What is now generally understood by an E. is a literary composition of moderate length on any given subject other than purely scientific. It should treat of life in general, and not of any specialised subject. It originally implied a want of finish, and Dr Johnson defined it as 'an irregular, undigested piece.' An E. is strictly rather a series of personal comments than a finished argument or conclusive examination of any matter. A number of works of antiquity, such as Cicero's *De Amicitia* (On Friendship) and *De Senectute* (On Old Age), and the moral discourses of Seneca the Younger, could quite properly be classed as E.s. As a separate form of Eng. literature, it dates from the close of the 16th cent. The name appears to have become common on the pub. of Montaigne's *Essais*, 1580. The first great name connected with the hist. of the Eng. E. is that of Bacon (1561–1626). Abraham Cowley may, however, perhaps be more truly regarded as the father of Eng. E. His E. *Of Myself* may be taken as a typical example of what such compositions should be. Other essayists of the 17th cent. were Sir Thomas Browne, Sir Wm Temple, and Dryden. The 18th cent. was the great age of E.-writing. In 1711

Joseph Addison and Richard Steele founded the *Spectator*, thus popularising the E. as a form of literature in England. The *Tatler* and the *Guardian* also contained numerous examples of typical E.s, mostly the work of Steele and Addison. Fielding's E.s appeared in the *Covent Garden Journal*, 1752; Dr Johnson's in the *Rambler*, 1750, the *Advertiser*, 1752, and the *Idler*, 1759. Other essayists of this period were Jonathan Swift and Goldsmith (in the *Bee* and the *Citizen of the World*). Such terms as review, memoir, or treatise, apply better to more exhaustive studies, such as Locke's *Essay Concerning Human Understanding*, or Burke's *Essay on the Sublime and Beautiful*, while the journalistic 'article' may be used for slighter sketches than those entitled to be called E.s. Names of the earlier period which deserve mention as writers of works closely approaching the E. in style are those of Sir Thomas More, Sir Philip Sidney, Robert Burton, Sir Thomas Overbury, Laurence Sterne, and Daniel Defoe. A great revival of the E. took place early in the 19th cent., and with this movement Charles Lamb's name is always closely connected. His *Essays of Elia* appeared in 1823, the *Last Essays of Elia* in 1833. Other essayists of note of the 19th cent. are Hazlitt, Leigh Hunt, Carlyle, Macaulay, Thackeray, Bagehot, Pater, and R. L. Stevenson. The E. in modern times has not been quite so popular. Men are less often essayists first and foremost, but poets, historians, or novelists, who write E.s occasionally in leisure hours, and who have little or no interest in the didacticism which formed such an integral part of the E.s of their predecessors. Some of the chief names are Augustine Birrell, A. C. Benson, E. V. Lucas, Andrew Lang, G. K. Chesterton, Austin Dobson, George Saintsbury, Max Beerbohm, Hilaire Belloc, A. G. Gardiner, and Robert Lynd. Pope alone of the 18th cent. conceived an E. in heroic verse. His E.s *On Criticism* and *On Men* are really treatises, but the *Moral Essays*, if in prose, might have appeared in the *Spectator*. Apart from this all E.s are understood to be prose writings. In America the chief essayists include W. Irving, R. W. Emerson, N. Hawthorne, and J. E. Lowell. In Germany, Lessing, Schlegel, and Hermann Grimm are among the best. The E. took firm root in France at a comparatively late period, the chief representatives being Montaigne, Voltaire, Rousseau, Lamartine, Cousin, Michelet, Sainte-Beuve, Gautier, Anatole France, and E. Faguet. See A. Chalmers, *British Essayists*, 1817; H. Walker, *The English Essay and Essayists*, 1915; E. Rhys, *Modern English Essays, 1870-1920*, 1922; J. B. Priestley, *Essayists, Past and Present*, 1925; B. Dobrée, *English Essayists*, 1946; M. G. Segar, *Essays from Eighteenth Century Periodicals*, 1947.

'*Essays and Reviews*.' In 1860 a remarkable vol. was pub. under this title. All the contributors, excepting one, were clergymen of the Church of England, and the book was severely censured for heterodox views by nearly all the bishops and

formally condemned by convocation in 1864. Bishop Thomson (afterwards archbishop of York) and Bishop Wilberforce replied to the *Essays and Reviews* in their works *Aids to Faith*, 1861, and *Replies to Essays and Reviews*, 1862. The vol. contained the following 7 papers: (1) 'The Education of the World'; (2) 'Bunsen's Biblical Researches'; (3) 'On the Study of the Evidences of Christianity'; (4) 'The National Church'; (5) 'The Mosaic Cosmogony'; (6) 'Tendencies of Religious Thought in England'; (7) 'The Interpretation of Scripture.'

Esseg, see *OSLEK*.

Essen, Hans Henrik von, Count (1755-1824), Swedish field-marshal and statesman, b. W. Gothland. He was a favourite of Gustavus III, fighting under him against the Russians (1788-90). E. was governor of Stockholm (1795), becoming grand equerry in 1800. He conducted a stubborn defence of Stralsund against the French (1807). Charles XIII sent him as ambas. to Paris, where he negotiated a peace (1810) in which Sweden regained Pomerania. See L. A. Thiers, *Histoire de l'Empire*, 1873.

Essen, Ger. city in the *Land of North Rhine-Westphalia* (q.v.), 18 m. NNE. of Düsseldorf (q.v.). It lies a few m. N. of the Ruhr (q.v.), and is the heart of the Ruhr industrial area. Its abbey was founded in the 8th cent., and part of the minster dates back to the 9th cent. The city is modern and well laid out, with good housing schemes. Half of its buildings were destroyed during the Second World War, but reconstruction was begun as soon as the war was over; some of the new industrial and administrative buildings are very fine. E. is the home of the great Krupp (q.v.) works; since the end of the war they have been diminished in size, and a large part of the former Krupp property is now used by other industrial undertakings. E. is an important coal-mining centre, and has metallurgical, chemical, and other industries. Pop. (1803) 3480; (1955) 681,900. During the Second World War, as a railway and communications centre of great importance to the Germans, E. was the target of deadly raids, one of the heaviest being on 25 July 1943, when 2000 tons of bombs were dropped by the R.A.F., photographic interpretation showing that the damage to Krupp's works was greater than all that wrought in the previous raids of that year, 110 buildings being hit and the Diesel engine works being totally destroyed by fire. It was equally important an objective as the home of Krupp's armament works. The heaviest air raid on E. was that of 11 March 1945, when the Allied armies were advancing into Germany. Gen. Eisenhower states that on that day a record was estab. for the load of bombs dropped on a single target in one raid when 1079 heavy bombers of the R.A.F. rained some 5000 tons on the E. rail centre (though the record was surpassed on the 12th when 1108 heavies dropped 5487 tons on Dortmund). These attacks were energetically supported by fighters and fighter-bombers

of the R.A.F. 2nd Tactical Air Force and the U.S. Tactical Air Command. The resulting chaos was such as to prove far beyond the powers of the Reichsbahn repair organisation to remedy, despite its immense efforts to keep the lines open (see *Report by the Supreme Commander to the Combined Chiefs of Staff on the Operations in Europe of the Allied Expeditionary Force*, H.M.S.O. 1946). The combined effort of all these attacks was that the vast arms factories, marshalling yards, rail ways and inland docks were out of action or actually obliterated. After the Amer. armies had encircled the Ruhr (1 April 1945) the fall of E. soon followed (6 April). See K. Ribbeck, *Geschichte der Stadt Essen*, 1915; H. Spethmann (ed.), *Essen, die Stadt*, 1938. See also WESTERN FRONT IN SECOND WORLD WAR.

Essen (previously *Esschen*), tn in Belgium, 18 m. N. of Antwerp, near the Dutch border. Pop. 9300, engaged in agriculture and manuf. of sugar, wax, and tobacco.

Essence (Lat. *essentia*, from *esse*, to be): 1. In philosophy, the equivalent of *Gk ousia*, and was originally used in the same sense as 'substance.' Later 'substance' came to be used for the undetermined substratum of a thing, E. for the qualities expressed in its definition. Locke neatly defines it by saying: 'Essence may be taken for the very being of a thing, whereby it is what it is.'

2. In pharmacy, E.s are solutions of essential oils in alcohol, and are capable of being prepared in 2 ways: (1) By adding refined spirit to the odoriferous parts of plants or to the essential oils, and distilling. (2) By adding the essential oil to the refined spirit and agitating till a uniform mixture is obtained. Thus E. of lemons is merely a solution of volatile oil in rectified spirit. The term E., however, has received a more comprehensive significance and is applied to a liquid possessing the properties of the substance of which it professes to be the E. *Quintessence* (Lat. *quinta essentia*, 5th E.), the pure E. of anything, a solution of an essential oil in alcohol. The name applies to the purest E. obtained after 5 distillations, and was originally used to denote ether.

Essendon, tn of Victoria, Australia, situated in Bourke co., on the Moonee Ponds, at a distance of 5 m. from Melbourne. Pop. 20,000.

Essenes, Jewish religious brotherhood of the time of Christ. Though it played a somewhat important part in the hist. of Jerusalem, very little is accurately known about the E. The Rom. historian, Pliny, the Jewish Josephus, and Philo the Alexandrian are the authorities who speak of them from personal knowledge. They are nowhere mentioned either in the Bible or in the Talmud, though it has been commonly held that the Nazirim referred to in the Talmud are the E. under another name. The E. were Pharisees, laying great stress on the maintenance of ceremonial purity. Ceremonial washings formed an important part of their practice,

and white garments were worn. Their food was specially prepared by the priests, and the common meal was eaten with great solemnity. Asceticism was the keynote of their system; every form of sensual enjoyment was held to be sinful. The E. were communists, mostly engaged in agriculture. The proceeds of all labour went into the common purse, from which all expenses were paid. Entrance to the order could be obtained only by a 3 years' novitiate. The E. objected to animal slaughter, and this fact prevented many of them from joining in the temple service. The sect came to an end in the 2nd cent. AD. Their connection with the origins of Christianity has not been satisfactorily worked out. The discovery of the Dead Sea Scrolls in 1947 gave rise to the question of possible E. authorship of some of these documents. See SCROLLS OF THE LAW. See G. Moore, *The Brook Kerith*, 1916.

Essential Oils, volatile O. which possess in a concentrated form the odours of the plants or vegetable substances from which they are obtained. These O. are generally contained in a special gland or cell within the plant. The E. O. are generally insoluble in water, but they dissolve in alcohol, ether, or fatty O. They contain a large proportion of carbon which causes them to ignite easily, but as a rule they leave no permanent grease spot. They possess an aromatic smell, a hot burning taste, and can be distilled, preferably in vacuum stills, at a low temp. under reduced pressure, so as to prevent decomposition or resinification of odorous components which can damage the perfume. The fractionated vacuum distillation can be employed for the separation of lightly odorous constituents (isolates) or for the elimination of impurities and of hydrocarbons (terpenes) of very weak odour, which are the main constituents of many E. O., and decrease their solubility in alcohol. A number of very costly flower O., such as *jasmin*, are extracted from the petals by non-odorous solvents, and isolated from the extracts by distillation in vacuum.

Essequibo, riv. of Brit. Guiana, which has its source in the Acarai Mts, about 45 m. N. of the Equator. It is a riv. of many rapids, and therefore very difficult to navigate, but the lower course for some 50 m. to Bartica is clear for large craft. The most noted falls of the E. itself are the Aretaka cataracts. There are sev. tribs., the Cuyuni with the Mazaruni, the Rupununi, and the Potaro. After flowing for a distance of 620 m. the E. enters the Atlantic, and at its mouth it measures a width of 20 m. Among the natural wonders of the region are the Kaieteur Falls (the old man's fall) on the Potaro R., 50 m. above its confluence with the E. These have a clear drop of 741 ft., or nearly 5 times the height of Niagara Falls. Owing to the difficulty of the journey, few people from other parts of the world have visited this spot, and its remoteness and seclusion greatly enhance its impressiveness. The Potaro R. here has a

width of 400 ft and it flows away amid ravines of thickly wooded sandstone cliffs. The dist. round the falls has now been proclaimed by the gov. of Brit. Guiana as the Kaieteur National Park, and hopes are entertained of making it a health resort for Brit. Guiana. The E. gives its name to one of the 3 counties (pop. 58,440, or rather less than 1 inhab. per sq. m.) into which Brit. Guiana is divided. (See BRITISH GUIANA.) The central colony of Demerara was an offshoot from E., and was estab. in 1645.

Essex, Earls of. This title was conferred in 1572 on Walter Devereux, scion of an old Herefordshire house, but had previously been held by Devereux's ancestors (the Mandevilles, Bohuns, Bouchiers) and by Thomas Cromwell. In 1139 King Stephen created Geoffrey Mandeville E. of E., and the family of Bohun was the next to bear the title, but on the death of Humphrey Bohun, 1373, it passed to Thomas of Woodstock, duke of Gloucester. In 1461 Edward IV created Henry Bouchier E. of E., but on the death of his successor the earldom became extinct, and in 1540 it was conferred on Thomas Cromwell (q.v.). The family of Parr obtained the earldom after the execution of Cromwell, but forfeited it in 1553. Thus the title was borne by 6 different families in Eng. hist. Robert, the 2nd E. of the Devereux (q.v.) creation, was E. marshal of England and one of Queen Elizabeth's favourites; and Robert, his son, the 3rd E. (q.v.), was commander-in-chief of the parl. forces in the Civil war. The earldom became extinct in 1646 at his death, but Charles II conferred the title on the Capell family in 1661 (see CAPELL, ARTHUR) and the present (8th) E. is a representative of this family.

Essex, James (1722-84), architect; b. Cambridge; son of a carpenter. He showed some skill in Gothic architecture as it was then understood, and he restored many old buildings, including Ely and Lincoln cathedrals as well as King's College Chapel and sev. colleges in Cambridge. He also designed the stone bridge at Trinity College, 1763-5; completed the Senate House, 1766-8; and rebuilt the chapel, library, and Master's Lodge at Sidney Sussex College, 1775-82.

Essex, Robert Devereux, 2nd Earl of (1566-1601), nobleman and favourite of Elizabeth I, son of Walter Devereux, 1st E. (d. 1576). He was b. in Herefordshire and educ. at Cambridge, and accompanied Leicester's expedition to Holland in 1585, where he showed great bravery in battle. E. became master of the horse (1587) and took part in Drake's expedition to Portugal (1589). In 1591 he commanded an expedition to Normandy, and the land-forces at Cadiz in 1596. E.'s charm and natural abilities soon made him a great favourite with the queen, though his marriage to Sidney's widow in 1590 had much displeased her. He became a privy councillor, 1593; E. marshal of England, 1597; and chancellor of Cambridge Univ., 1598. E. was also commander on 'the islands voyage,' an expedition to the

Azores in 1597, and its failure marked the beginning of his permanent decline in the royal favour. In 1599 he was appointed governor-general of Ireland, but after failing to put down the rebellion and returning to England contrary to orders he was accused of secretly treating with the rebel leader, Tyrone, and imprisoned, 1599-1600. After his release all his efforts to regain Elizabeth's favour were unsuccessful. E. therefore decided to compel the queen to dismiss her advisers, being convinced that the Cecils were primarily responsible for his downfall at court. Always impetuous and arrogant, he attempted to start a rebellion among the citizens of London which had never any hope of success: he was arrested, accused of high treason, and executed, Bacon, his former friend, being his prosecutor. Elizabeth is said to have agreed to the execution only with the greatest reluctance. E.'s charm and courage were insufficient compensation for his complete lack of statesmanship and disregard of tact and diplomacy in his dealings with the influential figures at court, including the queen herself, who, fond of him though she undoubtedly was, came to realise that his overweening personal ambition made him a luxury she could no longer afford. See W. B. Devereux, *Lives and Letters of the Devereux*, 1853; G. L. Strachey, *Elizabeth and Essex*, 1928; and S. B. Harrison, *The Life and Death of Robert Devereux, Earl of Essex*, 1937.

Essex, Robert Devereux, 3rd Earl of (c. 1591-1646), soldier, son of Robert (executed 1601), b. London. James I restored to him his father's rank and titles (1604). He was a boyhood friend of the prince of Wales (later Charles I), but by 1626 had joined the parl. party. E. was lieutenant-general in the army sent against the Scottish Covenanters (1639). He refused to accompany Charles in his flight from London, and became leader of the Presbyterian party. In 1642 he commanded the parliamentary army, and fought at Edgehill; captured Reading, and relieved Gloucester (1643). E. won the 1st battle of Newbury in 1643. His invasion of Cornwall (1644) proved unsuccessful, and his army capitulated at Lostwithiel, E. himself escaping in a boat. E. resigned his commission (1645) on the passing of the 'Self-denying Ordinance.'

Essex, Walter Devereux, 1st Earl of (c. 1541-76), Eng. nobleman and soldier, son of Sir Richard D. In 1569 he raised troops to suppress the N. rebellion under the E.s of Westmorland and Northumberland, and was created E. of E. in 1572 for his service. His attempts (1573-5) to subdue and colonise Ulster were not very successful, though he conducted his campaign with great cruelty. Elizabeth I recalled him in 1575, but he was reappointed earl-marshal of Ireland in 1576, and d. in Dublin.

Essex (O.E., East-Seaxe), maritime co. of SE. England, bounded by the cos. of Cambs and Suffolk on the N., on the E. by

the North Sea, on the S. by the R. Thames, and on the W. by London, Middx., and Herts. The surface is flat and marshy near the coast, but richly wooded in the SW., forming Epping Forest (5600 ac.). Among the chief rivs. are the Thames, Stour, Lee, Colne, Crouch, and Blackwater. Farming flourishes, and splendid wheat-crops are grown in the E. and N. Cereals, sugarbeet, fruit, and seeds are raised, and livestock reared. Manufs. include silk, cement, oil products, and foodstuffs. There are extensive engineering works at Dagenham, Chelmsford, and Colchester, a gov. powder-factory at Waltham Abbey, and large oil refineries at Shellhaven and Canvey. Oyster-fishing and brewing are also important. The Tilbury and Victoria and Albert Docks of the Port of London are on the S. coast of the co. Harwich is the port for Continental traffic; Chelmsford is the co. tn, and other important centres are the resort of Southend, Colchester, famous for its oysters, and the co. bors. of East and West Ham. New tns are being built at Harlow and Basildon. The abbey at Waltham is reputedly the oldest Norman building in England; founded in 1030, it was enlarged by King Harold in 1060. Area 1527 sq. m.; pop. 2,044,964. See T. Wright, *History and Topography of Essex*, 1831; A. C. Kelway's ed. of *Memorials of Old Essex*, 1908; P. Reaney, *Essex*, 1928; H. W. Tompkins, *Companion into Essex*, 1949; Clifford Bax, *Highways and Byways in Essex*, 1939; A. Mee, *Essex*, 1942; W. Addison, *Essex Heyday*, 1949; and the Victoria County History of Essex.

Essex Regiment, The, formerly the 44th and 56th R.s, which were linked in 1881 to form the present R. The 44th was raised in 1741, served in N. America under Gen. Braddock, and remained in Canada until 1765. Returned to America 1775 and served against the French also in W. Indies. Fought under Abercromby in Egypt in 1801. Joined Wellington's army in Peninsula in 1811, and captured a Fr. 'Eagle' at Salamanca; fought at Waterloo; thence in Burma and Afghanistan, Crimean and China campaigns. The 56th was raised in 1755, served at Havana in 1762, and was in the defence of Gibraltar, 1779-83. Served again in the W. Indies; then went to India (1805). Served in the Crimea and then in Egypt. Fought in S. African campaign, 1899-1902. Raised 31 battalions during First World War and served in France, Flanders, Gallipoli, Egypt, Palestine. As a unit of the famous 4th Indian Div. the R. played its part at Sidi Barrani in the first great victory won by the Brit. Army in the Second World War, and later they took part in the capture of Gen. von Arnim and his forces in N. Tunisia (1943). In the battle of Normandy (1944) the 2nd E. were part of the 45th Territorial Div. and fought in the battles for Venlo. The R. also fought on the It. front. This is one of the few R.s which bears an 'Eagle' on its colours, which commemorates that captured at Salamanca. At Oxford Point, Bermuda,

there is a quaint monument of tools, bayonets, and iron hoops erected by the men of the 56th R. (2nd Battalion, E. R.), who were isolated there during an outbreak of yellow fever many years ago. For details of recent regimental amalgamations, see REGIMENT.

Essington Port, bay of N. Australia on the N. side of Coburg peninsula. The shores of the bay are low and destitute of vegetation. The climate is unhealthy. On the W. side, 17 m. from its entrance, the Brit. settlement of Victoria was founded in 1839. It was abandoned in consequence of its insalubrity in the year 1849.

Essling, see ASPERN.

Esslingen, Ger. tn in the Land of Baden-Württemberg, 7 m. SE. of Stuttgart (q.v.), on the Neckar. It was founded in the 8th cent. There are sev. anc. churches, including the beautiful *Frauenkirche* (1321-1516), an old *Rathaus* with a Renaissance façade, and a new baroque *Rathaus*. The tn is overlooked by a fortress. There are machinery, textile, and leather industries, and a large trade in wine. Pop. 65,000.

Essonnes, former Fr. tn, now joined to Corbeil. See CORBEIL-ESSONNES.

Est, canal in the NE. of France, starting from the Meuse near Givet, and traversing the valley of the Meuse to Port-sur-Saône. It includes canalised portions of the R.s. Meuse and Moselle. The total length is 285 m.

Established Church, see ENGLAND, CHURCH OF; SCOTLAND, CHURCH OF; STATE CHURCH.

Estaing, Charles Hector Théodat, Comte d' (1729-94). Fr. adm., a native of Auvergne. In 1778 he went to help the U.S.A. against Britain, and in the following year took St Vincent and Grenada. At Hospital Hill Forts on a plateau 400 ft high adjoining St George's, the Brit. under Sir George (afterwards Lord) Macartney made a brilliant stand against the French under d'E. in July 1779. D'E.'s force of 3000 only succeeded in carrying the lines after losing 300 to a garrison which over the whole is, only numbered 500. D'E. however failed to capture St Lucia and was beaten off by a strong force landed on the is. through the advice of Rodney (1778). D'E. was, however, wounded in a subsequent engagement, and returned to France, where he was eventually put to death for supporting Marie Antoinette. See B. Edwards, *The History, Civil and Commercial, of the British Colonies in the West Indies*, 1793.

Estaires, Fr. tn in the dept of Nord, on the Lys, the scene of much fighting in the First World War. It has textile manufs. Pop. 4300.

Estância, tn of NE. Brazil, 36 m. SW. of Aracaju on the Piauí. It exports cotton and tobacco, as well as manufacturing textiles, footwear, and vegetable-oil products. Pop. 10,500.

Estate. An E. signifies that title or interest which a person has in lands, tenements, hereditaments, or other property. It is either real E., which comprises free-

hold lands, tenements, or hereditaments, and copyhold lands; or personal E., which comprises all other kinds of property or rights in or over property, including leasehold interests in lands, tenements, and hereditaments (see **ENTAIL; FEE**). This is the modern legal connotation of the term, and it signifies not the subject of ownership itself, but the proprietary interest subsisting in it. E.s are either in possession or in expectancy. E.s in expectancy are divided into E.s in remainder or reversion (see **CONTINGENT REMAINDER; REVERSION** (in law)). An E. in reversion arises either expressly, or by mere implication of law, as where a tenant in fee simple grants a life E. to another, and thereby impliedly reserves to himself the E. ownership in reversion. E.s may be enjoyed by one person only, or by more than one either severally (see **COMMON; TENANCY IN**) or jointly. E.s are also either legal or equitable. A legal E. subsists in the owner when he is in actual possession, and is also either entitled to the beneficial interest himself or holds in trust for some other person. A mortgagee by deed is the legal owner of land, the subject of the mortgage, but holds the residue of proceeds, where a sale takes place for the realisation of his debt, in trust for the mortgagor, or equitable owner. An equitable E. subsists in a person who, though not the actual and legal owner, is entitled to the beneficial interest of the property of which some other person is in possession as legal owner. E.s in popular language have come by a process of metonymy or extension to mean the actual lands and premises of a landowner of some territorial pretensions. The word was also used formerly as a synonym for status, or a man's condition in life. It is still used with a somewhat similar connotation in respect of the hierarchy of political classes, which in Great Britain are the 3 E.s of Lords Spiritual, Lords Temporal, and Commons. See **ESTATES OF THE REALM**.

Estate Duty is paid on the E.s of deceased persons. It dates from 1894. In general, E. D. is chargeable on the value of all property, whether settled or not, which passes or is deemed to pass at death. The charge to D. is not limited to property owned by the deceased but may extend to trust funds in which the deceased had a life interest and to gifts (up to £500 exempt) made within 5 years of death (1 year in the case of gifts to charity). Generally all property movable or immovable situated in the U.K. is liable to D. irrespective of domicile. Movable property abroad is subject to D. if the deceased is domiciled here. Besides gifts of under £500 there are other exemptions, such as E.s under £3000 and certain gov. securities for persons neither domiciled nor ordinarily resident here.

E. D. is payable on a graduated scale. The general rule is that all property settled or not in which the deceased had an interest is aggregated, the aggregate value determining the rate of D. If, however, the value of the deceased's own property

is not more than £10,000 it is not aggregated but treated as a separate E.

Net capital value of total estate		Rate per cent of duty
Exceeding	Not exceeding

The Finance Act, 1940 (as amended by Finance Act, 1944), introduced important new principles governing the valuation of shares and debentures of companies where the deceased had a controlling interest. Broadly, valuation is now on an assets basis instead of a market value basis.

The Finance Act, 1949, consolidated the Legacy and Succession D. into E. D. and increased the rates of D. These rates were amended by the Finance Act, 1954—see accompanying table. They are reduced by 45% in the case of agric. property and certain business assets. The average annual yield for 10 years after the Second World War was £160 million.

Estate Tail, see **ENTAIL**.

Estates of the Realm, classes of men invested with political rights in a nation or state. In Great Britain the 3 E. of the R. are the Lords Spiritual (or bishops), the Lords Temporal (peers entitled to vote in the House of Lords), and the Commons. The sovereign and these 3 E. together form the corporation or body politic of the kingdom. The Commons or 3rd E. comprises not only the members of any given House of Commons but the whole of the electorate. Originally the phrase denoted the nobles, the clergy, and the commons, but the growth of parliament and the consequent elimination of the clergy as a separate political body gradually tended to stereotype the phrase in the above

narrower meaning. Analogous E. are found in most countries. The term 4th E. of the R. is applied to the Press, because of its influence in public matters.

Estaunié, (Louis-Marie-) **Edouard** (1862-1942), Fr. novelist, b. Dijon. After teaching science in Paris, he became inspector-general of telegraphs. He began novel-writing with *Un Simple*, 1891, followed in the same year by *Bonne Dame*. E. became celebrated with *L'Empreinte*, 1895, suggested by his Jesuit education. Other works, mostly psycho-analytical, and probing the mysteries of the soul, include: *L'Épave*, 1902; *La Vie Secrète*, 1908; *Les Choses Voient*, 1913; *Solitudes*, 1917; *L'Ascension de M. Baslèvre*, 1921; *L'Appel de la Route*, 1923; *L'Infini aux Mains de Lumière*; *Le Labyrinthe*, 1924;

branch furnished the leaders of the Guelphs in the 13th and 14th cents. The male It. line became extinct on the death of Hercules III, 1803. The Estensi were mostly wise and enlightened rulers, and founded the univs. of Padua and Ferrara.

Estella, Sp. tn in the prov. of Navarra, on the Ega. In the Middle Ages it was the seat of the court of Navarre (q.v.), and in 1873-6 was the H.Q. of the Carlists (q.v.). It has many fine old buildings. Pop. 7700.

Estepa (Rom. *Asiapa*), Sp. mrkt tn in the prov. of Sevilla. Pop. 8000.

Estepona, Sp. tn in the prov. of Málaga, on the Mediterranean coast, with a trade in fruit and vegetables. Pop. 11,000.

Esterhazy de Galantha, name of an ant Hungarian family dating from the 13th

THE TOMB OF BEATRICE D'ESTE AND HER HUSBAND

Although this lady lived only 22 years (1475-97), she is one of the most famous members of the House of Este.

Tels qu'ils furent, 1927. He was elected member of the Academy, 1924. See life by J. Charpentier, 1932.

Estcourt, seat of magistracy for Weenen dist., Natal, South Africa, altitude 3833 ft. E. has large bacon and cheese factories. The climate is one of the finest in Natal and the scenery is charming. Stock-breeding is carried on on a large scale. Pop.: whites, 3300; Bantu, 3079; others, 479.

Este (ancnt *Atesto*), It. tn, in Veneto (q.v.), 15 m. SW. of Padua (q.v.). It has picturesque ramparts, a 17th cent. cathedral, and an archaeological museum. The House of E. (q.v.), took its name from the tn. Pop. (tn) 6600; (com.) 17,500.

Este, House of, one of the most ant and famous princely families of Italy, founded by Oberto II (d. c. 1015), Margrave of Casal Maggiore. To Azzo II, his grandson, the Emperor Henry III granted E. and other It. fiefs. Azzo was created duke of Milan, and assumed the name of E. His 2 sons Welf (Guelph) IV, and Fulco I founded respectively a Ger. and an It. branch of the H. of E. The It.

cent., prominent supporters of the Hapsburgs. The most famous members of the family are: *Paul IV* (1635-1713), who became a field-marshal, fought with distinction against the Turks, and was made a prince of the empire. *Nicholas IV* (1765-1833), a great promoter of art, and the man to whom Napoleon is said to have offered the throne of Italy. *Paul Anthony* (1786-1868), diplomat, who was Austrian ambas. in London until 1842, and in 1848 became minister for foreign affairs under Batthyani.

Esters, **Etheral Salts**, or **Acidic Ethers**, are compounds formed by the replacing of the hydrogen in acids by alkyl groups; they occupy the same position in organic chem. as the metallic S. do in inorganic. They are formed by the action of an acid or acid chloride on an alcohol, and are, as a rule, pleasant, fruity-smelling liquids, non-miscible with water, which are hydrolysed on heating with alkalis, an alcohol and the S. of an acid being formed. The fats consist of the palmitic, stearic, and oleic E. of glycerin, and on boiling with soda, the sodium S. of the acid (soap) and glycerin are formed. The process is

known as 'saponification.' Many E. are used for flavouring purposes, e.g. amyl acetate (jargonelle pear), ethyl butyrate (pineapple), etc., the former also being used as a solvent for celluloid.

Estevan, tn in Saskatchewan, Canada, 130 m. SE. of Regina. It is the centre of an extensive lignite coal-field, adjacent to the oil-fields of the Williston Basin. E. has a brick and tile plant and a regional plant of the Saskatchewan Power Corporation. Pop. 5230.

Esther, Book of, tells how, in the reign of the Persian king Ahasuerus, Haman, the king's minister, intrigued for the extermination of the Jews. But Ahasuerus had just married Esther, a Jewess, though her nationality is kept secret from her husband. She and her uncle, Mordecai, make a counterplot, which is ultimately successful. Mordecai is made minister and raised to great honour: Haman is hanged on the gallows 50 cubits high, which he has prepared for Mordecai, and instead of the massacre of the Jews, a massacre of the Persians takes place by royal edict. The Book then tells of the institution of the feast of Purim to commemorate this great deliverance. The word 'pur' has been proved to be truly Babylonian for a 'lot' and the feast was already known as Mordecai's day in the 2nd cent., according to 2 Macc. xv. 37. Ahasuerus is the Gk Xerxes (486-465 bc) and Mordecai is represented as becoming minister in the 12th year of his reign, i.e. in 474 bc. The references however raise such historical difficulties that many critics regard it as a romance intended to further the observance of the feast of Purim. Others, however, believe it has a historical basis (cf. A. W. Stroane, *The Book of Esther*, 1922). The work was in much favour among the Jews. Luther, in later years, did not scruple to express the small regard in which he held the work. It is noteworthy that the name of God does not appear once. See commentaries by L. B. Paton, 1908, and G. Smith, 1930; and J. Hoschander, *The Book of Esther in the Light of History*, 1923.

Estienne, or Etienne (Lat. *Stephanus*), Fr. family of scholars, printers, and publishers, the founder being Henry E. (c. 1465-1520), who started a business in Paris about 1500. For a time his foreman, Simon de Colines, who married Henry's widow, took over the estab., which was afterwards managed by Henry's 2nd son Robert (1503-59). Robert came under the influence of the Reformation, and aroused the anger of the univ. of Paris by his pub. of the *Novum Testamentum*, 1522, and of the Lat. Bible, 1540. He himself wrote a *Dictionarium seu Latinae Linguae Thesaurus*, 1532, and was printer to the king for Lat., Heb., and Gk works. In all Robert printed 11 eds. of the Bible, in Lat., Hebrew, and Fr., and 12 of the N.T., in Greek, Lat., and Fr. The opposition of the theologians forced him to leave Paris for Geneva, where he pub. sev. works of Calvin. His eldest son Henry (1531-98) joined him in 1551. The latter was one of the greatest scholars

of his time and pub. 1st eds. of some 20 Gk authors and compiled *Thesaurus Graecae Linguae* (5 vols.), 1572. Robert's brothers, Francis (1502-50) and Charles (1504-64, q.v.), were also engaged in the business. See M. Mattaire, *Stephanorum Historia*, 1709; W. P. Croswell, *A View of the Early Parisian Greek Press*, 1833; A. A. Renouard, *Annales de l'imprimerie des Estienne*, 1837; and L. Clément, *Henri Estienne et son oeuvre française*, 1899.

Estienne, Charles (Stephanus) (1504-1564), Fr. anatomist and printer, belonged to a famous family of printers (see ESTIENNE, above). He graduated in medicine at Paris, 1542; 3 years later he pub. *De Dissectione Partium Corporis Humani*, begun 15 years earlier. It was the first pub. work to include illustrations of the whole external venous and nervous systems; in it he also described the valves of the veins and the central canal of the spinal cord. E. was the last important anatomist before Vesalius. He was charged with heresy and d. in prison.

Estija, see ECIJA.

Estivation, see AESTIVATION.

Estland, the most N. of the Baltic provs. (q.v.), now forming part of Estonia. The area was conquered and christianised by the Livonian Knights (1211-27) and, as a Duchy of E., ceded in 1238 to Denmark. It became Livonian again in 1346, Swedish in 1561, and Russian in 1721.

Eston, urb. dist. of Yorks, England, 4 m. SE. of Middlesbrough, comprising South Bank and Grangetown where there are iron, steel and chemical works, and ship-building yards, and Normanby which is residential. Pop. 33,500.

Estonia (Estonian *Eesti*, or *Eestimaa*), constituent rep. of the U.S.S.R., bordering on the Gulf of Finland in the N., Latvia in the S., the Baltic Sea in the W., and Lake Peipus in the E. It is largely lowland plain, partly forested, with many lakes and marshes and soft, almost maritime climate. There are large oil-shale deposits. The main industries are oil-shale extraction and processing, the electrical and engineering industries, textiles, wood processing, and food (bacon, butter). Agriculture is also important. Dairy farming and hog raising are carried on, and grain, potatoes, vegetables, and flax are grown. The chief tns are Tallinn (cap.), Tartu, Pärnu, Narva, Kohtla-Järve. For hist. see BALTIC PROVINCES; BALTIC STATES; ESTLAND. During the period of independence, 1919-40, Estonian industry, cut off from the Russian market, declined, while agriculture fl. (export of butter and bacon to Britain and Germany). Independent E. was first a democratic rep., but from 1934 was a dictatorship under President Pats, the leader of the most influential Agrarian party. In 1924 a Communist uprising in Tallinn was suppressed. Area 17,400 sq. m.; pop. (1956) 1,100,000, mostly Estonians (see FINNS) and Russians (about 10 per cent), before the Second World War also Germans. See J. H. Jackson, *Estonia*, 1948; A. Oras, *Baltic Eclipse*, 1948; V. Raud, *Estonia*, 1953.

Estoppel, the legal term which is applied to anything which prevents a person from denying or confirming a fact on account of his own actions. The 3 kinds of E. are: (1) Those of record, which prevent either of the parties from offering any statements contrary to the recorded judgment; (2) E. by deed, which prevents a man from denying any statement made by him in a written deed; (3) E. in pais or by conduct, which includes such instances as a tenant's inability to deny his landlord's title, once the tenant is in possession.

Estovers, term applied to the supplies of wood which a tenant has the right to take for purposes of fuel or repair from the land on which he lives.

Estrays, animals which are not wild but are found wandering without an owner in any public place or on someone else's property. They become the temporary property of the lord of the manor if found within its confines; if in any other place, they become subject to the Crown. If they are not claimed within a year and a day, this proprietorship becomes permanent.

Estrout, term in Eng. law applied to a true copy of some writing, particularly a fine or amercement entered in the records of a court of law. It is also applied to recognisances when the conditions of the latter are not kept. Under these circumstances only are recognisances *estreated*, and the parties are considered as debtors to the Crown.

Estrées, Gabrielle d' (1573-99), mistress of Henry IV of France, daughter of the Marquis Antoine d'E. She married Nicolas d'Amerval, Seigneur de Liancourt, but she divorced him on account of her infatuation for Henry to whom she bore sev. children. Henry, it is said, wished to divorce Marguerite de Valois and to marry G., but her sudden death prevented the carrying out of his plans. See life by A. Desclozeaux, 1889.

Estréla, Serra da (formerly *Estrella*), mt range of Portugal, stretching SW.-NE. for about 75 m. through the dists. of Castelo Branco and Guarda (qq.v.). Its highest peak is the Malhão da Estréla.

Extremadura, prov. of W. Portugal, containing most of Lisbon dist., the S. part of Leiria dist., and the N. part of Setúbal dist. (qq.v.). It is on the lower Tagus (q.v.), and has a long coastline on the Atlantic. Livestock, wine, fruit, olives, and cork are produced. The chief tn is Lisbon. Area 2065 sq. m.; pop. 1,595,100.

2. (Or *Extremadura*) Region in Spain comprising the provs. of Badajoz and Cáceres (qq.v.). It lies between Portugal and New Castile. In mediæval times the name 'Extremes' was applied to the Christian marches during the Moorish struggles. The raising of livestock is the main industry, and cereals, olives, and figs are grown. Some copper, silver, and lead are found. Area 16,065 sq. m.; pop. 1,394,150.

Estremoz, tn of Portugal, in Évora dist., 25 m. NE. of Évora (q.v.). It has a 13th-cent. castle, and remains of its

ancient fortifications. In the 17th cent. it was important during the wars with Spain. There are marble quarries, and manufs. of pottery and tiles. Pop. 10,000.

Estuary (Lat. *æstuarium*, from *æstus*, the tide), an inlet of the sea at the mouth of a riv. where the water of the riv. and the sea meet, and the fresh and salt are mingled. The riv. seeks an exit in the sea, and the tide flows in towards the riv., so that some E.s are subject to tidal waves of great force.

Eszek, see OSLEK.

Esztergom (Ger. *Gran*; anct *Oster Ringun, Strigonium*), city of Hungary, in Komárom co., 22 m. NE. of Tatabánya (q.v.). It is on the Danube (q.v.), opposite the Czechoslovak tn of Parkád. (Once a border fortress of the Carolingian (q.v.) empire, E. was later the seat of the Arpad (q.v.) dynasty, and here St Stephen (see STEPHEN I of Hungary) was b. and crowned king. The archbishop of E. is primate of Hungary; his cathedral (1870) is modelled on St Peter's (q.v.) in Rome, and stands on an eminence on which are also the remains of the former royal palace. The archbishop's palace has a notable art collection. The tn is a spa, and has engineering industries; there are vineyards and coal-mines in the surrounding dist. Pop. 22,000. See SZÉKESFEHÉRVÁR.

Etah, Eskimo settlement on Smith Sound, Greenland.

Etampes, Fr. tn in the dept of Seine-et-Oise, on the Seine. It is known for its many anct churches and houses, and has a 12th cent. keep. There was considerable damage in the Second World War. The tn has a market gardening trade, and textile and metal manufs. Pop. 10,400.

Etaples, J. Lefèvre d', see FABER, JACQUES.

Étaples, Fr. fishing-port and resort in the dept of Pas-de-Calais, on the estuary of the Canche. It is believed to occupy the site of the Rom. *Quantovicus*. A treaty of peace was signed here in 1492 between Henry VII of England and Charles VIII of France. The fishing quarter of the tn is picturesque. The 15th cent. church was destroyed in the Second World War. Pop. 6500.

Etching, art of engraving by eating into the metal with a mordant. The so-called 'Dutch bath' (hydrochloric acid and potassium chlorate), dilute nitric acid, or a solution of perchloride of iron is the mordant commonly used. A thin layer composed of gums, waxes, and resins is spread over the metal plate to form the 'E.-ground.' One method of applying the ground is as follows. The gums, etc., are squeezed into a ball covered with silk. If the heated copper is brought into contact with the ball, the composition oozes through the silk, and as it melts may be spread over the plate with a silk pad or dabber. Usually the etcher holds the ground over a flame so as to blacken it with smoke. The object of this is to show up the lines he opens. If he wants

to transfer a design, all he need do is to cover a thin sheet of paper with chalk and then trace over the design on the paper, when it is laid upon the copper plate. When the drawing is traced through the ground with an E. needle, the plate is immersed in the acid bath, and the mordant 'bites' into the lines. After the most delicate strokes are sufficiently etched, the plate is taken out and these strokes are filled up with a stopping-out varnish, like Brunswick black. This process of immersion in the bath and stopping-out the lighter gradations is continued until the acid has bitten in sufficiently to make the blackest lines. If he likes, the etcher can proceed in a different way. At

British Museum

ETCHING OF HIS MOTHER BY
REMBRANDT, 1628

first he uses his needle to open only the darkest lines and then dips his plate into the mordant so as to get these partly bitten. He next draws in the parts which are to be a shade lighter, and allows the acid to corrode these. This process is persisted in till he comes to the lightest parts. It will be seen that the corrosion is in proportion to the depth of tone required. If a soft ground E. is required, that is one imitating the texture of a crayon drawing, tallow is mixed with the E. ground and the design is firmly traced through a sheet of paper, when the gruin of the latter and the kind of pencil used will leave their mark.

History.—Albrecht Dürer (1471–1528) was a pioneer in this field and etched his 'The Cannon' upon iron. Van Dyck (1599–1641), who was 'the solitary great etcher' of the Rubens school, depended for his splendid effects on the use of the open line and vigorous, dotted work. He etched sev. heads leaving accessories to be completed by an engraver. Rembrandt (1606–69), on the other hand, who is the

perfect 'painter-etcher,' relied on close-hatching, and discovered how, by leaving ink on the surface of the copper, he could cope with the difficult task of reproducing the chiaroscuro of his paintings and ensure a rich and liquid surface tone. His E.s embrace portraits, landscapes, and religious themes, 'Christ with the Sick around Him, Receiving little Children,' being widely accepted as his masterpiece. Other and notable painter-etchers of Holland were Adriaen van Ostade (1610–85), Paul Potter (1625–54), and Nicolas Berchem (1624–83). The E.s of Jacques Callot (1592–1635) and Claude of Lorraine (1600–82) are of great interest. In the 18th cent. the It. school of E. reached its high-water mark in the delicate 'Capricci' of Giovanni Tiepolo (1693–1770), and the architectural designs of Piranesi (1720–1778). A school of satirical E. developed in England. Hogarth (1697–1764) used E. as well as line-engraving to reproduce his paintings. Thomas Rowlandson (1756–1827) etched in outline, his prints being completed by aquatint or hand colouring or both (as in his Dr Syntax illustrations). George Cruikshank (1792–1878) may well be mentioned in connection with Rowlandson, as he has won universal favour by his sympathetic interpretation of Dickens's odd characters. Early in the 19th cent. (1807–19) appeared Turner's *Liber Studiorum*, all etched by the artist himself in outline and completed in mezzotint by various engravers. Francisco Goya (1746–1828) is the finest Sp. etcher; his power to seize upon all hypocrisies and affectation is well exemplified in his 'Caprichos,' whilst his 'Desastres de la Guerra' are remarkable, if almost repulsive, expositions of the terrors of war. In the last cent. the E.s of Jean François Millet (1814–75) and of Charles Meryon (1821–68) stand out. Also notable are those of A. Legros (1837–1911), but Whistler (1834–1903) with 2 exquisite London and Venice series was unsurpassed, though his brother-in-law, Seymour Haden (1818–1910), showed equal skill. Sir D. Y. Cameron, Sir Frank Brangwyn, Walter Sickert, and Sir Muirhead Bone are distinguished etchers of more recent times. E. had an exceptional vogue in the 1920's followed by a period of disfavour. It has been practised with distinction by some modern Fr. artists, e.g. by Matisse in his illustrations to Mallarmé's *Poésies*, 1932; and by Picasso whose 'Minotaure,' 1935, is a well-known plate. See ENGRAVING; PHOTOGRAPHY; PROCESS WORK. See also P. G. Homerton, *Etching and Etchers*, 1880; Sir F. Seymour Haden, *The Art of the Painter-Etcher*, 1890–1; A. M. Hind, *History of Engraving and Etching*, 1911.

Etching of Crystals is achieved artificially by subjecting C. to the action of such solvents as caustic alkalis or acids, although rock salt often becomes etched by a natural process. This salt, being deliquescent, becomes coated, after crystallisation, with a layer of water. In course of time tiny rectangular depressions are formed all over the surface. When a

C. is immersed in some solvent 'etch figures' are formed. The crystallographer frequently uses the E. marks to assist him in his classification of a certain piece of crystal; for they are found to be closely related to its crystallographic form.

Etchmiadzin, see ECHMIADZIN.

Etceoles, son of Oedipus and Jocasta, who, with his brother Polyneices, succeeded to the throne of Thebes on the flight of their father. They undertook to rule in turns, but quarrelled, and Polyneices fled to the court of Adrastus for vengeance. The result was the famous campaign known as the Seven against Thebes (q.v.). In this war E. and Polyneices killed each other. See *The Seven against Thebes* by Aeschylus. See also EPIGONI.

Eternal Punishment, see GEHENNA; HELL.

Etesian Winds are those which are prevalent, during summer, over the S. part of Europe. Their direction is N. across the Mediterranean Sea to N. Africa, and they seem to be caused by the rising of the heated air over the Sahara and the consequent influx of cooler air to replace it.

Etex, Antoine (1808-88), Fr. sculptor, architect, and painter, b. Paris. He studied sculpture under Dupaty and Pradier, painting at the Ingres School, and later architecture under Duban. In 1829 he won 2nd prize for sculpture at the Ecole des Beaux Arts, with his 'Hyacinthe mourant.' He also won in the same period prizes for a painting of a nude bather shown in the Lebrun Gallery, and other awards. His chief work was commissioned by the Fr. gov. for the Arc de Triomphe and the colossal groups on the rear face of the Arc. These groups represent the *Résistance* of France to the coalition of 1814, and *Paix*, 1815, but though impressive, suffer to some extent by such close juxtaposition with 'La Marseillaise,' the masterpiece of Rude, which is to be seen on the opposite side. He was the friend of Géricault on whom he wrote. Chief of his architectural works is the tomb of Napoleon I in the Invalides. His work was criticised by G. Planché as lacking in simplicity, though revealing all the secrets of the art. Pubs. include a biography, *Les Souvenirs d'un Artiste*, 1877-87. See P. E. Mangedut, *Antoine Etex*, 1894.

Ethyl, also called Cetyl Alcohol, for it seems to be the hydroxide of a radical called Cetyl. It is a solid, transparent, white crystalline mass, which melts at about 50° C., and is contained in spermacetti.

Ethane (C₂H₆), gas composed of hydrogen and carbon, is contained in the gas which rises from the earth. It is colourless, without smell, and will burn in air with a luminous though pale flame and is insoluble in water. E. is the second number of the paraffin series, the first being methane or marsh-gas (q.v.).

Ethelbald (fl. 716-57), king of Mercia. He succeeded to a weakened kingdom, but the death of Wiltred of Kent (725) and the abdication of Ine of Sussex (726) left him supreme in S. England. In 731 Bede states that all the Eng. provs. S. of

the Humber were subject to him and one of E.'s charters (736) actually calls him *rex Britanniae*. E. appears to have ruled energetically, but his private life and treatment of the Church angered St Boniface; and he was murdered in circumstances which suggest that he was regarded as a tyrant. At his death Mercian power temporarily declined, to be re-established by his son Offa (q.v.).

Ethelbald, king of Wessex (d. 860) (q.v.). In 856 his father agreed to a division of the kingdom, E. taking Wessex, while Ethelwulf retained Kent and the SE. He married Judith, his father's widow, in 858.

Ethelbert (fl. 560-616), king of Kent. His marriage with Bertha (q.v.), daughter of Charibert, king of the Franks, led indirectly to St Augustine's mission, and by him E. was converted to Christianity in 597, and he in his turn influenced thousands of his subjects to turn Christian. He destroyed pagan temples and built churches, and also issued the first written Eng. set of laws. E. seems to have held a recognised position of overlordship over the other kings S. of the Humber during the last 30 years of his reign; but Kent's supremacy vanished at his death.

Ethelbert (d. 868), king of Wessex, 3rd son of Ethelwulf (q.v.). He succeeded his father in Kent (858) and on the death of Ethelbald he took the whole realm (860).

Etheldreda, St (c. 630-c. 679), abbess and founder of the religious house of Ely. She was married twice, her second husband being Oswy, king of Northumbria. She preferred the religious life, and neither marriage was consummated. She was also known by the name of St Audrey, the origin of the present word *taudry*, originally applied to a cheap kind of lace purchased at St Audrey's Fair.

Ethelfleda (d. 918), Eng. princess, daughter of King Alfred, and wife of Ethelred, earldorman of Mercia. She was successful in helping her brother Edward to subdue the Danes, and on the death of her husband (911) ruled his lands alone, with the title of 'Lady of the Mercians.' She is famous for the fortress which she built to resist the Danes.

Ethelfrid, or **Ethelfrith** (d. 616), king of Northumbria, son of Ethelric and the real founder of Northumbrian power. Having succeeded in 593, he gained a great victory over the Britons of the N. at an unidentified place called Degastand in 603. He defeated the Britons at Chester between 613 and 616. In 616 he was slain in a battle against Redwald of E. Anglia.

Ethelred I (d. 871), king of the W. Saxons. He was the son of Ethelwulf and elder brother of Alfred (q.v.). It was in his reign that the Danes first attempted to make permanent settlements in England. He succeeded his brother Ethelbald in 865, and in 870 E. and Alfred defeated the Danes at Ashdown. E. was defeated at an unknown place called Merantun in 871 and d. shortly afterwards.

Ethelred II (c. 965), surnamed 'the

Unready' (lacking in 'rede' or counsel), Eng. king. He succeeded his half-brother, Edward the Martyr (978). At first he tried to buy peace from the Norsemen (see DANEGELD), but in 1002 E. ordered a large-scale massacre of the Danes in England, and it was probably largely to avenge this that Sweyn of Denmark attacked England (1003 seq.). In 1013 E. was forced to flee to Normandy leaving Sweyn in possession of all England. E. returned to England on Sweyn's death (1014) but was defeated by invading Danish forces under Sweyn's son, Canute (1016), and d. shortly afterwards. E. was an unpopular ruler, capricious and vacillating; but much of his failure may be explained by the disturbed conditions prevailing at his accession.

Ethelred, St. see AELRED, ST.

Ethelwold, St. (d. 984), Eng. Benedictine monk and bishop, b. Winchester. In 955 he was elected abbot of Abingdon, and in 963 bishop of Winchester. Together with St Dunstan and St Oswald of York E. led a monastic revival, founding or reforming numerous monasteries, and replacing secular canons. His feast is on 1 Aug.

Ethelwulf (d. 858), king of Wessex and Kent, son of Egbert. He succeeded to the throne in 839, and his reign was occupied with fending off constant raids by the Danes. In 851 E. won a notable victory over them at an unidentified place called Aclea. E. was an unambitious ruler; in 855 he went on a prolonged pilgrimage to Rome and in 856 granted Wessex to his son Ethelbald (q.v.), he himself retaining Kent and the SE. until his death.

Ether, in physics, see AETHER.

Ether, **Ethyl Ether**, or as it was formerly called, **Sulphuric Ether** ($C_2H_5)_2O$. is prepared by the so-called 'continuous process,' by the action of sulphuric acid on ordinary alcohol: 9 parts of concentrated sulphuric acid and 5 parts of alcohol are heated to $140^\circ C$. in a retort, whereby ethyl hydrogen sulphate is formed ($C_2H_5.OH + H_2SO_4 = C_2H_5.HSO_4 + H_2O$). A slow stream of alcohol is then run in, which reacts with the ethyl hydrogen sulphate to form E. ($C_2H_5.HSO_4 + C_2H_5.OH = (C_2H_5)_2O + H_2SO_4$). The sulphuric acid which is regenerated reacts with more alcohol according to the first equation, and so the process may be regarded as 'continuous,' at least, until the water formed dilutes the sulphuric acid to such an extent as to render it ineffective. The crude E. which distils over is washed with caustic soda solution, the top layer containing the E. being dried over lime and redistilled. E. is a colourless, mobile, and volatile liquid, with a peculiar smell, it is lighter than water (sp. gr. 0.72) and boils at $35^\circ C$. It is somewhat soluble in water, and readily dissolves fats, resins, and oils, for which purpose it is largely used in the arts. E. is very inflammable, burning with a somewhat luminous flame, and forming an explosive mixture if its vapour is mixed with air. Chemically it is stable and not

readily reactive. Owing to its low boiling point (below blood heat) it vaporises so rapidly in the air as to produce intense cold. Use is made of this in some freezing machines, and also in producing local anaesthesia by freezing. Medicinally it is also used as a heart stimulant, in small quantities; and more generally as an anaesthetic when inhaled, for which purpose it is safer than chloroform, though it is more irritant to the mucous membranes of the bronchi and its use is therefore contraindicated in cases of affections of the lungs. Accidents have occurred owing to its great inflammability. See also ANAESTHESIA.

Ether Waves (radio), name once given to the electro-magnetic radiations known as X-rays, light, heat, and wireless W. See AETHER.

Etherage, Sir George (c. 1635-81), Brit. dramatist, was educ. at Cambridge. A man in easy circumstances, he wrote plays merely to amuse himself, in those hours that he could snatch from the pleasant diversions of a man about town. He wrote 3 comedies: *The Comical Revenge, or Love in a Tub*, 1664; *She Would if She Could*, 1667; and *The Man of Mode, or Sir Fopling Flutter*, 1676. These plays had wit, but their indecency attracted the censure of Steele, though in this respect they were no worse than those of many of his contemporaries. Shortly after the production of his last comedy he was knighted, though the reason for this honour is unknown. He was sent as minister to The Hague by Charles II, and by James II in 1685 to Ratisbon, where his private conduct was disgraceful and his diplomatic value nothing. His works were collected and ed. by A. W. Verity, 1888; and H. P. B. Brett-Smith, 1927-; his *Letter Book* was ed. by S. Rosenfeld, 1928. See lives by V. Meindl, 1901 and F. S. McCarnie, 1931.

Ethers, or **Alkyl Oxides**, class of compounds of which ordinary or Ethyl E. (q.v.) is the best known. They are related to the metallo E. in the same way as the alcohols are to the hydroxides. Their formulae may be represented by ROR' , where R and R' are 2 hydro-carbon radicals. They are prepared by the action of the A. halides on silver O., or of the A. hydrogen sulphate on the alcohol, and in other ways. Chemically the E.s are neutral, inert bodies varying from volatile liquids to waxlike solids.

Ethical Societies. At the end of the 19th cent. E. S. to promote the study and application of E. principles without theological commitment were formed, first in America and then elsewhere, mainly in Britain, Germany, and Austria. The H.Q. of the Brit. S. is The E. Union, Incorporated, 4a Inverness Place, London, W. 2. The Union publishes a monthly *Journal News and Notes* and a quarterly *The Plain View*, and initiates social research, public conferences, summer schools, lecture courses, and puba. in furtherance of its object, that is, the improvement of human relations and the quality of living on a humanist basis.

For more than 40 years the Union has been specially interested in the moral aspect of education, and its pubs. in this field have been officially recognised and used. In addition the Union supports and promotes the formation of local groups. Presidents of the E. Union have included: J. A. Hobson, L. T. Hobhouse, Graham Wallas, Gilbert Murray, G. P. Gooch, H. N. Brailsford, and Sir Richard Gregory.

Ethics, the science which deals with human character and conduct, not considering them in the light of their own nature, but in respect of the moral judgments which have been diversely passed upon them. Like logic, therefore, it is a universal and practical science, dealing with elements common to the whole of the human race. This definition will at once show its intimate relations both with psychology and sociology. But although E. and psychology are closely related, there is a clear distinction between them which may be shortly expressed by saying that while psychology deals with the explanation and analysis of mental processes, and with the world as it is, E. concerns itself with the judgments, either condemnatory or laudatory, passed on these processes and their resultant actions, with the world, not only as it is, but also as it ought to be. An ethical bearing is therefore pre-supposed for the many psychological questions which come under discussion in E. Thus we have the question of the nature of volition itself, and the relation of will and character, which is considered substantially apart from the various acts of will which go to form it and which result from it. Character has been defined, indeed, as 'the habit of the will.' Then come the questions of Hedonism, conscience (q.v.), and the freedom of the will, and also among modern writers the question of the relation of the social life to E. E., as we have seen, deals with 2 subjects which are inseparably related: (1) Character, in relation to which it investigates the nature of duty and virtue; (2) conduct, in relation to which it attempts to differentiate between the various virtues and vices, and to discover the extent and range of obligation. Thus E. is seen to deal not only with the problems of action as they exist, but also with the more critical question of the principle or principles by which conduct should be regulated. The basis of E. is, indeed, the search for the *summum bonum*, the quest of man's highest good. It is by their varying conceptions of this highest good that the various schools are chiefly differentiated.

Thus, broadly classifying, we distinguish 2 great schools, the hedonistic and the rationalistic, to be found among both ancient and modern thinkers. The Cynics and Stoics were rationalists, that is to say, they held the life of virtue or reason to be the sought-for end, beside which nothing is to be considered. But Socrates, before this, when attempting to define virtue, had found himself compelled to do so in terms of pleasure. The chief good

must also be true felicity. Emphasis is laid on this by the hedonistic schools of Cyrenaics and Epicureans (see EPICUREANISM), where virtue is considered as leading to the highest pleasure, or, to use the Aristotelian term, *eudaimonia*, somewhat misleadingly trans. happiness by modern ethicists. With Plato and Aristotle the Socratic view is kept in its entirety and explained in a still deeper sense, and it is thus found that hedonism takes a lower place. Plato, indeed, in certain of his dialogues, explicitly condemns it. Aristotle taught that the highest good for any being is the perfect development and full exercise of its function; and since man is differentiated from the lower animals by reason, it is in the development of his moral and intellectual abilities that his end consists, the life of virtue and knowledge. The life of virtuous activity is subordinate and inferior to the life of the philosopher. It will be seen from this explanation that the Greeks treated of E. mainly from the individualistic standpoint, though the relation of E. to social science is not ignored. The scholastic philosophy, based as it was on Aristotle and his commentators, did not materially alter this view, save that in the latter the contemplation of the Deity was not explicitly propounded as man's final end and *summum bonum*. E. was brought into close union with religion, and the conception of duty was that of obedience to the commands of God. Later, however, attention was chiefly devoted to casuistry (q.v.), and instead of new theories on the subject being broached, energy was chiefly expended in the application of the principles and recognised laws to conduct under all possible variations of circumstances. E. shared, however, in the new birth of the Renaissance, and the doctrine of Utilitarianism took its rise.

Utilitarianism, called also Universal Hedonism, in contrast to the Eristic Hedonism of the Epicurean schools, is essentially social in its attitude. We have already remarked on the development of the doctrine of pleasure by Epicurus, and this conception had not been wanting in the scholastic system, for here the consideration of reward and punishment went always side by side with the consideration of obedience and disobedience to duty, of virtue and of vice. The Utilitarian philosophers frankly took up again this view, but with them it was the pleasure of the greatest number, rather than of the individual, that was to be sought. Now, too, a definite attempt was made to estab. E. on some basis other than the theological, but the idea of rewards and punishments still survives to a large extent. Hobbes and the naturalistic school founded their E. on the natural results of human action. E. to them was the codification of the results of actions according as they finally give pleasure or pain. As this conception becomes more and more altruistic, we see that virtue becomes equivalent to utility, and so the successors of Hobbes are commonly known as the Utilitarian school. A somewhat similar view, though expressed

in the language of rationalism, was that of Cumberland, who, in his *De legibus Naturae*, 1672, gives 'the common good of all' as the final end, though he expresses 'good' in terms of perfection as well as of happiness. Many ethicists of the following period, such as Shaftesbury and Butler, make use of similar phraseology. But it was in David Hume (1711-76) that the Utilitarian school found its first capable exponent, almost, one might say, its founder. Virtue he defined as the quality which an onlooker approves, and vice as that which the onlooker blames. With this as his basis, he proceeds to examine the virtues and vices, showing that in every case that quality is approved which is useful or directly agreeable. Thus utility becomes the sole criterion of virtue.

DAVID HUME

Wm Paley, in his *Moral Philosophy*, 1785, though taking his stand on the basis of Christianity, was a notable exponent at a later period of the utilitarian principle. The period of the Fr. Revolution was one of considerable activity in this dept of thought, and here again Utilitarianism is the main principle.

Jeremy Bentham widely extended the sphere of its operation, and caused the complete reunion of E. and politics, by applying it to the latter of these. The names of Ricardo and J. S. Mill are even more important. The latter was principally occupied in the defence of his theory, rather than in its exposition, for Bentham's works had evoked a large number of attacks. All these writers regarded man as a social being, and insisted on the fact that the most necessary virtue was benevolence or unselfishness, but it was objected that no reason was ever given why the advancement of the general happiness should be the duty of the individual. Paley, as we have seen, met this objection by theological motives, while Bentham did so by regarding the community as the unit. But no truly satisfactory proof of the principle has yet been adduced. Meanwhile, though Utilitarianism was the more prominent,

Rationalism also appeared in various forms, as interpreted by the Cambridge Platonists (q.v.), and the 18th-cent. Intuitionist school, of which Joseph Butler may be regarded as the founder. It regards conscience as the final judge of actions, but its weakness lies in the failure to give a complete definition of conscience. The ethical system of Kant, given to the world chiefly in his *Groundwork of the Metaphysics of Morals*, 1785, and the *Critique of Practical Reason*, 1788, was an attempt to clear away the many difficulties of the intuitionist system. Thus, through the transcendentalism of Germany, came into England the ethical idealism which has exercised so powerful an influence on the development of Eng. thought in every dept of philosophy during the past cent.

The question may be asked whether E. is the sort of subject which a professional moral philosopher can discuss in a spirit of nearly sceptical detachment. This detachment, though proper for the professional moralist in the academic exposition of E., does raise a real moral problem for him as a human being, and also as a teacher. For as a teacher he may be called upon to say something about principles on which he decides between right and wrong; he must try to say how questions of decision arise in his professional work; and ultimately he must admit that intellectual integrity is something at least partly moral in character. In order to teach E., a professional moral philosopher must care about the differences between right and wrong, between good and evil. No serious moralist can, ultimately, be satisfied with the philosopher who avers that questions concerning the meaning and end of human life signify nothing. In this context Butler in his *Dissertation on the Nature of Virtue*, raised the question of whether goodness consists simply in a general concern for human welfare. This, as he saw, was the attitude of the reforming sentimentalist. It is no doubt hard to distinguish charity from sentimentality, and it is hard for the same reason to distinguish tolerance from intellectual indifference; and even the honest intellectual is in danger of repeatedly confusing these opposites. See the works of the ethicists referred to in the text, and also H. Spencer, *The Data of Ethics*, 1879 (part 1 of *Principles of Ethics*, in 2 vols. completed 1893); T. H. Green, *Prolegomena to Ethics*, 1883; H. Sidgwick, *Outlines of the Hist. of Ethics*, 1886; C. E. Moore, *Ethics*, 1912; A. Schweitzer, *Kultur und Ethik*, 1923; A. Dyroff, *Religion and Moral*, 1925; E. Brunner, *Das Gebot und die Ordnungen*, 1932; W. Lillie, *An Introduction to Ethics*, 1948. See also COMPARATIVE ETHICS.

Ethicus, or Aethicus, reputed author of a cosmography, and also perhaps of a fuller, though less ambitious, work, entitled *Alia Totius Orbis Descriptio*. Internal evidence, such as the mention of the gate of St Peter in Rome, and of other signs of Christian supremacy, assigns the

cosmography to the latter part of the 4th cent. It is mentioned by Isidorus of Seville (7th cent.) and other writers, and an abridged form of the 2nd book is found in Orosius. The compendium is an abstract of ancient geographical lore, and might well have been put together from the results of the reputed survey undertaken, at the instance of Julius Caesar, by the 3 geometers, Polydektus, Zenodorus, and Theodotus.

Ethiopia (Abyssinia), independent inland country of N.E. Africa (forming between 1936 and 1941 part of It. E.

almost the whole of the plateau. Most of the region was formed as the result of volcanic activity, but, save for a few hot springs, the volcanic action is now extinct. The highest peaks are found in the Simen and Gojam ranges. As the slope of the country is least steep towards the W., the majority of the rivers empty themselves in the Nile. Many, however, of lesser significance lose themselves in the sand. The Hawash is the chief river. It rises in Shoa and flows into Lake Aussa, where further trace of it disappears. This remarkable phenomenon is partly explained

W. F. Mansell

THE TABLE OF ABYDOS IN THE TEMPLE OF SETI I

Africa). It is situated between 5° N. lat. and 35° and 42° E. long. Its boundaries are, on the N. the Red Sea, on the W. the Sudan, on the S. Kenya and Uganda, and on the E. Fr. and Brit. Somaliland.

Its area is estimated at 350,000 sq. m., with an estimated pop. of 10 to 12 million. The name A. is derived from *habesh*, meaning mixed, on account of the varied nature of its peoples; but, among the inhab., the whole country used to be called E. and the term 'Abyssinian' or 'Abyssinia' is regarded as being derogatory.

E. is a vast plateau intersected by deeply running rivers, whose beds have been worn to considerable depth, and in this way is shaped masses of land have been formed called 'ambas.' A feature of these ambas is their almost perpendicular ascent, a characteristic which marks

by the great depth below sea level of the lake. Compared with smaller neighbouring lakes the Aussa is almost fresh, while salt is present in the others to such a degree that it deposits a crust round the edges. The Hawash R. is to be used for a hydro-electric scheme (1957). The R. Abai, which forms the Upper Blue Nile, reaches that river through Lake Tana. The Takazze joins the Nile, changing its name, on nearing the confluence, to that of Atbara. The Moreb flows into Nubia, but disappears later in the sand. Of all the physical features of E. the Lake Tana is the most arresting. It is 60 m. long and presents a most striking picture. A new lake, some 9000 ft above sea-level, in the crater of an extinct volcano, was discovered in 1931 by Amer. surveying engineers and named Lake Southard in honour of a former Amer. minister to Addis Ababa.

Generally speaking, the climate of E. is temperate and fairly salubrious, owing to the practically uniform elevation, though in some parts a very wide range of temp. is covered during the day. The weather conditions may be divided into 3 periods: the cold season, from Oct. to Feb.; the hot, dry season till June; and the rainy season for the rest of the year. Rain is an important factor in E., as the Nile depends for its flood entirely upon its Ethiopian tribs. The climate is conducive to the luxuriant growth of the following trees: date-palm, mimosa, giant sycamore, gum (in many varieties), pine, fig, orange, pomegranate, peach, apricot, and banana. Among the smaller plants, cotton, indigo, and the sugar-cane grow in profusion. In the Kaffa country coffee is indigenous, and it is believed to take its name from that region. The production of mead, a popular drink in E., is dependent upon a regular supply of honey, a fact which gives bee cultivation much impetus. Ethiopian crops suffer considerably from swarms of locusts which visit the country periodically.

After incorporation of E. within the It. Colonial Empire, It. E. Africa was divided into the following separate provs., each of which included a part of E.: Eritrea, which extended to Danakil; Amhara (cap. Gondar), which comprised Amhara, Gojam, and a part of Shoa; Galla and Sidama (cap. Jimma), which included the W. part of E. as far as the Sudan; Harar (cap. Harar), which includes the Muslim pop. of Harar, Arussi, and Bali. In 1938 a royal decree estab. the new Gov. of Shoa, but in 1941 the Ethiopian Gov. returned to Addis Ababa. Prior to the It. conquest in 1936 the political divs. of E. comprised a number of provs. and dependent states. The former included Tigré in the N.E., Amhara in the centre, Gojam enclosed in a great sweep of the Abai, and Shoa on the E. of the Abai; while among the many dependent states were the Wallegas, Harar, Kaffa, Gallaland, and Central Somaliland. After the It. annexation had removed the Ethiopian throne as an object of the ambition of the rival chiefs, an increasing measure of Ethiopian unity, hitherto rendered impossible by the relationship between the emperor and the great chiefs, might have been expected in course of time. The emperor was restored by the Brit. Periods of incessant warfare, and the frequent exhaustion of natural products, account for the non-existence of large tns. The cap. of E. is Addis Ababa, in Shoa; other tns are Adowa (the cap. of Tigré), Adigrat, Macalle, and Antah, in Tigré; Dire-Dawa, Debra-Derhan, Aliu-Amber, and Ankober, in Shoa; Leika in Gallaland, and Bonga in Kaffa; and Gondar, Axum, Antalo, and Harar. There are ancient architectural remains at Axum, Gondar, and Ankober. Most of the transport of E. has hitherto been carried on by means of pack animals, so few of the roads are fit for wheel traffic. Many m. of macadam road were constructed in the neighbourhood of the cap. a few years ago. A railway links Addis

Ababa, via Dire-Dawa, with Jibuti (Fr. Somaliland), 488 m. away. Telegraphs and telephones connect the cap. with Harar and other places. The soil is extremely fertile. In fact Egypt owes all the richness of its own soil to the sediment brought down by Ethiopian rivs. Agriculture is followed on a large scale. In the hotter regions sugar-cane and coffee flourish; in the middle zone maize, wheat, barley, wild oranges, potatoes, and tobacco are grown, and, above 6000 ft, there are good pastures for mules, donkeys, goats, oxen, and sheep, and corn is cultivated. Horses and camels are a large part of the wealth of the people. The chief exports are coffee, civet, hides and skins, oil seeds, and wax. E. is certainly highly mineralised but no thorough geological survey has yet been carried out. Iron is found, and gold is washed in various streams; while salt, saltpetre, platinum, and sulphur are to be procured. Commercially, E. remained for a long time in a backward state, and not until the 20th cent., under the enlightened and wisely directed energy of Menelik II, was any effort made to advance its interests. Foreign undertakings gradually obtained a footing in the country in the cultivation of coffee. The ann. value of trade is estimated at approximately £23,000,000 imports, 1954, exports approximately the same. A big trade is done with the Sudan principally in hides, coffee, and shea butter.

The former Gov. of E. was feudal in its methods of administration. The princes possessed powerful influence, and formed a council in an occasional meeting called by the emperor. Two consultative organs of gov. were set up by the Italians: the General Assembly and the Council (Consulta), of which 6 native chiefs were members. There has never been a census but the estimated pop. is 18,000,000 (1956), of whom 30 per cent are Mohammedan, 50 per cent Christians (Copts), and the remainder Pagans.

In character the Ethiopians are easy-going, largely on account of the fertility of the soil, which provides an easy subsistence. Their Christianity is of a less enlightened kind, and since their conversion in the 4th cent. they have kept their connection with the Alexandrian Church through a Coptic head bishop. The Danakil profess Mohammedanism.

In ancient times E. was the classical name for a part of N.E. Africa, confined on the E. by the Red Sea, and to the N. by Egypt. The provs. of E., Kordofan, Sennaar, and Nubia roughly cover auct E. The etymology of the word is unknown, although it may well be Egyptian, but the Greeks, with their passion for derivations, referred it to 2 words, *aitchos* and *ops*, and said it meant 'swarthy faced.' Homer refers to the 'blameless Ethiopians,' whom he thought of as the men dwelling far away on the furthest borders, and tells how the gods went to their banquets. Herodotus recounts with evident delight a number of fairy tales about E., which he gathered from Egyptian priests. Thus

he divides the country E. and W. into the lands of the straight-haired and woolly-haired races, and discourses at some length on the elephant- and fish-eaters, the tortoise- and serpent-eaters, the Troglodytes ('dwellers in caves'), and the Blemmyes ('hideous men'), etc. Originally occupied by independent tribes, E. became an Egyptian prov. under the 18th dynasty, and paid tribute in negroes, ivory, gold, etc. During the 11th cent. BC E. was formed into an independent kingdom with the cap. at Napata. In 750 BC she was so strong that Egypt was obliged to acknowledge her yoke. When Egypt successfully rebelled in 660, the Ethiopians continued free till the Persian conqueror, Cambyses (q.v.), forced them in 525 to recognise his rule. The is. of Meroë, famous for the oracle of Jupiter Ammon, now became the cap. In the course of the 3rd cent. BC Ergamenes destroyed the theocratic gov. and estab. a military domination in its stead. Meroë fell before the armies of Augustus, when Queen Candace was counted among his victims. The great city of Meroë was a ruin in Nero's day, and in the 6th cent. its kingdom was supplanted by Christian Nubia. From the 1st cent. AD up to about 1000 the so-called Axumite dynasty reigned at Axum, and this was succeeded by another Christian power, that of the Zagwés. Scanty Egyptian stelae and records, and a few Ethiopic, trilingual, and Sabæan inscriptions, are almost the only sources of earliest Ethiopian hist. Christianity was introduced about AD 330. Modern hist. begins with the kingdom of Axum. Relations with the civilised world were severed after a Mohammedan conquest of the country in the middle of the 7th cent. In AD 1000 a general massacre was carried out by Princess Judith of all the royal family. The infant king, however, was safely conveyed to Shoa. Here he was welcomed, while the rest of the country was ruled by Judith. In 1268 the country was regained by the royal house, the reigning monarch being Tekunó Amtak. Portuguese attention was directed to E. in the 15th cent. A settlement resulted, and lasted 6 years, the royal family accepting the Rom. Church. In 1634 a rising against Rom. dominance resulted in the resignation of the negus (king) in favour of his son. A state of general confusion followed, no emperor being recognised. In 1769 Michel Sohul, the king of Tigré, installed himself as Itas (prime minister) over E., after assassinating Joas, the reigning monarch. A Galla chief soon overthrew him and assumed the position of sovereign, a dignity which eventually reached his grandson, Ras Ali. In 1850 a native of Amhara named Kassai, afterwards Theodore, defeated the Ras, and marrying his daughter, proclaimed himself governor. Three years later he conquered all opposition and installed himself as negus of E. He received assistance in governing from 2 Englishmen, who were killed in a rising in 1860. His rule now developed a tyrannical character, and so severe be-

came his administration that a general rebellion spread all over the country. It was put down after much fighting. Failure to secure European aid aroused a violent antipathy to Europeans, and Brit. and foreign envoys and missionaries were imprisoned. Peaceful overtures to obtain their release proved futile, and an expedition under Napier landed in 1868. The ill success of Theodore compelled him to treat for peace. He refused personally to surrender, and committed suicide. No sooner had the Brit. left than renewed strife broke out among the various chiefs for the crown. Prince Kassai of Tigré was successful in proclaiming himself emperor, though he failed to control insubordination among the various states. Meanwhile the Egyptians had become his enemies. An engagement resulted in such terrific slaughter that the parties mutually retired, and till 1882, when the Sudan was abandoned by the Egyptians, the difficulties of demarcation proved very troublesome. The Italians in 1885 occupied Massawa, and afterwards estab. friendly relations. Four years later Negus John II d., and Menelik of Shoa became emperor. In a treaty Italy assumed control of Ethiopian affairs, the empire becoming an It. protectorate. In 1895 a rising under Menelik resulted in a heavy defeat of the Italians. Following the ratification of the treaty, European missions were dispatched, and an agreement was concluded with the Brit. With the exception of Somaliland, however, the question of frontiers was judiciously avoided. In 1899 a rebellion under Mahomed Abdullah (the 'Mad Mullah') caused co-operation with the Brit., and although little practical help was rendered, the significance cannot be disregarded of the readiness of E. to request and accept Brit. aid. In 1906 an Anglo-It.-It. alliance agreed to protect their individual interests and ters. in the event of further disturbance. (See A. B. Wylde's *Modern Abyssinia*, 1901; Bruce's *Travels*, 1804; Mountmorris's *Voyages*, 1809-11.) King Menelik d. in 1913, and was succeeded by Lij Yasu, his grandson, who, coming under Ger. influence in the First World War, was deposed by public proclamation in 1916, and Watzen Zauditu, a daughter of Menelik, was nominated and subsequently crowned empress. At the same time Ras Tafari, a great-nephew of Menelik, was proclaimed heir to the throne, and for some time acted as regent to his aunt. In polity, the Gov. remains essentially feudal in character, but in 1919 a tentative step in the direction of Cabinet Gov. was taken. In 1923 E. became a member of the League of Nations. In 1924 a royal edict was promulgated to provide for the gradual manumission of slaves. The Empress Zauditu d. in Apr. 1930 from Lent fasting following paratyphoid. Her death ended the dual form of gov. of empress and regent, which had never been a success, especially as King Tafari, supported by the more educated elements in E., had always wanted to develop E. on modern lines. In 1927 he had been proclaimed

emperor or king of kings (*negus negusti*) and late in 1930 was proclaimed Emperor Haile Selassie I.

In 1935 Italo-Ethiopian relations began to deteriorate rapidly. It. claims to spheres of influence in E. were put forward half a cent. ago, but came to nothing after the disastrous It. defeat at Adowa (Adua) in 1896. At that time the Brit. Gov. recognised the It. zone of influence as extending virtually throughout modern E., but the treaty or accord of 1891 had been superseded by later agreements, and the whole position politically was then governed by a tripartite treaty made in 1906 between Great Britain, France, and Italy—a treaty which, in the It. view,

(chiefly relating to traffic in arms and slavery) to which her membership was indissolubly linked. (See on this *Documents relating to the Dispute between Ethiopia and Italy*, 1935, Cmd. 5044.) In the previous Dec. (1934) the undefined and contested frontier between It. Somaliland and Ogaden had led to difficulties, particularly the Wal-Wal incident, in which Brit. Somaliland was also involved. On 5 Dec. Ethiopian troops, who had been in touch with an It. frontier garrison for some days, attacked the Its., who withdrew. Later, It. reinforcements, supported by aeroplanes and tanks, repulsed the Ethiopians with severe loss. The It. Gov. sent a note of protest to Addis Ababa,

HAKAR

A wood market outside the main gate

recognised certain territorial adjustments in her favour in exchange for territorial cessions to E. in the region of the Somaliland coast. But the It. defeat at Adowa, coupled with the treaty Italy concluded with E. in 1896 at Addis Ababa recognising Ethiopian independence, excluded, in the view of the other European powers concerned, the possibility of an It. sphere of influence over the whole of E., and determined the basis of the tripartite treaty of 1906. This basis remained unaltered in the view of Great Britain and France in 1935, though Italy had never really relinquished her claims. (See on this G. A. Rossi, *Diritti d'Italia Oltremare*, 1916.) E. confirmed her independence by being admitted a member of the League of Nations, and Italy was a consenting party to her admission. Italy's contention, however, was that E. was admitted to membership only on certain specified and special conditions, and that in 1935 she might be regarded as no longer possessing the status of a League member, inasmuch as she had ceased to fulfil the conditions

while the Emperor, for his part, demanded arbitration in accordance with Article 5 of an Italo-Ethiopian treaty of 2 Aug. 1928. On the refusal of the It. Gov., E. submitted the dispute to the League of Nations. On 29 Jan. a violent encounter took place between It. and Ethiopian patrols at Afdub, S. of Wal-Wal. The It. Gov. again protested and mobilised 2 divs., the one for Somaliland and the other for Eritrea. Further incidents occurred and the Ethiopian Gov., in face of the It. mobilisation, now (Mar. 1935) demanded the application of Article 15 of the League Covenant (q.v.). In May Mussolini, in the Senate, spoke of the dangers threatening Somaliland and Eritrea and declared that Italy was ready to assume 'even the supreme responsibility.' Meanwhile, Brit. public opinion, which was overwhelmingly hostile to an It. expedition against E., aroused in Italy both apprehensions and irritation. The compromise proposed by Mr Eden to Mussolini—a rectification of frontiers to the advantage of Italy, and the annexation

of Ogaden, the right to construct a railway between Somaliland and Eritrea, and the cession by Britain to Italy of a passage giving access to the sea and of the port of Zella—was rejected by Italy as wholly inadequate (June). Later (Aug.), Italy rejected proposals put forward by France and Britain following a conference in Paris between Mr Eden, M. Laval, and Baron Aloisi. In Sept., Baron Aloisi deposited with the League Council a memorandum demanding the exclusion of E. from the League as a country barbarous, disunited, and countenancing slavery; he justified the use of force in order to reply to Ethiopian aggression and to establish civilisation in E., and refused even to discuss the memorandum with the Ethiopian delegates to the League. Mussolini was now plainly advertising his intention to invade E.—a move which had been obvious since the grand It. manoeuvres on the Upper Adige in the previous month. Whether Britain and France would have been able and justified in preventing by force this aggressive move by Italy must be left to the verdict of hist., but at the time it was generally believed in those countries that neither was sufficiently prepared to risk a major war in Europe, and this in spite of the threat by Italy to Brit. interests in the Mediterranean. Meanwhile a committee of the League was strenuously working to find some solution acceptable to Mussolini. One plan, involving an international police force to organise E., and territorial rectifications in favour of Italy, was accepted by Haile Selassie but rejected by Italy, which was again demanding that E. should be deprived of its domination over various subject peoples which were living on the frontiers of the empire 'under inhuman conditions.' On 2 Oct., the It. troops in E. Africa crossed the Ethiopian frontier and hostilities had begun. The council of the League declared Italy to be the aggressor and this imposed on each Member State of the League the obligation to apply the sanctions laid down in Article 16. (Austria and Hungary refused to join in the sanctions.) Italy protested against the economic and financial sanctions and decided to resort to counter-sanctions (Nov.). Later (Dec.) came the eleventh-hour effort by Sir Samuel Hoare and M. Laval to avert the war. The Hoare-Laval pact was a plan by which Italy was to receive Tigré without Axum, and the country of the Danakil and Ogaden, while E. was to obtain an outlet to the sea; and a zone for economic expansion and settlement was offered to Italy to the N. of Kenya. The Council of the League and Mussolini alike rejected the plan. The military operations which had begun on 3 Oct. on the Tigré front had in a week, almost without fighting, estab. 3 It. corps on the positions Axum-Adowa-Adigrat. By early Nov. the Italians had reached Makale and the Takazze Riv. After 15 Dec. partial Ethiopian offensives took place, causing the It. troops to fall back on Axum and Adowa. By the end of 1935 the It. front passed through Selaklaka-

Axum-Abbis Addi-Makale. But before that Gen. de Bono had been superseded by Marshal Badoglio, Mussolini being dissatisfied with the slow progress made by the former in the N. Badoglio pursued the campaign in the N. with redoubled vigour, having learned from the fighting at Tombien (20-26 Jan.) that the only way to meet the superior Ethiopian mobility was to attack on a wide front with all the modern essentials of mechanised warfare, including bombing from the air. Graziani's advance in the S. was hampered by the difficulty of bringing up supplies. Demoralisation set in by the end of April, and many Ethiopians returned to their agric. pursuits regardless of the campaign, while a great many deserted. Before the end of May the emperor, Haile Selassie, fled from his cap. to Jibuti, embarking for Palestine, where he sought Brit. protection, and the It. Gov. announced that it had annexed E. (The full details of the Italo-Abyssinian War will be found under ITALO-ABYSSINIAN WAR, 1935-36.) In this manner the only independent state of the African continent, apart from Egypt and Liberia, lost its sovereign status, though, by the prowess of allied arms, it was destined to be restored 5 years later. E. was consolidated with Eritrea and It. Somaliland into the colony of It. E. Africa. The annexation was recognised by the W. European powers a year later; but the Brit. Gov. only recognised It. sovereignty over E. in 1938. The Italians did not make substantial progress either in the development of the country or in its colonisation, though it was proposed to spend a large sum on rebuilding Addis Ababa and in opening up roads. Military roads were constructed, but the Italians probably never achieved much actual control outside the garrisons and air communications. For the conquest of E. by the Brit. forces in the Second World War, see ITALIAN EAST AFRICA, SECOND WORLD WAR CAMPAIGN IN (1941).

In recent years the trade of E. has fl. phenomenally, owing primarily to the exceptionally high price of coffee (1956) on the world mkt. The currency is the Ethiopian dollar linked with the U.S.A. dollar, and the currency of the country and its economy are admitted by world experts to be sound. The budget is balanced without difficulty and its foreign and internal debts are negligible. There is an increasing and active interest in all forms of mineral prospecting, including oil and uranium, both of which may well exist in payable quantities. Many other natural resources are attracting increasing local and foreign interests.

A new and relatively liberal constitution was granted by the Emperor on the occasion of his Silver Jubilee in 1955; the legal system is being energetically overhauled with the aid of European advisers, and a modern penal code has been introduced. Education and public health are subjects of special interest to the Emperor and much of his personal income is devoted to these purposes. As a member of U.N., E. sent 2 battalions of the Imperial Guard

to Korea and casualties included 141 killed. Foreign investment in E. is encouraged, and repatriation of profits and in many cases protective tariffs for reasonable periods, and other safeguards to investors, are guaranteed by law. Since the establishment of the Ethiopian Airlines, 1945, there has been created an exceptionally efficient internal service radiating from Addis Ababa to more than 30 centres in the Empire.

See J. T. Holland and H. Hozlor, *Record of the Exploration of Abyssinia* (2 vols.), 1870; A. B. Wyde, *Modern Abyssinia*, 1901; C. F. Rey, *Unconquered Abyssinia*, 1923; A. Hodson, *Seven Years in Southern Abyssinia*, 1927; Sir E. A. Wallis-Budge, *History of Ethiopia* (2 vols.), 1928; A. H. M. Jones and Elizabeth Monroe, *A History of Abyssinia*, 1935; C. F. Perham, *The Government of Ethiopia*, 1948; C. Sandford, *Ethiopia under Haile Selassie*, 1946, and *The Lion of Judah hath Prevailed*, 1955.

Ethiopian Languages are spoken in the modern state of Ethiopia and the surrounding dists. The main L. used up to the 14th cent., and which has been preserved as the L. of the E. Church and Ethiopic literature, is known as *tesana ge'ez*. The word *ge'ez*, which means 'free' or perhaps 'migration,' itself suggests that this tongue is a development of a foreign one, and namely in this case S.-Arabic. Indeed, it is generally accepted that S. Arabian colonies estab. in Ethiopia in the 2nd half of the 1st millennium BC introduced into that ter. the S. Semitic speech and script, which developed into the Ethiopic speech and script. The latter consists of 26 letters. There are 7 vowels, represented by hooks, which cannot be written without their consonants. Two dots separate adjoining words, and all the letters are written separately. No other Semitic dialect has so flexible or elaborate a syntax. It is written from left to right. In the 14th cent., after the 'reconstitution' of the 'Solomonic' dynasty in Ethiopia, Amharic (which is related to *Ge'ez*) became the main speech of Ethiopia and the official L. of the court (*tesana Negush*, 'the language of the Emperor'). In the N., however, its place is taken by 2 other related dialects, Tigré and Tigrat or Tigrina, this being nearer the ant *Ge'ez* than is Amharic.

Ethiopic Enoch, see ENOCH.

Ethmoid Bone ('sieve-like') is somewhat spongy in texture and cubical in form. It lies at the root of the nose between the 2 orbits of the eye sockets, and is one of the constituent B.s of the cranial box, the orbital plate of it being situated immediately behind the lachrymal B.

Ethnography, see ANTHROPOLOGY.

Ethnology, see ANTHROPOLOGY.

Ethyl, an alkyl, or organic radical, having the formula C_2H_5 , which can exist by itself and forms part of many compounds, such as E. alcohol, E. ether, etc., in which certain properties of the E. radicals persist.

Ethyl Acetate, see ACETIC ETHER.

Ethyl Carbinol, see PROPYL ALCOHOL.

Ethyl Chloride (C_2H_5Cl) is obtained by passing hydrogen C. into alcohol, in the presence of anhydrous zinc C., and condensing the product which passes over in a cooled receiver. E. C. is a colourless, ethereal liquid, boiling at $12^\circ C.$, which is soluble in alcohol, and only sparingly so in water. It is used as a local or refrigerating anaesthetic in dentistry and minor operations, and also as a general anaesthetic in place of nitrous oxide.

Ethyl Ether, see ETHER.

Ethyl Formate, see FORMIC ETHER.

Ethyl Nitrite, see NITROUS ETHER.

Ethylamine ($C_2H_5NH_2$), a substance resembling ammonia in its odour and many of its properties. It is best prepared in a pure state by the reduction of methyl cyanide (acetoneitrile). It is also formed, along with diethylamine ($C_2H_5)_2NH$), and triethylamine ($C_2H_5)_3N$), by the action of ethyl bromide or iodide on alcoholic ammonia. E. is a colourless, volatile liquid, boiling at $18^\circ C.$ It has a strong ammoniacal odour, and when in a dilute state is reminiscent of stale fish. It is very soluble in water to an alkaline solution, and with hydrochloric acid forms a salt which is deliquescent and soluble in alcohol, thus differing from the corresponding salt of ammonia.

Ethylene, or **Olefant Gas** (C_2H_4), a hydrocarbon prepared by heating alcohol with excess of sulphuric acid. A better method is to pass the vapour of ethyl alcohol over heated alumina, the latter acting as a catalyst: $C_2H_5OH = C_2H_4 + H_2O$. It is produced also by petroleum cracking (q.v.). E. is a colourless G. with a faint ethereal odour, and is insoluble in water. It burns with a very luminous flame, forming carbon dioxide and water. Chemically, E. is an 'unsaturated' substance, uniting directly with an equal vol. of chlorine to form E. dichloride or 'Dutch liquid,' and also with bromine, hydrogen, chloride, sulphuric acid, etc. It is present in small quantities in coal-gas. E. is used to some extent as an anaesthetic, but more largely as an artificial ripening agent for oranges, grape-fruit, etc. It is also important as an 'intermediate,' i.e. a compound prepared not so much for direct use as for conversion into other compounds. 'Polythene,' an extremely useful insulating plastic, is prepared from E. by polymerisation (q.v.).

Ethylene Alcohol, see GLYCOL.

Etienne, family of Fr. printers, see ESTIENNE.

Etienne, St., see ST ÉTIENNE.

Etiolation, see BLANCHING.

Etiology, the consideration of the causes of disease. These are divided into: (1) predisposing or remote, (2) exciting or

proximate, (3) determining. The various causes act in different ways.

Etiquette, Madame, see ANNA-ÉLIZABETH NOAILLES.

Etiquette is derived from the O.F. *estiquette*, 'a label,' another and closer Eng. derivative being 'ticket.' The *estiquette* seems to have been a kind of card of introduction, a meaning which offers some explanation of its later sense. The behaviour dictated by good breeding, the formal ceremonies prescribed by authority as appropriate to various social, court, and other official functions, and especially the observance of the rules of precedence, and the other proprieties of rank and office, are all part of E., which may briefly be described as 'conventional decorum.' See also ADDRESS, FORMS OF.

Etive, salmon riv. and sea-loch of Argyll, Scotland. The riv. rises on the Moor of Rannoch and finally is merged in the Firth of Lorne. The loch into which it flows is some 20 m. long, and is a submerged valley noteworthy for its natural beauty.

Etlar, Carit (1816-1900), pen-name of the Dan. dramatist and novelist, Johan Karl Christian Brosbøll, b. Fredericia. He studied painting for some time at the academy of Copenhagen, then took up literature, and pub. *Slægtskabet* in 1839. His works were very popular at the time, and include historical romances, tales of Dan. life, and dramas. His *Skrifter* (collected works) appeared at Copenhagen in 1859-68. Among individual works may be named *Livets Conflicter*, 1844; *Gjengældningen*, 1853; and *Arabere og Kabylser*, 1868.

Etna, or **Monte Gibello** (from Gk *alphō*, I burn), volcano, 10,758 ft., in the prov. of Catania (q.v.), on the E. coast of Sicily. By rail the circumference of its base measures 86 m., and it is estimated to cover over 450 sq. m. In shape it is a truncated cone; it has as many as 200 craters. On the W. side the symmetry of its slope is interrupted by a deep gully, 3 m. wide, known as Valle del Bove. Strabo (q.v.) mentions the 3 distinct zones of vegetation. Most of the highest region, down to a level of 7000 ft., is barren except for some stunted Alpine shrub, and is usually covered in snow, besides scoriae and ashes. The next zone is the zone of forests, the upper part of which is covered with birch trees, whilst the lower reaches (up to 6000 ft.) are dense with evergreen pines and chestnuts. The lowest region, which extends up to about 3000 ft., has the splendid fertility natural to volcanic soil. Here olives, vines, and all kinds of vegetables flourish, and the slopes are dotted everywhere with populous cities and villas. From 476 bc there have been repeated and serious eruptions. Catania was overwhelmed by the eruption of 1169, and in 1669 a great abyss, 12 m. long, was opened up in the side of the mt.

Eton, tn on the l. b. of the Thames, opposite Windsor, in Buckinghamshire, England. Pop. 4800.

Eton College, one of the most notable of Eng. public schools, was founded in 1440 by

Henry VI under the title of 'The College of the Blessed Mary of Eton beside Windsor,' but was not immediately completed. The building of the chapel was left incomplete in 1461, as a consequence of the Wars of the Roses, and finished in 1482. The buildings of 1521 were not part of the original plan, but the school was completed in 1523. The first headmaster was Westbury, and Bishop Waynflete was the first provost. The original foundation consisted of a provost, 10 priests, 4 clerks, 6 choristers, a schoolmaster, 25 poor

John H. Stone

THE QUADRANGLE, ETON COLLEGE

scholars, and 25 infirm bedesmen, but this constitution only lasted for a very few years. Revised statutes of 1443 provided for a provost, 10 priests, 10 chaplains, 10 clerks, 16 choristers, a schoolmaster, an usher, 70 scholars, and 13 poor infirm men. (The 13 poor men are not heard of after about 1460.) New statutes of 1868 provided a provost, 11 fellows, headmaster, lower master, not more than 2 chaplains (there is now 1), and 70 scholars. The number of pupils averages 1150. The 'Oppidans,' i.e. boys not on the foundation, form the great body of students. There are about 12 vacancies a year for collegers, filled by selection. Until 1851 the education was purely classical, but in that year mathematics was re-introduced, after having been dropped from the curriculum (it was certainly taught in the 15th cent.), and physical science was added in 1869. The Gothic stone chapel is the chief architectural beauty of the

college. A new east window was made in 1951. Collegers live within the walls, but most of the boys live in masters' houses, which are built of brick and picturesquely grouped about the older buildings and quadrangles. There is a special chapel for the younger school, a museum, and a fine library with about 22,000 books, including MSS. from the 10th cent., a Gutenberg Bible, and 3 Caxtons. In 1908 King Edward VII opened the much-needed school-hall, and a domed octagonal school library in memory of the Etonians who fought in the Boer War. There are also science schools, a school of mechanics, and an observatory. Speech day is celebrated on George III's birthday, 4 June; there is an annual cricket match at Lords between the school and Harrow, and on St Andrew's Day the oppidans play the collegers at football. Both Oxford and Cambridge rely much on Etonian oarsmen in their boat races. The eccentric custom known as 'Montera' (q.v.) was abolished in 1846. In the air raids of 1941 a bomb struck the Upper School, whose panels contained hundreds of names, some very distinguished, carved on the wood, and demolished the headmaster's room adjoining. Another bomb struck Savile House in Weston's Yard, the 17th cent. house of the preceptor. See W. L. Collins, *Etoniana, Ancient and Modern*, 1865; H. C. Maxwell-Lyte, *A History of Eton College, 1440-1910*, 1873, 1911; A. Clutton Brock, *Eton*, 1900; R. A. Austen-Leigh, *Guide to the Buildings of Eton College*, 1921; B. J. W. Hill, *Eton Medley*, 1948.

Étretat, Fr. seaside resort in the dept of Seine-Inférieure, known for its beautiful white cliffs. The church of Notre Dame dates from the 12th-13th cents. There are remains of a Rom. road and an aqueduct. Pop. 2000.

Etruria, name of the country of the Etruscans. E. Propria, through which the Arno flowed, lay W. of the Apennines and the Tiber; E. Campaniana lay S. of the Tiber; and E. Circumpadana embraced the valley of the Po. The famous confederation of 12 cities in E. Propria included Veii, Tarquinii, Clusium, Caere, Cortona, Volaterrae, Vulci, Volsinii, and Perusium; in the N. prov. were Felsina (Bologna), Mantua, Ravenna, and Adria, which gave its name to the Adriatic; and in the S. was Capua.

The Etruscans called themselves Rasena, whilst their Gk name was Tyrrheni. Their origin is uncertain; but they probably came from Asia Minor at some date before 800 BC, and this view is suggested by what little is known of their language. See also ALPHABET; ETRUSCAN LANGUAGE AND WRITING; EUGUBINE TABLES.

The Etruscan gov. was a close aristocracy, and was confined to the family of the Lucumones who combined civil with religious functions; the common people appear to have been in a state of serfdom. A meeting of the confederation was held annually at the temple of Voltumna near Volsinii.

E. was an empire when Rome was still

an insignificant city. Thus the Tarquin kings and the famous Lars Porsena of Clusium were probably Tuscan officials or magistrates sent to Rome in token of her subjection, and the Servian wall, the Capitoline temple, and the Cloaca Maxima still bear testimony to the reality of the Etruscan occupation. It was, moreover, to their conquerors that the Romans owed their colleges of augurs, their triumphs, their gladiatorial shows, their 12 lictors, their purple-bordered toga praetexta, their curule chair, and above all their regard and respect for women. The Etruscans attained their highest glory in the 6th cent. BC, when they figure in Gk hist. as the allies of the Carthaginians, who, in 538, expelled the Gk colonists from Corsica, and again when they (the Etruscans) were defeated in a famous naval battle against the tyrant Hiero I of Syracuse (474), and once more when they sent ships to help the Athenians during the siege of Syracuse (414). Indeed they were celebrated in ancient times like the Phoenicians, as a great sea power. But as early as 423, when the Samnites seized the stronghold of Capua, Etruscan supremacy had begun to decline. The inroads of the Gallic hordes affected E. even more than Rome, and in 396, after a 10 years' siege, the veteran Camillus finally captured and destroyed the populous and splendid city of Veii in spite of its cyclopean walls. The S. prov. swore allegiance to Rome in 351, and, after a series of crushing defeats, the fate of the Etruscans was finally sealed by the decisive Rom. victory of Cornelius Dolabella at the Vadimonian Lake (283), when Tarquinii was obliged to put an end to her stubborn resistance. In 91 they received the Rom. franchise. The military colonies estab. in E. by Sulla and Augustus destroyed the national character of the people, and the country thus became Romanised. See D. Randall-Molver, *The Etruscans*, 1927. See also ETRUSCAN ARCHITECTURE AND ART.

Etruria, dist. of Hanley (q.v.), in the city and co. bor. of Stoke-on-Trent. In 1769 Josiah Wedgwood and Thomas Bentley opened here their famous E. potteries; the original factory is now used for other purposes, but the fabric is preserved as an historic building. There is a memorial to Thomas Wedgwood, pioneer of photography and patron of Coleridge, in E. Park. Iron working is carried on. E. gives its name to certain beds of marls and clays in the N. Midlands, useful for pottery manuf.

Etruscan Architecture and Art, see ARCHITECTURE III.

Etruscan Language and Writing. E. was the L. spoken by the pre-Rom. pop. of Etruria (q.v.). It has come down to us in over 9000 inscriptions, which have been discovered in Etruria proper, roughly corresponding with modern Tuscany, as well as in other It. regions, such as Umbria, Campania, Enlilia, Sicily, Sardinia, and so forth, or even beyond the borders of Italy, in Styria, at Carthage, and in Egypt, where the most important E. document was found. This remarkable

text, containing about 1500 words, is written on the linen wrappings of an Egyptian mummy, and belongs to the Græco-Rom. period; it is preserved in the museum of Agram (or Zagreb), Yugoslavia. There are not many other long inscriptions extant. The most important of them are the tile from S. Maria di Capua (now in the Berlin museum), of the 5th cent. BC: about 300 words are preserved; the much more recent Perugia *cippus* contains about 120 words. The Tablet of Magliano (now in the Archaeological Museum at Florence), an inscription engraved on lead, is assigned to the 6th cent. BC. The last datable E. inscriptions belong to the early years of the Christian era.

Notwithstanding the relatively great number of inscriptions (the great majority consisting of a few words only), the many attempts to decipher the E. L. have been unsuccessful. It is certain, however, that it is neither Indo-European in structure or vocabulary, nor does it resemble any other known L., although it might have had some affinity with the anct group of the Caucasian L.s. On the other hand, the simple reading of E. inscriptions does not present great difficulties, because the E. script is fairly well known. E. W. goes, like the Semitic and early Gk and Lat. alphabets, nearly always from right to left; there are, however, inscriptions written in *boustrophedon* style, i.e. in alternate lines from right to left and left to right.

The original E. alphabet (8th cent. BC) derived from the early Gk, and contained 26 letters (21 consonants and 5 vowels). As time went on, there were reductions and various modifications, and about 400 BC the classical E. alphabet took its final form, having 20 letters: that is 4 vowels (*a, e, i, u*, but no *o*) and 16 consonants. E. speech knew no distinction between the voiced and breathed sounds *b* and *p*, *d* and *t*, *k* and *g*; therefore, the classical E. alphabet had no *b* or *d*. At a later stage, also *k* and *g* disappeared, and the letter *C* (E. *gamma*) was employed for *g* and *k*. See also ALPHABET.

Etsch, see ADIGE.

Etterbeek, industrial E. suburb of Brussels, Belgium. Pop. 51,500.

Ettlingen, Ger. tn in the Land of Baden-Württemberg (q.v.), 37 m. NW. of Stuttgart (q.v.). It is a picturesque tn, with a castle and an anct church. Pop. 5000.

Ettmüller, Ernest Moritz Ludwig (1802-1877), Ger. philologist. His great work was his patient research into Middle, High, and Low German, and into the anct Norse literature. From 1829 to 1852 he pub. scholarly eds. of old texts, including *Beowulf*, 1840, and he also brought out a *Lexicon anglo-saxonicum*; he studied the old Norse songs from the Niebelungen saga and pub. *Lieder der Edda von den Niebelungen*, 1837.

Ettrick, 1st Baron, see NAPIER.

Ettrick: 1. Riv. which waters part of Selkirkshire, Scotland. It rises in Capel Fell (2223 ft) in the SW., and flows almost due NE. for over 30 m., receiving

the waters of the Yarrow before joining the Tweed 3 m. below Selkirk. It passes through a country full of literary associations, for the 'Ettrick Shepherd,' James Hogg, lived in the par. of E.; and Deloraine, which recalls the hero of Scott's *Lay of the Last Minstrel*, lies below the vil. of Buccleuch. E. Water, upon which E. vil. stands, is part of the riv.

2. Forest, once covered all Selkirkshire and parts of the shires of Edinburgh and Peebles. It was once a favourite hunting ground for kings, but has been pastureland since the 18th cent.

Etty, William (1787-1849), painter, was the son of a miller, b. York. After 7 years in a printer's works, he at last (1806) realised his ambition and attended the Royal Academy schools in London, having for 1 year the advantage of Sir Thomas Lawrence's tuition. 'Sappho,' 1811, which was hung at the Royal Institution, was his first success. Elected R.A., 1828, he remained a life-long student of the nude in the Academy schools and his oil studies are now highly valued. One consequence of his study of the Venetian masters during his 1t. tour of 1821 was that he became famous as a colourist, and especially for the rich glow of his draperies and for the skill with which he harmonised his backgrounds with his central figures or subjects. His masterpieces include: 'Youth on the Prow and Polly at the Helm,' 1832; 'Cleopatra's Arrival in Cilicia'; and 'The Sirens.' The Tate Gallery, the York, and other municipal galleries of Britain have examples of his work. See lives by A. Gilchrist, 1855, and W. C. Monkhouse, 1874.

Etymology (Gk *etymos*, and *logos*), an investigation into the origin and original significance of words. It forms a subsidiary part of the science of comparative philology, but has only been scientifically studied since the 19th cent. False E.s have been often suggested through ignorance and half-knowledge. Folk-E. has played an important part in the development of languages. Words that people have known from their childhood are taken for granted, but it is quite different with the new terms they meet. These arrest their interest and, believing that every word has its signification, they seek for this, guided by resemblances of sounds to words already known, thus reaching false conclusions through false analogies. Various examples of the same illogical process are found in the O.T., in the Homeric tales, in quaint E.s of medieval writers, and even in some of the present-day dictionaries. Scientific E. was made possible by the birth of philology and by the study of other languages. It no longer sought the relation between the words of a single language exclusively within itself, but extended its view to a whole group of cognate tongues, or, wider still, to a whole family. Thus a new science arose under the title of Comparative Grammar. The evidence that the group of languages known as the Aryan language form a family, i.e. are all sister-dialects of one common tongue, consists

in their grammatical forms being the same, and in their having a great many words in common. In judging whether an individual word in one of these tongues is really the same as a word in another of these tongues, one is no longer guided by similarity of sound. Words are constantly undergoing changes, and each language follows its own fashion in making these changes. Corresponding words, therefore, in the sev. languages must, in the long course of ages, have come to differ greatly; and these differences follow certain laws which it is possible to ascertain. Of the laws of interchange of sound, Grimm's Law, named after the great Ger. philologist, is the most important. It exhibits the relations found to exist between the consonant sounds in the 3 groups of the Aryan languages. Followers of this theory were Curtius and Fick. From the 19th cent. onwards Eng. E. has been soundly based on an historical and scientific approach to the development of the Eng. language, as may be seen in the dictionaries of Skeat, Murray, and Wycl.

Etzel (or **Attila**), king of the Huns, see **ATTILA**.

Eu (the Rom. **Augusta**), Fr. tn in the dept of Seine-Inférieure, on the R. Bresle, 64 m. NNE. of Rouen. The riv. is canalised between E. and Le Tréport, 2 m. away. The tn is noted for the fine Gothic church of St Laurent (12th cent.), and the château of the Orléans family, which was devastated by fire in 1902 but which has since been restored. The forest of E. is SE. of the tn. Glass and casks are manuf. Pop. 5500.

Eua, one of the is. of Tonga, lying SE. of Tongatabu. It was discovered by Tasman in 1643.

Euboea, also called **Egripos** and **Negropont**, largest is. of the Grecian archipelago, having a length of some 90 m., and a breadth varying from 4 to 30 m. Area 1380 sq. m. It lies in a direction NW. to SE., is separated from the mainland by the narrow strait Euripus, and protects the coasts of Attica, Boeotia, and S. Thessaly. In Homer the inhab. are called **Abantes**. In the N. of E. dwelt the **Hittai**; below these were the **Eilopii**, and in the S. were the **Dryopes**. The centre of the is. was inhab. chiefly by Ionians. The promontory of Artemisium, where the Greeks gained a great victory at sea over the Persians (480 bc) forms a NE. extremity. Part of the same mt range which guards the E. of Thessaly, traverses the is. from end to end, Mt **Dirphys**, now **Delphi** (5738 ft), in the centre, being the highest peak. Chalcis and Eretria, the chief tns, were both Ionic settlements from Attica, which in their turn founded Cumae and Rhegium, etc., in Magna Graecia. Eretria was destroyed and its inhab. carried off to Persia during the great invasion of 490 bc. In 506 bc the Athenians estab. a hated cleruchy in Chalcis because that city had joined the Spartan league. After an ineffectual revolt, Pericles reduced the is. to submission to Athens in 446. After some

years of independence E. fell successively under Macedonian, Rom., and, during the Middle Ages, Venetian rule. From 1470 onwards it was subject to Turkish domination, but in 1832, it was incorporated with independent Greece. Magnesite and nickel are mined. E. produces cereals, olives, almonds, figs, and dairy produce. Pop. (is.) 150,000; dept (including N. Sporades) 163,700.

Eubulus (fl. 350 bc), Athenian politician, was an orator and a man of some ability; but it is impossible accurately to gauge his merits, as the speeches of Demosthenes, his arch-enemy, are the only source of our information concerning him. E. was largely influential in securing the acquittal of Aeschines, and further advocated peace at any price, a policy hateful to Demosthenes.

Eucaine, synthetic drug, comparable to cocaine in many of its actions, which is used as a local anesthetic in place of the latter, since it is less poisonous. Two E.s, the α and the β , are prepared, the latter being preferable; they are both derivatives of oxymethylpiperidine, and are prepared originally from acetone. E. is most frequently used in operations on the eye and nose, where it is applied to the surface in solution.

Eucalyptus, genus of Myrtaceae, contains over 500 evergreen trees occurring chiefly in Australia; while certain varieties are cultivated elsewhere, e.g. Algeria and Italy, for commercial purposes. Many reach a height of 150 ft and a girth of 30 ft or even more, and they frequently become hollow; *E. amygdalina* v. *regnans* attains a height of 300 ft. The species are of great economic value, yielding oils, kinos, and useful timber, while the well-known oil of E. is obtained from *E. globulus*, the blue-gum tree. The hydrocarbon 'melitose', a saccharine compound, is derived from the sap of various species of Tasmanian E. Gum and gum resin are yielded by *E. pauciflora*, *E. haemostoma*, and other species. *E. coccifera*, *E. gummit*, and *E. viminalis* grow outdoors in mild dists. of Britain.

Eucharist, **The** (Gk, meaning 'thanksgiving'), one of the earliest names for the act of worship instituted by Christ at the Last Supper. The Gospels tell us that in blessing the bread and wine Christ 'gave thanks' over them. It was the common Jewish method of blessing to give praise to the name of God over a thing or person. The memorial of His death instituted by Christ thus became known as the Giving of Thanks, the E., the sacrifice of praise and thanksgiving. Other names for it in the N.T. are the Breaking of Bread, and the Lord's Supper (this last perhaps including the Agape (q.v.), which at first was associated with it). In the East the service is usually called the Liturgy (q.v.). Catholics in the W. commonly call it the Mass (q.v.). Protestants, in accordance with their rejection of the Catholic teaching concerning the rite as a sacrifice, abandoned all such terminology and used the title 'Holy Communion' (q.v.), 'the Lord's Service', or 'the Lord's

Supper,' which avoided such implications. The Church of England did the same, but recognised the name Mass as in common use in Elizabethan times; and it is in fact increasingly used now by High Churchmen though there is much prejudice against it as implying Rom. Catholic teaching and beliefs.

The Gk verb *eucharistein* (to give thanks) was in early times used (so Justin says) in the sense of 'to consecrate,' and the word E. came to mean the consecrated elements, as well as the whole Eucharistic rite. So Irenaeus says that after consecration the bread is no longer common bread, but E., consisting of 2 parts, an earthly and a heavenly. This is the common teaching of both the Catholic and the Orthodox Churches and can be traced (as the quotation given shows) to the earliest times. It is also thought by Catholic scholars to be the teaching of the N.T., which is principally contained in the accounts of the Institution given in the synoptic Gospels, in the eucharistic teaching given in John vi. and xv., and in I Cor. xi. Some Protestant scholars agree that this is in some sense true.

The Rom. Catholic Church declares that, at the consecration, the Bread and Wine really and truly become the Body and the Blood of Christ by Transubstantiation (q.v.). Since Christ cannot be divided, this means that he is totally present, as God and Man, with his Body and Blood in either form of the sacrament. This is known as the doctrine of concomitance. The nature of Christ's presence in the Sacrament is real, but substantial in the metaphysical sense of substance; it is not a carnal and physical presence, nor is it spatial, though the sacrament is. For a classical exposition of this teaching, see the famous hymn sequence, *Lauda Sion* by St Thomas Aquinas.

Protestant teaching at the Reformation repudiated the Catholic doctrine of Transubstantiation, partly, perhaps because of the crude mis-statements and carnal misinterpretation of it that were widespread. Luther insisted strongly on belief in the Real Presence (q.v.), affirming however that the Bread and Wine are not changed at the Consecration, but somehow united with the Body and Blood of Christ. This is usually called the doctrine of Consubstantiation (q.v.). It differs from the Rom. Catholic teaching in stating that the (metaphysical) substance of Bread and Wine still exists after consecration, while Transubstantiation asserts that it no longer exists, though the species (physical qualities) do. Other Protestant reformers were more radical in their revision of sacramental teaching than Luther, asserting that the Bread and Wine remain plain bread and wine, unchanged. Zwingli taught that in receiving the Sacrament one merely reminds oneself of the death of Christ, and of one's union with him; Calvin that one not only did this, but in receiving the sacrament, at the same time, received Christ (though not in the sacrament). This last view is

called Receptionism. The Church of England permits her members to hold any of these views, though the majority of her people in fact believe in the Real Presence of Christ in the Sacrament, while not defining exactly what this means in the metaphysical sense. There are some Anglicans who actually believe in Transubstantiation, in spite of Article 28 condemning it. The binding authority of the 39 Articles on Anglicans is weak.

Another controversy between Rom. Catholics and Protestants concerns the nature of the Eucharistic rite. Catholics assert that from the first the E. has been regarded in the Church, and was instituted by Christ as, a sacrifice perpetuating on earth the offering that he perfected on the Cross and is forever pleading and presenting in Heaven: 'Do this in remembrance of Me' means 'Do this as a memorial before God of me.' Protestants, however, deny altogether the sacrificial nature of the E., and the priestly nature of the ministry that it involves. They regard the service as a memorial before men, reminding them of the death of Christ, and as in some way an act of communion with one another and with Him by eating and drinking ordinary food together, as at the Last Supper. The Church of England embraces holders of all these conflicting points of view.

At a very early date the liturgical nature of the E. developed considerably, and it has been suggested that St Paul's account of the institution was taken from an existing order of service. It is impossible here even to touch on the development of liturgiology, but these main groups of liturgy may be mentioned: the Rom., the Gallican, the Alexandrine, and the Antiochene, containing the liturgies of St Basil and St Chrysostom. There is no doubt that the E. was at first celebrated in the evening after supper. But it is equally certain that the change from evening to morning was universally made at a very early date. It is sometimes held that this change was made by St Paul in the Corinthian Church. St Augustine (*ad. Januar.*) makes no reference to the occasion of the alteration, but says, 'It has seemed good to the Holy Spirit that, for the honour of so great a sacrament, the Lord's Body and Blood should enter the Christian's mouth before other food. It is for this reason that the custom is observed throughout the world.' Fasting communion made a morning celebration the ordinary procedure, though it is probable that on fast days, when the faithful sometimes were fasting till 3 p.m., it would take place later. The practice of Evening Communion was received by Protestants as being more truly commemorative of the Last Supper. They also abandoned Fasting Communion in accordance with their views of the Sacrament as ordinary food. High Churchmen in the Church of England have strongly resisted these innovations. After the Second World War the Pope modified the rule of Fasting Communion and permitted Evening Mass and Holy Communion for Rom. Catholics,

owing to the increased stress of modern industrial life. In all the earliest references to the Holy E., it is considered that those who are present at the Consecration will all communicate. All those who had been present at the early part of the service but were unable to communicate had already departed at a given signal before the central act of the service began. Those who had departed would include the insane, the catechumens, and certain classes of penitents. The faithful all remained and all communicated with the priest.

The first falling away from this standard is shown in the second canon of the Council of Antioch (AD 344) when it is ordered that those who attended the service as far as the lections, but refused to communicate, should be cast out of the church until they repent and confess. The separation being effected by the exorcist. Until the 12th cent., it is admitted by all writers that the laity received the sacrament under both kinds in all solemn public administrations, though the species of bread alone was used under special circumstances. In certain parts, the custom of receiving the species of wine through a tube sprang up on account of the great fear which was felt lest any of the sacred element should be spilt. The greatest care was taken that no portion of the consecrated bread should fall to the ground. In the Catholic Church the chalice was withdrawn from the laity gradually from about 1100 onwards, and Communion has been given in one kind (bread) only ever since. This was a cause of great dispute at the Reformation, and all the Reformed Churches restored the chalice to the laity. In the East the custom of receiving the Blood of Christ by the method known as *intinction* early began. The consecrated bread is broken up and placed in the chalice, the 2 elements being given together into the communicant's mouth by a spoon. It is generally agreed that the early Christians received the sacrament standing, this being the usual posture for prayer on the Lord's Day and during Eastertide. Communicants, of course, had to be baptised persons and not under eccles. censure. The importance of private confession to a priest is insisted on in sev. places before the end of the 8th cent. An Eng. example occurs in the *Penitential* of Archbishop Theodore (c. AD 700), where a profession is made for dispensation from the rule if necessary. After special cases of excommunication and penance, reconciliation by the bishop or his deputy was, of course, necessary.

As for the days on which the E. was celebrated, our starting point is the celebrated passage in the Acts (II. 46) which is sometimes held to imply *daily* celebration. Particular mention, however, is later made only of the Lord's Day (xx. 7), and later allusions in the early writers make it comparatively clear that the Lord's Day was long regarded as the special day for 'the breaking of bread,' as it is now. The days next fixed for communion were the 'Station Days,' i.e. Wednesdays and Fridays. When at Rome the Pope celebrated in a

particular basilica. Daily celebrations were, however, in use by the time of Chrysostom. We may infer from a canon of the Council of Eliberis (c. AD 300) that at that time weekly communion was the regular rule of the church universal, and such it continued to be in the E. until the end of the 7th cent. Bede, when writing to Egbert, says that even the more devout amongst the Eng. laity do not communicate except at Easter, Christmas, and Epiphany, but advises insistence on daily communion, which he speaks of as the custom among many of the continental churches. The Church of England insists on communion 'three times a year of which Easter shall be one.' The Rom. Catholic Church, while encouraging frequent and daily communion (see PIUS X), requires it under pain of sin only once a year 'at Easter or thereabouts.' See B. J. Kidd, *The Thirty-nine Articles*, 1899; B. Frischkopf, *Die neuesten Erörterungen über die Abendmahlsfrage*, 1921; M. de la Taille, *Mysterium Fidei*, 1922; Y. Brilioth, *Eucharistic Faith and Practice*, 1930; W. Simpson, *Eucharist, Sacramental Principles*, 1932; A. O'Neill, *Mystery of the Eucharist*, 1933; G. Dix, *The Shape of the Liturgy*, 1943. See also COMMUNION, CONSUBSTANTIATION, IMPANATION, MASS, REAL PRESENCE, TRANSUBSTANTIATION, and the references under CHRISTIANITY.

Euchlorine, explosive, yellowish-green coloured gas, first prepared by Davy by heating hydrochloric acid with potassium chlorate. It has an extremely irritating odour, and is a powerful oxidising agent. It consists of a mixture of chlorine and chlorine dioxide, ClO₂.

Euchorite, basic arsenate of copper occurring as a distinct mineral. It is related to clinoclase, cornwallite, and tyrolite, all of which are generally isomorphous with the corresponding phosphates of copper.

Euchre, game of cards, popular in America, but not played until the end of the 19th cent. Thirty-two cards are used, all cards below 7 being rejected. The cards rank as at whist with the exception of the 'bowers.' The knave of trump suit (right bower) is the best trump; the knave of the same colour (left bower) is the next best, that card belonging to the trump suit. Each player receives 5 cards from the dealer by 2 or 3 at a time, the top card turned up being trumps. When two play, the non-dealer either 'orders up' the trumps or passes. If he passes then the dealer either takes up the trump or passes. If both pass, the non-dealer may call other trumps or may pass again when the dealer makes. If both pass again the hand is thrown in and the cards are dealt again. If the hand is played the non-dealer leads and the dealer plays and must follow suit if possible. The game then continues as at whist; if a player 'ordering up,' or taking up, or making the trump wins five tricks (a march) he scores 2 points; if 3 tricks (the point) he scores 1. If he fails to make 3 tricks he is euchred, and his opponent scores 2. Game is 5 up. Four-handed E. is generally played. Then the players cut for partners. If the first hand passes,

the second may assist, when his partner the dealer takes up the trump and the hand is played. If a player has a very good hand he may play alone against the other three. But he can only play alone when his partner 'orders up,' or when his partner assists, or when he takes up the trump, or when he orders the trump. The scores are reckoned as before, except that a player playing alone scores 4 points if he wins 5 tricks.

It may be noted that E., under very different rules, is a very popular game in the sergeants' messes of the Brit. Army. In this form of E., the number of cards in the pack varies according to the number of players. For 4 players, the cards are the joker, red deuce, black deuce (the Bennies), and ace to ten of each suit; for 5 players, add to the foregoing the nines of each suit; for 6 players, add the eights of each suit and 2 black sevens.

The cards change value according to the suit which is trumps. With a red suit: joker, red benny, black benny, the 2 red knaves (bowers) and the other cards in whist order. With a black suit the black benny and the red bonny change places, the black knaves take the place of the red knaves, which drop into their usual place as in whist. The knave of the suit called as trumps takes precedence over the other knave. Each player receives 5 cards, dealt 2 or 3 at a time; the top card of the remainder is turned up and becomes trumps. Each player in turn has the choice of calling, the dealer being last. If the suit turned up is called, then the dealer picks the faced card up and discards. If the nominated suit is not called, then the dealer turns it down and the call again goes round in any suit except the turn-down. Five-card E. is the form usually played, in which there are partners. The caller calls 2 suits: the first, trumps; the player holding the highest card of the second suit is his partner (buddy) but does not declare himself. If the caller and his partner take 5 tricks (a march), 2 points are scored; if 3 tricks, 1 point; if they fail to take 3 tricks they are euchred, and all their opponents score 2 each. When a player is 'low man' (has scored fewest points) he may 'call on his own' (without a partner). A march in this case scores 1 point for every player, and for 3 tricks half this number (3 points for 5 players, etc.). The first player to reach 7 points drops out of the game and the others follow at the same figure. When only 3 or 2 players remain, there are no partners.

Eucken, Rudolf Christoph (1846-1926), Ger. philosopher, b. Aurich, educ. Göttingen and Berlin. After teaching at Basel (1871-4) he was appointed to the chair of philosophy at Jena, which he held until 1920. In 1908 he won the Nobel prize for literature. Of his numerous works the most valuable are *Die Methode der aristotelischen Forschung*, 1872, and *Geschichte der philosophischen Terminologie*, 1879. His later writings are concerned more with ethical and religious problems; these include *The Life of the Spirit* (trans. 1909) and *Mensch und Welt*, 1918. See

W. R. Boyce Gibson, *Eucken's Philosophy of Life*, 1906; M. Booth, *Eucken, His Philosophy and Influence*, 1913.

Eucalase ('easily fracture'), very rare mineral bearing some relation to beryl, and found in Brazil and the S. Urals.

Euclid (c. 330-c. 275 BC), Gk mathematician, b. at Alexandria. His life is practically a blank, but many of his treatises, including the famous *Elements* (*Stoicheia*), have come down to us. This work, which includes 5 books on plane geometry, 1 on proportion, 3 on the properties of numbers, 1 on incommensurable magnitudes, and finally 3 on solid geometry, was for centuries the textbook on geometry in all schools, and has only in comparatively recent years been superseded on the Continent and in the U.S.A. His *Data* (*Nedomena*) contains 95 theorems, in which it is shown that, given certain hypotheses, other things are deducible. The *Phaenomena* deals with the appearances produced by celestial motions. The musical treatises, entitled *Introduction to Harmony*, and *Section of the Scale*, and the *Optics* and *Katoptrics*, etc., are of doubtful authenticity. See T. Heath, *The Thirteen Books of Euclid's Elements* (trans.), 2nd ed., 3 vols., 1926. See also GEOMETRY.

Euclid, or **Eucleides**, of **Megara** (c. 450-c. 380 BC), Gk philosopher, one of the most zealous disciples of Socrates, and also the founder of that school of philosophy variously called the Megarian, dialectic, or eristic. His philosophy prepared the way for the sceptics, for he delighted in proving contradictory propositions and so encouraged doubt. His writings have all perished.

Eudaemonism (from Gk *eudaimonia*, which describes the condition of a man under the care of a kindly spirit or genius), a much abused term in philosophy in the sense that every writer has contorted or enlarged its meaning to express his own ideas. As a system of philosophy E. upholds happiness as the chief goal of man, the confusion arising from the diverse conceptions of what is essential to that state. According to Aristotle the truly *eudaimones* are those who enjoy a contemplative existence without material anxieties, and without an impediment to the full and complete realisation of their highest self. Plato conceived a magnificent social 'eudaemonia', to which every member of the state contributed, and in which everyone shared. For the Epicureans E. was equivalent to hedonism (see ETHICS).

Eudemus of Rhodes, pupil of Aristotle (q.v.). The *Eudemian Ethics* attributed to him is probably no more than an edition of a course on ethics by his master. Fragments of his history of astronomy and mathematics have survived; there are editions by Spengel, 1866, and Mullaoh, 1881.

Eudialyte, or **Eudyalite** (Gk 'easily dissolved'), a vitreous basillite of calcium, sodium, iron, zirconium, and other elements found in Greenland in the form of pink rhombohedral crystals.

Eudiometer (from Gk *eudios*, and *metron*, measure), was primarily an apparatus to determine the purity of air, that is the amount of oxygen in it, but it is now generally used for the analysis of gases and especially of gaseous mixtures. A E. consists essentially of a graduated glass tubular vessel fitted at the top with platinum electrodes for the introduction of the electric spark. As a measure it depends on the observation of the amount of shrinkage after one or more chemical reactions in the vol. or vols. of the gas or gases under consideration. In the case of air the reaction is set up by the explosion caused by the introduction of an electric spark. A known vol. of the atmosphere is confined with about half its vol. of hydrogen. After an electric current has been passed through the mixture, all the oxygen of the air unites with some of the hydrogen to form aqueous vapour, which soon condenses. The shrinkage therefore measures 3 times the vol. of the oxygen, this gas combining with twice its own vol. of hydrogen to form water.

Eudocia, or **Athenais** (c. 395-c. 460), wife of Theodosius II., Byzantine emperor, was the daughter of an Athenian sophist. She was converted to Christianity by Pulcheria, sister to the Emperor Theodosius, whom she (E.) eventually married (421). She went to Jerusalem, and became implicated in the Monophysite controversy (453), but St Euthymius finally reconciled her to the true faith. Among her works were a paraphrase of the Book of Daniel and a poem on her husband's Persian conquests.

Eudoxus, 1. Gk navigator, was dispatched in 325 BC by Ptolemy Euergetes, king of Egypt, to explore India and the Arabian Sea. His adventures are recounted by Strabo, who included E.'s discoveries in his great geographical work.

2. of **Cnidus** (c. 407-c. 355 BC). Gk astronomer, studied under Plato for some time, spent years in Egypt, learning from the priests, and later opened a school in Athens which rivalled that of Plato. According to Pliny and Strabo he first fixed the length of the year as 365½ days, whilst Vitruvius ascribes to him the invention of the sun-dial. He was also a mathematician and philosopher, and was much admired by Cicero.

Euganean Hills (It. *Colli Euganei*), range of low, wooded, volcanic hills in Veneto (q.v.), Italy, extending for about 10 m. between Padua and Este (q.v.). The highest point is Mt Vonda (1980 ft). There are many fine villas on the hill slopes. Petrarch spent his last years here, at Arquà (q.v.).

Eugène, François, Prince of Savoy (1663-1736), Fr. gen., b. Paris. He was the youngest son of the count of Soissons, grandson of the duke of Savoy and related, on his mother's side, to Cardinal Mazarin. He was originally intended for the church, but his tastes were more for military renown. After his father's death, and on the refusal of Louis XIV to give him a commission, he left France and

served under Emperor Leopold as a volunteer against the Turks. He displayed great courage in the coalition war in Italy against France and covered himself with glory. He became a field-marshal in 1693, and put an end to Turkish power in Hungary by winning the famous battle of Zenta in 1697. He commanded the It. army in the War of Succession in 1701, but effected little of importance, owing to the smallness of his forces. In 1703 he became president of the council of war, took over command of the imperial army, and assisted Marlborough to win the battle of Blenheim, 1704. After being checked by the Fr. gen., Vendôme, and twice wounded he defeated the Fr. and drove them out of Italy. He shared with Marlborough, the victories of Oudenarde and Malplaquet. After the retirement of England and Holland from the struggle, Prince E. was unable to withstand the enemy on the Rhine, and was defeated by Villars in 1712. In 1716 war with the Turks recommenced, and the prince was everywhere successful. He defeated an army twice the size of his own at Peterwerdein, took Temesvar, and after a desperate battle took Belgrade by assault. After the Peace of Passarowitz, he laboured with unwearied energy in the cabinet. He died at Vienna. See lives by G. B. Malletson, 1888; Lt.-Gen. Sir G. MacMunn, 1934.

Eugene, city of Oregon on the Willamette R. The chief industries are flour milling and the manuf. of furniture and woollens. It is the seat of the Univ. of Oregon and Northwest Christian College. Pop. 35,880.

Eugenia, genus of Myrtaceae, contains numerous species, all of which grow in the tropics, and many bear edible fruits. The best-known plant in the genus is *E. caryophyllata*, which produces the cloves of commerce; they are the dried flower-buds of the tree. *E. Malaccensis* is known as the Malay apple, or rose apple.

Eugenic Acid, see **EUGENOL**.

Eugenics, that science which has for its aims the perpetuation of those inherent and hereditary qualities which aid in the development of the human race. (See **BIOLOGY**—*Practical Value of Biology*.) Sir F. Galton—who first coined the word E. in his work on *Human Faculty*, 1869—by his valuable research work and his many pubs. added considerably to the importance and value of the science. Not only this, but in his will he left sufficient money to found the Galton Chair of Eugenics at the London Univ. Attached to the chair is a valuable library and laboratory. The Galton Laboratory for National Eugenics publishes the *Annals of Eugenics*, the *Eugenics Laboratory Memoirs*, the *Eugenics Laboratory Lecture Series*, and the important *Treasury of Human Inheritance*, an extensive collection of family pedigrees, illustrating the inheritance of physical, mental, and pathological characters in man. Besides the works of Galton, there is an extensive literature on E. See F. Galton, *Probability the Foundation of Eugenics*,

1907; S. J. Holmes, *Studies in Evolution and Eugenics*, 1923; O. Neurath, *Modern Man in the Making*, 1939; also G. K. Chesterton's counterblast, *Eugenics and Other Evils*, 1922; T. Kemp, *Genetics and Disease*, 1952. The E. Society was formed in London in 1911 to promote the study of national E., and publishes a quarterly review. See also HEREDITY; MENDEL AND MENDELISM.

Eugénie, **Marie Ignace Augustine de Montijo** (1826-1920), empress of France, daughter of the Count of Montijo, b. at Granada, Spain. In 1853, at Notre Dame, Paris, she was married to Napoleon III, and 3 years later their only son, the prince imperial, was b. Her influence on her husband's policy was a bad one: she encouraged court extravagance, was at least partly responsible for the Mexican tragedy, and urged Napoleon to fight Prussia in 1870. She fled to England after Sedan, settling at Chislehurst, and later at Farnborough. Her husband d. in 1873 and she lost her son in the Zulu War of 1879. She d. while on a visit to Madrid. See lives by M. Paléologue (Eng. trans.), 1928; R. Sencourt, 1931; and O. Aubry, 1939.

Eugenin ($C_{10}H_{12}O_2$), substance which is obtained from oil of cloves.

Eugenius, name of 4 popes: E. I (St.), pope from 654-7, festival, 27 Aug.; E. II, pope from 824-7; E. III, pope from 1145-53; and E. IV, pope from 1431-47. The latter's pontificate was marked by a schism, created by proceedings in the council of Basel towards the reform of the Church and the limitation of papal authority. He excommunicated the council and the council deposed him, but he succeeded in re-uniting the Church round his own person and office. Holding a council at Florence, he concluded a re-union with the Gk Church (1439), and later with Armenians (1439), Jacobites (1443), and Nestorians (1445).

Eugenol, or **Eugenic Acid** ($C_{10}H_{12}O_2$) is obtained from oil of cloves by extraction with sodium hydroxide and decomposition of the resulting sodium eugenate with dilute sulphuric acid. It is a colourless or pale yellow liquid, boiling at about 252°C ., and is used as an antiseptic and local analgesic in dentistry, as a constituent of cellulose acetate varnishes, and for the production of isoeugenol for vanilla flavouring.

Eugubine (or **Iguvine**) **Tables**. These tablets, numbering 7, were found in the 15th cent. at Iguvium, the modern Gubbio (Umbria, Italy). They contain large texts, which are engraved on both faces of the tablets, and have been deciphered as parts of the liturgy of a sacred brotherhood of Iguvium. T. I-IV and part of the Vth are written in Umbrian script, which is not only an offshoot of the Etruscan (q.v.) alphabet, but is so close to its classical form that eminent Etruscologists, such as the late It. Prof. Giulio Buonamici, consider it as Etruscan. These tablets are attributed by some scholars to the 4th or even the 5th cent. BC, by others to the 2nd or 3rd

cent. BC. The rest of T. V and T.s VI and VII are written in Rom. characters and are assigned to the 1st cent. BC.

Eugubium, see **Gubbio**.

Euhemerus and **Euhemerism**. The latter is the name applied to the historical theory of the origin of mythology, founded by the former, a native of Messene about the 4th cent. BC. While voyaging to the Indian Ocean he discovered (so he claimed) an is. called Panchala, and on it a number of inscriptions representing the gods of Greece as mere humans, deified after death for their superior strength and abilities. His *Hiera Anagraphe* led to his being accused of atheism and his name became a byword for mendacity. Later, however, many (e.g. Polybius, Lactantius, and St. Augustine) adopted the theory. Later Gk writers simplified it, eliminating extravagances and leaving a number of commonplace and credible stories. Aeolus became an anet mariner; the Cyclopes, a race of savages inhabiting Sicily; Atlas, an astronomer; Scylla and Pegasus, fast-sailing pirates. The system survives in some current handbooks of mythology. It was the favourite theory of the 18th cent. in France. It reached England in a trans. of Abbé Bauer's *Mythology and Fables of Antiquity Explained from History*. Vossius, Bochart, and Huet belong to this school; Gladstone was its able exponent. Herbert Spencer used it to explain also the origin of religion in his *Principles of Sociology*, 1877-90. See also ANCESTOR WORSHIP.

Eulenspiegel (Ger. for 'owl-glass'), the prototype of all knavish fools of later times, b. at the end of the 13th cent., near Schöppenstadt, in Brunswick. He was 3 times baptised, once in the font, secondly in the mud, and the third time in hot water. He wandered over Europe, experienced many wonderful and comical adventures, and perpetrated many knavish tricks. His place of burial is not certain, as 2 places claim to have his bones in their respective churchyards. One stone stands to his memory at Mölln, near Lübeck, where he is supposed to have died in 1350. His bones are also at Damme in Belgium, where his death is placed about 1307. In modern times his story is embodied in one of the masterpieces of Belgian literature—*Till Eulenspiegel en Lamme Goedzak* by C. de Coster. The first ed. appeared in 1868. It is really a kind of epic which celebrates the struggles of the people to secure freedom from Sp. tyranny. Gerhard Hauptmann, the great Ger. poet and dramatist, pub. a vast poem called *Eulenspiegel*, in parts so mystic that it puzzled his critics.

Euler, **Leonhard** (1707-83), Swiss mathematician, b. at Basel, and studied under John Bernoulli. He went to St Petersburg, where he became prof. of physics in 1730, and in 1733 of mathematics in the Academy of Sciences. In 1741 he was invited to Berlin by Frederick the Great, and he pub. many valuable papers during this period. His later years were spent in St Petersburg in almost total blindness, but his servant wrote at his master's

dictation. The *Introduction to Algebra* (trans. 1840) was completed in this way. His chief works are: *Theory of Planetary Motion*, 1765; *Institution of Differential and Integral Calculus*, 1855; *Introduction to Analysis of Infinities*, 1748. In addition to his work on pure mathematics he made important contributions in various branches of applied mathematics and science, such as *Lettres à une princesse d'Allemagne sur quelques Sujets et de philosophie*, 1768-72, written for the use of the princess Anhalt-Dessau; *Dioptrics*, 1771. See lives by S. Schulz-Euler, 1907; A. Spelser, 1934. See also EULERIAN NUMBERS; HYDROKINETICS—Euler's Equations of Motion.

LEONHARD EULER

Engraving after a painting by E. Lorgne

Eulerian Number. Named after Euler (q.v.) (1707-1783), the Swiss mathematician. The expansion of $\cos x$ is $\cos x =$

$$1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \dots, \text{ and the expansion of}$$

$$\sec x = \frac{1}{\cos x} \text{ may be written}$$

$$1 + \frac{A_1 x^2}{2!} + \frac{A_2 x^4}{4!} + \frac{A_3 x^6}{6!} + \dots \text{ where } A_1,$$

A_2, A_3 , etc., are known as E. N.s, the first 9 of which were first computed by Euler. x is expressed in radian measure in the series. The first 5 are 1, 5, 61, 1385, 50521, and the 50th contains 127 figures. Some of the properties of these numbers may be noted here, viz., every E. N. is a positive odd integer; the sum of any two successive E. N.s is divisible by 3. The chief usefulness of E. N.s is in the summation of certain series.

Eumaeus, faithful swineherd, who recognised Ulysses on his return from Troy, and helped him destroy the suitors of Penelope.

Eumenes (c. 360-316 BC), Macedonian

general, and a native of Cardia in the Thracian Chersonesus. At a very early age he was employed as private secretary by Philip II of Macedon, and, on the death of that prince, by Alexander. When Alexander died Cappadocia, Paphlagonia, and Pontus were assigned to E. He was put to death by Antigonius.

Eumenes I, king of Pergamum. He succeeded his uncle, Philetaerus, in 263 BC. The only event of importance in his reign was his victory near Sardis over Antiochus Soter, which enabled him to secure possession of the districts round his cap.

Eumenides (the 'benevolent'), euphemistical name for Erinyes (Rom. Furies, or Dirae), 3 hellish maidens who haunted men guilty of perjury, murder, inhospitality, or violation of filial duty. Their names were Alecto, Megaera, and Tisiphone. In the poets there is sometimes only one, and in Aeschylus, a whole chorus of them. Later, sacrifices of sheep and nephalla (honey and water) were offered to them, while poets and sculptors represented them as winged virgins, dressed as huntresses, but with serpents, encircling their heads. See J. G. Lawton, *Modern Greek Folklore and Ancient Greek Religion*, 1910.

Eumenius: (1) Trojan killed by Camilla in Italy (see Virgil, *Aeneid*, ii).

(2) Gallic rhetorician, b. at Autun about AD 280. He was grandson of Glaucus, the Athenian rhetorician who had settled in Gaul. E. practised rhetoric successfully both at Autun and at Rome. He was appointed to the court of Constantius Chlorus, and put at the head of a new college in Autun. Of the panegyrics attributed to him, one was made before the Emperor on the occasion of the retaking of Britain; another deals with the foundation of colleges; the 3rd in praise of Constantina Augusta, was spoken at Treves and is full of hyperbole. These speeches have frequently been reprinted, especially in the collection known as the *Diodecim panegyrici veteres* (ed. E. Böhrens, 1874).

Eumolpus ('sweet singer'), son of Poseidon and Chlone, a legendary priest, poet, and warrior. The Eleusinian mysteries were believed to have been founded by E. As priest E. purified Heracles from the murder of the centaurs; as musician he taught him to play the lyre. He is said to have been the first priest of Dionysus, and to have introduced the cultivation of the vine and fruit trees.

Eunapius (c. AD 345-420), Gk historian and adherent of the neoplatonic school of Iamblichus, b. at Sardis. Fragments of his *Historical Memoirs* (AD 270-404) and *Lives of the Sophists* (i.e. the later neoplatonists) have survived. The latter was ed. by T. F. Bossonade (1822) and (together with a work of the same name by Philostratus) by W. C. Wright (Loeb Library, with trans.), 1922.

Eunomius, leader of an extreme sect of Arians, who were called after him Eunomians. His confession of faith addressed to Theodosius in 383 was rejected. After

his death his followers disbanded through internal divisions.

Eunuch (Gk *eunukhos*, one who has charge of a bed), etymologically, one who has charge of women's apartments in the E. countries. The term, however, applies particularly to a person who has been castrated in order to serve as attendant in a harem. Sometimes E.s occupied high official places in the state, so that the word E. was applied to a high official, the chamberlain. The barbarous custom of castration was probably earliest practised in Africa, but it was also a custom among the Romans. As late as the 17th and 18th cents. male castrati were employed in church choirs and on the operatic stage to sing soprano and contralto parts.

Euonymus, family *Celastraceae*, genus of about 120 species of trees and shrubs. *E. europaeus*, the Spindle Tree, grows in Britain; *E. alatus*, winged Spindle Tree, comes from China, both deciduous, with ornamental fruits. *E. japonicus*, Japan, *E. radicans*, and *E. nanus*, Orient, are popular evergreens.

Eupatoria, see YEVPATORIYA.

Eupatorium, a genus of *Compositae*, which takes its name from Mithridates Eupator, king of Pontus, who first recognised its medicinal properties. There is only one Brit. species, *E. cannabinum*, the hemp-agrimony, which grows in marshy soil. Formerly it was valued as a medicine. It is abundant in America. *E. perfoliatum*, or cross-wort, is used as a substitute for Peruvian bark.

Eupatridae (lit. 'the well born'), members of the old Athenian nobility. Their privileges were abolished by Solon (q.v.).

Eupen, industrial town with a hydro-pathic. estab. in the prov. of Liège, Belgium, 9 m. S. of Aachen. By the treaty of Versailles (1919) it was stipulated that the dists. of E. and Malmédy should be transferred from Germany to Belgium, if the inhabs. wished it, as a subsequent plebiscite indicated. The ceded dist. has an area of 400 sq. m. and a pop. of 60,000, of whom five-sixths are Ger.-speaking. When Belgium capitulated to the Germans in May 1940 E. once more fell to Germany. In Oct. 1944 Amer. First Army troops entered Germany in the Aachen area east of E. which was soon afterwards captured. Pop. (tn) 14,100.

Euphemism (Gk *eu*, well; *phēmī*, I say) is the avoidance of an unpleasant or indelicate word or expression by the use of one which is less direct, and which evokes a less disagreeable image in the mind. Thus 'pass away' or 'join the majority' is used for 'die', 'gentlemen of the road' for 'highwaymen', 'in a vicious condition' for 'intoxicated'. Anet examples are the name *Eumenides* (q.v.), meaning Benign Ones, applied by the Greeks to the Furies, and *Euxine* ('hospitable') used for the stormy Black Sea. See also FIGURE OF SPEECH.

Euphorbia, Family *Euphorbiaceae*, genus of some 1600 herbs, shrubs, and trees widely distributed throughout the world.

Native to Britain are the Spurges with milky juice—*E. lathyris*, Caper Spurge; *E. platyphyllos*, Broad Spurge; *E. stricta*, Upright Spurge; *E. helioscopia*, Sun Spurge; *E. peplus*, Petty Spurge; *E. exigua*, Dwarf Spurge; *E. paralias*, Sea Spurge; *E. cyparissias*, Cypress Spurge; and *E. amygduloides*, Wood Spurge. Many African species are succulent, exuding a milky latex if injured, which may be toxic or of medicinal value; *E. meloformis* of Cape Province is characteristic. E. are characterised by an inflorescence in which flowers are reduced, male to one stamen, female to a long-stalked ovary, surrounded by a series of bracts forming an involucre, itself surrounded by 2 or more larger bracts, and the whole being known as a cyathium. The bracts are often green or yellow, but in *E. pulcherrima*, Poinsettia, *E. fulgens*, and *E. splendens*, Crown of Thorns, the bracts are large and brilliantly coloured red, and the plants are commonly grown as decoratives in warm greenhouses. *E. marginata* is a hardy ann. with white bracts, and *E. epithymoides* is a perennial herbaceous plant.

Euphorbiaceae, a family of Dicotyledons contains over 4000 species of trees, shrubs, and herbs, and is distributed over the whole globe. Many contain dangerously poisonous substances, while some are used as purgatives, others have a farinaceous substance used as food, e.g. cassava, and rubber, castor-oil, and casarilla bark are well-known products. Few of the characteristics are common, but the flowers are always unisexual and regular. There are generally 5 perianth leaves, the stamens may be united or free, 1 to many in number. The ovary is superior, usually with 3 united carpels, and is trilobular, and there are always 1 to 2 ovules in each loculus. Genera include *Aleurites*, *Codiaeum*, *Croton*, *Euphorbia*, *Hevea*, *Hippomane*, *Manihot*, *Omphalia*, *Ricinus*, *Sapium*, *Toxicodendron*.

Euphorbia, derived from the *Euphorbia officinarum* growing in NW. Africa, a violent, irritant, and acrid substance, formerly much used in medicine, especially as a remedy for angina pectoris. The term is sometimes inaccurately applied to the various species of gum-resin.

Euphorbus, son of Panthous, one of the bravest of the Trojans slain by Menelaus (*Iliad*, xvii. 1-60). Pythagoras, who taught the transmigration of souls, declared he had once been E., and claimed his shield, which hung in the temple of Hera near Argos, as his own.

Euphorbia, family *Sapindaceae*, genus of evergreen trees, of which *E. longana* (synonym *Nephelium longana*), India, is the Longyen or Linkeng, with edible fruit.

Euphrasia, genus of *Scrophulariaceae*, contains over 130 species of plants which are semi-parasites, i.e. they have green leaves and carry out photosynthesis, but their roots are attached to other plants from which water and salts are obtained. *E. officinalis* is the common euphrasy, or eyebright, with many related species.

Euphrates (Babylonian *Puratta*; Hebrew *Perath*; Arabic *Frat*), largest riv. of W. Asia. It rises in Turkey in two branches, the Kara Su and the Murad; the former rises about 20 m. NE. of Erzerum, in the Tsheldis Mts, the latter 45 m. NE. from the nearest point of Lake Van. Both these rivs. flow in a SW. direction till they unite near Kebban in about 39° N. lat. and 39° 25' E. long. The united stream then flows SW. to Sunaysat, having forced a passage through the main range of the Taurus Mts and formed a succession of rapids and cataracts. Thence it flows SE. across Syria and into Iraq at Abu Kemal to its junction with the Tigris,

little to the amazing fertility of the region.

Euphrosyne, 'the Joyous One,' one of the Graces, see CHARITES.

Euphuism, the florid mode of speaking and writing in vogue towards the end of the reign of Queen Elizabeth I. It was brought into fashion by the romance *Euphues*, written in 1578 by John Lyly, who in addressing his writings chiefly to women said he would rather see his works 'lie shut in a lady's casket, than open in a scholar's study.' His idea was not to improve, but to amuse. E. did not attempt to render the simplicity of nature, but to be artificial and affected in its

EUPHRATES

E.N.A.

A ferry near Deir-oz-Zor, Syria

and the joint riv., now called Shat-el-Arab, empties itself by sev. arms into the Persian Gulf, after a course of about 1700 m. The present place of junction with the Tigris has been shown by Sir W. Willcocks to be at Garnat Ali, 30 m. higher up than Kurna, the former place of confluence. Formerly the Tigris and the E. preserved each a separate course to the sea. The distance between the two rivs. varies from 20 to 200 m. The prin. tribs. of the E. after it emerges from the mts are, on the r. b., the Sagar; on the l. b. the Balik Su and the Khabur. The riv. is navigable for small craft as far as Bir, a distance of 1200 m., whilst larger vessels can ascend as far as the confluence with the Tigris. The E. has played a conspicuous part in the hist. of the world, as the many ruins of great cities on its banks bear witness; besides Babylon, 'the glory of kingdoms,' Ur, Zarsa, Nippur, and Sippara were situated there. The canal system of the riv. was very complete in early times, and contributed not a

desire for refinement. Dr Landmann (New Shakes. Soc. Tran. 1880-6) gives the following sound description of E.: '(i) An equal number of words in collateral or antithetical sentences, well balanced often to the number of syllables, the corresponding words being pointed out by alliteration, consonance or rhyme; (ii) "Unnatural Natural History," which he (Lyly) learned from Pliny; (iii) An oppressive load of examples taken from ancient hist. and mythology, as well as apophthegms from ancient writers.' Some commentators on Shakespeare have suggested that in *Love's Labour Lost* the dramatist was satirising the euphuists in the character of Don Adriano de Armado, and Scott burlesques E. in his character of Sir Piercie Shaffton in *The Monastery*. But neither Sir Piercie nor Armado talks the E. of its masters. Lyly, Greene, and Lodge. See under LYLY; also C. G. Child. *John Lyly and Euphuism*, 1894.

Eupolis (c. 440-411 BC), Athenian poet of the old comedy. He is ranked by

Horace as one of the greatest writers of his school. In the elegance and purity of his diction he was reputed to be equal to Aristophanes, and in command of irony and sarcasm to rival Cratinus. His plays, of which only fragments survive, included *Kolakes*, *Maricas*, *The Baptae*, *The Demoi*, and *Poleis*. It is not true that he was drowned by Alcibiades, who is said to have thrown him into the sea for having attacked him in one of his plays. See G. Norwood, *Greek Comedy*, 1931.

Eurasian, term used to denote children born of a Hindu mother and a European father. For more than half a century it was confined to India, but is now descriptive of any half-caste.

Eurasians (Russian *Yevraziysy*), ideological and political movement among Russian émigrés in the 1920's and thirties. In contrast to the two traditional conceptions of Russian hist., those of Westernisers and Slavophiles (q.v.), the E. (e.g. philologist Prince N. S. Trubetskoy, economist and geographer P. N. Savitskiy) stressed the Asiatic factors in the making of Russia, and Asiatic elements in Russian culture. Some leading E. (e.g. Prince D. S. Svyatopolk-Mirski) came to consider Soviet Russia as the true realisation of the 'Eurasian' nature of Russia. See *Russia in Resurrection*, by an English Europeanist, 1928.

'Euratom', see under EUROPEAN (COAL AND STEEL) COMMUNITY.

Eure, dept of NW. France, formed in 1907 from a portion of the old prov. of Normandy. It has 3 arrons., Évreux (the chief tn of the dept), Les Andelys, and Bernay. The ter. of E. is broken up by its rvs. into well-wooded plateaus. Chief products wheat, flax, and beetroot, cattle and horses of pure Norman breed, for which the dist. is famous. Fruit is abundant; the minerals are marl and brick-clay. There are important textile industries, and some metallurgy. Area 2330 sq. m. Pop 316,000.

Eure-et-Loire, dept of N. France, SE. of the dept of Eure. The E. portion is a gently undulating plain, called the Beauce; the W. called the Perche, is more diversified, with hills, forests, and numerous rvs. The chief riv. in the N. is the Eure, in the S. are the Loir and the Huisne. None of the rvs. is navigable save the Eure for a short distance. The Perche dist. has a slightly colder and healthier climate than the Beauce. Wheat and oats are the prin. crops, and apples are largely grown. Textile goods and boots are manufactured and there are foundries. The prin. tns are Chartres (the cap.), Dreux, Châteaudun, and Nogent-le-Rotrou (qq.v.). Area 2291 sq. m. Pop. 261,050.

Eureka, city of California, U.S.A., port on Humboldt Bay, co. seat of Humboldt co., and the most westerly city in the U.S.A. Great quantities of redwood lumber are shipped, and it is a commercial fishing centre; there is dairying and truck farming in the region. Pop. 23,050.

Eureka Stockade, see BALLARAT; DIGGERS' CONFERENCE.

Eurhythmic (Gk *eu*, well; *rhythmos*,

flow) is a method, developed by Émile Jaques-Dalcroze, of teaching music through its realisation and interpretation by movements of the body. By a succession of exercises carefully graded and directed, an intellectual appreciation of rhythm is attained, based on the natural perception of rhythm illustrated by the movements of many people in response to a march or dance music. Later exercises develop the imagination and encourage its expression by free descriptive movements. Attention and concentration, in addition to physical control, are exacted by all the exercises, by means of which the sense of hearing and the judgment of direction and intensity of sound are trained. Concentration is essential, for even momentary wandering causes the movements of the body to be out of time with the music. Moreover, without concentration the high degree of physical control that can be gained would be impossible, for the more difficult exercises demand separate control of each arm, the legs, and head, so that each can move at a different rate from the other and simultaneously express 4 different rhythms. The eurhythmic method of teaching music incorporates the development of mental and physical control, thereby increasing efficiency. See É. Jaques-Dalcroze, *Rhythm, Music, and Education*, 1921.

Euripides (c. 484-407 BC), last of the great Gk tragedians; b. at Phlya in Attica, son of Mnesarchus and Cleito. His wife's name was Melite. There are no grounds for accepting the calumnies of anc. writers that E. was a misogynist and that his mother was of low birth. Nor need we hesitate to reject the story that he was twice married and embittered by the infidelity of both wives. In his youth, E. was an outstanding athlete, winning prizes both at Athens and Kleusis. He was also a skilled painter, and his plays contain sev. references to this art. He received a good education and early came under the influence of such thinkers as Protagoras, Anaxagoras, and Socrates. In later life, his outspoken antagonism to the war-party at Athens, drove him further and further into isolation until, in about 408, he went into voluntary exile, dying next year at the court of Archelaus, king of Macedon. He began his career as a dramatist in 455, winning 3rd place with the *Pleiades*. Not till 442 did he secure the 1st prize, and only 4 times in all. The scientific and philosophic thought expounded in his plays, often approaching religious scepticism, did not find favour with his contemporaries. He represented the new moral and social influences that were affecting Athens, and in the next cent. his popularity increased ten-fold, and many considered his dramas superior to those of Aeschylus and Sophocles. He is noted pre-eminently as a master of pathos and for his delineation of female character. He is interested in the experiences of the ordinary individual, rather than in that of legendary beings, drawing his characters with a fine realistic touch. E. has been called the most

modern of the 3 great Athenian dramatists, and 'the forerunner of Rationalism.' The ancient criticisms of Aristophanes (*Thesmophoriazuseae* and *Frogs*) and others are very prejudiced, but Quintilian and Cicero both admired E.

E. was essentially a realist whose art reflected the humours and passions of daily life and the vehicle he sought as his medium was a drama of archaic plots and simple style, not unminged with sheer incongruities; but, seen through his rationalism, the plays became a formidable weapon of propaganda for the 5th cent. Illumination. For E. plot is almost immaterial, for several of his plays seem, in point of plot, to be much the same as the compositions of Phrynichus. He introduced changes in Gk drama: notably

EURIPIDES

in the prologue which, in his plays, assumes the form of versified programme; and in his employment of the device of the *deus ex machina* or god who comes on at the end to wind up the plot whether artistically or not.

Eighteen certainly authentic plays have survived: *Cyclops* (sole surviving complete specimen of a satyr play); *Alceste*, 438; *Medea*, 431; *Hippolytus*, 428; *Andromache*, c. 430; *Hecuba*, c. 425; *Heracleidae*, *Suppliant Women*; *Heracles*; *Ion*; *Trojan Women*, 415; *Iphigenia in Tauris* and *Helen*, 414-412; *Electra*, *Phoenissae*, ? 410; *Iphigenia in Aulis*, *Bacchae*, 406. The *Ihesus* which has come down to us is of doubtful authenticity, but E. is known to have written an early play under that title. See the complete critical ed. by Gilbert Murray. There are numerous eds. of separate plays, and a complete trans. by A. S. Way in *Everyman's Library* (2 vols.), 1956. See also G. Murray, *Euripides and his Age*, 1914.

Euripus, or **Euripos**, see **EUBOEA**.

Euroclydon, a N.E. wind. In the Mediterranean now called **Gregale**. It is mentioned in Acts, xxvii. as being the

cause of the shipwreck of the vessel in which St Paul was sailing.

Europa, daughter of Agenor, or Phoenix king of Phoenicia, and sister of Cadmus. She was loved by Zeus, who took the form of a white bull and carried her away to Crete, where she bore him Minos, Rhadamanthus, and Sarpedon. After death she was worshipped in Crete as 'Hellotis'. The etymology of her name is disputed. Cf. Persephone. See Horace, *Odes*, iii. 27; Ovid, *Metam.*, ii. 833; A. Pauly-Wissowa, *Realencyclopädie der klassischen Altertumswissenschaft* (vol. vi) 1909.

'Europa,' The, see **LIBERTÉ**.

Europa Point, the most southerly point of the Strait of Gibraltar (q.v.).

Europe is situated in the N. Temperate zone. It is, except Australia, the smallest of the continents, but is both historically and politically extremely important. Its area is 3,800,000 sq. m., about one-fourteenth of the total land area of the globe, the greatest length being 3400 m., and the greatest breadth 2400 m. Geographically, E. should be regarded as forming with Asia one great div. of the land surface of the globe. Its E. boundaries are the Caspian Sea, Ural R., and Ural Mts. These boundaries do not, however, mark a distinct difference either in flora or fauna; or of political divs., as Russia in E. and Siberia are united in the R.S.F.S.R. The other boundaries are: on the N. the Arctic Ocean, on the W. the Atlantic Ocean, on the S. the Mediterranean Sea, Black Sea, and Caucasus Mts. The boundaries of the R.S.F.S.R. however extend beyond the Caucasus. The coast line of E. is greater in proportion to its size than that of the other continents, being some 50,000 m. The land is penetrated by large seas and gulfs, and its coast-line contains sev. large peninsulas, conditions which greatly favour its trade. The surface is divided into 2 parts, the great central plain, occupying two-thirds of its surface, stretching from the Ural Mts to the Atlantic, and the highlands in the centre and the S. Apart from these 2 divs. is the mountainous dist. of Scandinavia, including the Brit. Isles. The S. system consists of the Alps, Pyrenees, Sierra Nevada, Apennines, Balkans, and Carpathians. The great transverse watershed runs from N.E. to S.W., and the rivs. therefore flow generally NW. and SE. The 2 chief centres of this watershed are the Valdai uplands and the Alps. From the bogs and lakes of the moraine Valdai Hills flow the Volga (2100 m.) into the Caspian Sea, the Don into the sea of Azov, the Dnieper into the Black Sea, the N. Dvina into the White Sea, and the W. Dvina into the Baltic. From the Alps flow the Danube (1700 m.) into the Black Sea, the Rhine into the N. Sea, the Rhône, Po, and Adige, into the Mediterranean. There are 3 prin. groups of lakes, viz. the Alpine lakes with Geneva, Constance, Lucerne, Neuchâtel in Switzerland; Maggiore, Garda and Como in Italy; Balaton in Hungary; the Scandinavian group with Wiener, Wetter, and Mälär in Sweden and Miosen and Randsfjord in

Norway; the lakes of the central plain, Ladoga, Onega, Peipus, and Ilmen in Russia; and Saima and others in Finland. The is., with the exception of Iceland, lie near the mainland, the prin. being Great Britain and Ireland, Sardinia, Corsica, Sicily, Iceland, Novaya Zemlya, and Crete.

GEOLOGY.—In earliest geological times the coast of E. appears to have had a greater extension towards the N. and NW., whilst the S. and E. dists. were under the sea. The oldest rocks, those of pre-Cambrian and Palaeozoic age, are most continuous in the N. part of the continent, and extend over a large part of N. Russia, Finland, the Scandinavian Peninsula, and the N. and W. parts of the Brit. Isles. They also occur in Brittany, Central France, and Spain. The newer rocks of the Mesozoic and Cainozoic Periods are generally found on the lower lying lands, but occur nevertheless, in the Pyrenees, Alps, Caucasus, Carpathians, and Apennines. Their most continuous belt is in the central plain from the N. Sea into Russia. During the Cambrian Period the S. part of E. was covered by a shallow sea, while a large sea existed in W. Scandinavia, off N. Scotland, and apparently also in Wales. In the Ordovician and Silurian Periods the continent was further submerged, the Brit. Isles disappearing almost entirely. This was apparently a period of great volcanic activity. Next came the Devonian and Old Red Sandstone Period. The latter was deposited in lakes and inland seas, while the former is of marine origin. Between the Silurian and Devonian periods the sea had receded and left great masses of land uncovered. The Atlantic Ocean, however, still stretched over the S. of England and the centre of E., while submarine volcanic eruption was frequent in Germany. The Carboniferous Period marked a further extension of the sea, which covered Ireland and England, the low grounds of Central E. and a great part of Russia. Volcanic disturbance was frequent, and eventually the sea receded, leaving vast tracts of newly exposed lands. At the beginning of the Mesozoic era, large inland seas appear to have covered parts of E., including the S. portions of the Brit. Isles, and the lower course of the Rhine. Towards the close of the Triassic Period however, the land subsided, and allowed these lakes to become connected with the open sea. During the Jurassic Period the Brit. Isles seem to have risen above sea-level, with the exception of SE. England. Similarly S. France and E. Spain were submerged, and the lower parts of N. Germany and Russia, Italy, and the Balkans were also partly under water. This submergence appears to have lasted for a very lengthy period, but towards the close of the Jurassic Period the land again rose, and in the early Cretaceous Period Middle E. was generally dry. Later on, however, the land again subsided, leaving a vast sea over Central E., while the Mediterranean Sea was of far greater extent than at present, and covered part of France, Spain, Italy, Greece, and was probably connected directly with the

Indian Ocean. At the beginning of the Cainozoic Period the land had again risen and left the centre of E. above sea-level. The S. lands were, however, represented only by is. and narrow peninsulas, a condition which persisted until the late Miocene Period. During the Eocene Period, the Alps, Pyrenees, and Carpathians were thrown up, and a further elevation of the same ranges was effected in the Miocene Period. During the Pleistocene Period the bed of the Mediterranean was elevated, uncovering the lands of S. Europe. Violent changes of surface do not seem to have taken place in the Pleistocene Period, but there were successive elevations and depressions. During this period the Brit. Isles appear at one time to have formed part of the continent, while at a later period large tracts of them again lay under water.

CLIMATE.—The climate of E. is very diverse. There are 4 main climatic zones, the NW. region (stretching from N. Spain through France to Norway), the Mediterranean zone, Central E., and E. E. The NW. region has mild winters, cool summers and cloud and rain all the year around with a maximum in the autumn. The Mediterranean zone is characterised by very mild winters, hot dry summers, and abundant sunshine; most of the rain falls in the spring and autumn. In Central E., winters are cold and the summers warm, with the maximum rainfall in summer. E. E. is notorious for its extremely cold winters. The temperate unsettled climate of the NW. region is accounted for by its position in the main track of the Atlantic depressions (q.v.), its long coast line, and especially by the influence of the Gulf Stream, which keeps the major ports free from ice all the year round. The Mediterranean climate, because of its lack of severe winters, was very favourable for the early development of civilisation, but the hot dry summers, although ideal for the ripening of fruits, are not conducive to hard work. The rigours of the weather in the Central and E. parts of E. delayed the advance of civilisation there for many centuries, but also favoured the development of hardy nomadic hunters. There is evidence to show that about 6000–3000 BC the climate of E. was warmer and wetter than it is now, resulting in dense forests. From about 3000 BC to the beginning of the Christian era the climate gradually became cooler and drier, and man began to spread all over the continent. From AD 800–1200 it is believed that conditions in the N. of E. were much less severe than they are now—this was the period of the voyages of exploration of the Vikings. This was followed by a colder period ('the little ice-age') but from 1850 onwards there has been a general warming of the atmosphere resulting in a slow recession of the glaciers which still continues. See W. G. Kendrew, *The Climates of the Continents*, 1937; C. E. P. Brooks, *Climate through the Ages*, 1949.

HISTORY.—This is intended only as a broad survey of events. For more detailed information, *see* separate articles on individuals, events, etc.

From the Greek Communities to the Crusades.—The recorded hist. of E. begins c. 2000–1500 bc with the Gk communities, and its subsequent culture has been indebted to Gk standards to a remarkable extent (*see* GREEK HISTORY (ANCIENT), and CRETE.—*Archaeology*). When E. was threatened by the Persians in the 5th cent. bc, the Gk communities united against the common enemy and averted the danger by their victories at Marathon (490 bc), Salamis (480), and Plataea (479). Though capable of united action in times of extreme peril, Greece was not a corporate whole, but a collection of small independent city states, some with a highly developed and advanced system of gov., but each striving for supremacy over the others. Athens' power was soon envied by the other cities, and at the end of the Peloponnesian war, Athens was taken by the Spartan, Lysander, and its democratic gov. destroyed (404 bc). The ensuing internal struggles of the peninsula made it an easy prey for the rising power of Macedonia, and when Philip was succeeded by his son, Alexander the Great (q.v.), the latter was master of almost all Greece. His amazing victories in Asia (334–323 bc) led to no decisive result, and upon his death his empire disintegrated.

As Grecian power declined, that of Rome grew. In the 4th and 3rd cents. bc Rome conducted a series of successful wars against the neighbouring Etruscan, Lat., and Samnian tribes, and became the leading state in Italy (*see* ROMAN HISTORY). The Gk cities in S. Italy sought help from Pyrrhus, king of Epirus (280 bc). But his ability could not match the might of the Romans, and when he left Italy (274 bc) the remaining states soon acknowledged Rome's supremacy. The latter's triumphant urge for expansion led her into war with Carthage (q.v.), at that time mistress of the E. Mediterranean. The 1st Punic war between Carthage and Rome lasted 264–241 bc. Initially, the Carthaginians controlled the sea, but the

Roms. built fleet after fleet and achieved complete naval supremacy, gaining Sicily from Carthage. Carthage returned to the attack, and during the 2nd Punic war (218–201 bc), Hannibal's (q.v.) military genius seriously threatened the power of Rome. In spite of crushing defeats at Trasimene and Cannae the Roms. never yielded, and with the defeat and death of Hasdrubal (207 bc) the tide turned against Carthage. The 3rd war (149 bc) saw the total destruction of Carthage (146 bc). From then onwards, Rome went from conquest to conquest; all Europe S. of the Danube and W. of the Rhine, including much of Britain, Asia Minor, and W. Africa fell under her sway. In the areas that she conquered Rome introduced her culture and political institutions. Her conquests aggravated the cleavage between the rich and the poor, while her huge armies prepared the way for a military dictatorship. Julius Caesar's (q.v.) ambition and the astuteness of Augustus (q.v.) estab. the Rom. empire. Constantine (q.v.) made Christianity the official religion of Rome (AD 334), a decision which decided the religious future of all E., even of those regions which Rome was never to conquer.

In 323 the cap. was transferred to Constantinople, and from 395 the Rom. dominions were divided into empires of the E. and W., both threatened by barbarian invaders. In the W., the Empire was crumbling away as its pop. fell and a stifling bureaucracy discouraged all initiative; slowly, its frontiers were pushed back by the invading tribes from the W. and E. In 451 the Huns invaded E. under Attila, and the barbarian surge was accelerated. Britain fell to the Angles and the Saxons, Gaul to the Visigoths, Burgundians, and Franks (the latter of whom also conquered W. Germany), Italy to the Ostrogoths, and N. Africa to the Vandals. In the disruption the Christian Church maintained its unity: gradually, the barbarians adopted Christianity, and the pope finally claimed the right of disposing of the imperial crown. During the 6th cent. Italy was invaded by the Lombards, while in the 8th cent. the Muslims swept into Spain and Gaul, to be checked at Tours by Charles Martel (732). The latter's triumphs were continued by his grandson Charlemagne (q.v.) who estab. an empire throughout Central E. from the Ebro to the Danube, and who was crowned holy Rom. emperor by Pope Leo III in 800.

Charlemagne's empire was divided by his grandsons into France, Lotharingia, and Germany, Lotharingia ultimately being parcelled out between France and Germany. Italy broke up into a collection of petty dukedoms and city-states. The next centuries saw a confused series of struggles between the monarchs and their nobles, the latter generally increasing their power at the expense of the former. This instability had its origins in the feudal system (*see* FEUDALISM), now prevalent throughout W. E. During the 9th and 10th cents. the Scandinavian Northmen estab. themselves in Normandy

and S. Italy and harassed England, which was to fall to one of their descendants, Wm. of Normandy, in 1066. In 1054 the Byzantine Church broke off relations with the Papacy, causing a religious breach between E. and W. E. which has never been healed. Palestine had been in Muslim hands since the 7th cent.; but in the 11th cent. the Seljuks conquered the country and Christian pilgrimages there became more difficult. Devout Christians dreamed of a war to liberate the Holy Places; and from the 11th to the 13th cents. the Crusades (q.v.) agitated European affairs, acting occasionally as a unifying, but more often as a disruptive force in the political sphere. A Lat. kingdom existed in Palestine from 1099 until the end of the 12th cent. In the 4th crusade (1202-4) the crusaders were diverted from their true goal and captured Constantinople, an act which, more than any other, caused the breach between the Rom. and Orthodox Churches to become final. The Ger. kings still claimed the title of emperors of the W., but their power was very unreal, and their influence much weakened by the conflict with the popes on the investiture question. The Papacy had gained materially and morally from the centralising and reforming influences of Pope Gregory VII (Hildebrand) (q.v.), and was now a power with which to be reckoned. In Spain a succession of small states was formed as the country gradually freed itself from the Moors, while in E. of E. the Teutonic Knights, whom the failure of the Crusades had left without occupation, turned their attention to the neighbouring country of Prussia and converted the Wends to Christianity.

*From the Hundred Years War (1337-1453) to the Seven Years War (1756-63).—*The Hundred Years War (q.v.), waged by the Eng. kings against France in prosecution of their claim to the Fr. throne, though nearly resulting in a complete Eng. conquest of France under Henry V, finally left France more unified than it had been before. Louis XI broke the power of the feudal lords and his successors were free to devote themselves to foreign conquests. But their designs on Italy brought them into conflict with Charles V (q.v.), who had inherited the Netherlands, Spain, Naples, and Austria, and who was elected emperor in 1519. His son, Philip II, succeeded to the hereditary dominions, but the imperial crown passed to the Austrian branch of the family.

By the 14th cent. the Ottoman Turks were overrunning Asia Minor: in 1453 they captured Constantinople and went on to occupy the Balkans. In 1529 and again in 1683, they even threatened Vienna (see *TURKEY.—History*). The Turkish conquest of Asia Minor and the Balkans gave added impetus to the overseas expansion of England, Spain, and France. The 15th cent. saw the beginnings of the Renaissance (q.v.), although there had been a limited tradition of classical learning in E. since the 13th cent. As a result of the Reformation

(q.v.), Protestantism became dominant in Britain, Scandinavia, and N. Germany, while large Protestant minorities existed in France and Hungary. Much of Central E., though initially converted to Protestantism, was later won back to Catholicism during the counter-reformation. Spain, the most ardent defender of Catholicism, was weakened by the loss of the Netherlands and by Eng. attacks upon her colonies and shipping, while in the 17th cent. the Portuguese reasserted their independence. In France, the religious wars ended with the estab. of the Bourbon dynasty. During the course of the Thirty Years War (1618-48) the Protestant states of Germany were sev. times in serious jeopardy, but were rescued first by Gustavus Adolphus of Sweden, and later by the intervention, for purely political motives, of Catholic France. The treaty of Westphalia left Germany exhausted, the religious divisions being virtually the same as at the beginning of the war, but gave territorial gains to Sweden and France. Sweden was now the leading Protestant power in E.; but her power was destroyed by the ambition of her king, Charles XII, who, after successfully defeating a coalition of Russia, Saxony, and Denmark, led his army into S. Russia, where he was utterly defeated at Poltava (1709). France, which by the treaty of Westphalia had received the prov. of Alsace, was now the strongest power in E., and shortly afterwards defeated Spain, forcing her to the disadvantageous peace of the Pyrenees (1659). Shortly afterwards Louis XIV married the Sp. Infanta Maria Theresa, who became the heiress to the Sp. throne upon the extinction of the male line. The Fr. invasion of Flanders had, however, already raised the jealousy of the other Powers and led to a triple alliance between England, Sweden, and Holland. When Louis's grandson, the duke of Anjou, was proclaimed heir to the Sp. throne, a new coalition was formed (1701) between England, Holland, and Austria. In the war which ensued, the military genius of the duke of Marlborough proved superior to that of the Fr. gens., and Louis was forced to make peace. The king of Spain renounced his right of succession to the Fr. throne, and surrendered the Netherlands, Naples, and Milan to Austria.

While Louis' wars were exhausting France, Prussia was gradually growing in strength. This duchy fell by inheritance to the elector of Brandenburg in 1618, and in 1701 the elector took the title of king of Prussia. In 1740, Frederick the Great (q.v.) invaded Silesia, successfully defending his capture against Austria, France, and Russia in the Seven Years War that followed (1756-63). Poland was partitioned between Russia, Austria, and Prussia in 1772, 1793, and 1795. Russia had risen steadily in importance since Poltava. Peter the Great had extended his hold over the Baltic, founded St Petersburg, and introduced the externals of W. civilisation. France's power was declining. During the Seven

Years War England had sided with Prussia, capturing Canada from France. Louis XV's reign was marked by extravagance and incompetence which led directly to the Revolution.

From the French Revolution to the Franco-Prussian War, 1871.—It is difficult to over-estimate the importance of the Fr. Revolution (see FRANCE.—History). The whole structure of Fr. society was altered irrevocably. The intensity of the convulsion was so great that the rest of E. thought that the country must be prostrate, and was surprised and alarmed to find it arise to a career of conquest. The enthusiasm of the people created a succession of victorious armies with capable gens. to lead them. Hoche, Pichegru, and Moreau were only eclipsed by the far greater genius of Napoleon (q.v.), whose military daring changed the map of E. He extended his rule over all Germany W. of the Rhine, a considerable part of N. Germany, and the major part of Italy: made his brother-in-law, Murat, king of Naples, his brother, Joseph, king of Spain, and another brother, Louis, king of Holland. He also placed one of his marshals, Bernadotte, upon the throne of Sweden. England remained free from invasion as a result of the naval victories of the Nile (1798) and Trafalgar (1805), and was able to keep Napoleon's ablest marshals well occupied in Spain during the Peninsular war. Prussia and Austria suffered terribly, however, and the lesser states were formed into a Confederation of the Rhine under Napoleon's patronage. Upon the weakening of his power by the disastrous Russian campaign of 1812, the vanquished nations rose into revolt and the campaigns of 1813 and 1814 determined the issue in their favour. Napoleon's escape from Elba and his brief return to imperial power only culminated in the disaster of Waterloo, and cost Ney and Murat their lives.

At the Congress of Vienna, France was reduced to the limits of 1790 and the map of E. redistributed. The Netherlands became one kingdom which lasted until 1830, when the Belgians threw off the alliance and estab. a kingdom for themselves. The Ger. states formed a loose confederacy under the presidency of Austria; Italy reverted to a number of petty states, the Venetian prov. remaining under Austrian control. Bernadotte retained the Swedish throne. The Holy Alliance formed between Russia, Austria, and Prussia for the administration of their respective kingdoms according to the principles of Christianity became the greatest factor in furthering reactionary measures and impeding the growth of constitutional liberty.

Turkish power was in decline; and in 1827 Greece recovered her freedom by the intervention of France and England. But restiveness against authority was not confined to countries with alien govs. The period 1815-48 was one in which the liberal intelligentsia, joined sometimes by sections of the aristocracy, sometimes by the growing urban middle classes,

endeavoured—usually unsuccessfully—to wrest constitutional reforms from their rulers. In England, exceptionally, considerable electoral reform was achieved in 1832. But in Europe 1848 was a year of revolution. Metternich was ousted from power, and for a brief period it seemed that a liberal united Germany might be formed; but Austrian authority was reasserted, and hopes of a liberal Germany vanished for nearly 100 years. In France the monarchy of Louis Philippe fell, and a wave of enthusiasm resulted in the nephew of the great Napoleon being elected president, and by the end of 1852 he had succeeded in becoming emperor as Napoleon III (q.v.). To retain his position he kept the nation's thoughts fixed upon foreign affairs. In 1854 he joined with England to prevent Russia from aggrandising itself at the expense of Turkey (see CRIMEAN WAR). In 1859 he helped the king of Sardinia, who had become the champion of the movement for a united Italy, in his war against Austria, and received Nice and Savoy as his reward. The victories of France and Sardinia in 1859 added Parma, Modena, and Tuscany to Sardinia, while Garibaldi's expedition of 1860 led to the further addition of Naples and Sicily. Austria, however, was still left in possession of the Venetian dominions, and the pope held the papal states. In 1863 Napoleon was induced to set up Archduke Maximilian of Austria as emperor of Mexico under Fr. protection, and the latter's capture and execution by the rebels greatly injured the Fr. emperor's prestige. In the meantime, Bismarck's Prussia had gradually forcibly ousted Austria from supremacy in Ger. affairs. The attempt of Denmark to incorporate the Ger. duchy of Schleswig into the kingdom led to the declaration of war by Prussia and Austria, and to their capture of Schleswig-Holstein. The administration of the latter soon provided Prussia with an excuse for war with Austria which was declared in 1866. The Austrians were utterly defeated, and the Italians, who had sided with Prussia, captured Venice. Hanover, which had supported Austria, was annexed to Prussia. The question of the Sp. succession in 1870 was the pretext for the Franco-Prussian war. The peace of 1871 added Alsace-Lorraine to the Ger. empire, which was formed during the course of the war under the headship of Prussia, Austria having henceforth no voice in Ger. affairs. The withdrawal of the Fr. garrison from Rome enabled the It. state to make that ancient city her cap. and seat of gov. By the Lateran Treaty (1929) the pope acquiesced in this arrangement.

From the Balkan War (1912) to the 'Armed Peace.'—During the latter years of last cent., the prin. readjustment of European ter. was in the Balkan peninsula. In 1859 the duchies of Moldavia and Wallachia were united into the kingdom of Rumania. The independence of Rumania and Serbia was recognised by the treaty of Berlin in 1878. In 1908, taking advantage of the annexation of Bosnia and

Hercegovina by Austria, Bulgaria formally asserted her independence of Turkish rule. During the autumn of 1912 an alliance was formed between Bulgaria, Greece, Serbia, and Montenegro against Turkey, and the whole of Turkey in E. captured, with the exception of a small ter. around Constantinople and the sea of Marmora. The question of apportioning the captured ter. led to a quarrel in which Bulgaria attacked Greece and Serbia, only to be forced to come to humiliating terms (see BALKAN WARS). Turkey-in-E. was now restricted practically to Constantinople, but Turkey was befriended diplomatically by the Central Powers, Germany and Austria. The div. of sympathy in the Balkans was the epitome of the state of affairs throughout E. Germany and Austria had formed a Dual Alliance (q.v.) since 1879, and in 1882 this had been extended to include Italy, forming a Triple Alliance (q.v.) of which the terms were secret. On the other side there was the Entente Cordiale (q.v.) between France and England, an agreement (1904) which settled old quarrels, leaving France a free hand in Morocco and England in Egypt. England, however, was not bound, except morally, to undertake concerted action with France against Germany or any other country. The growing distrust between the great powers has given the 1st decade of the 20th cent. the title of 'the Armed Peace.'

The First World War 1914-18.—On 28 June 1914 the Archduke Franz Ferdinand and his wife were assassinated in Sarajevo, Bosnia, by a fanatical Serb. Encouraged by Germany, Austria declared war on Serbia. Russia and France sided with the Serbs against Austria and Germany. When Germany invaded Belgium, England declared war on Germany (4 Aug. 1914). Turkey joined the Central Powers, and Japan the Allies, but Italy and Bulgaria remained neutral at first. (For a fuller account of the war, its causes and events, see WORLD WAR, FIRST, and articles on individual campaigns, personalities, etc.)

Belgian resistance was soon overcome, and the Germans advanced until checked within 52 kilometres of Paris (see FRANCE AND FLANDERS, FIRST WORLD WAR CAMPAIGNS IN). In Feb. 1915 the Allies attempted to win the Balkans by an attack on Constantinople. In Mar. the naval effort to force the Narrows proved disastrous (see DARDANELLES). An attempt was then made by land (see GALLIPOLI CAMPAIGN). Italy, after being given vast territorial promises by the Allies, declared war on Austria in May 1915, but by this time the initial Russian advance in the E. was being checked by the Ger. counter-offensive, and there was no hope of Austria collapsing between a combined Russian and It. invasion. Meanwhile on the W. Front stalemate had been reached. The Gers. were able to hold their positions on the W. Front while concentrating an attack on the E. By Oct. 1915 all Poland and part of Courland and Lithuania were in Ger. hands.

Allied prestige was so low in 1915 that Germany was easily able to outbid the Allies in the effort to secure Bulgarian aid (see BULGARIA). Meanwhile, Greece's armed neutrality was becoming a menace. Serbia was rapidly overcome. By the end of Dec. the Allies abandoned their Gallipoli foothold in order to reinforce the Salonika garrison. In Jan. 1916 Montenegro was overrun by the Austrians, and in Feb. the Italians had to evacuate Albania. Simultaneously the Germans were attempting a decisive blow on the W. Front. However, a recuperated Russian army made successful advances into Galicia during the summer. At the same time, the Italians drove the Austrians back in the Trentino and Gorizia. These successes decided Rumania to enter the war on the Allied side, to be crushed almost immediately by a Ger. and Bulgarian army under Mackensen (see RUMANIAN FRONT, FIRST WORLD WAR CAMPAIGN ON). Meanwhile the Allied effort towards forcing a military decision was being made on the W. Front, and the battles of the Somme (see SOMME, BATTLE OF THE) were waged from June to Nov., battles which proved terribly costly and indecisive. On the sea Germany was endeavouring to overcome Brit. supremacy by the use of submarines, but became embroiled with neutral countries. Portugal joined the Allies in Mar. 1916. The Grand Fleets of England and Germany only encountered each other once during the war, on 31 May 1916 (see JUTLAND, BATTLE OF).

1916 ended in stalemate, with widespread depression among the Entente powers. In contrast, the Central powers were consolidated in an optimism which proved to be unfounded. President Wilson of the U.S.A. tried to mediate on the basis of 'peace proposals' submitted by Germany. Then in Feb. 1917 Ludendorff launched the unrestricted U-boat campaign, and in April 1917 America declared war on Germany.

Ludendorff and Hindenburg hoped to win the war before Amer. intervention became effective, and in the first half of 1917 the submarine warfare proved a serious menace. Moreover, the Allied offensive on the W. Front during 1917 proved the practical impossibility of piercing the Ger. lines, while Germany was relieved of a powerful enemy by the collapse of the Russian monarchy in the Mar. Revolution (see RUSSIA, History). Tsar Nicholas II was deposed, and a provisional democratic gov. was organised on 15 Mar. The revolution had been supported by the military leaders and at first it seemed that Russia would prosecute the war with renewed vigour. Kerensky organised a campaign in Galicia in June 1917 but this developed into a complete rout, and the Russians threw down their arms, refusing to fight. Russia was further disrupted by the movement towards autonomy among the Poles and Finns, the Letts of Courland, the Ruthenians in the Ukraine, the Estonians, the Lithuanians, and the Georgians of the Caucasus. The Kerensky Gov. was

finally overthrown by a Bolshevik *coup d'état*. Lenin estab. a dictatorship of the proletariat, and repudiated political democracy as it is understood in Western E. (see RUSSIA). Peace offers were at once made to Germany. Meanwhile, Finland and Lithuania had become independent reps. in Dec. 1917. The Russians agreed to the Ger. terms in Mar. 1918 (see BREST-LITOVSK, TREATY OF). Britain did not recognise the Soviet gov. until 1924, although trade relations were estab. before this. Rumania, being isolated, had signed a peace treaty with the Central Powers. In the autumn the Germans broke through the It. line on the Upper Isonzo, inflicting a crushing defeat (see CAPORETTO, BATTLE OF). But by Dec. the first drafts of Amer. troops were arriving to stiffen resistance on the W. Front. In Jan. 1918, Wilson enunciated the 'Fourteen Points' (q.v.), which were accepted as embodying the Allied war aims, and in one clause advocating the autonomy of the constituent peoples of the Dual Monarchy was spelt the doom of the Hapsburgs.

Germany was to make one more supreme effort. Ludendorff and Hindenburg planned a colossal offensive at an unexpected point on the W. Front where the Brit. and Fr. armies joined. The attack was launched on 21 Mar. 1918, against the central sector of the Allied lines between Arras and the R. Oise. The Brit. armies were rolled back, but the Germans failed in their purpose of taking Amiens. In May 1918 the Germans launched a second offensive against the Fr. lines on the Aisne and the Oise. Meanwhile Amer. reinforcements were arriving in numbers, and the Italians were checking the Austrian drive on the Piave R. On 15 July 1918, the Gers. began their third and final offensive in the second battle of the Marne. Foch's counter-attack with Fr. and Amer. troops proved successful, and by Aug. the Ger. armies were in retreat.

In the near E. Foch planned a simultaneous offensive in Macedonia under Franchet d'Espèrey (q.v.) and in Syria under Allenby (q.v.). Bulgaria was put out of the war, an armistice being signed at Salonika on 30 Sept. A month later, following Allenby's successes in Syria, Turkey also signed an armistice. It. successes against Austria forced an armistice on 3 Nov., and the Dual Monarchy split up into its constituent states. Czechoslovakia emerged as a rep. and Yugoslavia as a kingdom, while on 13 Nov. Ger. Austria was proclaimed a rep. Three days later Hungary became an independent state. In Germany, Ludendorff resigned on 27 Oct. and on the following day a naval mutiny at Kiel was the beginning of a widespread socialist revolution. On 7 Nov. Bavaria became a rep. and the king fled, while 2 days later Wm II also abdicated and a rep. was estab. in Berlin. The provisional gov. under Ebert hastened to accept the Allied terms, and the Armistice was signed on 11 Nov.

Peace Conference—Treaty of Versailles, Treaty of Saint-Germain, and other peace treaties.—On 18 Jan. 1919, the Peace Conference formally opened at Paris, but the huge plenary sessions came to no decisions not already reached by the Council of Ten, which council was superseded in Mar. by the still smaller Council of Four, consisting of President Wilson, Clemenceau, Lloyd George, and Orlando. After a reorganisation of gov. Germany signed the treaty, together with all the Allied and Associated Powers, at Versailles on 28 June 1919 (see VERMILLES, TREATY OF). In the forefront of the treaty was set the League Covenant (see COVENANT OF THE LEAGUE OF NATIONS). Although this was the result of President Wilson's idealistic purpose, he was no longer supported by the Amer. Senate, which refused to ratify the treaty. America accordingly concluded a separate peace with Germany and Austria. The treaty of Versailles was followed by the treaty of Saint-Germain, concluded with Austria on 10 Sept. 1919; of Neuilly with Bulgaria on 27 Nov. 1919; of the Trianon with Hungary on 4 June 1920; and of Sèvres with Turkey on 10 Aug. 1920. Turkey resisted the attempts which Greece made to take over the new possessions awarded at the 1919-20 Peace Conference, and a Graeco-Turkish war was only terminated by the revision in Turkey's favour of the treaty of Sèvres by the terms of the Lausanne Treaty, 24 July 1923.

Succession States—Turkey and Greece—Rise of Mussolini.—The prin. results of the peace treaties were in geographical reconstruction. The treaty of Versailles confirmed the creation of the 'succession' states of Poland, Czechoslovakia, and Yugoslavia, of Finland, and of the Baltic states of Lithuania, Latvia, and Estonia, while Danzig was made a Free City under the League of Nations. Rumania gained Bessarabia, Bukovina, and part of the Banat of Temesvar, while in 1922 the Ukraine became one of the federated States of Soviet Russia. Turkey became a rep. in Oct. 1923. In Greece, a rep. was estab. in 1924-5 but the monarchy was restored in 1935. The boundary between Italy and Yugoslavia on the E. Adriatic was one of post-war E.'s most difficult problems. In 1924 the Fiume problem was settled by the Rome agreement, whereby Fiume, although governed by Italy, should remain a free port to Yugoslavia.

The war left Italy politically unstable. The Fascist party came into being in Mar. 1919. As leader, Mussolini (q.v.) organised an armed force of irregulars, known as Black Shirts, and these were active in furthering the revolutionary strikes of 1919 and 1920. In Oct. 1922 Mussolini entered Rome in triumph, and was invited by the king to form a ministry, thus legalising his position (see FASCISM; ITALY.—History).

The Irish Free State—First Meeting of the League of Nations—Reparations.—In Britain the gov. was attempting to end the Civil war in Ireland. The Irish Free

State, created in 1921, was granted dominion status, and in 1922 a gov. was organised under Michael Collins; but the compromise remained unacceptable to the extreme Republicans and also to the Ulster Unionists (*see* IRELAND). Six cos. of Ulster remained part of the U.K., but with legislative autonomy.

The first meeting of the League of Nations was held at Paris on 16 Jan. 1920, with Léon Bourgeois of France as chairman (*see* LEAGUE OF NATIONS). European diplomacy, however, was conducted by conferences outside the sphere of the League.

The main problem 1921-4 was that of Ger. reparations (*see* REPARATIONS; GERMANY.—*History*; FRANCE.—*History*). Under Fr. influence the Reparations Committee in 1921 fixed Germany's reparations' debt at an impossibly high figure, disregarding Brit. warnings that all E. would suffer from the economic ruin of Germany that this ensured. In Jan. 1923, Poincaré (q.v.) ordered Fr. military occupation of the Ruhr, on the grounds that Germany's reparations were in arrears: the Ger. gov. organised 'passive resistance' to the economic demands made on the country, and galloping inflation resulted. Later, 'passive resistance' was called off, and in 1924 the currency was reformed. Meanwhile, in May 1924, Poincaré was defeated in the Fr. elections, the value of the franc having dropped by 50 per cent, and the radical Herriot (q.v.) succeeded him.

On 30 Nov. 1923 the Reparations Committee had met and inaugurated 2 committees of experts. The first committee met at Paris in Jan. 1924, under the chairmanship of Gen. Dawes (q.v.), U.S.A. representative. The purpose of the Dawes committee was to draw up a scheme of reparations and to provide for the economic recovery of Germany (*see* DAWES PLAN). The new Fr. gov. under Herriot accepted the scheme, consenting to a military evacuation of the Ruhr within 12 months. On 16 Aug. the London protocol recording acceptance of the Dawes plan without modification was signed by all the parties concerned. The plan was put into operation immediately.

Little Entente formed—Boundary Problems of East and Central Europe.—Affairs in E. E. centred during the years 1920-3 partly on Hungary and partly on the W. boundaries of Soviet Russia. The fear of Hungary, where until 1921, the possibility of a Hapsburg restoration remained, and also the lesser fear of Bulgaria, were countered by the formation of the Little Entente by treaties signed on 23 April and 7 June, between Czechoslovakia, Yugoslavia, and Rumania. Rumania concluded a further defensive treaty with Poland on 3 Mar. 1921, as Rumania could obtain no recognition from Soviet Russia for her possession of Bessarabia.

The various frontier problems in E. E. were settled largely through the Permanent Court of International Justice, inaugurated in Dec. 1920, but the

delimitation of the Albanian frontier led to a serious political murder. On 27 Aug. 1923, Gen. Tellini, head of an It. commission, was murdered with his companions while investigating the Gracco-Albanian frontier near Janina. The Italians then occupied Corfu. The It. action was condemned by the assembly of the League, then in its Fourth Session, but the evacuation of Corfu was only effected by the payment of a heavy Gk indemnity to Italy.

The Locarno Pact.—On 5 Oct. 1925, the conference of European statesmen opened at Locarno in Switzerland, with the object of guaranteeing the existing frontiers of both France and Germany, and so stabilising the European situation. Austen Chamberlain, chairman, and Briand represented Great Britain and France respectively, while Luther and Stresemann represented Germany, and Scialoja Italy. Belgium, Czechoslovakia, and Poland were also represented. The Locarno Pact was initiated by the delegates on 16 Oct., and the date of signature was fixed for 1 Dec., to take place in London (*see* LOCARNO CONFERENCE AND TREATIES). Germany was formally admitted to the League of Nations in 1926. At this point, the prestige and powers of the League seemed to be rising fast, and the prospects for continued world peace seemed good.

Disarmament.—The Kellogg Pact.—Some progress had been made in this field since Versailles. Naval disarmament was tackled at the Washington Conference (1921) and carried a stage further at the London Conference (1929). In 1927 Briand suggested a bilateral treaty with the U.S.A. for the renunciation of war; Kellogg, Amer. secretary of state made a counter suggestion for a multilateral treaty to which other states should be invited to adhere (*see* KELLOGG PACT). The list of signatories was imposing, but the pact was in fact meaningless except as a moral gesture.

Young Plan—Cancellation of Reparations—World Depression.—In 1929 the Young Plan for the payment of Ger. reparations came into operation, lightening the burdens previously imposed. By 1930 no foreign troops remained in Germany. By 1930-1 all European events were overshadowed by the world economic depression. Germany was practically bankrupt by 1931 and in 1932 at Lausanne the cancellation of all further reparations was formally agreed. Ger. unemployed ran into sev. million, and the political situation was so unstable that Brüning resorted to gov. by decree. The way was open for the rise to power of the National Socialists (Nazis) under Adolf Hitler (q.v.). Elsewhere in E. the outstanding event was the fall of the Bourbon monarchy in Spain and the estab. of a rep. (*see* SPAIN.—*History*).

Rise of the Nazis—Murder of Dollfus—Saar Plebiscite—Italian attack on Abyssinia.—The rise of Hitler's Nazi party in Germany ruined any chance of success for the Disarmament Conference which had

been sitting since 1932. By 1933 Hitler was sole dictator. Germany withdrew from the League of Nations and the Disarmament Conference (Oct.), while her hostility to Soviet Russia resulted in a *rapprochement* between that country and France. Fr. political prestige was being seriously lowered by disclosures of widespread corruption. Soviet Russia joined the League of Nations in 1934. In Austria, the Nazis murdered Chancellor Dollfuss (q.v.) in July 1934, but their attempt to seize power subsequently failed. In 1935 as a result of a plebiscite the Saar was returned to Germany. International tension in E. increased in 1935. The 'collective peace system,' goal of the League, was proving illusory in the eyes of realists. Britain had tried to set an example to the world in reducing armaments, but in doing so had allowed her own armament to become inadequate. Meanwhile, Hitler reintroduced conscription in Germany. But in England few yet dreamed of the true rate of Ger. rearmament or the predatory character of Nazi policy. Meanwhile, the principle of collective security received a rude shock in the course of the strenuous efforts made by the Brit. and Fr. govs. to prevent Italy from invading Abyssinia (1935) and it may be said that the collapse of the policy of applying economic sanctions to Italy, after the opening of the It. invasion, sealed the doom of the League as a force in the sphere of power politics. The sanctions did some economic damage to Italy without affecting the outcome of the war, and had the effect of driving Italy into Germany's arms.

The Spanish Civil War.—Civil war broke out in Spain in 1936. Britain and France resolutely followed a policy of 'non-intervention,' while Mussolini and Hitler actively supported Franco (q.v.), ostensibly in fulfilment of their common anti-communistic ideology expressed in the anti-commintern pact (q.v.) and their aid had a pronounced effect on the ultimate outcome of the war, won by Franco in 1938. The year was also marked by the successful application by Turkey to remilitarise the Dardanelles; and the grant of this cemented the good relations between Turkey and Britain.

German annexation of Austria.—*The Munich Pact.*—*German Seizure of Czechoslovakia.*—*German Invasion of Poland.*—Hitler's grip on Germany itself was now complete, and E. had a foretaste of future Ger. policy when Ger. troops marched into the demilitarised Rhineland zone in 1936. In 1938 Hitler annexed Austria in an unresisted invasion (see AUSTRIA.—*History*) and the former rep. became a prov. of the Reich. In the autumn of 1938 Hitler incited the Ger. minority in the Czech Sudetenland to demand incorporation in the Reich. Both France and Russia were bound by treaty to defend the Czechs, and Britain, though not a guarantor of Czechoslovakia's integrity, could be expected to follow France. But when the crisis came, neither France nor Britain was adequately equipped for

war. In these circumstances they yielded to Hitler and concluded the notorious Munich Pact (q.v.) on 29 Sept. 1938, which has been described as 'one of the great capitulations of history.' In spite of his Munich promises, Hitler soon overran the rest of Czechoslovakia (see CZECHOSLOVAKIA.—*History*). Britain and France protested, but did not attempt to resist Hitler. Hitler then proceeded to seize Memel (q.v.). It was in the light of these events that Britain in Mar. 1939 gave a unilateral guarantee to Poland. On 23 Aug., the world was amazed by the news of a Ger.-Russian pact. The pub. text of this Pact recorded a close agreement between the 2 Powers, adding that if either were attacked by a third, the other would give no help to the attacking Power. No one could doubt, however, that more specific bargains were covered by secret clauses, and events soon showed that these concerned the betrayal of the Baltic states, the partition of Poland, and forced concessions from Finland. After a force of ultimatums, which Poland was given no opportunity to answer, the Ger. armies invaded Poland (Sept. 1939) (for full details of the causes of the Second World War and of all immediately antecedent events, see WORLD WAR, SECOND).

HISTORY OF EUROPE DURING THE SECOND WORLD WAR (1939-45).—*German Conquest of Poland.*—The hist. of E. in the first 2 years of the war was the record of the rapid and shattering Ger. conquest of one European country after another, until Britain remained the sole defender of the liberties of mankind against a triumphant Germany holding down most of the Continent, including her fascist partner, Italy, whose unhappy people had been dragged into the war by Mussolini in the expectation of cheap and easy rewards. For the greater part of this period Stalin played the rôle of European Janus, always apparently ready to enter into formal agreements with Hitler, yet never losing an opportunity of strengthening his frontiers against him.

By the middle of Sept. Warsaw was surrounded and the Polish armies fell back on their last line of defence in the E. At this point the Soviet army crossed the frontier in their rear and Polish resistance collapsed (24 Sept.). Once again Poland was partitioned, with provision for a small puppet state under Ger. domination. In the W. of E. the Allied declaration of war was followed by a long lull—excepting at sea (see NAVAL OPERATIONS IN SECOND WORLD WAR). Russia took the opportunity to reduce the 3 small Baltic reps. to vassalage, this being presumably part of the price paid by the Reich for the Russian 'entente.' Soon afterwards Russia invaded Finland—the obvious purpose of this unprovoked onslaught being to secure her Baltic position against Ger. encroachments (see FINLAND.—*History*).

Up to the end of the spring of 1940 there were no major military developments on the W. Front. The devastating completeness of the success of Germany's

Polish campaign not only freed Germany of the nightmare of a war on 2 fronts, but it demonstrated, even more obviously than the fate of Czechoslovakia (q.v.), the reprisals small states, however 'guaranteed,' might expect at Germany's hands if they were spirited enough to offer resistance to her plans of European conquest.

German Conquest of Scandinavia, Belgium, and Holland—Collapse of France—Franco-German Armistice—Italy declares war.—Suddenly, in April 1940, Ger. forces seized a number of key points in Denmark and Norway, including both Copenhagen and Oslo. Denmark was powerless to resist, but its only outlying dependency, Iceland, was saved by being taken under the immediate protection of Great Britain. The Norwegians offered a heroic resistance under King Haakon and a Brit. expedition was hurriedly landed in Norway. But the Ger. surprise invasion was complete and their forces, landed by parachute and in troop-carrying planes, soon put them in possession of the few existing airfields. Norwegian resistance became hopeless; the king went to England and the Brit. force was re-embarked for Britain (see NORWAY AND DENMARK, GERMAN INVASION OF (1940)). This Allied defeat produced immediate repercussions in Britain and France, Churchill (q.v.) replacing Chamberlain (q.v.) as prime minister of Britain, and Paul Reynaud (q.v.) replacing Daladier (q.v.), both being pledged to the more vigorous prosecution of the war.

Without notice or declaration of war, the full fury of the Ger. war-machine was next unloosed against both Holland and Belgium, with the object of forcing a way through their ters, and turning the left flank of the Maginot Line (10 May). Holland was crushed in a few days, and King Leopold surrendered on 28 May. The Dutch royal family escaped to England. The greatest rearguard action that military hist. has ever recorded culminated in the evacuation from Dunkirk, when 335,000 men of the B.E.F. were brought home. The Gers. entered Paris on 14 June. (For the immediate effect on Britain of the collapse of the Western Front and the preparations made for the defence of Great Britain against a Ger. invasion, see GREAT BRITAIN: History.) Reynaud, who seemed prepared to carry on the fight in Fr. ter. overseas, found himself in a minority of one in his own cabinet, and a new cabinet was formed under Pétain (q.v.), which in 1941 had become so permeated by Ger. sympathisers that the 2 countries thenceforth openly collaborated against Britain. France signed an armistice with Germany on 22 June and with Italy, which country had entered the war on 11 June in the hope of securing the spoils of victory at the least cost to herself in blood and treasure, on 24 June. (For the campaign on the W. Front, see WESTERN FRONT IN SECOND WORLD WAR and for the immediate and underlying causes of the collapse of France, see FRANCE: History.)

The Fr. Fleet, on which much reliance had been placed by Britain for the protection of her Mediterranean interests, was now in danger of being handed over to Germany. Churchill promptly ordered the destruction of the Fr. fleets in Oran and Mers-el-Kebir, a number of ships being sunk or put out of action (see NAVAL OPERATIONS IN SECOND WORLD WAR).

German infiltration in the Balkans and Hungary—Tripartite Pact.—In the E. Mediterranean a large It. army under Graziani, based on Libya, was preparing to invade Egypt, while new armies suddenly advanced on Albania to invade Greece. But by the end of the year the entire It. Colonial Empire was in jeopardy through the military and naval successes of Britain and Gk arms (see AFRICA, NORTH, SECOND WORLD WAR CAMPAIGNS IN; GREECE, SECOND WORLD WAR CAMPAIGNS IN (1941); and ITALIAN EAST AFRICA, SECOND WORLD WAR CAMPAIGNS IN (1941)).

For the time being, Greece, aided by Brit. naval, military, and air forces, heroically resisted the invader, and indeed had Germany not taken a hand, would have driven the Italians out of Albania. Meanwhile, Hungary was admitted to the Axis (q.v.). Rumania's entire system of gov. was soon subverted by the Germans, and some Rumanian ter. was ceded to Russia. Turkey continued to declare her friendship with Britain. In Spain, Franco pursued an opportunist policy, which, when France fell, seemed likely to bring him into the war as a partner in the Axis; but he became cautious when it was seen, in the autumn (1940), that the destruction of Brit. power was still far off. Meanwhile, despite Ger. military successes, the hope of the oppressed nations of E. was reposed in Britain, who was obtaining material aid from the U.S.A. The menace of 'Hitlerism' to the New World, made obvious by the Tripartite Pact between Germany, Italy, and Japan, drew closer the bonds of sympathy between the U.S.A. and Great Britain. (See BERLIN, Pact of.)

During the first 5 months of 1940, the Balkan States, including Turkey, were the scene of much diplomatic competition between the W. Allies, the Axis, and Russia. Rumania was forced to cede Bessarabia and N. Bukovina to Russia, whose confines now reached the Lower Danube. A pro-Ger. puppet gov. in Rumania repudiated the Anglo-Fr. guarantee and withdrew Rumania's membership of the League of Nations. Thus the Balkan Entente was at an end. Now, both Bulgaria and Hungary, undermined by Nazi sympathisers, pressed territorial demands on Rumania. With Ger. aid, Bulgaria obtained the S. Dobrudja. Britain acquiesced in the vain hope of buying off Bulgarian sympathy for the Axis. Hungary and Rumania could not agree and, on 30 Aug., It. ministers at a conference in Vienna dictated a settlement which cost Rumania over half of Transylvania. This betrayal

resulted in the abdication of King Carol (6 Sept.) and the entry of Ger. troops. Rumania was now virtually a Ger. protectorate.

Nazi persecutions in occupied countries.—Under German occupation, the countries of E. suffered privations and hardships in varying degree. There was a general shortage of food and a denial of elementary civil rights and liberties; acts of extreme brutality were carried out, sometimes, as in Czechoslovakia and Poland (and later in Yugoslavia and Russia), on a vast scale. In Germany itself persecution of certain racial and political groups had been a feature of Nazism since its earliest years in power.

German Conquest of the Balkans.—In the hope of forestalling a Ger. invasion of Greece, Eden, Brit. foreign secretary, visited the Balkans in an effort to organise a Balkan bloc of resistance. To counteract this, the Germans hastily occupied Bulgaria, 'invited' Yugoslavia to join the Axis, and gave 'friendly' advice to Greece to conclude peace with Italy. The Yugoslavs rose in revolt against their pro-Axis rulers and prepared to fight the Germans, but the country was overrun in a few days. This was followed by the Ger. conquest of Greece and Crete after fierce resistance by Gk and Brit. troops against overwhelming odds (see GREECE, SECOND WORLD WAR CAMPAIGN in (1941)). Greece was later ceded to Italy as a political sop.

German Invasion of Russia—Anglo-Russian Alliance.—With the conquest of the Balkans, all W. Europe was conquered or effectively neutralised—with the exception of Britain. Hitler's attack on Russia now could be launched without fear of direct allied intervention. On 22 June the Germans began their offensive along the whole Russian frontier.

The Germans launched 3 major attacks: in Lithuania so as to menace Leningrad; in Poland from Brest-Litovsk against Grodno and Vilna, so as to menace Moscow; and in Bessarabia, by combined Germano-Rumanian forces, across the Pruth, aimed against the Ukraine. Soon afterwards, further attacks developed in White Russia, particularly around Minsk, in Finland, and around Murmansk (for this campaign, see EASTERN FRONT or RUSSO-GERMAN CAMPAIGNS in SECOND WORLD WAR). The Baltic states were soon largely overrun, and in E. Poland the Germans advanced a considerable distance. But from the beginning they met with unexpectedly strong resistance from the Red Army, and gradually it seemed evident the Russians would hold their own. On 12 July the Brit. and Soviet govts. signed a formal agreement undertaking to render each other all assistance in the war, and to negotiate no armistice or treaty of peace except by mutual consent.

Russo-Polish Agreement (July 1941).—*Alked guarantee to Turkey.*—The overrunning of E. Poland by the Germans brought into sharp relief the political relations between the Poles and the Soviet Gov. On July 30 the Soviet Gov. and

Gen. Sikorski, Polish prime minister, concluded an agreement by which the Soviet-Ger. Treaty of 1939 regarding territorial changes was declared void. The 2 govts. agreed to render each other mutual aid of all kinds in the war. The delimitation of the new frontiers was, however, left over until the end of the war. Shortly after this agreement, the Brit. and Soviet govts. made a joint declaration in Ankara guaranteeing help to Turkey if she were attacked by a European power and renewing pledges to respect the territorial integrity of Turkey and the Montreux Convention of 1936 regarding the Straits.

The Atlantic Charter.—Germany's diplomatic situation had deteriorated since the heyday of her military successes in Greece and Crete. Held up in her giant thrusts at Leningrad, Moscow, and Kiev, Germany was more than ever anxious to create a diversion which should prevent Britain from fully concerting her strategy with Russia. Towards the middle of Aug. 1941 it was generally believed that Germany intended to put forward 'peace' proposals, designed to perpetuate Hitler's 'New Order' and, above all, to accentuate the split in America between the pro-Ally public and the isolationists. But this move was forestalled by an historic meeting at sea on Roosevelt's (q.v.) invitation between the President and Churchill, the outcome of which was a joint statement of principles on the national policies of their respective countries on which they based their hopes for a better future for the world—a remarkable manifesto and entirely without precedent or parallel, for it was in effect a pact between a belligerent and a non-belligerent (see ATLANTIC CHARTER).

The outbreak of war on the E. front changed the whole aspect of European and world affairs. On the Axis side troops from the subject countries of Hungary, Rumania, and even Italy were soon thrown into the struggle. Finland, resenting its defeat in 1939-40, was soon induced to co-operate in the invasion of Russia. Later, in response to Russian requests, Britain declared war on these Ger. satellite countries. But for geographical reasons the help which Britain might render Russia could only be in the form of munitions of war and even then delivery involved hazardous convoy operations in the Arctic. The entry of Russia into the war brought new hope to the defeated nations. The spirit of revolt in France expressed itself in sporadic acts of violence, followed by ferocious reprisals by the occupying Germans. Meanwhile the tide had turned in Russia. The Russian winter fell with devastating effect on the ill-protected rank and file of the invading armies. The misery of the Ger. soldiers in the intense cold could not be concealed from the Ger. people, and the situation became so aggravated that Hitler tried to restore confidence by assuming personal command of the Ger. armies. Greater help was, however, forthcoming for the Axis from the Far E. when the treacherous

Jap. attack on Pearl Harbour brought America into the war overnight. Though the year ended with heavy territorial losses for the Allies in the Far E. theatre of war, in Europe and N. Africa, on the other hand, the legend of Nazi invincibility had been shattered for ever. The new alliance, disposing ultimately of resources far transcending those of the Axis, had been firmly estab., though a long period of effort, more intense than any yet undertaken, had to be faced before the decisive strength of the grand alliance could be made effective.

German Spring Campaign of 1942—Defence of Stalingrad.—The Russian counter-offensive which had relieved the gloom of Dec. 1941, was brought to an end by the Jan. frosts, and left the Germans to resume preparations for the spring campaign. Heavy disasters befell the Allies in the Far E. and further threats there were fast developing. Yet the real key to the situation was the control of Africa and the Mediterranean, in which sea the garrison of Malta alone kept the Brit. flag flying in what had become almost an Axis-controlled *mare clausum*. When the expected Ger. offensive on the E. Front came, it proved to be concentrated on the S. sectors, beginning with the Crimea. Fierce protracted battles were fought and Sebastopol fell 1 July. Rostov surrendered on 28 Aug. The Russians therefore decided to withdraw from the whole huge industrial area comprised within the loop of the Don. The Gers, having captured Rostov, hastened to exploit their success in 2 directions: 1 great army wheeled right to invade the Caucasian passes through which they hoped to march before winter and so reach the Caspian Sea and the oilfields of Baku; another army advanced straight forward to cut the chief remaining lifeline of the Soviet, the Volga. But at this critical juncture the Russian resistance buttressed itself upon the steel city of Stalingrad, at the point of the Volga nearest to the Don; and by the heroic endurance of the garrison and people of that fortress, continued over several weeks, gradually fought the invaders to a standstill.

The autumn of 1942 may be regarded as the dividing line in the calendar of the war. Both sides knew that the initiative of the Axis in grand strategy was spent at last and that with their increasing resources the Allies would soon be in a position to attack. The Ger. leaders indeed tacitly acknowledged this governing fact in their public utterances, and their purpose now was to convert E. into an impregnable Ger. fortress, capable of resisting an indefinite siege until weariness or internal dissension should cause the allies to give up their efforts to reduce it. It was at this time (23 Oct.) that Alexander (q.v.) launched the Eighth Army (q.v.) to the attack on the Axis positions at El Alamein. The Ger. and It. armies were driven out of N. Africa or captured and the way opened for the invasion of Italy in the following year.

This was achieved partly through the victory of El Alamein and partly by the surprise landing of an army of Brit. and Amer. troops at key points of Algiers and Morocco. The response of the Axis to these events was to man the battlements of the threatened fortress of E. The Ger. army marched into the unoccupied zone of France, the Fr. navy scuttling their ships rather than surrender them to the enemy; and the Italians were permitted to occupy parts of SE. France. On the Russian front a severe check was administered to the Wehrmacht in the Caucasus in Nov.; while 2 days later an impressive counter-offensive began in front of Stalingrad, and before long a Ger. army of 300,000 men was completely encircled.

Casablanca Conference—German Sixth Army annihilated by the Red Army.—11 Jan. 1943 Roosevelt and Churchill, with their military advisers, met at Casablanca to plan the conduct of the war by a more closely integrated effort. The immediate objective for 1943 was to eliminate Italy from the war. This programme was duly executed, and indeed Allied successes came more quickly than was foreseen at Casablanca, the chief factor being the remarkable Russian victories. On 1 Jan the Russians captured Veliki Luki, broke the Ger. lines of investment before Leningrad, and brought about the surrender of the remnants of the Ger. Sixth Army. The Ger. army in the Caucasus was falling back towards the lower Don. The recapture of Rostov on 14 Feb. marked the liberation of the main Caucasian area, and throughout Jan.-Feb. many cities in the Donetz Basin and the Ukraine were successfully delivered.

Allied Invasion of Sicily—French Fleet joins the Allies—Collapse of Italian resistance—German retreat from Donetz Basin.—By 13 May the Axis had lost its last foothold in N. Africa with the surrender of their forces in Tunisia and the Allies prepared to cross the Mediterranean and complete the overthrow of Italy. On 31 May the Fr. fleet at Alexandria, which had been neutralised since 1940, joined the Allied navies.

The fact that in the Far E. the Jap. were everywhere held meant that the largest possible forces could be committed in E. for the reduction of Axis forces and resources. In the Mediterranean the Allies launched their invasion on the S. corner of Sicily by an amphibious operation on an unprecedented scale. In July the Fascist Grand Council met and deposed Mussolini, and an emergency gov. under Badoglio dissolved the Fascist Party and sent overtures of peace to the Brit. Gov. Meanwhile the invasion of the It. mainland had begun, and on the day (3 Sept.) that the Brit. Eighth Army entered Calabria, Badoglio's envoys had secretly given in their 'unconditional surrender'—as required by the Casablanca declaration. This heavy blow to the Germans, who thenceforth had to garrison with their own resources, not only

the It. mainland but the great Balkan regions hitherto garrisoned by It. troops, came in the midst of a disastrous campaign on the E. Front. In previous years the summer fighting had always favoured the Ger. arms; this time the tables were turned when the Germans, striking against the great Russian salient at Kursk, were held and then hurled back with great losses by a powerful Russian counter-offensive. On 6 Nov. the Russians retook Kiev and speedily developed a vast salient, in the process cutting the most important lines of lateral communication left to the Germans on Russian soil. When the frosts descended on the N. half of the front the Russians opened their winter campaign with a deep penetration near Nevel. By Christmas the Ger. counter-offensive, for which they had concentrated the greater part of their armoured strength, was exhausted, and the Russian forces under Gen. Vatutin (q.v.) struck back from the S. of the salient in a powerful counter-thrust.

The surrender of Italy was made public on 8 Sept. simultaneously with fresh Allied landings near Salerno. By 1 Oct. Naples had fallen, though the road to Rome remained barred till the summer of the following year. In Corsica and Sardinia native co-operation was instrumental in driving out the Germans, but an Allied expedition to take the Dodecanese Is. was overwhelmed by a swift Ger. counterstroke. In the Balkans, however, the It. surrender gave greater scope to the partisan forces of the enslaved countries, though in both Yugoslavia and Greece their exploits were to some extent discounted by dissensions amongst themselves or with their exiled govts.

United Nations Relief and Rehabilitation Administration.—With so many signs of ultimate victory and its concomitant anxieties and responsibilities, there was a growing concentration of thought upon the problems of future reconstruction. For shorter term problems of liberated E. there was set up the United Nations Relief and Rehabilitation Administration (U.N.R.R.A.); and a corps of administrators (Civil Affairs) was formed, under military responsibility, to provide for the military gov. of enemy ter. and initial civil gov. of liberated ter. As to permanent machinery to replace the League of Nations Covenant, the 4 great Powers recognised 'the necessity of establishing at the earliest practicable date a general international organisation, based on the principle of the sovereign equality of all peace-loving States, large or small, for the maintenance of international peace and security' (see *further under UNITED NATIONS, CHARTER OF THE*). 2 other declarations made at the conference of the 4 foreign ministers of France, Britain, Russia, and the U.S.A. at Moscow (Oct.) dealt directly with Germany; one announced plans for the trial of Ger. war criminals, while the other favoured the re-establishment of an independent Austria (see *CRIMES, WAR; NUREMBERG TRIAL*). Other conferences followed including a

meeting at Teheran between Roosevelt, Churchill, and Stalin who issued a manifesto declaring that the Ger. forces would be destroyed by operations of agreed scope and timing from E., W., and S., and accepting responsibility for a peace that would 'banish the scourge and terror of war for many generations.'

Red Army clears the Crimea—Rome taken by the Allies.—The year 1944 found the Allies at last deployed in their full military might. The assumption in Jan. by Eisenhower (q.v.) of the supreme command of the allied forces concentrated for the invasion of western E. heralded the outstanding military enterprise of the year. But meanwhile the main offensive power remained with the Red Army, while to the Eighth and Fifth Allied Armies in Italy was assigned the duty of checking the powerful Ger. force of Kesselring (q.v.) S. of Rome. In Mar. the Russian armies in the Ukraine swept over the riv. barriers in the S. half of the front and crossed into Rumania, threatening the Danube basin. The Crimea was cleared in May, and Sebastopol recovered. In the N. a new offensive against Finland pierced the Mannerheim Line (June), by which time the focus of strategic interest had shifted to France. Meanwhile the deadlock in Italy was resolved by sea-power which covered a new landing at the Anzio-Nettuno beaches. In spite of heavy losses the invading troops held firm on the beaches while the forces on the main front broke through the Gustav Line and effected a junction with them. Thus the Ger. flank was turned and the road opened to Rome, which fell on 4 June.

Allied Invasion of Normandy—Political reactions in Germany.—The immense and hazardous amphibious operation of landing on the coast of Normandy was begun on the morning of 6 June, the culmination of months of intensive but hidden activity in Britain and America and on the Atlantic seaways, directed to the marshalling and equipment of the greatest army of invasion ever launched overseas against a hostile shore. The hub of the great battle of Normandy was a tactically defensive position covering Cuen, which was taken on 9 July, and thereafter for sev. weeks the most dangerous hostile striking force was pinned down to an almost static battle. But after Cherbourg fell (26 June) and the Amer. armies turned S. again to break through the Ger. lines at St Lô and sweep out into Brittany, there followed a rapid and dramatic transformation of the whole aspect of the campaign. While the Brit. and Canadians held the enemy before Caen, the Amers. turned eastward again and advanced through Angou and Maine and so threatened to take the enemy's great panzer army in the flank. The Ger. commander, Rommel (q.v.), now tried to evade the trap by a bold counter-offensive aimed at the hinge of the Amer. wheel at Avranches. His failure led to the headlong retreat of the entire Ger. army, and a substantial part of it was destroyed at the Falaise Gap (see *WESTERN FRONT IN*

SECOND WORLD WAR), the remainder retreating to the Seine and across the riv. after destroying most of the bridges. In the vain effort to sustain the defence of Normandy S. France was denuded of first-line Ger. troops and a landing, based on Italy, was easily effected by a new Allied army which quickly captured Toulon and Marseilles and advanced up the Rhône valley. Its progress was effectively assisted by men of the Fr. *maquis* (or partisans). Paris was liberated on 25 Aug. A provisional gov. was at once set up under Gen. de Gaulle (q.v.). On the left of the line the continued pursuit of the retreating Germans soon brought the Brit. and Canadians into Brussels, and most of Belgium and part of Holland were freed by the early autumn.

The political reactions of these heavy defeats in Germany were profound. An important section of the military caste attempted to overthrow the leaders whose policy and strategy had led to these disasters, while an abortive attempt on Hitler's life on 20 June was followed by a ruthless purge in the course of which many officers were executed. The morale of the Ger. people at this critical time seems to have been sustained mainly by the vain hope of destroying their foe in England by the aid of 'secret weapons' such as flying bombs (q.v.) and rockets (q.v.) which caused considerable destruction of civil life and property in S.E. England and Belgium, but had only negligible effect on the war effort.

Red Army's Summer Offensive of 1944—Russians conquer Rumania—German retreat up the Danube—Red Army invests Budapest.—At the end of June the Red Army opened their summer offensive. In the centre of the front they quickly overran all E. Poland and approached the Vistula, at which moment the underground forces in Warsaw, vainly anticipating the relief of the city by the Russians, rose prematurely against the Germans only to be crushed after a heroic resistance of sev. weeks. The incident embittered the already strained relations between Russia and Poland, arising out of the Russian claim to retain the provs. seized from Poland in 1939. Further N. the Russian armies forced their way through Lithuania to the mouth of the Niemen, and Riga fell to them on 13 Oct. Finland signed an armistice at the end of Sept.

On the S. half of the E. front the Russian advance was now resumed, both over the Carpathian passes and up the Danube valley. Rumania then sued for peace and re-entered the war on the side of the Allies. Bulgaria, thus isolated, also submitted to the Allies' terms. These defections not only forced the Germans to a hasty retreat up the Danube, but imperilled their armies of occupation in Yugoslavia and Greece, which now began a hazardous withdrawal, continually harassed by Tito's partisans who had now grown into a formidable army. Mainly by the efforts of the Gk guerilla bands, Greece was completely liberated by the autumn. The Red Army pushed on into central E., con-

verging upon Hungary by way of the Danube and over the Transylvanian Mts and entered Budapest on Christmas Day.

The campaign on the W. Front now seemed stationary compared with the mobile conditions of the summer, but the methodical massing of force opposite the Siegfried Line (q.v.) still involved hard fighting. The main battles were brought about by operations to extend the Allied grip on the classic gateways to Germany—the gaps of Belfort, the Saar, and Aachen. The last-named city, the first major city of Germany to fall to the Allies (21 Oct.), thus became the seat of the first experiment in the civil administration of hostile ter.

Post-war problems of liberated countries of Europe—Interneecine strife in Greece.—From the time of the landing in France an over sanguine sense of the imminence of complete victory in E. pervaded the public mind, which naturally became ever more interested in post-war problems, and in some of the countries suddenly liberated from Ger. tyranny the difficulties of transition were only too evident. In Greece a civil war broke out which was to rage for sev. years.

Failure of von Runstedt's Counter-offensive in the Ardennes—Red Army on the Oder—Yalta Conference—Allied Advance across the Rhine—Conquest of East Prussia—Fall of Berlin.—In Dec. von Runstedt (q.v.), the Ger. commander-in-chief, made bold attempts to restore Ger. fortunes by a powerful thrust through the Ardennes (see WESTERN FRONT IN SECOND WORLD WAR); but at the turn of the year the Allies launched a counter-attack which threw the Germans back on the defensive. The failure of this ambitious offensive proved strategically disastrous to the Ger. commander, for his enterprise had necessitated fighting the decisive battle of the campaign W. of the Rhine and made it certain that he would not have the strength for a protracted defence after the riv. was crossed. In the E., by the middle of Jan. 1945, the main Russian line was sweeping irresistibly over the frozen plain of Poland and up to the Oder opposite Berlin by the beginning of Feb. Here there was a pause; but meanwhile other Russian forces occupied Budapest (13 Feb.) and pressed on into Austria. A thrust towards the mouth of the Oder cut off E. Prussia, which was now gradually reduced in bitter fighting. The resumption of the advance from the middle Oder brought the Russian armies into the suburbs of Berlin in mid-April, and S. of the capital mobile detachments broke through the enfeebled resistance to the banks of the Elbe. While this last great surge of the Red Army was in its initial stages, Churchill, Roosevelt, and Stalin held a conference at Yalta (q.v.) in the Crimea to co-ordinate allied policy and administration after the subjugation of Germany which all might see to be imminent. The Conference had not ended when on Feb. 8 the Battle for the Rhine opened with a strong Brit. offensive in Holland, which towards the end of the

month developed into a general attack all along the line. As soon as the exploitation of the bridgeheads won on the Rhine began it was obvious that Germany's doom was at hand. Field-Marshal Montgomery (q.v.) swung northward to complete the liberation of Holland and to drive the confused mass of the German right towards Schleswig-Holstein. At the same time the Amer. armies encircled the Ruhr area and then penetrated far into Central Germany beyond that great industrial region. The Amer. Third Army drove on irresistibly under its meteoric commander, Gen. Patton (q.v.), into Bavaria and to the Austrian frontier, while the Fr. army advanced to the Swiss border from the N. In E. Prussia the Russian avalanche engulfed in its train numerous cities and strongholds. With the surrender of Königsberg (9 April) the whole of E. Prussia (q.v.) was overrun. Vienna was taken on 13 April and, on 2 May, after a devastating bombardment, which completed the destruction previously wrought by Allied bombers, the surviving Nazi leaders in the city surrendered the blazing ruins of the Reich. The final disruption of the Nazi and Fascist hierarchies of E. was precipitated in Italy by Field-Marshal Alexander's forces, which, in 3 weeks, broke Kesselring's formidable position on the Bologna line.

Final Offensive in Italy—Germany's Unconditional Surrender.—The final offensive in Italy was launched on 9 April and within a few days the Allies crossed the Po at a number of points and a Ger. collapse followed. On 29 April all the Ger. forces here and in Austria surrendered. The previous day the fugitive ex-dictator, Mussolini, was caught and lynched by It. partisans near Milan. Hitler probably perished in the ruins of his chancellery, though the precise circumstances of his end cannot be estab. with absolute certainty. Doenitz (q.v.), the naval commander-in-chief, now arrogated to himself *pro tem.* the supreme power and was allowed by the Allies to sign in that capacity the act of unconditional surrender to the United Nations generally (29 April), the final submission being made at Rheims on 7 May.

Atrocities of incredible horror had been revealed as the Allied forces overran the concentration camps (q.v. and see AUSCHWITZ, BELSEN, BUCHENWALD, etc.) of Germany and a beginning was made with the trial and punishment of those immediately responsible. A more solemn act of high justice was inaugurated at Nuremberg, previously the H.Q. of National Socialism (q.v.), where the apprehended chiefs of the party were arraigned before an international tribunal on an indictment charging them with war crimes (q.v. and see also NUREMBERG TRIAL).

Reconstruction Measures—Problem of Displaced Persons—Political reconstruction.—The material and spiritual ravage in E. was only too conspicuous, and a joint responsibility for the reconstruction of the continent rested primarily on Great

Britain, Russia, and America; but the prospect of the continuous application of a concerted policy was prejudiced by the fact that the reconstruction proceeded in 2 zones dominated respectively by Anglo-American and Russian influence. Germany and Austria were partitioned for administration between the 2 groups of Powers, the frontier being defined by the Elbe and a continuation southward, and the Western half being subdivided between Brit., Amer., and Fr. zones. Central Control Commissions in Berlin and Vienna were appointed to co-ordinate these sev. administrations. A problem of grave dimensions confronted all by the swollen flux and reflux of millions of displaced persons. On the E. side of Germany, Russian influence remained strong in the areas that had been occupied by Russian troops in the course of the war. A part of former E. Poland was annexed by the Soviet Union, compensation being given by extending the Polish frontier at the expense of Germany, to the Oder. For this new Poland the Russians had nominated a gov. which they set up in Warsaw when they captured the city (Jan.) and this gov., slightly reconstructed, was recognised by Great Britain and America in place of the exiled gov. which had maintained its continuous existence in London. Bulgaria and Rumania were settled under coalition govts. friendly to Moscow; in Yugoslavia the victorious Tito (q.v.) was acclaimed by an overwhelming majority of electors, the exiled young king being deposed and a republic inaugurated. In Hungary a general election gave the Small-holders a large majority over the Communists. Czechoslovakia settled down under a gov. of progressive views to a programme of reconstruction which included the nationalisation of about 1000 large industrial concerns. In Austria, as in Germany, the country was divided into 4 zones of occupation, elections giving the Catholic People's party a majority. In Western E. the transition from war and foreign occupation to peace and freedom was less difficult than elsewhere. Political equilibrium was secured for a time in France under de Gaulle, though economic recovery was hampered by a gravely damaged transport system and lack of supplies. In Belgium an issue which threatened to split the country was the projected return of King Leopold. Ultimately the regency was continued for some years while he remained abroad. By contrast the queen of the Netherlands and the king of Norway, both of whom had resolutely sustained the long struggle were welcomed back by their subjects with popular acclaim. Denmark, where also the monarchy emerged with great credit, returned fruitfully to the works of peace. In Russia the losses in life and treasure during the war were on a scale so vast as to subject the national resources both material and moral, to the heaviest strain. On the fields of battle lay sev. million Russian dead. A new and characteristic 5-year plan was promptly

announced. The loss of 6,000,000 destroyed houses had to be made good and 25,000,000 displaced persons had to be settled and cared for. Russia was to be the chief beneficiary of the reparations to be demanded of Germany. Under the Potsdam Agreement the Allies were bound to restore local self-gov. in Germany and to introduce elective representative principles into the administration. The agreement in fact provided that the administration of affairs of Germany should be directed to the decentralisation of the political structure and the development of local responsibility. It was not intended to prevent progress towards a central gov. with powers necessary to deal with matters which might properly be dealt with on a nation-wide basis; but it was intended to prevent the estab. for the time being of a strong central gov. dominating the Ger. people instead of being responsible to their democratic will. These explicit agreements, signed by Stalin among others, were not honoured when the time came to implement them, and, in particular, the execution of the agreement that Germany should be treated as an economic unit was met on the Russian side by a blank refusal (see further POTSDAM AGREEMENT).

Conflicting ideologies in resettlement of Europe and discussion of Peace treaties.—The W. Powers being in control of half E. and Russia of the other half, the resettlement of the whole was organised on unrelated lines. Across the line of demarcation there was little economic intercourse and from the E. side little communication of intelligence. All gov. beyond the so-called 'iron-curtain' were either members of the Soviet Union or soon wholly subject to its influence. In Greece the continued presence of Brit. troops probably saved the country from Communism, and in 1946 the king returned to Athens. In all the Balkan countries, excepting Albania and Yugoslavia, stabilisation of political regimes was marked by the holding of elections. The year passed in Poland without the gov. holding the free elections to which it had pledged itself. Meanwhile the allied countries in the W. of E. restored and reconstructed their political systems upon lines of parliamentary self-gov. Of all the allied countries France had most difficulty in finding a political *modus vivendi* for the post-war period. The Fourth Republic came into being in Oct. 1946, but elections gave no overall majority to any party, and after the retirement of de Gaulle from the country's leadership, gov. followed gov. with monotonous frequency, small pressure groups being able to overthrow the ministry of the day without much difficulty, though gov. has shown slightly more stability since 1954. Italy became a rep. (1946) with a Christian Democrat gov.

E. being thus divided, the settlement of terms of peace seemed to resolve itself largely into a diplomatic trial of strength for the adjustment of frontiers between

the rival systems. After more than 20 weeks of discussion, first in Paris and then in New York, the Council of Foreign Ministers completed (Dec.) the 5 treaties with Germany's former satellite states in E. Italy, Bulgaria, Finland, Rumania, and Hungary. A few days later the Council decided to meet in Moscow on 10 Mar. 1947, to try to devise a common policy in Germany and Austria. Throughout the year Hevin (q.v.) and Byrnes (U.S.A.) made strenuous efforts to establish 4-Power agreement on Germany, but the discussion within the Council of Foreign Ministers only served to emphasise the differences.

In Germany and Austria administration and disarmament had been based by the Potsdam Agreement upon the close co-operation between the 4 Powers—Britain, Russia, U.S.A., and France. This agreement of Aug. 1945 remained throughout 1946 the charter of Allied control, and though much of it was increasingly less observed and applied no attempt was made to revise it. As one consequence of it there arrived in the W. zones of Germany during 1946 nearly 4,000,000 Gers. expelled from Poland, Hungary, and Czechoslovakia. Over 2,000,000 were scheduled to enter the Russian zone. But in one great matter co-operation was real. The state trial of the principal Ger. leaders for high crimes and misdemeanours against humanity and international law was carried to a conclusion and a number of the accused put to death by judgment of a tribunal representative of the 4 Powers. In administration, however, there was no such measure of agreement. No Ger. agency able to act in Germany as a whole came into being. Greater unity began to develop between the Brit. and Amer. zones, but throughout 1946 E. and W. Germany drifted further apart. The division of E. between opposed political and social systems was responsible for cutting Germany in two.

Russian intransigence.—The 'Iron Curtain.'—Although the League of Nations had now been formally dissolved (31 July) nothing in the events of 1947 suggested that its successor, the U.N., had any substantial prospect of realising the dreams of promoting universal peace on which the League had been founded after the First World War. A common policy of the Great Powers, which was its condition precedent, grew steadily more improbable, and consequently the proceedings of the Security Council and the Assembly (see UNITED NATIONS, CHARTER OF THE) were generally felt to be far less significant for the dominant issues than the meetings, albeit inconclusive, between the representatives of the U.S.A., and those of Great Britain, Russia, and France. Unhappily, as the year wore on, Russia became progressively more and more flagrantly ranged in opposition to the other three. This intransigence of Russia was, in fact, the decisive feature of European hist. after the war. The signing of peace treaties with Italy, and the lesser European satellites of Germany, did little to solve the

deadlock. The Soviet Union concentrated on consolidating its relations with and influence over all nations—except Greece and Turkey—E. of the line of div. estab. at the time of the Ger. surrender. Under Russian influence all these countries were by 1948 ruled by single-party totalitarian régimes. Rigid control of communications prevented W. E. from learning very much of what was happening behind the so-called 'iron curtain,' while those within the Soviet Union were yet more ignorant of the conditions of the W. In W. E. a fierce struggle for power raged between the Communist parties, largely following the direction of Russian policy, and other political groups. The background to the conflict was the economic misery and chaos of a continent threatened with starvation and bankruptcy.

Marshall Plan—Russian Counter-moves.—It was evident that nothing could avert these evils from occurring in the not very distant future, and, at the same time, offer a prospect of ultimate recovery to European autarchy except the importation of vast supplies from the New World. Accordingly Marshall (q.v.), the secretary of state, in a speech at Harvard (5 June) outlined his plan to come to the rescue of E. with financial help on a gigantic scale. The condition of assistance was that the European nations should meet and submit a combined statement of their needs and that the aid would be granted only for recovery and as part of a system of mutual aid; but when a conference with this object assembled in Paris, the Soviet Union persuaded their satellite states not to participate. The W. peoples (16 nations) submitted their proposals in a general report giving details of a 4-year programme of reconstruction and at the end of the year the U.S.A. Gov. recommended the enormous figure of 17,000 million dollars.

In every aspect the political and still more the economic instability of E. was intimately related to the uncertainty over the place that Germany was eventually to take in the Continental system. In Germany little now remained of the Potsdam provisions after the Brit. and Amer. govts., forced to counteract the exclusive policy in the Soviet zone, formed their own economic state out of their combined zones.

The 'Cold War' between the Western Powers and Russia—The 'Western Union.'—The hist. of E. in 1948 is the hist. of the struggle between Russia and the W. world, when the div. between E. and W. became more sharply defined, with both sides in the 'cold war' endeavouring to consolidate the forces under their control. In the House of Commons (22 Jan.) Ernest Bevin (q.v.), Brit. foreign minister, put forward the idea of a 'Western Union' or voluntary association of the govts. of Britain, France, and the three 'Benelux' countries to deal with practical economic and military problems. Meanwhile Russia consolidated the countries of E. E. in a solid Communist bloc.

Russian Coup d'État in Prague—Treaty

of Brussels.—The Czech Communist party, openly supported by Russia, carried out a *coup d'état* in Prague as the result of which a Communist-dominated gov. took office and civil liberties were destroyed. In Yugoslavia, however, Tito refused to submit to Russian orders, and boldly maintained his position, Yugoslavia being expelled from the Cominform (q.v.). On 4 Mar., the Brit., Fr., and Benelux govts. representatives met in Brussels to form a W. Union and, on 17 Mar., the treaty of Brussels (q.v.) was signed, pledging the signatories to close co-operation in economic matters and to give immediate military assistance if any of them should be the object of armed attack in E. The 5 govts. also agreed to set up a permanent consultative council to meet in London. Meanwhile the European recovery programme, which had been made possible by Marshall's offer of aid the previous year, made steady progress, and on 3 April Truman signed the Foreign Assistance Act authorising aid to E. for 1 year. When this act was signed the 16 European nations which had accepted the Marshall offer met again in Paris to set up a joint organisation for European Economic Co-operation (O.E.E.C.) which was intended to outlive the European Recovery Programme and which is still (1957) functioning.

A divided Germany—Blockade of Berlin.—Meanwhile the problem of Germany—and to a lesser extent of Austria—became more urgent and menacing. In Feb. the Brit., Fr., and U.S.A. govts. began discussions in London about the future of the 3 W. zones of Germany. These discussions, in which the Benelux countries later joined, finally resulted in a 6-Power agreement which was pub. on 7 June providing for the election of a provisional Ger. Gov. in the W. zones 'until the eventual establishment of German unity.' In June the Russians banned traffic between their zone and the W., and on 19 June the blockade of Berlin began—the W. Powers imposing restrictions on trade as a countermove. A disagreement on Ger. currency reform was the Russian pretext for this move, but the blockade was in reality a deliberate attempt to force the W. Powers either to abandon their plan for W. Germany or to leave Berlin. Unable to supply the pop. of their sectors with food and other supplies by road or rail the W. Powers arranged to supply them by air, and carried this through successfully throughout the autumn. The div. of Germany, of Berlin itself, was accentuated when separate city councils were elected in the Allied and Russian zones of the city—the Russian elections being carried out in the usual Communist one-list manner. While the blockade continued, the W. Powers were forced to concentrate on restoring the W. zones to a state of political and economic health and in this they were helped by the success of their currency reform which so stimulated Ger. production that by the end of 1948 the output of coal, steel, and consumer goods was

approaching the 1936 level. A constituent assembly met at Bonn on 1 Sept. to adopt a constitution or basic law. The Brit. and Amer. military commanders in Germany announced that the coal and steel industries would be handed back to Ger. trustees under allied supervision until a Ger. gov., elected by the people, could decide their future ownership.

European Recovery.—Meanwhile, under the stimulus of generous Amer. aid, W. Europe made speedy progress towards economic recovery, though the problem of the 'dollar gap' was to remain with the sterling area long after apparent economic recovery had been obtained.

Council of Europe.—The Consultative Council of the W. Union, consisting of the foreign ministers of the 5 W. Powers met in London on 27-28 Jan. when they agreed on the creation of a council of E. (q.v.) consisting of a ministerial committee meeting in private and a consultative body meeting in public. The Council decided to invite other European countries to take part in negotiations for the estab. of the Council of E. The defence organisation of the W. Union began to take shape when the defence ministers of the 5 powers met in Paris (Sept. 1948) and the nucleus of a joint command was set up.

North Atlantic Pact.—Meanwhile negotiations had been in progress for the conclusion of a N. Atlantic Pact in which the U.S.A. should be associated with W. E. in security arrangements. The draft pact of treaty was completed in Mar. 1949. Its principal Article (V.) recognised that any aggression against one of the signatories would be considered as an aggression against all. In those circumstances immediate action against aggression, either individually or collectively, and by armed forces, is contemplated by the pact. The pact was signed on 4 April 1949 by the U.S.A., Canada, Great Britain, France, Belgium, Holland, and Luxembourg, Norway, Italy, and Denmark were invited to adhere later, and, in a still later stage, Portugal, Iceland, Greece, Turkey, and W. Germany (see supra).

Berlin blockade lifted.—End of Greek Civil War.—In May 1949 the Russians lifted the Berlin blockade. Throughout 1949 Russia seemed to relax her efforts in the 'cold war', concentrating, instead, on strengthening her grip on the satellite nations of E. Europe. In Hungary, for example, the Primate, Cardinal Mindszenty (q.v.) was in Feb. sentenced to life imprisonment on charges of treason; in Poland a Polish-born Russian gen., Rokossovsky, became defence minister. The satellites followed Russia's lead in breaking off relations with Tito's Yugoslavia and exerting all possible economic pressure on her, in an attempt to break Tito's resistance; but the Yugoslav leader turned to the W. for economic help, and his assertion of Yugoslavia's rights in the face of Russian threats rallied elements of the pop. previously antagonistic to the régime, to him. Now that the Gk Communists could no longer rely on active Yugoslav help from across the Gk-

Yugoslav frontiers, their chances of winning the civil war declined considerably, and they were finally crushed by Papagos (q.v.).

Formation of the Federal German Republic and the German Democratic Republic—European Coal and Steel Community.—A constitution for a W. Ger. federal rep. embracing the ter. administered by Britain, France, and the U.S.A. was adopted at Bonn in May 1949. Following elections there, the W. powers ended their military occupation, though retaining troops in W. Germany for defensive purposes. Heuss (q.v.), a liberal,

first president of the new rep. with its cap. at Bonn, and Adenauer (q.v.), a Christian Democrat, its chancellor. Russia protested against the creation of the new state and in Oct. a 'German Democratic Republic' was proclaimed in the Russian zone of Germany, with a gov. obviously modelled on that of the other Russian satellites. This division of Germany into 2 states, 1 on each side of the 'iron curtain,' seemed to make eventual German reunity more distant than ever, though it remained the avowed aim of both govts. and was now acknowledged by all the major powers. The W., however, countered all Russian suggestions for Ger. reunification by insisting that reunification must be preceded by genuinely free elections in both E. and W. Germany: and this condition Russia was never prepared to accept.

The Statute of the Council of Europe was signed by 10 nations in London in 1949; and the following year, W. Germany was invited to join the Council. In May 1950, Robert Schuman, the Fr. foreign minister, proposed a plan for pooling European coal and steel production under a single authority, having supra-national powers (see EUROPEAN COAL AND STEEL COMMUNITY). Britain expressed interest, and said she would co-operate with any authority that was estab. on these lines, but declined to join, but eventually 6 countries, Belgium, Luxembourg, the Netherlands, France, W. Germany, and Italy agreed to a conference. A treaty was signed, April 1951, which was ratified in June 1952. This was a considerable step towards ultimate European economic unity.

Problems of West German Rearmament—Korean War—Belgium.—Throughout 1950 the W. was increasingly absorbed by the problem of W. Ger. rearmament. There was already a militarized Ger. force in the E., allegedly confined to police duties, about which France, Britain, and the U.S.A. had unsuccessfully protested. In the W. it was felt essential that W. Germany should play her part in the military defence of W. Europe: but action was held up largely by the Fr. fears of a rebirth of the old Ger. militarism. In New York in Sept. the Brit., Fr., and Americans formally agreed that Germany should contribute to a European defence force: but no agreement was reached on detail. In Dec. Eisenhower (q.v.) was appointed supreme commander of the proposed W. European defence force.

The year's events in E. were overshadowed by the outbreak of the Korean War (q.v.) which soon had economic repercussions in E. Most of the W. European countries eventually contributed either combatant or non-combatant units to the U.N.O. force in Korea. The most spectacular political events of the year occurred in Belgium (q.v.) where the return of King Leopold caused rioting which threatened to lead to civil war: the crisis was solved, when Leopold delegated his powers to his son, Baudouin (q.v.) (Aug. 1950). Baudouin became king on Leopold's abdication in July 1951.

In 1951 the organisation of the N.A.T.O. forces began to take concrete shape. Turkey and Greece were admitted to N.A.T.O. in the autumn. But the question of a Ger. military contribution to N.A.T.O. was still unsettled. In Jan. the Fr. premier, Pleven, suggested a unification of the military forces of W. Europe under a European Minister of Defence subordinate to a European Council of Ministers—a military counterpart to Schuman's coal and steel plan. Negotiations proceeded throughout the year with Pleven's scheme as their basis. It was clear that France wanted political safeguards before she would permit Ger. re-armament; but her views appeared to imply an amount of European unification involving Britain which Britain was not prepared to accept.

During the year the W. Powers and Russia both put forward disarmament proposals, but these came to nothing. Meanwhile, re-armament in W. Europe coupled with the effects of the Korean war, was causing economic difficulties in some countries. W. Germany, however, with no re-armament burden, was entering on a period of booming economic prosperity. In Britain, the Conservatives under Churchill were returned to power after 6 years of Labour gov.

The European Defence Community (E.D.C.)—Death of Stalin—Revolution in East Berlin—End of Korean War.—It was becoming increasingly clear that Russia was particularly anxious to prevent W. Germany re-arming. During 1952 she made further proposals for a Ger. peace-treaty, but these foundered, as before, on the issue of free all-Ger. elections. The W. powers' suggestion for an Austrian peace-treaty (Mar. 1952) were rejected by Russia. In the same month Ismay (q.v.) became secretary-general of N.A.T.O., with H.Q. in Paris; in Sept., 8 N.A.T.O. countries took part in joint military and naval manoeuvres. On 26 May the Ger. Contract, ending the occupation of W. Germany and granting sovereignty to the Federal Rep. was signed in Bonn by representatives of France, Britain, and the U.S.A. and Chancellor Adenauer, in spite of some last-minute Fr. misgivings. The day before Russia had again suggested talks on a Ger. peace-treaty. Then, on 27 May the treaty to estab. the European Defence Community (E.D.C.) by which France, Luxembourg, Italy, Belgium, the Nether-

lands, and W. Germany agreed to joint defence forces, was signed in Paris. The Brit. and Amer. govts. linked themselves to E.D.C. but did not join it; and the treaty establishing it had to be ratified by the parliaments of the nations concerned before it came into force. It was already clear that Fr. public opinion was far from united on the issue. At the end of May Ridgway succeeded Eisenhower as supreme commander of the S.H.A.P.E. forces in Europe (subsequently succeeded by Gruenther, and then by Norstad). At the end of June Marshall Aid came to an end. But the problem of the 'dollar gap' remained.

During 1953 the common coal and steel markets of the European Coal and Steel Community came into being. There were also tentative moves to forward the idea of European political unification but the draft treaty for a European Political Community, put forward in May, received a hostile reception from every major country involved. More sound, if less ambitious, signs of unity among the European powers were the first annual session of the Nordic Council (Denmark, Norway, Sweden, and Iceland) which met in Feb., which had common citizenship as its ultimate aim, and the treaty of friendship signed in 1953 between Yugoslavia, Greece, and Turkey.

In Mar. 1953 Stalin d. suddnly. There was an apparent lessening of tension between W. Europe and the Soviet bloc and in May Churchill proposed top-level private talks between the 4 great Powers, with a view to solving their outstanding differences. Russia, however, was anxious to include Communist China in any such conference and made a number of other conditions which precluded any possibility of Western agreement. She again raised the question of a Ger. peace-treaty in 1953, with the apparent intention of influencing the elections in W. Germany against Adenauer, the supporter of E.D.C.; but in spite of this Adenauer and his gov. were returned to power (Oct.). It was obvious that the Soviet satellites were being subjected to increasing economic strain. In May the Czech currency was revalued, and there were riots; but on 17 June serious rioting broke out in the Soviet sector of Berlin which at one point seemed to be about to touch off a revolt all over E. Germany (there were, in fact, simultaneous riots in other E. Ger. cities) and which was only crushed by Soviet tanks. Afterwards, a number of economic concessions were announced, and the E. Ger. gov. was reorganised. The flow of refugees from E. Germany to the W. increased considerably.

The year had opened with severe storms and gales which caused terrible damage in the Netherlands and along the E. coast of Britain, and heavy casualties. Through the year, the process of ratifying E.D.C. in the various parliaments concerned continued slowly. In Sept. the U.S.A. signed a 10-year defence agreement with Franco Spain, under which the U.S.A. was granted naval and military bases in Spain, and

Spain received Amer. economic aid. The Korean War ended in Sept., when a truce was signed at Panmunjong. In Italy, the Christian Democrats again formed a gov. after the general election in June, although the Montesi scandal at one time threatened to bring down the gov. and actually caused the resignation of Piccioni, the able and pro-W. foreign minister.

Four-Power Conference in Berlin
Geneva Conference on Indo-China—Rejection of E.D.C. by France—London Agreements—Settlement of Trieste Problem.—1954 opened with the long delayed Four-Power Conference, which met in Berlin in Jan., but it was soon obvious that Russia's attitude towards the major outstanding issues—Austria and Germany—was fundamentally unchanged in spite of her changed leadership. Molotov agreed to discuss an Austrian peace-treaty but no agreement was reached on the subject. The Russian foreign minister bitterly attacked E.D.C., threatening that W. Ger. adherence to it would end all hope of a peace-treaty with Germany. He again raised the question of China being included in high-level discussions. The conference ended in failure in Feb. but it was agreed that a conference at Geneva in April-July would meet to discuss Korea and Indo-China. At this conference Chinese representatives did attend, and the Indo-China conflict was settled; but no agreement was reached on Korea.

The future of E.D.C. was still in the balance. It was obvious that France was having growing doubts on the subject. Russia was playing a temporarily conciliatory hand, which had its effect on Fr. public opinion and in March and again in July she suggested a general European treaty of collective security, and proposed that she herself might join N.A.T.O. In Aug. the E.D.C. countries met at Brussels to try to resolve the Fr. doubts on the treaty, but the conference broke up without agreement being reached, and on 30 Aug. the Fr. Assembly rejected E.D.C.

The Brit. Gov. took the initiative in starting discussions with France, W. Germany, and the other E.D.C. powers to find a formula acceptable to France which would take the place of E.D.C. A 9-power conference opened in London in Sept. and agreement was reached in Oct. The Ger. Federal Rep. was to enter N.A.T.O., and both Germany and Italy should enter the Brussels Treaty Organisation. Britain guaranteed to retain substantial armed forces on the continent to help in Europe's defence, and the U.S.A. agreed to give the new formula the same moral and material support that she had pledged to E.D.C. Russia countered this substantial success in the cause of Western Union by suggesting new talks on Germany, but Britain, France, and the U.S.A. insisted that these could not take place until the London and Paris agreements had been ratified by all the nations concerned.

W. Europe's strength was further increased in 1954 when in Oct. Italy and Yugoslavia initialled an agreement in

London settling the Trieste dispute, which had caused antagonism between the two countries ever since the end of the war. Zone A, including Trieste city, went to Italy, Zone B to Yugoslavia, and the port of Trieste remained a free port.

An Austrian Peace-Treaty—West Germany joins N.A.T.O.—Easing of East-West tension.—Further political changes took place in Russia in 1955. Malenkov (q.v.) was replaced by Bulganin and Krushchev (q.v.). In May a Four Power conference in Vienna finally agreed on an Austrian Peace Treaty, which was signed on 15 May and came into force on 27 July.

By the beginning of May the ratification of the London agreements was completed. Germany became a member of N.A.T.O. on 19 May though it was November before the new Ger. army came officially into existence, and not until 1957 were the first Ger. conscripts called up. The Ger. opposition (Social Democrats) continued to attack Ger. re-armament within N.A.T.O., primarily on the grounds that it made an eventual re-unification of Germany less likely, a fear which, as the Russians had long known, had a profound effect on sections of Ger. public opinion that were far from Socialist. The questions of Germany's financial contributions to W. defence, and towards the maintenance of foreign troops stationed in Germany for German's own defence and for that of W. Europe as a whole also remained unsettled.

E.-W. tension seemed to ease during the second half of the year. The heads of the Fr., Brit., Russian, and the U.S. govts. met at Geneva in July—the first such meeting since Potsdam, 10 years before—and though nothing very tangible resulted from their discussions, the atmosphere was noticeably cordial. In Oct.-Nov., however, a meeting of the 4 foreign ministers of these states, which had been proposed by the July meeting, ended in complete disagreement on every topic discussed. In June, there were signs of a Yugoslav-Russian rapprochement, although Tito declared his intention of preserving his existing links with the W. The Hungarian communist gov. released Cardinal Mindszenty from prison on health grounds in July, though he remained under house arrest. In Sept. the W. Ger. chancellor, Adenauer, went to Moscow for talks, as a result of which diplomatic relations were estab. between the Federal Rep. and Russia, and Russia agreed to return the remaining Ger. prisoners of war that she still detained to Germany.

Increased Tension in the Mediterranean and the Middle East—The Saar.—There were indications, however, that the centre of tension were shifting towards the Mediterranean and the Middle E. The *crisis* campaign in Cyprus (q.v.) had now become extremely bitter. A conference in London attended by Gk and Turkish gov. representatives ended in failure. The Cyprus situation embittered Anglo-Gk relations, and caused dissension between Greece and Turkey, so that by 1956 the N.A.T.O. link in the E. Mediterranean, as

represented by Greece and Turkey, had become virtually ineffective. In the Middle E. the W. still retained considerable political and economic influence through the Bagdad Pact (q.v.) of which Britain was a member; but the U.S.A.'s refusal actually to join the pact weakened its effectiveness. Egypt was rapidly building up an anti-W. bloc in the Middle E., and there were signs of growing Soviet influence in the area. Fr. public opinion was becoming more concentrated on the growing problem of Algeria: but the result of the Saar plebiscite in Dec., which rejected the proposed European Statute, caused a shortlived revival of Fr. fears about Germany. France and Germany subsequently reached agreement on the Saar (1956), however, and on 1 Jan. 1957 the Saar became part of the Federal Rep.

Change of Government in Poland—Revolution in Hungary.—In Feb. 1956 Khrushchev made an outspoken denunciation of Stalin and Stalinism which indicated that in future more freedom of action was to be allowed to the Soviet satellites; and indicated, too, that serious economic problems existed in E. Europe which were now being blamed on to the errors of the Stalin regime. In April the dissolution of the Cominform was announced. In June there was serious rioting in Poznan, Poland. By Oct. the situation in Poland was so critical from the Russian angle that Bulganin and Khrushchev visited the country on the 19th to attempt to retrieve matters. The 'Titoist' Communist Gomulka was elected secretary of the Polish communist party and thus became the effective ruler of Poland: Rokossovsky was dropped from the Politburo and subsequently returned to Russia. By Jan. 1957 it seemed that Poland had achieved a compromise gov. on Titoist lines, entailing considerably more internal freedom and independence of action, though Russian troops remained in the country. The Polish example touched off a similar train of events in Hungary (Oct.) but these rapidly became not merely anti-Russian but anti-Communist in form, and the Russians eventually used force (Nov.-Dec. 1956) to crush what had become a revolution aimed at the estab. of a gov. on W. democratic lines. A Soviet puppet regime under Kardar was estab. in Budapest and a campaign of savage repression followed. Resolutions passed by the U.N. condemning Russian action were entirely ignored by the Soviet Union. W. Europe and the U.S.A. opened their frontiers to the flood of refugees which poured out of Hungary.

Suez Crisis—Middle East becomes the centre of crisis.—While N.A.T.O.'s military strength as a whole increased throughout the year, the continuing tension between Greece and Britain and Greece and Turkey weakened it politically, and Iceland's useful position within the organisation was for a time in doubt. The question of Ger. re-unification still loomed large in the internal politics of W. Germany, but for the time being the Great Powers were concentrated on other issues.

But during the second half of 1956 W. Europe was affected principally by Middle E. events and W. Europe itself ceased to be the main scene of action. In July Nasser nationalised the Suez Canal: on 29 Oct. Israeli troops invaded Egypt, and France and Britain landed troops in Egypt with the declared intention of separating the combatants and safeguarding the Suez Canal. The immediate effect however, was to unite world opinion against Britain and France (whose action was condemned in the U.N.) and to destroy at least temporarily, what Anglo-Fr. influence remained in the Middle E. The Suez Canal had been blocked by Egypt in the first few hours of the fighting, and this had serious economic repercussions in E. In France and Britain petrol and oil were rationed; in most of the rest of W. Europe petrol restrictions of some kind were necessary. By Jan. 1957 the Anglo-Fr. forces had withdrawn from Egypt, being replaced by a U.N.O. force, and salvage work had begun on the Canal. But events since July 1956 had shown all too clearly that W. Europe's vulnerability lay now not along the frontier between E. and W. Germany, but in the Middle E.: and here there was no N.A.T.O. to safeguard her. *See also EUROPEAN COMMON MARKET.*

European Coal and Steel Community. In May 1950 Schuman, Fr. foreign minister,

proposed a plan for pooling E. C. and S. production under a single 'high authority,' possessing supra-national powers. The outcome of this 'Schuman plan' was the treaty of 18 April 1951, signed in Paris by France, Belgium, the Netherlands, Italy, Federal Germany, and Luxembourg, setting up the E. C. and S. C., which had been ratified by all the countries concerned by June 1952. A common market for coal and iron ore was estab. Feb. 1953, and for steel in May. The High Authority of the organisation (first president, Monnet of France: H.Q., Luxembourg) was then empowered to abolish customs duties and other restrictions on the inter-state trade of these commodities. Britain would not join the Community, but in Dec. 1954 signed an 'Agreement of Association' with it, and sev. other states (including the U.S.A. and the Scandinavian bloc) maintain delegations with the High Authority. The Community has done much to further European economic union and has provided inspiration for suggested similar 'pools' for atomic energy ('Euratom'), etc. The High Authority has pub. an ann. general report since 1953.

European Common Market, estab. by 6 countries, Belgium, France, Germany, Italy, Luxembourg, and the Netherlands, in the Rome Treaty of Mar. 1957, to create a 'Common Market' within a common external tariff wall. The process was to take the form of gradual reductions in tariffs and other restrictions on trade between the 6 countries, spread over 12 to 15 years. Within the E. C. M. there was to be free movement of labour and capital, and common policies for agriculture and transport; and for an experimental period of at least 5 years the overseas ters. of the six were to be associated with the parent community. An elaborate institutional structure, including a council of ministers to decide major policy questions by a system of weighted voting, was created. A social fund was to assist workers displaced by the free competition within the E. C. M., and an investment fund was to help underdeveloped regions in the market area. The general purpose was continental economic integration, in which there would be deliberate co-ordination of economic policies, leading ultimately to increasing political integration. The motives for the creation of the E. C. M. were both the urge to raise living standards by greater international div. of labour (as was shown to be possible by the Coal and Steel Community) and the urge to unite in the face of Russian influence in Europe.

In view of this closer economic and (in time) political integration of some of the main countries on the Continent, Great Britain proposed the formation of a Free Trade Area in association with the E. C. M. The idea was for the 16 members (all or some) of the Organisation for European Economic Co-operation (O.E.E.C., q.v.) to form an even larger Area, of which the E. C. M. would be part, in which there would be free trade in industrial products but not, or not necessarily, free movement of labour or capital, or common policies in

agriculture or transport, and in which each country would continue to fix its national tariffs, subject to the rules of the General Agreement on Tariffs and Trade (G.A.T.T., q.v.). The area would be estab. on a consultative basis through the O.E.E.C., and would be a much looser grouping than the more closely-knit E. C. M. The Brit. proposal that agriculture be excluded from the Free Trade Area rested on the view that otherwise the system of imperial preference, under which agric. imports from the commonwealth are favoured compared with those from other countries, would be undermined. An opposite view was that many preferences were not of great value to the Commonwealth, that some sacrifice had to be made for the advantage to Brit. manufactured goods of access to a European market comparable in size with that of the U.S.A. or U.S.S.R., and that the Commonwealth countries might on balance gain from the larger European market for their agric. exports. The arguments for Brit. association with the E. C. M. through the Free Trade Area varied widely from the positive one that Britain should lead Europe in its endeavours to associate more closely (although Britain herself would not integrate politically) to the negative one that if Britain stayed out Germany would dominate Europe.

At bottom the difference between the E. C. M. and the Free Trade Area is that while the 6 have been ready to abandon some national sovereignty and to create a supra-national authority in order to reap the advantages of international co-operation, the Brit. approach has been influenced by the reluctance to loosen the ties with the Commonwealth (and with the U.S.A.) and to commit herself too deeply in Europe by political association. *See also* CUSTOMS UNION.

European Corn Borer (*Pyrausta nubilalis*), moth, comparatively harmless to crops in Europe, where it has long been known, but regarded as a serious menace in the U.S.A. It made its first appearance on the E. coast of America in 1817, having been carried in, presumably, on Eng. vessels, and since then has penetrated further W. It has chiefly attacked Indian corn, where its ravages have threatened the future of the whole crop. The alarm of agriculturists during 1926 led to the sum of 10,000,000 dollars being granted by Congress to fight the invader, and 2 lines of defence have since been adopted with some promise of success. One of these is the importation of parasites that prey upon the moth, and the other consists in thoroughly cleaning up the fields after an Indian corn harvest, and destroying all stalks and vegetable refuse with fire, in order to prevent further breeding of the moths.

European Defence Community (E.D.C.), proposed defensive federation of France, Belgium, Italy, Luxembourg, the Netherlands, and the Ger. Federal Rep. The treaty establishing E.D.C. was signed in May 1952, but required ratification by the

parliaments of the countries concerned before it came into force. From the first France had reservations about it, partly because she considered the control of armaments envisaged under it inadequate, and partly because Britain and the U.S.A., though linked with the treaty, were not members of E.D.C. In spite of protracted negotiations to come to an agreement satisfactory to France, the Fr. assembly rejected E.D.C. 30 Aug. 1954. E.D.C. was subsequently superseded by the defence arrangements made under the London and Paris agreements (q.v.). See also WESTERN UNION; EUROPE, HISTORY.

European Payments Union (E.P.U.), a project of the Organisation for European Economic Co-operation (q.v.), is a self-working multilateral system for offsetting the monthly surpluses or deficits of the member-countries, for determining a single balance, for granting gold and dollar credits, and for softening the impact of short-term fluctuations. E.P.U. will have fulfilled its purpose when full currency convertibility supplants it, first with and afterwards without a supporting European Fund. The most encouraging result of E.P.U. and O.E.E.C. has been the gradual elimination of quantitative restrictions. By mid-1950's three-fourths of W. E. trade on private account had been freed from quotas. (A result was that the tariff question once again became more important than the quota question.) In 1954 the average level of 'liberalisation' was 83 per cent. The figure improved to 90 per cent during 1955. In 1948 and 1951 production deficiencies and raw material shortages dominated the European scheme. In more recent years the main problem has become that of the balance of payments.

Europium, chemical element discovered by Demarcay in 1896. It belongs to the group of rare earths. Its symbol is Eu, its atomic weight 152, and its atomic number 63. E. oxide is a pale powder.

Eurotas, one of the chief rvs. of the Peloponnese, in Greece. Its course is not more than 50 m., flowing through Laconia to the gulf of Gythion.

Euryale Ferox, genus of one species, family *Nymphaeaceae*, is an ann. aquatic herb, bearing deep violet flowers and edible seeds, native to the E. Indies.

Eurydice: (1) Wife of Orpheus. She was bitten by a serpent while fleeing from Aristaeus (q.v.). Orpheus descended to Hades after her, and with his music persuaded Pluto to let her follow him back to the upper world, on condition that he should not once look behind him. This, however, he did, and E. was snatched from him again. See Virgil, *Georgics*, iv; Ovid, *Metam.* x 1.

(2) Illyrian princess, wife of Amyntas II of Macedonia, mother of Philip II and Perdiccas III.

(3) Wife of Arrhidacus, the imbecile son of Philip II. They were married in 322 bc and put to death by order of Olympias (317 bc).

Eurymedon, in anc. geography, riv. of Pamphylia, Asia Minor. At its mouth the

Athenian commander Cimon signally defeated the Persians in 487 bc. Its modern name is Koprü.

Euryome, genus of decapod brachyurous crustaceans, which belongs to the family Mafidae; the species are known as spider-crabs. *E. aspera* inhabits the Mediterranean.

Eurypterids, an extinct subclass of aquatic merostome arthropods which lived from Ordovician to Permian times, but were most abundant during the Silurian and Devonian. Some giant forms of the genus *Pterygotus* are the largest known arthropods.

Eurystheus, see HERCULES.

Eusden, Laurence (1688-1730), Poet Laureate, b. Spofforth, Yorks, son of the rector. He was educ. at St Peter's School, York, and Cambridge. In 1717 he wrote a poem to celebrate the marriage of the duke of Newcastle, who in gratitude used his powers as lord chamberlain to appoint E. Poet Laureate when the post fell vacant in the following year. This unworthy choice was naturally resented by other poets, and Pope pilloried E. in his *Dunciad* as a drunken parson. He had in fact taken orders about 1725, and became rector of Coningsby in Lincs. His trans. from Claudian and Statius are better than his original work; he also made some contributions to the *Spectator* (q.v.).

Eusebius of Emesa (AD c. 295-c. 360), b. at Edessa; he refused the see of Alexandria, being averse from theological disputes, but accepted the small bishopric of Emesa, instead. He was, however, driven from this, accused of sorcery for his prowess as a mathematician and philosopher. Only fragments of his works survive.

Eusebius of Nicomedia (d. c. 342), Gk bishop and theologian, related on the maternal side to the Emperor Julian, whose early tutor he was. Like E. of Caesarea, he was a defender of Arius (q.v.), and placed himself at the head of the Arian party after the Council of Nicaea. The Emperor Constantine was baptised by him in 337, and 2 years later he was promoted to the see of Constantinople.

Eusebius Pamphilus of Caesarea (AD c. 264-c. 349), 'father' of eccl. hist., probably b. in Palestine, took the name of his martyred instructor, St Pamphilus. About 313 he became Bishop of Caesarea and was prominent in the Council of Nicaea, as leader of the semi-Arian party, which, opposed to discussing the nature of the Trinity, preferred the old language of Scripture in referring to it. He is reputed the most learned father of the Church, after Origen and Jerome; Constantine said that he was fit to be the bishop of all the world. Two of his treatises survive, the *Preparation* (*Praeparatio Evangelica*) and the *Demonstration* (*Demonstratio Evangelica*) of the Gospel, 2 apologetic works, and many other writings of the highest value, especially *The History of the Church, from the Time of its Founder to the Year 323*, and the *Chronicon*, a hist. of the world to 328, containing extracts from many works no longer

extant. Some of the most informative passages in his *History* are those on the liturgy and primitive ritual, on the Ignatian Epistles, on the persecutions of Diocletian and Trajan, and on the Thundering Legion. Less important are *The Martyrs of Palestine*, treatises against Hierocles and Marcellus, the *Theophania* (discovered 1839), and a panegyric *Life of Constantine*. See E.'s complete works, ed. E. Schwartz and T. Mommsen (1903-09); *Church History*, ed. Heinichen, 3 vols. (1868-70), with the *Life of Constantine* and the *Oration in Praise of Constantine*; also the article on E. in J. Herzog's *Encyclopædia*, 1854; I. Dörner's *History of the Person of Christ*, (ii) 1839; P. Schaaf's *Church History* (ii) 1867; Introduction to Lee's trans. of the *Theophania*; J. J. Blunt's *The Christian Church during the first three centuries*, 1888. See also trans. by Kirsopp Lake and J. E. Oulton, 1926-32, and by H. Lawlor and J. E. Oulton, 1927-8.

Euskara, see BASQUE.

Euskirchen, Ger. tn in the Land of N. Rhine-Westphalia (q.v.), 33 m. S. of Düsseldorf (q.v.). It has important textile industries. During the Second World War E. was of strategic importance as a road-centre during the allied advance to the Rhine in Feb., 1945. Its capture, with that of Prüm (in the Eifel, q.v.), led to the breaching of the Siegfried Line (q.v.) in this region, and eventually to the seizure of the bridge at Remagen (q.v.). Pop. 20,000.

Euspongia, see SPONGES.

Eustachian Tube (after Bartolommeo Eustachio, It. anatomist, 1520-74), cylindrical tube lined with mucous membrane, dilated at both ends and connecting the cavity of the middle ear with the pharynx, to which it passes downwards, forwards, and inwards, for a distance of about 1½ in. It is partly osseous, but chiefly cartilaginous. Sound vibrations acting on the *tympenic membrane* and the *fenestra ovalis* cause constant changes of pressure in the middle ear, which changes are equalised by means of this tube. It is open during rest, but closed during deglutition. Permanent occlusion of this tube is one of the most common forms of deafness. See EAR.

Eustachian Valve, after Eustachio, the attachment which in the foetus directs the blood from the inferior vena cava through the foramen ovale into the left auricle. Its remains will be found attached to the right and lower margins of the opening of the inferior vena cava.

Eustachio, Bartolommeo (1520-74), It. physician and anatomist, b. Severino. His name is perpetuated in the Eustachian tube (q.v.) although he was not first to discover it. He was physician to the pope and taught anatomy in Rome. His *Tabulae Anatomicae*, unpub. until 1714, would have estab. him as one of the greatest of all anatomists had they been pub. during his lifetime. He made many discoveries in anatomy. Besides the *Tabulae*, he wrote *Opuscula Anatomica*, 1564.

Eustathius (d. c. 1193), celebrated Gk

scholar, b. Constantinople. He first became a monk and afterwards a deacon and teacher of rhetoric in his native city. In 1160 he became archbishop of Thessalonica and subsequently of Myra. E. was a man of great learning, and was deeply versed in the anc. classic authors. His commentary on Homer (1st ed. Rome, 1542-50) is his prin. work. Some letters and theological and historical treatises were first pub. by Tafel in 1832, and *De capita Thessalonica* (an account of the taking of Thessalonica by the Normans in 1185) by I. Bekker in 1842.

Eutaw Springs, near Eutawville, in S. Carolina, U.S.A. The E.S. originate at the foot of a hill, and spread into a large stream which disappears underground to appear again farther on. The last battle of the War of Independence in S. Carolina was fought here, 8 Sept. 1781.

Eutectic, name which was given by Frederick Guthrie, a scientific writer, to those mixtures in which the components are in such proportions as to solidify on cooling, after melting, at one temp. like a pure substance. This temp., which is called the E. point, is the lowest freezing temp. of any mixture of the components. E. mixtures play an important part in the constitution of alloys, the heterogeneous structure of which may be demonstrated by the uneven action of etching agents.

Euterpe: 1. The goddess of lyrical poetry represented with the double flute. See MUSES.

2. Genus of tropical Amer. spineless palms, 10 species; *E. edulis*, the Assai palm, produces an edible fruit from which a nutritious drink 'Assai' is made; *E. oleracea*, the cabbage palm, yields an edible terminal bud, and some timber.

Euthanasia, the administration of pain-relieving drugs to those who are dying. The term is also applied to the direct painless killing of human beings who are suffering from mental or physical disease that is thought to be incurable. In this latter sense E. is illegal, but has been the subject of much controversy; it is absolutely condemned by the Rom. Catholic Church, no matter what the circumstances, as a violation of the divine law. The Voluntary E. Society, founded in 1935 and backed by a number of non-Rom. Catholic doctors and clergymen, unsuccessfully promoted a bill to legalise E. The question was again debated by the House of Lords in 1950 (see Hansard (House of Lords), 28 Nov. 1950), when physicians and surgeons of the highest eminence and experience made clear their unqualified disapproval of the practice. See the address of Pope Pius XII to members of a National Congress of It. anaesthetists, delivered on 24 Feb. 1957. See also C. K. Millard, *Euthanasia, a Plea for Legislation*, 1931; H. Roberts, *Euthanasia*, 1936.

Eutheria (Gk *eu*, well, and *therion*, an animal), name given to a sub-order of mammals (q.v.) comprising all but the marsupials and monotremes, first applied by Gill in 1872. It is a synonym of Monodelphia and Placentalia.

Eutocius (c. AD 550), Gk mathematician and geometer of Ascalon, in Palestine, and pupil of the architect Isidorus. He is noted for his *Commentaries on Apollonius of Perga and Archimedes*, 4 of which are extant, including comments on Archimedes' *Treatise on the Sphere and Cylinder*. E. discusses the problem of the duplication of the cube and gives sev. solutions.

Eutropius, Flavius (d. c. AD 370), Rom. historian. He was secretary to the emperors Constantine and Julian, accompanying the latter on his Parthian expedition. He probably rose to high office in the state, possibly that of senator or consul. He wrote *Breviarium Rerum Romanorum ab urbe condita*, a concise hist. down to the death of Jovian, AD 364. The work was continued by Paul the Deacon and Landulfus Sagax, who brought it down to AD 820. See the ed. by F. Rühl (2nd ed. 1913), and that (with the continuations) by H. Droysen in *Monumenta Germaniae Hist.*, II (1879).

Eutyches, originator of the Eutychian heresy, which held that after the incarnation Christ had but *one* nature, the human nature being absorbed in the divine. The cause of E., however, was somewhat favoured at Alexandria, where St Cyril had taught an apparently similar doctrine; and owing to the influence of Dioscurus of Alexandria, a fresh council was held at Ephesus. To this period belongs Pope Leo's famous treatise on the two natures of Christ in the incarnation. E. was restored by the 'Robber Council' of Ephesus (449), but this decree was reversed at Chalcedon (451). After this, the heretic disappears from hist., and the sect became subject to penal laws.

Euwe, Max (Maasgijels) (1901-), Dutch chessmaster, b. Watergraafsmeer near Amsterdam, Netherlands. At an early age he was recognised as the best chess player in Holland, and he won the world championship by beating Alexander Alekhine (q.v.) in a match in 1935. However, he held the title for only 2 years, since he was defeated in a return match by Alekhine in 1937. By profession a teacher of mathematics, he was also a most prolific writer of books on chess and his writings have had considerable influence on modern chess theory. In style of play and in his writing he is a great apostle of methodical logic. See his *Judgement and Planning in Chess*, 1953.

Euxine, see BLACK SEA.

Evagoras, ruler of Salamis in Cyprus, c. 410-374 BC. The Athenians and Egyptians aided him in his long wars with the Persians, ending with a peace in 376 (see Xen., *Hell.* II. 1). He was assassinated, and succeeded by his son, Nicocles. An oration of Isocrates praising E. is still extant. E. II succeeded Nicocles, and was dethroned by Protagoras.

Evagrius (c. 536-94), 'Scholasticus,' of Antioch, wrote a *Church History* (from AD 431-594), a continuation of the work of Eusebius, ed. J. Bidez and L. Parmentier, 1898. He also trans. Athanasius' *Life of St Anthony* into Lat.

Evald, Johannes, see EWALD, JOHANNES.

Evander, son of Hermes, 60 years before the Trojan War led an Arcadian colony to Latium, founding Pallantium (later the Palatine Hill). He was supposed to have taught the inhab. various arts and sev. Arcadian cults, particularly that of Pan (Faunus). He was venerated as a hero on the Aventine. He is father of Pallas, and ally of Aeneas against Turnus in *Aeneid*, viii, x, xi. See H. Nettleship, *Lectures and Essays*, 1895.

Evangelical (adj. from Gk *euangelos*, good tidings, Gospel). This term was originally claimed as a right by all Protestants, in that their beliefs were derived entirely from the evangel or Bible. In the course of time, however, its use and meaning have varied greatly. The term has been especially applied to the school which insists on the utter depravity of unregenerate human nature, necessity for conversion, justification of sinners by faith, free offer of the Gospel to all mankind, and the divine inspiration, authority and sufficiency of Holy Scripture (reserving the right of individual believers to interpret scriptural passages according to their judgment). In the Anglican communion, holders of such beliefs are usually known as 'Low Church.' In Germany the word applies to the United Church as opposed to the Lutheran and Reformed Churches, but it is also sometimes assumed by the pietistic party within the Protestant Church. See CHURCH HISTORY.

Evangelical Alliance, voluntary association of Protestant Christians of various countries and denominations, first formed in London, 1846, at a conference of 821 clergymen and laymen, representing some 50 Protestant churches. The idea started in Scotland, as a protest against Popery and Puseyism (see PUSEY). Nine points were agreed upon as a basis of the A. formed by members holding 'the views commonly called evangelical.' Its aims include maintaining religious liberty throughout the world and succouring the persecuted. It held many international meetings and pub. a monthly journal, *Evangelical Christendom*. See A. Bonnet, *Lettres sur l'alliance évangélique*, 1847; A. J. Arnold, *History of the Evangelical Alliance*, 1897.

Evangelical and Reformed Church, a Protestant body based largely in Pennsylvania, Missouri, and Illinois, of Lutheran and R., Ger., Swiss, and Fr. origins. It was formed between 1934 and 1941 by the union of the E. Synod of N. America and the R. Church in the U.S.A. In 1954 it had 1900 pastors, 774,000 communicants, a Sunday-school enrolment of 515,000, and property of the value of \$266,500,000. In 1956 union with the Congregational Christian churches (see CONGREGATIONALISM) was authorised, to take effect in 1957 under the name United C. of Christ. The R. C. in America is a separate body.

Evangelical Church. This religious body of N. America was founded in E. Pennsylvania by Jacob Albright (Albrecht) in 1800. The rules of gov. and beliefs adopted were very similar to those of the

Methodists. Albright was leader of the association till his death in 1908. In 1816 the first ann. conference was called and in 1818 the present title was first adopted. In 1846, when it merged with the United Brethren in Christ to form the Evangelical United Brethren Church, it had 213,000 members in the U.S.A.

Evangelical Union, religious body (also called Morisonians) formed in Scotland, 1843, by the Rev. J. Morison of Kilmarnock and other ministers who had left the United Secession Church. They were joined by ministers from the Congregational U. who held similar views. The chief article of their faith was belief in the universality of the Saviour's atonement. They also believed in the freedom of the human will. By 1896 the Congregational Union absorbed nearly all the churches. See the *Doctrinal Declaration* of the union, 1856; F. Ferguson, *The History of the Evangelical Union*, 1876, and *The Worthies of the Evangelical Union*, 1883.

Evangelical United Brethren Church, formed by the union in 1946 of the Evangelical Church and the United Brethren in Christ (qq.v.). The total membership in 1952 was 724,000.

Evangelist (a bringer of good tidings, preacher of the Gospel), in the N.T., signifies an official of the Christian Church, whose chief duties seem to have been those of a missionary and pioneer. The E. is not permanently connected with any local field of work, or employed in the regular ministry; his work is of an itinerant rather than a local nature. Thus Philip of Caesarea and Timothy of Ephesus are called E.s. The term was also used in post-apostolic times for those who read and explained the written Gospels in public worship; but it is more often used to-day in its earlier sense and has been transferred to the writers of the 4 Gospels.

Evans, Sir Arthur John (1851-1941), archaeologist, b. Nash Mills, Hertfordshire, eldest son of Sir John E., a wealthy paper-maker and distinguished antiquary. Educ. at Harrow, Oxford, and Göttingen. Married a daughter of E. A. Freeman, the historian. He made archaeological explorations in Finland, Lapland, Balkans, and Crete. In 1884 he was appointed keeper of the Ashmolean Museum, which he entirely reorganised, leaving it in 1896 without a rival in England outside national collections. His Cretan enterprise, whereby he discovered the pre-Phoenician script, made him famous and won him academic honours all over Europe. By his discoveries through excavations at Knossos, where he built himself a villa, he carried further the work of Schliemann, proving, in his *Cretan Pictographs*, 1896, and *Further Discoveries of Cretan Script*, 1898, that the Mycenaean or Aegean culture did in fact possess a system of writing. His chronological scheme of Aegean archaeology, as set out in his *Essay on the Classification of Minoan Civilization*, 1906, has been accepted almost universally. He issued the first part of his *Scripta Minoa* in 1909. But his greatest work is his *The Palace of*

Minos, which did not begin to appear till 1921 (completed 1936). It deals with the earlier Minoan periods and is the definitive pub. of his Cretan discoveries. Other works include *Mycenaean Tree and Pillar-Cult*, 1901, *Through Bosnia*, 1875. E. also ed. and supplemented Freeman's *History of Sicily*, vol. IV, 1891. In 1914 he was elected to the Chair of the Soc. of Antiquaries. Extraordinary Prof. of Prehistoric Archaeology, Oxford Univ. President of the British Association, 1916-19. See Dr Joan Evans, *Time and Chance*, 1943, for further remarks on her father's career.

Evans, Caradoc (1878-1945), novelist, b. Pentycrey, Llandyssul, Wales. At 14 he was apprenticed to a draper, and remained in the business for 12 years. Moving to London, he took classes at the Working Men's College and turned to journalism, eventually becoming editor of *T.P.'s Weekly*. His books were mainly bitter satires on his own land and people, and his first collection of stories, *My People*, 1915, was suppressed in Wales; it was followed by *Capel Sion*, 1916, *My Neighbours*, 1919, and *Pilgrims in a Foreign Land*, 1942. His novels include *Nothing to Pay*, 1930, *This Way to Heaven*, 1933, *Wasps*, 1934, and *Morgan Bible*, 1943; he also wrote a play, *Taffy*, 1925. In 1933 he married the Countess Barcynska, an Englishwoman who wrote novels as Oliver Sandys, and she wrote his life in 1946.

Evans, Dame Edith Mary (1888-), actress, b. London. D.B.E. 1946. She made her first appearance at King's Hall, Covent Garden (1912), in *Trilussa* and *Cressida*. She has appeared in the plays of Shakespeare and Shaw and in revived Restoration drama—particularly Congreve's *The Way of the World*. Among her chief successes are *Mistress Page*, *Helena*, and *Nerissa* in Shakespeare's plays, *Millamant* in Congreve's play, *Lady Utterwood* in Shaw's *Heartbreak House*, and *Lady Bracknell* in *The Importance of Being Earnest*. Modern plays in which she has appeared include *Daphne Laureola*, *Waters of the Moon*, *The Park is Light Enough*, and *The Chalk Garden*.

Evans, Sir Edward Radcliffe Garth Russell, 1st Baron Mountevans (1881-1957), adm. and explorer, popularly known as 'Evans of the Broke'. E. was in the S.Y. *Morning*, relief ship in search of Capt. Scott's ship the *Discovery* (1902-4); was second in command of Scott's expedition to the S. Pole and succeeded Scott on his death. In the First World War he commanded a destroyer guarding the Straits of Dover and won fame in 1917 when his destroyer *Broke*, with *Swift*, defeated 6 Ger. destroyers which had crept through the fog to raid Dover. Capt. of H.M.S. *Carlisle*, 1921-3; of the battle-cruiser *Repulse*, 1926-7; rear-adm. in command of the Australian Navy, 1929-31; commander-in-chief, Africa station, 1933-1935; of the *Nore*, 1935-9. Awarded King Edward VII and King George V medals for Antarctic exploration and a score of times decorated for bravery.

London Regional Commissioner for Civil Defence, 1939-45. Created Baron Mountevans, 1945. Publications: *Keeping the Seas*, 1920, *South with Scott*, 1921, and *Adventurous Life*, 1946.

Evans, Sir George de Laey (1787-1870). gen., b. Ireland. In 1815 he fought at Waterloo. He commanded the Brit. Auxiliary Legion during the first Carlist War in Spain. He also distinguished himself at the siege of Sebastopol and the battle of Inkerman in the Crimean War, for which services he received the thanks of the House of Commons in 1855 and was created G.C.B. For many years he was M.P. for Westminster.

Evans, George Essex (1865-1909). Australian poet, b. London, son of an M.P. Educ. at schools in Wales and in Guernsey, he emigrated to Queensland in 1881 and became district registrar at Toowoomba. His first book of verse, *The Repentance of Magdalene Despar*, 1891, was followed by *Lorraine and Other Verses*, 1898, and in 1901 he won a prize of £50 for his 'Ode for Commonwealth Day.' His last vol. of verse was *The Secret Key*, 1906. His *Collected Verse* was pub. in 1928.

Evans, Marian, see ELIOT, GEORGE.

Evans, Oliver (1755-1819). Amer. inventor, b. Newport, Delaware. He invented a machine for making wire card teeth (1777) used in carding cotton and wool, and is also noted for his improved machinery for flour-mills. E. is said to have invented the first steam engine, constructed on the high-pressure system, sending his drawings and specifications to England, 1795. He also made the first steam dredging machine of U.S.A. His project of a railway between New York and Philadelphia failed through lack of funds. E. has been called the 'Watt of America.' He wrote *The Young Millwright's and Miller's Guide*, 1795. See R. Thurston, *Growth of the Steam Engine*, 1878.

Evans, Robley Dunglison (1846-1912). Amer. naval officer; appointed to the Naval Academy from Utah in 1860. He was in command of the *Iowa* at the naval battle of Santiago in the Sp.-Amer. War, and was commander of the *Yorktown* at Valparaiso in 1891, where he earned the name of 'Fighting Bob Evans.' In 1901 he was made rear-adm., and in 1902 commander of the Asiatic fleet. He became commander of the Atlantic fleet in 1905, and in 1907 commander-in-chief of that fleet on tour of the world. *A Sailor's Log*, pub. in 1891, is his work. He retired from public life in 1908.

Evans, William (1811-58), landscape painter in water-colours, is usually known as 'Evans of Bristol.' A painter of Welsh scenery, one of his finest works is 'Troth Mawr.'

Evanston, residential and industrial city in Illinois, U.S.A., adjoining Chicago on the N., seat of NW. Univ. It is the national H.Q. of the Women's Christian Temperance Union, and the world H.Q. of Rotary International. Pop. 73,600.

Evansville, city in Indiana, U.S.A., on the Ohio R. (bridged) near Illinois border.

It is the railway and commercial centre of an agric. area. Manufs. include furniture, automobiles, refrigerators, and flour. It is the seat of E. College. Pop. 128,600.

Evaporation, or Vaporisation, is the process by which a substance changes into the state of vapour. Some solids, such as snow, camphor, iodine, etc., readily disappear in the state of vapour at temps. well below their melting points (see TRIPLE POINT, SUBLIMATION). The E. of a liquid may go on at all temps., but the rate of change is greater the higher the temp., until the boiling-point (q.v.) is reached, when 'free E.' occurs. The rate at which E. takes place depends (1) on the area of the surface exposed; (2) on the freedom from vapour of the space above the liquid; and (3) on the difference between the vapour pressure and the external pressure. Thus, taking a quantity of liquid, it will evaporate most rapidly if placed (1) in a shallow vessel; (2) in a draught, so as to remove the vapour as soon as formed; and (3) if heated, or placed under an exhausted receiver, the vapour pressure being increased in the former case, and in the latter the external pressure reduced. If a quantity of liquid is placed in an evacuated vessel, some of it will evaporate until the space above the liquid is 'saturated' with the vapour; equilibrium is then maintained, or in other words, E. and condensation take place at equal rates. For every temp. there is a maximum vapour pressure, which becomes equal to atmospheric pressure at the boiling-point of the liquid. The presence of another gas or vapour, such as air, has no effect upon the magnitude of the vapour pressure, but merely increases the time taken to arrive at the state of equilibrium. A large amount of heat is absorbed in the process of E., the remaining liquid and its surroundings being cooled, sometimes to a considerable extent. Thus, by placing a dish of water under the receiver of an air-pump, together with some sulphuric acid to absorb the vapour, the water may be frozen by rapidly exhausting the receiver. Again, by directing a spray of ethyl chloride upon animal or vegetable tissue, the latter is soon frozen by the cold produced by the rapid E. of the former, use being made of this for producing local anaesthesia in the case of small operations.

Evaporation in nature.—E. is constantly taking place all over the surface of the globe, but is most rapid in tropical regions, where the hot air is able to take up a large amount of moisture from the sea, lakes, and rivers. This water-laden atmosphere, when it condenses in a cooler climate, gives up some of its moisture in the form of rain, snow, or hail, according to the surrounding temp. Thus the water on the earth is undergoing a constant cycle of E. and condensation which may be represented as follows:—

Taking the W. of Europe, E. is rapid in spring and still more so in summer, and on the other hand, from Nov. to Feb. it is almost at a standstill, due to the falling temp. and consequent moisture-laden state of the atmosphere. Measurements of the annual E. have been made at various places, the following being a selection. Interior basin of the U.S.A. in lat. 36° N., 150 in.; Cumana, S. America, 136 in.; Madras, 91 in.; Co. Cavan, Ireland, 13 in.; and over a very large area in Europe less than 20 in. It has been found that in general the ann. E. and rainfall are approximately proportional.

Commercial applications of evaporation.—E. plays an important part in most manufacturing processes, and various means have been devised to facilitate the removal of moisture from solutions and substances. Thus brine is concentrated by being made to trickle down piles of brushwood, placed in a current of air, a large surface being thereby exposed for E. The same principle is applied to the coolers used in breweries and elsewhere, a stream of water being made to trickle over the pipes containing the warm liquid. Liquids like sugar, syrups, and various extracts are evaporated in vacuum pans, in which the external pressure is reduced as far as possible by suction pumps, so that E. will proceed fairly rapidly, even at a low temp. In freezing machines of the liquid ammonia type, the low temp. is produced by the rapid E. of the liquefied ammonia under reduced pressure. See also PHYSICAL CONSTANTS. See E. Rausbrand, *Evaporating, Condensing, and Cooling Apparatus*, 1933.

Evatt, Herbert Vere (1894–), Australian lawyer and statesman, b. E. Maitland, New South Wales, member of the House of Representatives since 1940, leader of the federal parli. Labour party and leader of the Opposition since 1951. He entered politics in 1925 as a member of the legislative assembly of New South Wales, retiring in 1930 to become a judge of the high court of Australia until 1940, when he re-entered politics as member of the House of Representatives for Barton, New South Wales. E. was attorney-general and minister for external affairs 1941–9 and deputy prime minister 1946–9. He was leader of the Australian missions to Washington and London 1942–3, a member of the Australian delegation to the U.N. conference, San Francisco, 1945, president of the S. Pacific regional conference, Canberra, 1947, and chairman of the Brit. conference on the Jap. peace treaty, 1947. Of particular note was his work with the U.N.O.; he was leader of the Australian delegation to the U.N. assembly, 1946–8, and president of the assembly for session 1948–9. In 1954 E. fought the general election with lavish promises of increased social benefits, but his party failed to gain power. In 1954 when a royal commission was appointed to investigate Petrov's allegations that a Soviet spy-ring involving Australians existed in Australia (see

PETROV AFFAIR) E. represented some of those accused by Petrov. His conduct throughout the affair was highly partisan and touched off a bitter quarrel within the Australian Labour party between the Right (chiefly Catholic) and Left factions. Sev. efforts to oust E. from the party leadership, 1955–6, were unsuccessful, however, though the quarrel seriously weakened the party as a whole, and in Dec. 1955 the Labour party lost ground in the general election. While Menzies (q.v.) supported the Anglo-Fr. action in Egypt, Oct.–Nov. 1956, E. was strongly hostile to it. His pubs. include *The King and his Dominions Governors*, 1936; *Rum Rebellion*, 1938; *Australian Labour Leader*, 1940; *Australian Foreign Policy*, 1945; *Australia in World Affairs*, 1946; *The United Nations*, 1948.

Eve, wife of Adam (q.v.) from one of whose ribs Gen. ii. 21–4 says she was taken, teaching in this way the unity of the species, the natural priority of the husband in the family (cf., 1 Cor. xi. 8 f.), indissolubility of marriage (cf. Mark x. 7), and mutual love of man and wife (Eph. v. 31). The name, E., given in Gen. iii. 20, is of uncertain and probably pre-Heb. Semitic origin. The Heb. margin explains it by *Haavrah* 'Life,' and the Septuagint renders the name as 'Zoe' (so that the christian names Eva and Zoe are equivalents). E. is then described as the mother of all living, i.e. humans. E. was the first to fall, and the story of her temptation in Gen. is an accurate psychological study. The promise made in Gen. iii. 15, is the first Gospel, or prophecy of salvation in Christ, there described as the seed of the woman. E. is therefore the prototype of the Blessed Virgin Mary, as Adam is of Christ (1 Cor. xv. 45). A famous medieval hymn (Eng. Hymnal 213) makes play with the fact that Eva reversed gives us Ave, Gabriel's greeting to Mary.

Evection (Lat. *erectio*, carrying forward), a lunar inequality resulting from the oscillatory motion of the moon's apse line and also from the oscillation of the eccentricity of its orbit. The combined effect may alter the moon's long. by $\pm 1^{\circ} 17'$ with a period of 31.812 days. See LUNAR THEORY; MOON.

Evelyn, John (1620–1706), diarist, b. Wotton House, near Dorking, Surrey. He was educ. at Southover Free School, and went, in 1637, to Balliol College, Oxford, but came down in 2 years without a degree. He had some time before been admitted as a law student, and in 1640 he took up his residence in the Temple, though he never, apparently, thought of practising as a barrister. He was interested in horticulture, and improved the grounds of his father's estate at Wotton. From 1641 he travelled much on the Continent, but settled in England in 1652 at Sayes Court, Deptford, where he devoted much of his time to the lens, which he brought to a state of high perfection. He was author of a celebrated work on sylviculture, entitled *Sylva, or a Discourse of Forest-trees*, 1664.

He did, indeed, do much to improve horticulture and introduce exotics into this country. He also wrote on a wide variety of subjects, including hist., religion, architecture, law, sculpture, navigation and commerce, medals, and salads and pub. sev. trans. of Gk, Lat., and Fr. authors. After the Restoration he held many minor offices and sat on various commissions. For a while he was secretary of the Royal Society, but twice declined the presidency. A friend of many notable people, including Pepys, he was *au courant* with most of the events of the day, which were duly recorded in his famous *Diary* which he kept from 1624 to 1706, and which was discovered in 1817 in an old clothes basket and first pub. in 1818 ed. by Wm Bray. It is a mine of information about England and the Continent in his day. Later eds. are by J. Forster, 1850-2; H. B. Wheatley, 1879; A. Dobson, 1906; and (the first complete text) E. S. de Beer, 6 vols., 1954-5. See also H. Evelyn, *The History of the Evelyn Family*, 1915; Lord Ponsonby, *John Evelyn*, 1933; and bibliography by G. Keynes, 1937.

Evening Primrose, see OENOTHERA.

Evening Standard, London evening paper formed by an amalgamation in 1905 of 2 evening papers, the *Evening Standard* (founded 1827 as the *Standard*, q.v.) and the *St James's Gazette* (founded 1880). The *St James's Gazette* was from the first distinguished for its strongly literary character, and belonged rather to the category of reviews, though it was an ardent supporter of Imperialism. In 1923 the *E. S.* absorbed the *Pull Mall Gazette* (q.v.). The *E. S.* is now controlled by the Beaverbrook Foundations. The paper is notable for its political and social news and comment.

Evenki (old name Tungus), Tungus (q.v.) speaking people scattered over a vast area in Siberia, from the R. Yenisey to the Sea of Okhotsk; they numbered 38,000 in 1926. They are semi-nomadic and engage in fur trapping, fishing, and reindeer breeding. They have been known since the 14th cent., and have been subject to Russia since the 17th cent.

E. National District, formed in 1931, belongs to the Krasnoyarsk Kray (q.v.). Area 285,900 sq. m.: pop. c. 25,000, mainly Russians, about one-fifth E. It has large mineral resources (Tungus coal basin) hardly yet exploited. The cap. is Tura. See W. Kolarz, *Russia and Her Colonies*, 1952.

Everdingen, Aldert (Allart) van (1621-1675), Dutch landscape painter and engraver; studied under R. Savery and R. Molyn, surpassing both. He travelled in Norway and Sweden and excelled in sketches of rugged scenery, marine views, and storms. Among his best pictures are: 'Landscape with River,' c. 1648 (Louvre); 'Landscape with Waterfall,' 1650 (Munich); 'Wooded Slope,' 'Castle by River,' and 'Norwegian Waterfall' (Berlin Museum); 'Norwegian Landscape' (National Museum, Amsterdam); 'Storm at Sea' (Munich). His most famous

etchings are the series illustrating 'Reineke Fuchs.' Some of his original drawings are in the Brit. Museum.

Everest, Mount, or Chomolunga ('Goddess Mother of the World'), the world's highest mt., situated in the Himalaya on the frontier between E. Nepal and Tibet. The height, not yet precisely determined owing to the difficulty of determining mean sea-level under the mt., is over 29,000 ft. The conventional figure of 29,002 ft is the mean of 6 readings computed in 1852. Its name is derived from Sir George Everest, a surveyor-general of India. The 11 attempts to reach the summit have formed an epic story of human refusal to accept defeat. In 1921 a reconnaissance party was sent out from Britain by joint enterprise of the Royal Geographical Society and the Alpine Club. Operating from Tibet (Nepal refused entry), they surveyed the N. side and discovered a route up the N. ridge. In 1922 a climbing party followed this ridge to 26,700 ft, and another to 27,300 ft using oxygen. A third expedition in 1924 encountered terrible snowstorms, despite which Norton and Somervell climbed to 28,000 ft without oxygen, and Somervell alone to 28,130 ft. Mallory and Irvine then made an attempt with oxygen. They were last seen by Odell close to 28,000 ft, but were never seen again and their bodies have not been recovered. In 1933, aircraft flights of the Houston expedition were made over the summit by the Marquis of Douglas and Clydesdale and Flt. Lt. McIntyre. That same year a fourth climbing expedition from the N. enabled Wyn Harris, Wager, and Smythe to reach 28,100 ft without oxygen. The first named found Mallory's ice-axe. There were further, less successful attempts in 1935, 1936, and 1938. After the Second World War Tibet refused entry to Europeans, but in 1951 Nepal granted access to a Brit. expedition, which made a first reconnaissance from the S. of Everest's W. face. They discovered a new route up the Khumbu glacier leading to the S. col. In 1952 this route was followed by 2 Swiss expeditions, when Raymond Lambert and the Sherpa Tenzing Norgay reached 28,200 ft on the SE. ridge. The final Brit. attempt came in 1953 under the leadership of Col. John Hunt (q.v.). A distinguishing feature of this attack was the use of oxygen in bulk. On 29 May Edmund Hillary and Tenzing (qq.v.) reached the summit. See C. K. Howard-Bury, *Mount Everest, the Reconnaissance*, 1921; C. G. Bruce, *The Assault on Mount Everest*, 1922; E. F. Norton, *The Fight for Everest*, 1924; H. Rutledge, *Everest*, 1933, and *Everest—The Unfinished Adventure*, 1935 and 1936; H. W. Tilman, *Mount Everest*, 1938; *The Mountain World*, 1953 (ed. Marcel Kurz); John Hunt, *The Ascent of Everest*, 1953; W. H. Murray, *The Story of Everest*, 1953; W. Noyce South Col, 1954.

Everest (Mt) Foundation, a Trust Fund constituted by the Royal Geographical Society and the Alpine Club for exploration and research in mt regions. Limited

financial grants may be made to approved expeditions.

Everett: 1. Until 1870 part of Malden, 3 m. N. of Boston, U.S.A., now a city with important manufs., including iron and steel, coke products, chemicals, leather goods, furniture, electrical apparatus, paints, paper and wood products. Pop. 46,000.

2. Port city of Washington, U.S.A., 25 m. N. of Seattle on Puget Sound, with

bird life. Florida is sometimes called the Everglade State after this swampy dist. 'Evergreen State,' see WASHINGTON.

Evergreens, are those plants, shrubs, and trees which keep their leaves and do not shed them annually. The leaves sometimes live as long as 4 or 5 years on E. trees, but they are constantly shedding and making new ones, so that the trees are never left bare. In tropical climates certain trees that are deciduous when

a fine harbour and beautiful mt scenery, many lumber mills, iron works, and factories and salmon canneries. Pop. 33,849.

Evergem, small tn in the prov. of E. Flanders, Belgium, 4 m. N. of Ghent. It manufs. lace, linen and cotton goods, starch, and soap. Pop. 10,700.

Everglades, swampy subtropical region of S. Florida, U.S.A. It is 100 m. long and 50-75 m. wide, and consists of saw-grass, savannah, and water dotted by is. 'hammocks' with clumps of trees. It is frequented by numerous alligators, and has a rich variety of flora and animal and

grown in temperate regions are E.; as an example of this the *Robinia pseudacacia*, popularly known as acacia, may be quoted. All conifers except the larch are E., and many shrubs and creepers, e.g. box, laurel, ivy, are cultivated because they do not shed their leaves in autumn. See FORESTRY, TREE.

Everlasting Flowers are flowers which retain their form and colour for a long time after they have been picked and dried. A few genera of the order Compositae are among the best known, and sev. are cultivated in gardens for decorative purposes; they are often dyed bright

colours, and some are bleached white. *Antennaria dioica*, mt everlasting, or cat's foot, is the only Brit. species growing wild, but *Anaphalis margaritacea* is naturalised in S. Wales, Scotland, and the Channel Is. In gardens, *Ammobium alatum*, *Helichrysum*, *Helipterum*, *Waitzia*, and *Xeranthemum*, all provide flowers which, if gathered freshly opened, and hung to dry, heads down, keep well for up to 3 years. The Statice or Sea Lavender grown for drying is *Limonium*. See IMMORTELLES.

EVERLASTING FLOWERS: STATICE

Eversley, vil. of NE. Hampshire, England. There is in the neighbourhood a fine old Jacobean residence, Bramshill House, which was built for the son of James I and is now a civil police college. Charles Kingsley (q.v.), the novelist, was rector of E. from 1844 until his death in 1875 and is buried in the churchyard. He founded the vil. school in 1853.

Evertsen, Dutch naval family which produced sev. distinguished officers, of whom 5 were brothers. Two of them were killed in action, viz. Vice-Adm. Cornelius in 1666 in the second battle off the N. Foreland; and Adm. Jan, in the same year in 'St James's Fight.' Cornelius, the son of Jan, attained the rank of vice-adm. and died in 1679. No fewer than 9 members of the E. family fell in action at sea.

Everyman, title of a popular morality play of the 15th cent. The characters are E., God, Death, Good Deeds, Knowledge, Beauty, Strength, and other abstractions. E. is summoned by Death, and all his friends forsake him; except Good Deeds. See A. C. Cawley (ed.), *Everyman and Medieval Miracle Plays*, 1956.

Everyman's Library, a comprehensive L. of the representative works of all time, initiated in 1906 and pub. at a popular price by Joseph Malaby Dent (q.v.) of the firm of J. M. Dent & Sons, Ltd., London, and imported into the U.S.A. and pub. there by E. P. Dutton & Co., Inc., New York. The name was suggested by Ernest Rhys, the general

editor (q.v.), whose cue was the line in the old morality play, 'Everyman, I will go with thee, and be thy guide.' It was the founder's intention that the L. should eventually reach the grand total of 1000 vols. and would constitute a cultural treasure house which would be within the reach of Everyman. Owing to conditions and events (including 2 world wars) outside the control of the publishers the numerical peak was not attained until 1956, the year of the L.'s golden jubilee. From its very beginning this bold enterprise was rewarded with widespread popularity, and the following are a few details of how it gradually took shape over the years.

As might be expected in a popular series, fiction began early to estab. its claims, with Lytton, Scott, Kingsley, George Eliot, Charles Reade, Trollope, Defoe, Fenimore Cooper, Marryat, and Dickens, and it is interesting to note that the first Brit. author to win a complete representation was Jane Austen (Nos. 21-5). By this time Tennyson and Browning were in the poetry section, Aeschylus, Euripides, and Plato were there to represent the classics in their formal sense, and Pepys, Gilbert White, and Benvenuto Cellini laid the foundations of the autobiographical form that was to become so popular in modern publishing. The second 100 was remarkable for some courageous publishing ventures, involving considerable risks at that time—a 3-vol. set of Shakespeare of nearly 1,000 pages per vol., a batch of no less than 21 long 'Waverley' novels, Grote's *History of Greece*, in 12 vols., Thierry's *Norman Conquest* in 2, Addison's *Spectator* in 4 long vols., and St Augustine of Hippo's *Confessions*. Herman Melville, then practically unknown in this country, was introduced to Brit. readers with *Moby Dick* and *Typee* and has gained ground ever since; Melville was only one among many Amer. authors including Emerson, Hawthorne, Washington Irving, and Oliver Wendell Holmes, whose claims were staked by John Macrae on behalf of Duttons, the New York publishers of the L. The third 100 was also notable for some large-scale ventures—15 more Dickens novels with the famous G. K. C. Introductions, especially hazardous because of their great length but none the less an extremely successful experiment, and a strong representation of Ruskin in no less than 13 vols., with the added complication of illustrations, a venture which does not seem to be so important now as it did then, although Ruskin still has his devoted admirers. Two famous books which have gained rather than lost in prestige and popularity since those days are to be found in this group—*Wuthering Heights* and *Vanity Fair*. Amongst them, too, are *Jane Eyre* and the well-beloved *Vicar of Wakefield*, *Little Women* and *Good Wives* (together in 1 vol.), de Quincey's *Opium Eater* and Bunyan's *Pilgrim's Progress*. From this point to the half-way mark the international

character of the L. began to make itself more apparent and the list is sprinkled with such great names as Dante, Cervantes, Goethe, Victor Hugo, Dumas, Daudet, Ibsen, Montaigne, Balzac—a European invasion which was to pave the way for the Russian heavyweights to follow. The classical foundation already laid was reinforced by Homer and Virgil.

The second lap of the marathon, numbers 501–1000, opened in 1911 with Dostoevsky's *Crime and Punishment*, the first to represent the Tolstol-Dostoevsky-Turgenev triumvirate. The Russian steam-roller did not, however, in any way succeed in crushing such hardy European individualists as Rousseau, Pascal, Boccaccio, Rabelais, and Flaubert, an extra-insular cultural stream which culminated in the pub. of Manzoni's masterly lt. novel *The Betrothed*, number 999 in the series. Some new experiments were made, including the artistically risky but commercially sound one of including a number of near-contemporary celebrities such as R. L. Stevenson, Samuel Butler, Oscar Wilde, John Galsworthy, Joseph Conrad, D. H. Lawrence, G. K. Chesterton, Hilaire Belloc, H. G. Wells, W. H. Hudson, Richard Jefferies, Arnold Bennett, Somerset Maugham, and J. B. Priestley. E. L. serves to throw a most interesting light on the changes that have taken place in the standards of 'immortality' during the 50 years of its growth. Some of the great Victorian novelists are no longer so solidly estab. as they at one time appeared to be and the materialist philosophers have wobbled on their pedestals. Poetry and plays are more popular than essays and belles-lettres, and standard histories, as distinct from biographies, have lost ground—evidently hist. needs rewriting for each generation. With this evidence of the fickleness of fame in mind it was natural that when the time came to select the thousandth vol. editorial policy should favour a work whose claim to permanence none could deny. Inevitably there were few such candidates at that stage, but there was one book which is recognised throughout the world as of basic importance in the hist. of civilisation, especially of Christian culture, and which had not hitherto been included because of its intrinsic textual difficulties, Aristotle's *Metaphysics*. After consultation with Sir David Ross, the leading contemporary Aristotelian, it was decided to attempt a new translation and re-arrangement of the text that would render it easily comprehensible to the E. reader. The editing and translating were entrusted to the classical and philosophical scholar, John Warrington, whose version made its first appearance in March 1956.

Previously incorporated in the L., but later an independent offshoot in an appropriately more generous format, is E. Reference L., which forms a valuable companion to the great range of the main series, and provides the reader with an equipment which will aid him in its interpretation and use. The aim of

this offshoot, which started with the enlarged 12-vol. *Everyman's Encyclopaedia*, now reissued in this present (4th) ed., was to offer a reliable set of reference books covering all that anyone except a specialist was likely to require. Two of the vols., both newly compiled by D. C. Browning, supply an ideal background to the literary side of E.: the *Dictionary of Quotations and Proverbs*, already a well estab. favourite, serves both as a guide to literature and as a fascinating study in its own right, and the *Dictionary of Shakespeare Quotations*, a book similarly planned and devoted exclusively to the greatest of Eng. writers because of the unique place he holds in world literature. The Gk and Rom. classics are exhaustively covered in the *Smaller Classical Dictionary* and the *Atlas of Ancient and Classical Geography*, and a parallel vol., the *Dictionary of Non-classical Mythology*, elucidates the background of Eastern, Egyptian, Celtic, and Norse legend. Hist. generally is summarised for reference purposes in the *Dictionary of Dates*. Eric Blom's *Dictionary of Music* is devoted to the most international of all the arts, and the practical aspects of the writer's and reader's requirements are catered for by *Everyman's English Dictionary* and Roget's *Thesaurus*, the latter essentially a 'dictionary in reverse,' a word finder and an idea finder which has proved its value to 3 generations of writers.

E. L. is a dynamic, not a static, creation—a wood of a thousand trees rather than a cemetery of a thousand monuments. Its success necessitated the estab. In 1906 of Dents' factory, the Temple Press (later the Aldine Press) at Letchworth, Hertfordshire, the firm's City promises at that time being no longer large enough to cope with the immense requirements of the L. Binding at Letchworth began at the end of 1906, and 2 years later the factory was enlarged by the installation of a printing plant. To-day almost all the vols. are bound at Letchworth and most of them are also printed there. By the end of 1956, the 'golden jubilee' year of E. L., the total sales, including the reference L., were nearly 50,000,000 copies.

Eves, Reginald (1876–1941), painter, b. London, studied art under Legros, Frederick Brown, and Henry Tonks at the Slade School. In 1899 his picture 'Waiting' was accepted for the Royal Academy. E. became a regular exhibitor at the Royal Academy, Royal Society of Portrait Painters, the Salon, and elsewhere, specialising in portraiture. The National Portrait Gallery acquired his 'Thomas Hardy' in 1931. Other portraits in the same gallery are those of Shackleton and Jellicoe and, in the Tate Gallery, are portraits of Sir Frank Benson and Sir Max Beerholm. Among his portraits of women are those of the Queen of Spain and Miss Julia Nelson. If he lacked charm of colour, he had a fine feeling for character.

Evesham, municipal bor. and mkt tn of Worcestershire, England. It is situated

on the r. b. of the Avon, on the fringe of the Cotswolds, 15 m. S.E. of Worcester. The extreme fertility of the soil renders the neighbourhood most suitable for market gardening, which is the chief industry. There is a fine bridge over the riv., here navigable, also a library, technical college, hospital, etc. In a battle fought here in 1265, by which Henry III. regained the throne and the barons were crushed for a time, the prince of Wales defeated Simon de Montfort, earl of Leicester. E. is noted for its abbey founded in 701, a magnificent detached belfry (q.v.), built in the 16th cent., 110 ft high, and containing a clock with chiming and 12 bells, which still remain, also a mutilated gateway of the 12th cent., a fine arch, and the abbot's stables. Pop. 12,066 (1954).

Eviction, in law, means the ejection of a person from possession of lands or tenements. E. may be total or partial, an instance of the latter being where some other person sets up a claim to a right of way or other easement over the land. Entry by a landlord to view the state of repair, or to effect alterations, is not E. or trespass if the tenant agreed to allow the landlord to enter for such purposes. To maintain an action for damages for E. physical expulsion need not be proved, any act tending to prejudice the quiet enjoyment or comfort of the tenant being an E. or *constructive E.* The remedy for E. is generally an action of damages for breach of a covenant (q.v.) for quiet enjoyment, and an action of ejection to recover the land (*see ENTRY*); but when there is no contractual relationship between the tenant and the person evicting him, an action of damages for trespass would be the appropriate remedy, and if the evictor acted without colour of right, the tenant would recover heavy damages. In the case of a house protected under the Rent Restriction Acts, the Courts require satisfaction on sev. essential points before they will grant an E. order. *See also RECOVERY OF LAND.*

Evidence. Legal E. denotes the means by which facts are ascertained for judicial purposes. It is a branch of the law of procedure, but there exists no general or codifying Act, and indeed it is probably undesirable that judicial discretion in the matter of reception of E. should be so fettered. Sir James Fitzjames Stephen was employed in 1872 to draw a code for England, but the code drawn never passed into law, although its model, drafted by the same judge, subsequently became the Indian Evidence Act of 1872. The whole of our law of E. as it exists now is a system of restriction upon the admission of testimony, and, based as it is upon the formal rules of inductive logic, reveals a strong tendency to narrow the freedom which formerly characterised, especially in state trials, the conduct of judicial proceedings. The bulk of the rules of E. is negative in character. That part of the law of E. which relates to *relevancy* of facts as distinct from *mode of proof* of a fact deemed to be relevant is dominated by 4

primary rules of exclusion, or rules which (subject to certain important exceptions) exclude the admission as E. of facts which outside legal circles might well be regarded as affording excellent testimony. These rules include the following 4 classes of facts: (1) Facts similar to, but not specially connected with, each other; e.g. if the issue is whether A forged B's signature to a cheque, the fact that he forged C's signature on some former occasion is irrelevant. But if there is a question whether an act was done intentionally or accidentally by A, the fact, if so, that such an act formed part of a systematic course of conduct would be relevant; e.g. if A is suing on a policy of fire insurance, the fact that he had sustained fires in other houses insured by him would be relevant to the issue, whether the fire was accidental or not. (2) The fact that a person not called as a witness has asserted the existence of any fact. This is the fundamental principle which is more popularly expressed in the maxim that hearsay is no E. The most striking exceptions to this rule are afforded by the various rules of convenience which allow of the admission of statements by deceased persons (as to which *see DECLARATIONS OF DECEASED PERSONS*), and statements which amount to admissions. Admissions may be E. against a party to an action when made on his behalf by any person who has a substantial interest in the event of the proceedings, or who is an agent expressly or impliedly authorised by that party to make such admissions. But admissions made 'without prejudice' can under no circumstances be adduced in E. The rule against hearsay renders irrelevant statements in books or documents not made by parties to the proceedings or their authorised agents. Exceptions to this rule excluding documentary E. include, *inter alia*, entries in public records, official books, or registers; recitals of public facts in statutes and proclamations, and statements in works of hist. Final judgments, orders or decrees of any court are always E. as against all persons of all facts stated or decided by such judgments, etc., or upon which they are based, but not of facts which may only be inferred as probable from their existence. (3) The fact that any person is of opinion that a fact exists. Fact, not opinion, is what a witness is in general required to state. But the opinions of experts on points of science or art are admissible in E., subject to the judge's decision on their competence as experts. As a matter of law judges have full power on all technical matters to call in the aid of judicial assessors, but except in Admiralty cases they seldom avail themselves of their statutory powers. (4) The fact that any person's character is such as to render conduct imputed to him probable or improbable. E. of character may, however, be given in criminal trials in certain circumstances stated in the Criminal Evidence Act, 1898. That Act allows the prosecution to give E. of a prisoner's bad character if the prisoner has himself or by his counsel given E. to

establish his own good character, or has at the trial cast imputation on that of the prosecutor or witnesses for the prosecution. E. of previous convictions may be given before the verdict (a) if proof of such former offences is admissible on other grounds, e.g. as showing a systematic course of conduct (see above); (b) to rebut E. of good character.

E. is said to be either oral or documentary. Documentary or written E. consists of records, documents under seal, such as charters and deeds, and writings not under seal. Bentham used the term real E. to denote such E. as was neither oral nor documentary in the above special sense; but E. which is not oral is generally classified, even if unscientifically, as documentary. Acts of Parliament are records of the highest nature, from their quality as the memorials of legislation; but a distinction is made with respect to E. between public and private statutes. A public statute requires no proof in courts of justice; but private Acts must be proved by copies compared with the original roll of Parliament. Records of the proceedings of courts of justice are proved by exemplifications, sworn copies, and office copies. Exemplifications are transcripts of the records of different courts, accredited by having the seals of such courts attached to them. Sworn copies are transcripts made by individuals who authenticate them upon oath when they are produced in E. Office copies are copies certified to be true and accurate by an officer expressly entrusted with that business. The reception of various certificates, official and public documents, is regulated by various statutes, especially the Evidence Act, 1845. Charters and deeds are proved by the production of the instrument and proof of the execution by the party to be charged with it; but where the document is more than 30 years old the execution need not be proved. The general rule is that the original deed must be produced. Deeds attested must, in general, be proved by one at least of the attesting witnesses; but if the witnesses be dead, or cannot be found, the execution may be proved by proof of the handwriting of the party. The method adopted to prove handwriting in general is to secure the testimony of some person acquainted with the handwriting of the individual in question, or who has seen him write, or who has had written correspondence with him; but otherwise the testimony of persons skilled in calligraphy as 'experts' is wholly ex-

Evidence Act, 1898, both the accused and the husband or the wife of the accused are competent witnesses; but the principle that the accused is not compelled to incriminate himself is preserved by the provision that such witnesses are not compelled to give E. except that the wife or husband of accused may be called either for the prosecution or the defence, and without the consent of the accused, if he (or she) is charged with any offence under the Vagrancy Act, 1824 (neglect to maintain wife and family), Offences against the Person Act, 1861 (relating to rape, indecent assault, and the like offences), the Married Women's Property Act, 1882 (offences by a married man or woman against the other spouse's property), and the Criminal Law Amendment Act, 1885 (sexual offences). E. must be given on oath unless the witness objects to being sworn, upon the ground that he has no religious beliefs, when he may instead solemnly affirm in the Scottish fashion. Children of tender years who do not understand the nature of an oath may give E. without being sworn if the judge thinks the child sufficiently intelligent to give E. and to understand the moral obligation of speaking the truth.

The only change for many years in the principles of the law of E. is that introduced by the Evidence Act, 1938, which admits documentary E. in civil proceedings in order to establish facts on which direct oral E. would be admissible. But such E. is only admitted where the maker of the documentary statement either had personal knowledge of the matters therein dealt with or, if he had not, the document is part of a continuous record and he made the statement in the performance of a duty to record information supplied to him by a person who might reasonably be supposed to have personal knowledge of the matters recorded. But in either case the maker of the statement must be called as a witness. The court may, in order to avoid undue expense or delay, admit such a statement in E. notwithstanding that the maker of it is available but is not called, and in these circumstances the court may accept a certified copy of the original document. But nothing in the Act will render admissible as E. any statement made by a person interested at a time when the proceedings were pending or anticipated. It is for the court to decide what weight is to be attached to such statement, regard being had to the question whether the statement was or was not made contemporaneously with the occurrence or existence of the facts stated, and to the question whether or not the maker had any incentive to conceal or misrepresent the facts. See Stephen, *Digest of the Law of Evidence*, 1876; Taylor, *The Law of Evidence*, 1920; S. L. Hipson, *Law of Evidence*, 9th ed. 1952; G. D. Nokes, *An Introduction to Evidence*, 2nd ed. 1956.

Evil has no positive existence. It is the privation of good, rather than the mere absence of it, e.g. it is a physical E. for a man to be blind, since it is

Practically all persons are competent to give E. at the present day. Formerly plaintiffs and defendants were not allowed to give E. on the ground that they were interested parties, the result being that probably the best possible E. was excluded. Where the judge decides that any witness is too young or mentally infirm to testify, the witness is incompetent to give E. In certain cases witnesses may claim a privilege (see CONFIDENTIALITY IN LAW). Since the passing of the Criminal

natural for him to see, and it is a spiritual E. for a man to refuse to do what he knows to be good. The existence of E. is one of the everlasting problems both of theology and philosophy—how to account for it, and what to infer from it; and in accordance with the significance attached to it, philosophy inclines to an optimistic or pessimistic view of the world, or, further, an attempt to compromise between the two. The last theory would explain E. as warring against the triumph of good, and is thus of a dualistic character. J. S. Mill, in his *Essays on Religion*, regards this as a plausible explanation of the mixture of good and E. in the world. The difficulty of explaining E. is theological rather than scientific, it being often stated that for science there is no E. in the universe. The teachings of Freud (q.v.) and the psychoanalysts on the origin of the 'sense of guilt' are of interest in this connection, but the recent tendency of scientific thought is to recognise its limitations, and to leave moral questions to the theologians.

Evil Eye, the belief that certain people possess the power of injuring, bewitching, and even killing by a glance from the eye. Children and young people are supposed to be particularly susceptible, and any unexpected calamity befalling a child may be accounted for by its having been 'overlooked.' The glance of a person suffering from any physical calamity, such as a cast in the eye or a squint, is regarded as particularly dangerous. The power is supposed to be involuntary in many cases and not cultivated with evil intent. Few of the old classic writers fail to refer to it, and the wearing of amulets or charms against it was universal. Envy was supposed by many to be the impulse of the E. E., and it was therefore looked upon as unfortunate to have one's possessions praised unduly, the prosperous in particular having reason to fear it. The E. E. may affect animals as well as children. It is still a common belief in Africa and the East.

Evil-Merodach, Awel, or Amel-Marduk ('man of Marduk'), king of Babylon (562-560 BC), son and successor of Nebuchadnezzar. He released Jehoiachin, king of Judah, from prison in the 37th year of his captivity (see 2 Kings xxv. 27). He was killed in a rebellion led by his brother-in-law, Neriglissar (Nergalsharezzer), who seized the crown in his stead. Herodotus (q.v.) (3rd cent. BC) speaks of him as an arbitrary and unwise ruler.

Evoll, see EBOLI.

Evolute, see CURVES.

Evolution (Lat. *evolutio*, an unrolling), literally, the process of opening out or unfolding what is wrapped up. In biology it encompasses the process by which primordial life has developed by successive stages into the multiplicity of animal and plant life, extinct and existing, and implies that the potential for this development existed in that primordial life. Herbert Spencer's definition is as follows: 'Evolution is an integration of matter and concomitant dissipation of motion; during

which the matter passes from an indefinite, incoherent homogeneity to a definite, coherent heterogeneity, and during which the retained motion undergoes a parallel transformation' (*First Principles*, pt. II, chap. xvii). The theory of E., first started by C. Bonnet in 1762, is the hypothesis that the germ, instead of being brought into existence by the process of fecundation, is developed from a pre-existing form which contains the rudiments of all parts of the future organism. This theory (also called the theory of preformation) is directly opposed to that of 'epigenesis.' This latter view, which originated with Aristotle, was supported in the 18th cent. by C. F. Wolff, who believed that development came about through a series of new formations and transformations, and 'epigenesis' entirely superseded the old evolutionist theories of Bonnet, until they were revived in a more refined form in the 'germplasm' theory of Weismann. It is shown that the ovum cannot be entirely undifferentiated, as parts of the adult organism may be traced back to corresponding parts in the embryo. E., however, in this sense is only a branch of embryology (q.v.). The word is more generally applied to the development of matter from its simple unorganised condition—or even from the electron-systems called atoms from which matter itself evolved—to the present structure of the physical universe. This is called Inorganic E. and its main direction is towards the 'degradation of energy, for in every transformation of Inorganic matter some energy is wasted. Living matter is a more complex form of inorganic matter, and the living may be said to have originated from the non-living. Setting aside the possibility of spontaneous generation, substances gradually assumed the properties of living matter through the medium of colloidal compounds of carbon which form the proteid common only to plant and animal life. Organic E. traces the development of simple unicellular forms called the Protista to more complex multicellular forms, from aquatic forms to terrestrial, from invertebrates to vertebrates, and from mammals to man (see BIOLOGY).

The theory of E. is especially associated with the name of Charles Darwin (see DARWINISM), but it had been foreshadowed by Aristotle among the Greeks, and by Linnaeus and Buffon, Erasmus Darwin, and Lamarck in the 18th and 19th cents. A group of Catholic Darwinists also appeal to St Augustine's teaching of 'rationes seminales.' The evidence for organic E. lies in the study of fossils (palaeontology), the similarities in development and in structure of certain animals (and plants), and in the facts of their geographical distribution; there is also direct evidence from general chemical relationship in higher animals.

In the sphere of idealist-philosophy Hegel developed the moral and abstract element of his philosophy of spirit in correlation with the idea of E. Apart from the fact of E., various theories as to its

method have been propounded—the theory of inheritance of acquired characters by Lamarck and that of natural selection by Darwin and Russel Wallace. In addition, there is the theory of orthogenesis that evolutionary change follows definite and predetermined directions, and also Cope's theory of kinogenesis or 'mechanical genesis.' In so far as orthogenesis E. tends towards the development of the 'highest' type, it has not been a straight ladderlike process, but one of slow experiment and frustration, as is shown by the study of palaeontology. In fact, E. does not show any tendency to produce a high type, only a number of types, and it is only in relation to the peculiar position of the conscious Mind of man that orthogenesis in the sense of evolving 'upwards' can be applied strictly. We must assume, however, that something of the same nature as Mind is inherent in all living organisms, but in the course of E. new properties arise. Such E. Bergson calls 'creative,' and Lloyd-Morgan 'emergent.' It must be borne in mind that E. as a theory cannot adequately explain the cause of such emergences; it only professes to show their relation to preceding and succeeding emergences. Before the emergence of Mind in man, E. was operated by the blind purpose of adapting types to their environment and of insuring the survival of those best adapted, but with the beginning of what is called the 'psychozoic period' Mind became dominant, and, with Mind, values, and subsequently ethical values, came into being. Man is the agent of a self-conscious E. which, as Thomas Huxley points out in *Evolution and Ethics*, is at variance with the non-moral cosmic process from which he himself has evolved. We may hold, however, that a self-conscious ethical E. will be the central fact of future development. Whereas before Mind the direction of E. was decided by environment, Mind enables man to control this and, in the words of L. T. Hobhouse, 'to grasp the conditions of his development that he may master and make use of them in his further growth.' In connection with purpose in E. we may recall T. H. Huxley's definition of a species: 'In most cases a species can be regarded as a geographically definable group, whose members actually interbreed or are potentially capable of interbreeding in nature, which in nature does not interbreed freely or with full fertility with related groups, and is distinguished from them by constant morphological differences.' Huxley, therefore, gets rid of the idea of purpose from the universe but believes in 'biological progress.' He detects no purpose in past E.: 'The purpose manifested in evolution, whether in adaptation, specialisation, or biological progress, is only an apparent purpose. It is just as much a product of blind forces as is the falling of a stone to earth or the ebb and flow of tides. It is we who have read purpose into evolution, as earlier men projected will and emotion into inorganic phenomena like a storm or earthquake. If we wish to work towards a

purpose for the future of man, we must formulate that purpose ourselves. Purposes in life are made, not found.' Commenting on these statements, Julian Huxley says: 'But then if it be admitted that, through the mechanism of natural selection, there is purpose in the universe, can we resolve the difficulty offered by apparent examples of fiendish purpose, by the thought that we, with our high level of consciousness, may be reading into the lower levels feelings which do not there exist? Or must we appeal, with the theologians, to a fundamental falling away of the universe from its destined purpose—in short, to Original Sin?' (See Julian Huxley, *Evolution: The Modern Synthesis*, 1942.) See also ANTHROPOLOGY; BIOLOGY; DARWINISM; MAN. The method of E. has long ago superseded the *a priori* in the writing of hist.; one of the most brilliant expositions of the method in this sphere was the work *Ancient Law* by H. S. Maine, 1861.

Évora: 1. Dist. of S. central Portugal, in Alto Alentejo prov. (q.v.). It is bounded on the E. by the R. Guadiana (q.v.) and Spain. There are cork-oak forests, and cereals, olives, and vines are produced. Area 2853 sq. m.; pop. 219,650.

2. (anc. *Liberalitas Julias*; *Ebora*) City of Portugal, cap. of the dist. of E. and of the prov. of Alto Alentejo, 70 m. ESE. of Lisbon (q.v.). It became a bishopric in the 4th cent., and was an important trading tn under the Moors. In the 15th and 16th cents. it was a seat of the Portuguese court. From the 16th to the 18th cents. it had a Jesuit univ. E. is surrounded by anc. walls, and has picturesque streets and squares. Its 12th-cent. archiepiscopal cathedral has a fine Gothic cloister. The aqueduct and the ruined temple of Diana probably date from the 2nd or 3rd cents. The city is a market centre for the Alentejo lowland, and has manufs. of cotton, hats, and metal goods. Pop. 25,400.

Évremond, Saint-, Charles Marguetel de Saint-Denis (1613-1703), Fr. writer, b. at Saint-Denis in Normandy, and educ. at Clermont, Caen, and later at the Collège d'Harcourt in Paris. He afterwards entered the army, and fought with distinction in the Thirty Years War, seeing much service in the Netherlands. He had to flee, however, in 1661, first to

Holland and thence to England, where he received a cordial welcome from Charles II and became the chief figure of the salon of the duchess of Mazarin in London. His fame as a Fr. writer and wit is notably illustrated in his *Conversation avec le Père Canaye*, and *Lettre sur la Paix des Pyrénées*; his writings include political essays (*Réflexions sur les divers génies du peuple romain*, 1663), literary criticism (*De la tragédie ancienne et moderne*, 1672, and *Sur les poèmes des anciens*, 1685), sev. comedies, and the charming letters to Ninon de Lenclose. Although he lived for the best part of 40 years in England, he never learned Eng. and was unacquainted with Shakespeare. He was buried in Westminster Abbey. A *Choix d'Oeuvres* was ed. by R. de Planhol, 3 vols., 1927. See M. Wilmette, *Saint-Evremond, critique littéraire*, 1921; A. M. Schmidt, *Saint-Evremond, ou l'humaniste impur*, 1932.

Evreux (anc. *Civitas Eburowicum*), Fr. tn, cap. of the dept of Eure, on the R. Iton. The cathedral, parts of which date from the 12th cent., has notable 13th cent.-16th cent. stained-glass windows. There are Rom. remains near by, including an aqueduct, palace, and theatre. E. manufs. millinery, and has engineering and chemical industries. The tn was greatly damaged in the Second World War. Pop. 20,400.

Ewald, Heinrich Georg August (1803-1875), famous Ger. Orientalist and biblical critic, b. at Göttingen. He was prof. of philosophy and Oriental languages at Göttingen, 1827-37; prof. of theology at Tübingen, 1838-48; and again at Göttingen, 1848-67. He lost his position for a time for political reasons, in 1837 and 1867. His first book on *Genesis* appeared in 1823. E.'s greatest work was *Geschichte des Volkes Israel bis Christus*, 1843-59, trans. into Eng. 1867-86. Other works are *Kritische Grammatik der hebräischen Sprache*, 1827, *Die Poetischen Bücher des alten Bundes*, 1835-9, *Die Propheten des alten Bundes*, 1840, *Die Altertümer des Volkes Israel*, 1848, *Die Lehre der Bibel von Gott*, 1871-6. Many of his works have been trans. into Eng. See T. W. Davies, *Heinrich Ewald*, 1903.

Ewald, Johannes (1743-81), Dan. poet, b. Copenhagen, son of a pastor. In 1764 he wrote an allegorical poem entitled *Lykkens Tempel*, which was well received, but his lyrical power is best shown in the biblical drama, *Adam og Eva*, 1769, and in the lyrics *Til Sjaelen* and *Til min Moltke*. His most beautiful work, the opera *Fiskerne*, was written in 1778, containing a song called 'Kong Christian stod ved højen Mast', which has become the national song of Denmark. E. is among the greatest of Dan. lyrical poets. See K. Flor, *J. Ewald*, 1943; S. Thomsen, *J. Ewald, En Digters Livshistorie*, 1943.

Ewart, James Cossar (1851-1934), zoologist, educ. at Penicuik and Edinburgh. He became prof. of natural hist. at Aberdeen in 1878, and regius prof. of natural hist. at Edinburgh Univ., 1882. He started the marine biology station near

Aberdeen in 1879, and became a member of the Fishery Board for Scotland in 1882. His works include: *The Locomotor System of the Echinoderms* (with Romanes), 1881, *On the Preservation of Fish*, 1887, *Guide to Zebras, Hybrids, etc.*, 1900, *On a Pre-Jurassic Hybrid*, 1907, *The Development of the Horse*, 1915, *Moulting of the King Penguin*, 1917, *The Nesting Feathers of the Mallard*, 1921.

Ewart, William (1798-1869), politician, educ. at Eton and Christ Church, Oxford. He first entered Parliament in 1828 and was a prominent Radical and free trader. He was largely responsible for the passing of the act limiting capital punishment, 1837, and in 1850 carried a Bill establishing public libraries. Wm Ewart Gladstone (q.v.) was named after E.

Ewe, group of negro people in Togoland, W. Africa, incorporated with Ghana following a plebiscite in 1956 when 93,000 voted for incorporation and 67,000 against. The E. tribe is spread over parts of Fr. Togoland. Their culture is similar to the Ashanti. They are a pagan people.

Ewell, Richard Stoddert (Stoddard) (1817-72), Amer. soldier on the Confederate side in the Civil war. He graduated at West Point in 1840. In the Mexican war (1847) he was present at Contreras (q.v.) and Churubusco (q.v.). He helped to suppress the outbreak of the Apache Indians in 1857, and resigning his commission on the outbreak of the Civil war, 1861, served under 'Stonewall' Jackson. E. commanded a div. near Richmond (1862) and a corps of Lee's army at Gettysburg (1863). He was badly wounded at the battle of Bull Run (1861), and at Warrenton Turnpike. He was also present at Winchester, the Wilderness, and Spotsylvania Courthouse (1864). Captured by Sheridan at Sailor's Creek, near Appomattox R., in 1865, he lived in retirement after the war. See P. G. Hamlin, *Old Bald Head*, 1940.

Ewing, Sir James Alfred (1855-1935), civil engineer, b. Dundee; in 1881 he pointed out the phenomenon of *hysteresis*, or the lagging of magnetic effects behind their causes. He was prof. of mechanical engineering at the Imperial Univ., Tokyo, 1878-83; at Univ. College, Dundee, 1883-1890; at Cambridge Univ., 1890-1903 (Rede lecturer there, 1904). He was director of naval education, 1903-16; a member of the Ordnance Research Board, 1906-8. During the First World War he was in charge of the cipher dept of the Admiralty. He was awarded the Albert medal, 1929. His pubs. include: *Treatise on Earthquake Measurement*, 1883, *Magnetic Induction in Iron and other Metals*, 1891, *The Steam Engine and other Heat Engines*, 1894, *The Strength of Materials*, 1899, *The Mechanical Production of Cold*, 1908, *Thermodynamics for Engineers*, 1920, *The Physicist in Engineering Practice*, 1923.

Ewing, Juliana Horatia Orr (1841-85), writer for young people, b. Ecclesfield, Yorks, daughter of Margaret Gatty, to whose pub., *Aunt Judy's Magazine*, she largely contributed. She married Major E. in 1867, and to this may be attributed

her interest in soldiers, as exemplified in many of her tales. Amongst her delightful stories of child-life may be mentioned: *Mrs Overthway*, 1869, *The Brownies and Other Tales*, 1870, *A Flat Iron for a Parthing*, 1872, *Jan of the Windmill*, 1876, *Old Fashioned Fairy Tales*, 1882, *Jackanapes*, 1883, *Snapdragon and Old Father Christmas*, 1888, and *Verses for Children*, 1888. See life by H. K. F. Eden (her sister), 1886; also C. Maxwell, *Mrs Gatty and Mrs Ewing*, 1949.

Ex Cathedra. The pope speaks *ex cathedra* when in virtue of his office he defines a doctrine concerning faith and morals; hence the phrase has come to be used for any authoritative and official announcement.

Ex Libris, see BOOKPLATES.

Examination, in evidence, denotes the interrogation upon oath of witnesses. E.-in-chief means the interrogation of one's own witnesses; cross-E., that of the opposing witnesses; and re-E., that of one's own witnesses after they have been cross-examined. In E.-in-chief counsel is not entitled to put leading questions, that is to say, questions which suggest the answer expected. In cross-E. there is no such limitation, or, indeed, any other limitation than that imposed by the discretion of counsel himself or the presiding judge. Questions in re-E.s can only be put upon matters arising out of the cross-E.; the object of re-E. is to rehabilitate a witness whose testimony has been shaken in cross-E., but leading questions may not be put any more than in E.-in-chief. On application to a judge in chambers, leave may be obtained to examine witnesses abroad, by the process called taking evidence on commission. See also EVIDENCE.

Examinations. Educational E. as now held have evolved from those of the medieval univs. Since univs. were then guilds of learned men whose craft was teaching, E. were designed to ascertain fitness to teach. An admitted aspirant for fellowship of a guild was recognised as a bachelor. After some experience of teaching and further tests a successful aspirant was known as a doctor, master or prof. Among the earliest univ. tests of which we know details were those held at Bologna in the 13th and 14th cents. They consisted of private *viva voce* E. and public 'conventus' or delivery of a speech and maintenance of a thesis against opponents. The same principle obtained in the more complicated system in vogue at Paris. The public defence of a thesis is still part of the practice in some European univs. So too is the conferment of a mastership, M.A., as the 1st degree. This also prevails in Scotland. But in Oxford and Cambridge the Bachelorship grew to be the determining test. Mastership, carrying with it the full privileges of membership of the Senate, follows the B.A. without further examination after a specified period of time after matriculation (q.v.) (31 terms or 7 years at Oxford). Written E. were introduced at Oxford and Cambridge during the 18th cent.; practical tests in subjects like medicine

and science were later innovations. In practically all countries which have been influenced by Eng. developments the Bachelor's degree is the first and in many ways the most important. At Oxford the stages are: Responsions or 'Smalls,' Moderations, and Finals (Pass and Honours); at Cambridge they are the Previous E. of 'Little-Go' and the Tripos E. in 2 parts. London Univ., which was at first simply an examining body, grants internal and external degrees. For many years the stages were: Matriculation, Intermediate, and Final E. for the Bachelor's degree. Now, as in the civic univs., entrance is granted on the candidates' results in the General Certificate of Education. This examination superseded (1951) the School and Higher School Certificate E. Papers are set at 2 levels, the Ordinary and Advanced. All subjects are optional and there are no group requirements. Univs., and in some cases faculties, lay down entrance requirements. The E. are conducted by approved examining bodies (there are 8 of these run by various univs.). These E. have become widely recognised by professional bodies for the purpose of exempting candidates from entrance and other E. In a general way success in them is regarded as the criterion of the satisfactory completion of a secondary school course. There are, however, other examining bodies which are more concerned with technical and professional education (see TECHNICAL EDUCATION; COMMERCIAL EDUCATION; and EDUCATION). Professional organisations have their own E., exemptions from parts of which may be granted to holders of degrees. Appointments to some branches of the Civil Service are made on the basis of competitive E. The question of the actual value of E. is a vexed one. At the moment the same E. can be used for sev. different purposes. It might be used to judge what a candidate has learned from his course; it might be used to predict future academic success; or it might be used as a basis for predicting subsequent professional achievement. The conditions under which E. are taken often militate against their discovering what the examiners wish to know. They are often used in fact as occupational or educational selective devices. See C. Valentine, *The Reliability of Examinations*, 1932; P. Hartog and E. Rhodes, *Examination of Exams*, 1935; *The Construction and Use of Examinations*, ed. by H. Hawkes, 1936; Ministry of Education Circular 168, April 1948; Reports of the Secondary Schools Examinations Council.

Examinations (U.S.A.). The re-organisation of the secondary schools during the 19th cent. in America forced educators to revise their views on E. The Common school made it almost impossible to organise promotions from one grade to the next on the basis of examination success. In time the grades became age groups and graduation from High School a recognition that the course had been completed successfully without necessarily the pass-

ing of a severe leaving exam. This created problems for the colleges and univs. The older univs. retain their own entrance tests but many state institutions accept students who have graduated from accredited high schools. Consequently the univ. pop. has increased enormously. Since entrance tests are not rigorous there is a good deal of wastage throughout the course, and students frequently move from stronger to weaker institutions during the course of their studies. Selection is much more rigorous at the Ph.D. level. Here the E. are of the type usual in England. Essay type papers are set on course work; in addition a thesis is required. At the Bachelor and lower levels many of the E. are of the objective test type. These have been developed for a great variety of specific purposes. On the whole they are used to predict future success rather than to discover what a student has learned during a course. If carefully worked out they can form the basis of very accurate predictive instruments of professional competence and further academic success. The very large numbers of students that attend all types of educational institution have to some extent forced on to educators the use of these tests. They are quickly marked and the human element which necessarily enters into the marking of many essay type examination papers is entirely removed.

Examiner of Stage Plays, see CENSORSHIP OF THE DRAMA.

Exanthema (Gk 'eruption'), any disease characterised by a skin eruption. In practice the term is applied to those infectious fevers which are accompanied by a skin rash.

Exarch, (Gk *exarchos*) signifies chief person, or leader. In the Rom. empire the viceroy of the Byzantine emperor in Italy bore this title, and it has been conferred at different times on governors and chief officers, both in secular and eccles. matters. In the Christian Church E. was originally a title of the bishops, but afterwards came to be applied to a primate only. The spiritual head of the modern Bulgarian Church bears the title of E.

Excalibur, the mystic sword of the legendary King Arthur, which, according to the promise of Merlin, he received from the Lady of the Lake. At his death it was hurled into the lake by Sir Bedivere, where it was received by a hand which rose from the waters.

Excambion, in Scots law, the term applied to the exchange of heritable subjects.

Excavation, in engineering, is an open cutting in the ground. The machines used are called excavators. They are sometimes known as 'steam navvies,' and combine the properties of a digger and a crane. The kind that generally comes into operation first looks like an ordinary steam crane, save that it is mounted on wheels and rails. It is fitted with an iron scoop with a heavy handle to which a second chain is fastened. The machine that is used to widen the cutting made by

the above is stationed on a temporary line of rails a few ft from the edge of the cutting. The jib of the machine is lowered until the row of scoops cut into the earth; they then scrape up the side of the bank and passing over the excavator empty themselves into waggons beyond. The machine and the waggons are moved along together. Another class of excavator is the 'ladder excavator'; this comprises a ladder pivoted at the upper end which can be raised or dropped at the lower end to any required angle. The ladder is constructed of 2 channel irons braced together, a trolley running in the middle and forming the back of the bucket. The resistance of the excavated material is met directly by a chain which is attached to the bucket. A small independent engine controls the movements of the ladder. The operation of filling, emptying, and lowering a bucket of half a cub. yd capacity takes about 40 sec. The first type of excavator is capable of more varieties of work, but the second is more powerful. The most economic method of working is for double track roads for waggons to be cut on the flank, a central gullet having first been cut for the machine's own passage. These machines are a modification of the dredgers (q.v.) used for dock works, etc.; in America they are called 'dredgers,' as are the other variety, a practice which is confusing. 'Grabs' are sometimes called 'excavators,' but this use is deceptive as grabs can work both in water and on land, and the term 'excavator' is properly applied only to land machines. See W. Barnes, *Excavating Machinery*, 1928; K. Park, *Principles of Modern Excavation Equipment*, 1942.

Excellency, title of honour, once borne in Great Britain by the viceroy of India and the lord-lieutenant of Ireland, and now by the governors of colonies, and ambas.

Excentric, see ECCENTRIC.

Excess Profits Duty, a tax varying from 40 to 80 per cent imposed in 1915 on P. exceeding by £200 or more those made before 1914, the standard by which the E. P. were measured being the average of P. of any 2 of the 3 years preceding the war. Exemption was allowed to farmers and to persons engaged in certain professions and employments. Though successful in producing revenue, the tax was not economic, as it encouraged wasteful expenditure by the taxpaying firm or company. It was abolished in 1921. See PROFITS TAX; EXCESS PROFITS TAX; EXCESS PROFITS LEVY.

Excess Profits Levy was introduced in the 1952 budget as a temporary measure. It imposed a tax of 30 per cent on the amount by which P. made from 1 Jan. 1952 exceeded the standard P. of a trade or business or company (not partnerships or individuals). The L. was abolished from 31 Dec. 1953. The standard was based on the period 1946 to 1951; there were sev. alternatives and a minimum of £5000. The yield for the financial year 1954-5 was £77 million, and

for 1955-6 £18 million. See EXCESS PROFITS DUTY; EXCESS PROFITS TAX; PROFITS TAX.

Excess Profits Tax was charged by the Finance Act (No. 2) 1939 as a T. to deal with all P. arising out of the war, and operated from 1 April 1939 to 31 Dec. 1946. It applied to all trades and businesses carried on in the U.K., but not professions. The T. was charged upon the amount by which the P. exceeded the standard P. The rate was 60 per cent up to 1 April 1940, 100 per cent from then until 31 Dec. 1945, and 60 per cent thereafter. A refund of 20 per cent for the period where the T. was 100 per cent was made after the war. These refunds were subject to income T. and had to be used for developing or re-equipping the trade or business (Finance Act (No. 2) 1945). National Defence Contribution (later Profits Tax, q.v.) was chargeable instead of E. P. T. if it exceeded the latter in amount. The average yield for the financial years 1941-2 to 1945-6 was £394 million. The net refunds made for the financial years 1945-6 to 1954-5 were £276 million. See PROFITS TAX; EXCESS PROFITS DUTY; EXCESS PROFITS LEVY.

Exchange (Fr. *changer*; It. *cangiare*, *cambiare*, *cambire*, to barter or exchange), term applied to many transactions and to the circumstances connected with them, all of which have, however, the basal idea of the giving of one thing—material, labour, or rights—for another. The *Exchange of Lands*, in law, is a mutual or reciprocal grant of equal interests in land, the one in consideration of the other, as a grant of a fee simple in return for a fee simple. Facilities for E. by parties under disability or tenants for life are now provided under the Inclosure Acts and the Settled Land Acts. In eccles. procedure, the *Exchange of Livings* is conditioned by the consent of the bishops and patrons of both the benefices concerned. It is effected by resignation, and no monetary compensation for inequality in the value of the livings may be offered or accepted. *Exchange in Commerce* is used in various senses of the giving or receiving of money or of one currency in return for an equivalent sum in another currency (see EXCHANGE, FOREIGN); the giving or receiving of money in one place for a bill providing the payment of an equivalent sum in another place; the rate at which this documentary transfer of money may be made, etc. The *Exchange* is applied to the assemblage or merchants, bankers, and brokers for the transaction of business in commodities, stocks, bonds, bills, etc., and also to the place in which they meet for such purpose, e.g. the Royal E. in London, the Bourse in Paris, and the Stock E. in New York. A *Deed of Exchange* is a legal document recording the transfer of lands, etc., and is provided for by the Real Property Act of 1845.

Exchange, Bill of, see BILL.

Exchange, Foreign, term applied to the exchange of one currency for another in order to settle the indebtedness arising out of trade between countries. (F. currency

itself is often referred to as 'foreign exchange'.)

The basic theory of exchange is that only the balance of the transactions shall be liquidated, by a transfer of credit or gold. F. E. is at its simplest when 'at par,' i.e. when a sum of currency in one country is able to buy a bill for a sum of currency in another country, the 2 sums being equivalent to the same amount of bullion of a given standard. The discharge of international liabilities may be performed in 3 ways: (1) By remitting bullion or cash in coin. This method is little used owing to the cost of transport and insurance. (2) By remitting international securities, i.e. certain well-known gov. bonds and other securities or stocks and shares. This method is also expensive since brokerage charges have to be added to the cost, and the margin between the buying and selling price is also a loss. (3) By remitting bills of exchange. This is the cheapest and easiest method of F. E. and the most common. These bills need not be drawn upon the country to which they are remitted, e.g. it may be most profitable to effect a remittance from London to Paris by means of an Amsterdam bill drawn upon Paris. The principle upon which this business is transacted may be roughly illustrated thus: A, a merchant in London, has to make a remittance to Paris to a merchant B. B, in order to save A the risk and expense of transmitting cash, draws a bill for the amount due upon him. B sells this bill to C, another Paris merchant, who sends it in place of cash to settle his account with D in England. At the expiry of the time the bill has to run, D takes it to A, and receives cash in exchange for it, while the possession of the bill marks A's discharge from B's debt. The bills are commonly drawn at 3 months' date.

F.E. and the market price of bills of exchange are affected by 2 main causes, the relative indebtedness of the 2 countries involved, and the rate of discount ruling in each. If one country is considerably in debt to the other, the price of bills upon the creditor rises in the debtor's market owing to the competition of merchants who are trying to buy bills to remit, while in the creditor's market the absence of demand for bills upon the debtor tends to lower their price. The second factor is really the value or price of money in the 2 countries, since a high rate of interest in one country will tend to make foreign merchants buy bills upon it, and the increasing demand again leads to an increase in price.

The First World War played havoc with the ratio of F. E. The natural flow of trade and consequently of bills of exchange between the nations was severely impeded, and in the case of the enemy countries stopped altogether. The inflation of the currencies of Germany and Austria by means of the printing press explains why the currencies of these countries had for some time not even an external nominal value. When the new Reichsbank was formed in Germany, it

called in all its previous circulation and converted it into Reichsmarks at the rate of 1 trillion marks for 1 Reichsmark.

F. E. was also much disturbed in the decades following the First World War by the abnormal influence of huge indemnity and war debt payments and by attempts to secure transitory commercial advantages through deliberate currency depreciation. In Britain the machinery of the Exchange Equalisation Fund, which was estab. in 1932, contributed to the removal of difficulties caused by rapid fluctuations of E. But towards the end of 1938 the fund, having sustained heavy losses of gold in defence of the currency, had to be strengthened by increasing the Bank of England's fiduciary issue to a record issue, a sum of £200 million of gold, valued at the old parity price of 85s. per fine oz. (equivalent to £350 million at the then current price), being transferred to the Fund from the issue dept of the Bank.

On the outbreak of the Second World War in 1939, the gold reserve of the Bank of England was transferred to the Exchange Equalisation Fund (or Account) as part of the general plan for strengthening the country's financial resources abroad. U.K. residents holding U.S.A. dollar securities were required to register their holdings with the Bank of England, and thereafter the Brit. Gov. gradually acquired all Brit. holdings of U.S.A. railroad and industrial dollar securities at fixed sterling prices, the purpose being to conserve all the dollar exchange possible for financing war purchases in the U.S.A.

The Exchange Control Act, 1947, purported to put in legislative form the obligation which rested on Britain, as a result of the series of agreements with the U.S.A. associated with Bretton Woods (q.v.) and the Amer. loan to Britain of 1946, to free current exchange business from control while at the same time maintaining a necessary restraint upon movements of capital.

The pound was periodically weak, and in 1949, to stop a serious run on the reserves, it was devalued by 30 per cent in terms of dollars. Then improvements in exports strengthened the demand for sterling. In 1954 it was almost possible to abandon exchange controls over imports, overseas investments, etc., and make sterling freely convertible into other currencies. But in 1955-6 the position deteriorated again, the reserves shrank, and convertibility seemed as far off as ever. See STABILISATION; METROLOGY.

Exchange Rates, see METROLOGY.

Exchequer (Norman-Fr. *eschequier*). The name of the king's court of revenue is taken from the fact that in early times the accounts were reckoned upon a chequered cloth, resembling a large chess-board, round which the officers sat. The Eng. and Fr. words are allied to the Lat. root *scac*, which appears in *scacum*, a chess-board, and *scaccarium*, the Court of E., and also the chequered cloth used there. It appears that the sums of money received by the treasurer were scored upon the squares of this cloth with

counters, the process being suggestive of a game of chess. The name only began to be used about the time of Henry I, and previous to the use of the chequered cloth as an aid to calculation business was transacted by means of 'tallies,' or notched sticks.

Exchequer, Chancellor of the, head of the Treasury Dept, being one of the most important members of the cabinet in the Brit. Gov. He must be a member of the House of Commons, and acts as the first finance minister of the crown, having the duties of preparing the ann. budget, i.e. the estimates of revenue and expenditure, imposing or removing taxes in order to meet deficit or surplus, and, in general, managing all matters relating to public money. He is also responsible for co-ordinating economic policy. The office of C. of E. may be held by the prime minister, if the latter is a member of the House of Commons, and the combined office has been held by Wm Pitt (1804-6), George Canning (1827), Sir Robert Peel (1834-5), and Wm Ewart Gladstone (1873-4 and 1880-2). The chancellor was originally an under-treasurer, who checked the proceedings of the lord high treasurer. He also had important judicial functions, sitting on the 'equity side' of the Court of Exchequer. These disappeared in the 18th cent., the last C. of the E. who sat as a judge being Sir Robert Walpole, who gave a decision in this capacity in 1735.

Exchequer Bills, see BILL OF EXCHEQUER.

Exchequer Bonds, see PUBLIC DEBT.

Exchequer Court, former court dealing with common law and revenue cases. These functions are now performed respectively by the Queen's Bench and Chancery Divs. of the high C.

Exchequer (Ale) Gallon, see METROLOGY.

Excise Duties, imposed on home-produced commodities and services, usually of stable consumption, so that the estimated revenue can be relied upon. Sometimes levied on certain commodities as a countervailing tax to a customs duty on imported goods of the same nature. If an article is manuf. both at home and abroad, a customs duty tends to exclude the foreign article from the home market; an E. duty, by taxing the home product as well, makes it as large a source of revenue as possible. All licences come under the heading of E., excepting those for motor vehicles. E. D. were first imposed by the Long Parliament in 1643 to raise funds for the Civil war against Charles I, and were levied on wine, beer, tobacco, and other articles. But the term is Dutch, and the procedure medieval. A similar parl. project had failed in 1626. The leading events in the hist. of E. D. are: (1) Walpole's abortive E. Bill of 1733 to check frauds in the customs revenue from tobacco and to found a bonded warehouse system—a plan successfully revived during the ministry of Wm Pitt the Younger; (2) the Parnell Commission of E. Enquiry in 1833-9; (3) the amalgamation in 1909 of customs and E.; and (4) the

advent of entertainments tax in 1916. The 4 pillars of Brit. E. policy are alcoholic liquors, tobacco, motoring, and entertainment. Tea, coffee, matches, and playing cards are also significant. Specific D., despite their regressive tendency, are usually preferred to *ad valorem* D. since more easily predictable, and mass-consumption goods are favoured because they are less sensitive than others to rises in price. See also CUSTOMS DUTIES. See F. W. Hirst, *Gladstone as Financier and Economist*, 1931; G. F. Shirras and L. Rostas, *The Burden of British Taxation*, 1942; and Ann. Reports of Commissioners of H.M. Customs and Excise.

Excise (Wine) Gallon, see METROLOGY.

Excitants, see STIMULANTS.

Excclave, see ENCLAVE.

Exclusion Bill (1679-80), measure brought forward by Shaftesbury to prevent the duke of York (afterwards James II) from coming to the throne, owing to his adherence to the Rom. Catholic faith. It was 3 times passed by the Commons, but on each occasion Charles II dissolved parliament.

Excommunication (Lat. *ex*, out of, from; *communio*, communion), exclusion by formal sentence of offenders from the rights and privileges of the religious community to which they belong. The hist. of the practice of E. may be traced through pagan analogies, Heb. customs, primitive Christian practice, medieval and monastic usage, and modern survivals in existing Christian Churches. That the Christian Church has always laid claim to the powers of E. is shown by such early writers as Irenaeus, Cyprian, Basil, Ambrose, etc., who give proof of the existence of 2 degrees of E.; the first involving exclusion from the participation in eucharistic service, and the second involving 'exclusion from all church privileges.' The former was the usual punishment for light offences, the latter the penalty for graver scandals. The necessity for Church discipline did not cease to be recognised at the Reformation; though its administration would seem to have passed through a period of some confusion. In some cases, the old episcopal power passed into the hands of the civil magistrate, in others it was conceded to the presbyterial courts. In the Anglican Church the right of excommunication is in the hands of the bishops, though it is never exercised. In contemporary Eng. Free Churches the purity of the Church is commonly secured by the removal of persons unsuitable for membership by a vote of the responsible authority. In the Rom. Church E. is either *ferendae sententiae*, when the intervention of judicial process is required to attach it to a given person; or *latae sententiae*, when a crime carries E. with it automatically. An excommunicated person may be *tolerandus*, who is cut off from the spiritual benefits of the Church only; or *non tolerandus*, with whom the faithful may not associate in any way at all. E. in certain cases is reserved in varying degrees of strictness to the Holy See. See the *Codex Iuris Canonici*.

Excretions, eliminatory products of such organs as the skin (q.v.), kidneys (q.v.), intestines (q.v.), etc., viz. sweat, urine, faeces, etc. See also RESPIRATION.

Exe, riv. of England, which rises in Exmoor. It flows through the coe. of Somerset and Devon in a southerly direction, its chief tribs. being the Barle, Loman, Batham, Culm, and Creedy. Its course of 54 m. is through beautifully wooded and picturesque country. The tns on its course are Dulverton, Tiverton, Exeter, Exmouth, etc. Its estuary is navigable for 8 m., but although it is a m. in width, the estuary does not take large vessels because of the shallow waters. A canal connects it with Exeter.

Execution, enforcement of judgments and other proceedings analogous to judgments of courts of law in civil actions. The term denotes the process by which a party is put into possession of that to which the judgment declares him to be entitled. It is generally effected by a writ directed to the sheriff or other proper officer, commanding him to seize goods or take other compulsory proceedings to carry out the judgment. In the simplest form of judgment the defendant is ordered to pay the judgment creditor *forthwith*, and the latter may at once proceed to E. Under a writ of *fi. fa.*, which is the most ordinary form of E., the sheriff is directed to 'cause to be made' (*ferri facias*) out of the goods and chattels of the debtor the sum recovered by the judgment, together with interest at 4 per cent, and to bring the sum into court for payment to the judgment creditor. Armed with this writ the sheriff may enter the premises of the debtor and seize what property of the debtor he can find, with the exception of wearing apparel and bedding, and tools and implements of trade to the maximum value of £5. He may then sell the goods seized, including leases of land, but not freehold estates of inheritance, for these latter go to the heir of the debtor. Where goods seized are claimed by a 3rd person the sheriff must take out an interpleader summons upon which an issue to try the title to the goods will be directed. (For the application of a writ of *elegit* to enforce E. against the debtor's lands, see ELEGIT.) In many cases the ordinary processes of the common law will not avail to enforce a judgment, e.g. against a share of the proceeds of land to be, but not yet, sold, or against rents. In such cases the court may at its discretion appoint a receiver by way of what is called equitable E. Another mode of equitable E. is to obtain a charging order against a partnership interest; E. against debts owing to the judgment debtor is enforced by process of attachment of the debts (see GARNISHEE). Other writs of E. are of *attachment* (q.v.), of *possession*, to put the plaintiff into possession of land recovered in an action, and of *delivery*, to enable the plaintiff to get possession of property other than land or money. E. is also used to denote the giving effect to the sentence of a court of criminal jurisdiction, and in this sense usually means the E. of sentence of death.

(see CAPITAL PUNISHMENT). For the meaning of E. in relation to deeds and wills, see DEED; WILL.

Executive. In every sovereign political society, or state, there must exist some person, group of persons, or body independent of all external control, with power to maintain the independence of the state against aggression from without and to preserve order within. Such person or body is known as the E. Non-sovereign political societies may also possess an E., but in all such cases, as e.g. in the case of colonies and protectorates, that E. acts under the active or latent control of the E. of some other state or suzerain power. E. powers are to be distinguished from legislative, although both may be vested in one person or group of persons. The function of a legislature is to make laws, but the functions of the E. are (1) to give those laws legal effect, and to enforce them where necessary, and (2) to determine the policy of the state in its foreign relations. In the case of an absolute and despotic monarchy all the executive powers reside in one person, who may or may not be assisted by a council of chosen advisers. In a limited constitutional monarchy, the E. power resides collectively in the crown and its responsible ministers or cabinet (see CABINET and CROWN). In federal states the E. powers reside in some central body composed of representatives of the various federated bodies. In the Brit. Crown Colonies a nominated governor or governor and council wield the E. powers (see COLONIAL LAW; CROWN COLONIES).

It is to be observed that the interdependence of the legislature and E. of those representative govs. of the present day which possess what may be termed a 'parliamentary executive' is such that the E., far from being distinct from the legislature, is, in reality, chosen from among the members of the latter, and not only appointed but dismissed by the elective portion of the legislature. In the case of those representative govs. where the E. power is in an emperor and his ministers, or a president and his cabinet, the E. is appointed by the legislature, and is therefore a 'non-parliamentary E.' Under the constitutions of Britain, Belgium, Italy, and the Fr. Rep. there exist parl. E.s, while examples of non-parl. E.s are to be found in the U.S.A. and the pre-1939 Ger. empire. For an exposition of the various prerogatives of the E. in England, see CROWN; and for the relationship between the E. and parliament, see CABINET. See also CONSTITUTION.

Executor. The person or persons to whom another person commits by his last will the carrying out of his testamentary wishes is or are his E. or E.s. An E. can only be appointed by will or by codicil; but he need not be termed an E. in the will if it can be inferred from the powers and duties vested in him by the testator that he is to be E. It is usual to appoint 2 E.s, although 1 is sufficient; any number up to and including 4 may be appointed. An E. may be a legatee: thus

a child or wife to whom the whole or a portion of the estate is left may be appointed sole E., or 1 of 2 E.s. If an E. has not been appointed in the will, or if the E. be dead, or does not wish to act, the residuary legatee nearest of kin to the deceased, or a legatee, is entitled to act and administer the will. A person appointed E. may accept or refuse office, but he will be taken to have accepted if he performs acts of authority over the estate or property from which it may reasonably be implied that he means to accept, and similarly his refusal may be implied from his abstaining from intermeddling in the administration. The authority of an E. dates from the moment of the testator's death. The will is the only source of his title to act, but probate of the will is the only evidence of that title. Before probate an E. may validly perform any of his executorial functions, such as receiving debts or paying legacies, but he can maintain no action at law until he takes out probate. Where there are sev. E.s they are not bound to act jointly, and most executorial acts are valid even if done by 1 E. separately. The duties of an E. are to bury the deceased in a fitting manner, but without incurring unreasonable expense; then he should prove the will and take out administration. The other duties are, within a convenient time after the testator's death, to collect the goods comprised in the estate, make an inventory of the personalty, advertise for creditors and debtors, and deal with the personal effects as directed by the will. He has a year in which to pay or transfer the legacies; but if the solvency of the estate is beyond question, he should pay or transfer them before the end of the year, and may be sued if he does not do so. At the end of his year he must submit an account of his dealings to the proper authorities. These dealings will, in general, be the payment of debts and legacies in the order laid down by the rules of equity.

Since the Land Transfer Act, 1897, real property also vests, in the first instance, in the E.s or other personal representatives of the deceased, whether the deceased *d.* intestate or not; and an E. may sell the real estate if necessary for the purpose of paying debts, but where not required for debts the E. must transfer the real estate to the devisee, or, if not devised, to the next of kin. An E. should be careful not to mix the moneys belonging to the estate with his own, as he may be charged interest on it. Interest is charged on all moneys received by an E. and not properly applied, or which have been allowed by him to lie idle. If a stranger, i.e. one not constituted E. by the will, assumes the functions of an E. by intermeddling in the administration, he is called in law an *E. de son tort*, i.e. an E. of his own wrong. Such acts of intermeddling do not include the burial of the deceased, or the preservation of the goods, or payment of funeral expenses, or other acts which may appropriately be termed acts of salvage or charity. An *E. de son*

tort is liable for such assets as come into his hands, and may be sued as if he were the rightful E. There is no remuneration allowed to an E. save as expressly provided by the will; but in Canada the E. is allowed 5 per cent commission on the money passing through his hands.

Exeutory. In the Eng. law of real property an E. interest is a future estate or title to land, which is said to arise of its own strength when the contingency on which it rests is fulfilled, and to put an end to prior estates or interest; e.g. in an ordinary marriage settlement of land, the settlor, a day or two before the marriage, conveys land to trustees to hold for him until the marriage takes place, and after that to such other uses or trusts as may have been agreed upon between the spouses or their parents. In the law of contract, an E. consideration (q.v.) means a future as opposed to a present consideration or a promise as opposed to an act.

Exedra, in architecture, an open recess, such as a niche containing a seat, and usually curved in plan.

Exegesis, exposition, explanation, or interpretation of the Holy Scriptures. Hermeneutics is the term frequently used for the discovery of the meaning of the Bible, but E. is distinguished from it as covering the exposition and application of Holy Scripture to faith and conduct.

In a general sense, however, the term is now applied to the science and art of the elucidation of Scripture. E. includes both the study of the text and its doctrinal bearing, with the conclusions to be drawn from it. E. requires a wide and accurate learning as well as intellectual and spiritual intuition.

The 2 main currents of E. are the literal and allegorical. The tendency to seek an underlying sense in writings of venerable age regarded as authentic and weighty, if not inspired, gave rise to the allegorical method, which, as it gives full scope for the penetration of original minds, is much more popular than the literal method. The 19th-cent. exegetes were the first to establish a satisfactory critical attitude by insisting on the human as well as the divine element in the Scriptures. The Jewish E. of the O.T. is seen in the Talmud (q.v.). Hellenist Jews used allegorical interpretation to reconcile the Heb. traditions and Gk philosophical thought. Philo was the greatest master of this art, and he discovered a twofold teaching in the Pentateuch—the verbal and the figurative. The Alexandrian school adopted this system, and its influences show themselves, though to a lesser extent, in the writings of Hippolytus and Augustine. As opposed to these, the Antiochene school, represented by Theodorus, Lucian, Diodorus, and Chrysostom, aimed at a grammatical and historical criticism, which at times, however, degenerated into an unspiritual and bare interpretation. Exegetical work was practically at a standstill during the Middle Ages; but Nicolas de Lyra (1270–1346) made a transition to the modern

period in his *Postillae*, emphasising the literal sense; and the humanists, headed by Erasmus, began serious and systematic philological investigations. Modern exegetes are too numerous to mention. See E. Hatch, *Hibbert Lectures*, 1888; and A. Cave, *Introduction to Theology*, 1896. For fullest and latest information, see also *The Cambridge Bible for Schools and Colleges*; the *International Critical Commentary*; and *A Catholic Commentary on Holy Scriptures*, 1953.

Exelmans, Remy Joseph Isidore, Comte (1775–1852), marshal of France, who fought under Murat in the Sp. campaign, during which he was taken prisoner and sent to England. He escaped in 1811 and joined Napoleon's army in Russia in 1812, being made a gen. of div. for his bravery. He was exiled from France at the fall of Napoleon, but was allowed to return in 1823.

Exemplum, or **Exemplar** (Lat. 'example'), in medieval religious literature, signifies a short tale used for a didactic purpose, an illustrative story akin to a fable (q.v.).

Exequatur, in international law, the document issued by the state to which a consul is accredited, confirming his appointment. This appointment has, of course, previously been made by commission or patent issued by the consul's own state. The foreign state is at liberty to decline an E., or to withdraw it when issued.

Exeter: 1. City, a co. of itself, administrative cap. of Devon, England, at the head of the estuary of the R. Exe, 9 m. from the S. coast of Devon, and 172 m. from London, an episcopal see, and the seat of E. Univ. (q.v.). As a mercantile and residential centre, holiday resort, and minor port at the conjunction of many roads and of the W. and S. Regions of Brit. Railways, it retains much of its ancient dignity as the metropolis of the SW. peninsula, formerly the Brit. kingdom of Dumnonia. Its origin has not been estab. Inconclusive evidence suggested that a tn may have existed here in the 3rd cent. bc. That 'Isca of the Dumnonii' was well estab. by AD 55 has been proved by excavation. Sixty years later it was known to Ptolemy the geographer in distant Alexandria and continuous habitation from his day to ours is a dominant feature of the city's story. St Boniface, the apostle of Germany and a native of Crediton, received his early education in an Exeter monastery about AD 690, by which time the Saxon incursions had extended to this dist. For 2 centuries the Britons and Saxons shared the city, jointly defending it against the Danes in 877 and 894. In 928 Athelstan met the Witans here and expelled the remaining Britons. In 1003 the place was sacked by Sweyn. At the Norman Conquest, E. was already an ancient city with prescriptive privileges, among which Domesday notices an exemption from geld save when London, Winchester, and York, the other regional caps. of the country, might be taxed. The tn of those days,

enclosed by a wall of mixed Rom., Saxon, and medieval workmanship (now attenuated, but still continuous save where the 4 main gates have been demolished within the last 150 years), covered a polygonal area of one half by one third m., upon a 170-ft hill E. of the riv. In 1067, with Harold's kin as its guests, E. defied the Conqueror, but submitted after a siege of 18 days. Within the highest N.E. angle of the town wall, Wm then raised the strong motte-and-bailey castle of Rougemont, so named from its red masonry and earth, noticed by Shakespeare in *Richard III*, act iv., scene ii. The earliest allusions to municipal gov. here recall Rom.

THE GUILDHALL, EXETER

and Saxon administration: it is not until about 1200 that a mayor is noticed. The extant city charters commence with a confirmation by Henry II of customary rights enjoyed under his grandfather, Henry I, together with the privileges of the Londoners. Other grants were received from 22 sovereigns or princes between Richard I and George III. Henry VII, in token of his gratitude for firm resistance to Perkin Warbeck, gave the State Sword and Cap of Maintenance which are still borne before the mayor. Henry VIII, in 1537, made E. a co. incorporate, independent of Devonshire, with liberty to elect its own sheriff. In 1549 it withstood the Prayer-Book Rebels. In 1643 it was occupied by Prince Maurice for King Charles. In 1646 it surrendered to Fairfax. Wm III spent 11 days here after his landing at Brixham in 1688.

The Guildhall, home of the ancient City Court, is documented from 1160 and believed to be the oldest municipal building in the country. Rebuilt in 1330 and 1468-70, the date of the fine timber roof, it has a famous Elizabethan portico with an upper chamber athwart the pavement and contains much good woodwork, portraits, including two by Lely (q.v.) of Princess Henrietta ('Madame'), b. here in 1644, and of George Monk, duke of Albemarle, whose maternal grandfather was thrice mayor; the city regalia and silver ware. At a little distance the handsome 15th-cent. Hall of the Tuckers commemorates E.'s woollen trade and her many corporate guilds. The cathedral church of St Peter, around whose foundations exist remains of the Rom. baths and Saxon conventual buildings, springs from a monastic church estab. by Athelstan in 932 and rebuilt by Canute in 1017. The see was removed hither from Crediton in 1050, when Edward the Confessor and his queen personally enthroned Leofric as 1st bishop of Exeter. As now seen, the noble structure is most remarkable for its massive transeptal towers of 1112-33, which leave unbroken the lofty vault over nave, choir, and sanctuary, 100 yds long from E. to W.; for its unique 14th-cent. organ-screen, fine minstrels' gallery, episcopal throne, tombs of the medieval bishops, and sculptured W. screen. In 1942 a Ger. bomb destroyed the Chapel of St James in the S. choir aisle, besides doing other grave damage to the cathedral and adjacent palace. The Benedictine Priory of St Nicholas, in the Mint, contains good 13th-cent. work.

Intensive bombing on 4 May 1942 destroyed 9 and damaged 22 churches; destroyed 1800 and damaged 17,000 other buildings. Three devastated areas deface the city centre, with other damage dispersed over a wide area. The Probate Registry perished with all its contents, as did Bampfylde House, Norman House, Chevalier House and the medieval Hall of the Vicars Choral. The City Library was gutted by fire. Much damage was done to Southernhay, Queen's Crescent, and York Road, and also to St Sidwell's Church, most of the banks, St Luke's College, and the Heavitree Hill Hospital. Nevertheless, E. retains a remarkable wealth and variety of good buildings belonging to all periods from the Middle Ages to the Regency. Her most famous accumulations of historical manuscripts also survived: the *Exeter Book* of A.-S. poetry, *Exeter Domesday Book*, the episcopal and chapter archives in the cathedral library, the copious city archives, with other collections belonging to the city library, and the co. records in the castle. In the bombed area adjoining South Street, in ground that probably comprised one of the central *insulae* of the Rom. city of Isca, excavations in 1946 uncovered 2 interesting wooden houses of the 1st Rom. occupation. Finds of Samian and coarse pottery of pre-Flavian character enable the period of occupation to be fixed at about AD 55-75. Beneath the

remains of St. George's Church the walls and flooring of a colonnaded stone building were found of the same period extending up to and below South Street. The discoveries give a good indication of the alignment of the Rom. city. Fragments of walls found seem to establish that the one-time Saxon church was a building some 35-40 ft long and about 15 ft broad. It is of interest as the sole example of the period known technically as Devon.

St Luke's College, founded in 1838 as a Church of England Training College, the oldest foundation of its kind in the country, was partially destroyed in 1942. It was reopened in 1945 and prepares about 200 students, chiefly for the Ministry of Education Certificate. The Royal Albert Memorial Museum and Art Gallery in Queen Street contains good collections illustrating zoology and local archaeology.

The port of E. extends down-river to the sea, and coastwise eastward to the Axe and westward to the Teign. In the 54-m. canal stretching from the tn quays to Topsham, E. has the earliest lock canal in the country, though much deepened and widened since its construction in Elizabethan days. The prin. industries are paper-making, brewing, flour-milling, tanning, iron and brass founding, and light engineering. The parl. bor. of 4705 ac. returns 1 member. Pop. 76,600.

2. Tn of New Hampshire, U.S.A., cap. of Rockingham co., 10 m. from Portsmouth, at which many eminent men were educ.; there are some fine colonial homes. It was at E. that the first independent state gov. was formed. It contains the Phillips E. Academy (opened 1783). Pop. 5860.

Exeter, Peerage of. The titles earl, marquess, and duke of E. have been borne by members of the families of Holland (Holland), Beaufort, Courtenay, and Cecil. The 1st duke of E. was John Holland, son of Thomas (d. 1360). He was created duke by Richard II in 1397, and as the king's half-brother held a high position at court, but after plotting against Henry IV he was beheaded in 1400. The 2nd duke, Thomas Beaufort, was created in 1416. He was the youngest son of John of Gaunt by Katharine Swynford. The title expired on his death (c. 1426). In 1443 John Holland, son of the 1st duke, was created duke of E. under Henry VI. His son, Henry, supported Henry VI in the Wars of the Roses, and was attainted (1461). In 1525 the earl of Devon, Henry Courtenay, was created marquess of E., the title becoming extinct on his execution (c. 1538). The earldom of E. was bestowed on Thomas Cecil, 2nd Lord Burghley, 1605, son of William (d. 1598), by James I. His direct descendants carried on the title, Henry, the 10th earl, becoming marquess of E. in 1801. The present marquess is a lineal descendant.

Exeter, University of, incorporated as the U. College of the S. W. in 1922, and created the univ. of E. by royal char-

ter in 1955. It provides courses for degrees in the faculties of arts, sciences, social studies, and law. There are about 1000 students, 550 of whom are accommodated in halls of residence.

Exeter Book, or Codex Exoniensis, a unique MS., probably of the first half of the 11th cent., which was presented to E. Cathedral, where it is still preserved, by Leofric, bishop of E. from 1050 to 1071. In addition to some legal documents it contains an anthology of O.E. poetry. It includes among other pieces *Widsith*, *Deor*, *The Wanderer*, *The Seafarer*, *The Rhyming Poem*, *The Whale*, *The Ruin*, a number of religious poems, and some 80 riddles. It is one of the most important sources for O.E. poetry. See ed., with trans., by I. Gollancz, 1895.

Exeter College, Oxford, founded in 1314 by Walter de Stapeldon, bishop of E. Twelve scholars studying philosophy were supported at Oxford by the income of the rectory of Gwinear, Cornwall, which he had conveyed for this purpose to the dean and chapter of Exeter. Stapeldon housed them in Hart Hall and Arthur Hall, in the par. of St Peter in the East, but in 1315 removed them to buildings on the present site, known as Stapeldon Hall. In 1404 Edmund Stafford, bishop of E., added 2 fellowships and gave the college its present name. One of its more famous members was the earl of Shaftesbury.

Exeter, or Exon, Domesday, part of the great survey of England ordered by William the Conqueror. It is preserved at Exeter, and contains the original returns made by the 12 local jurors sent from each hundred in the cos. of Wilts, Dorset, Somerset, Devon, and Cornwall. It includes the details, omitted from the great *Domesday Book*, of the tally of live stock.

Exeter Hall, large building which formerly stood on the N. side of the Strand, London, originally built in 1831 as a proprietary estab. for the meetings of religious and charitable societies. It was purchased by the Young Men's Christian Association in 1880, and demolished in 1907, the site being occupied by the Strand Palace Hotel.

Exhibit, in law, a document shown to a witness while giving evidence and sworn to by him, or shown to a deponent while being sworn previous to making an affidavit in which it is referred to.

Exhibition. This term has come to be applied to the display of goods to the public for promoting trade, and denotes in a general sense a public show, but E.s are nowadays largely used by wholesalers as a convenient means of reaching the retail buyers and sellers of their goods. The first E. of any national importance was that credited to the marquis d'Avèze at Paris in 1798, consisting of a collective display of the art factories of France, including those of Sévres and the Gobelins. E.s continued to be held at Paris at varying intervals until the 11th, in 1849, of greater brilliance and extent than any preceding. The first E. of this

kind held in England was the unsuccessful National Repository near Charing Cross in 1838. Others followed at Manchester in 1837, Leeds in 1839, and Birmingham in 1849. The Great E. of 1851 (held in London) was a landmark in the development of such shows. A second great international E. was held in London in 1862, and though the numbers attending were over 6 millions, its success was marred by the recent death of the prince consort. Vienna held an international E. in 1863, which was surpassed by the Paris E. of 1878, for which the Trocadero Palace was erected, attended by 16 million persons. Even more magnificent was the Universal E. of 1889 at Paris, for which the Eiffel Tower (q.v.) was built, attended by 32 million persons. Es continued to be held at various capitals every few years, among the more notable being the Franco-Brit. at London, 1908, the Japanese-Brit., London, 1910, and that at Brussels, 1910, the last seriously marred by fire.

Es have been a great feature of the commercial hist. of the U.S.A. In 1876 there was held at Philadelphia the Centennial E. to celebrate the 100th anniversary of Amer. Independence, attended by nearly 10 million. The most remarkable feature was the display of U.S.A. machinery. A World's Industrial Fair, less successful than the Centennial E., was held at New Orleans in 1884-5. To celebrate the 400th anniversary of the discovery of America an E. was organised at Chicago in 1893. In 1933 Chicago opened a great World's Fair to celebrate a centenary of progress (attendance 22 million), followed by another in 1934 (attendance 16 million). The World's Fair at New York in 1939-40, which covered 1216 ac., attracted 34 million. The greatest E. ever undertaken in Great Britain was the Brit. Empire E. held at Wembley in 1924-5. It covered an area of 216 ac., and the various buildings housed treasures worth many millions of pounds. Great pavilions represented the dominions and colonies as well as the home gov. There were a model coal mine, cigarette factory, printing works, and other displays, while the amusement park and tattoo were immensely popular; in the first 6 months the Queen's doll's house (designed by Sir E. Lutyens and now at Windsor Castle) gained £20,000 for charity. In 1929 Spain organised 2 Es, one at Barcelona and the other at Seville, the former notable for the most beautiful electrically illuminated fountains ever seen. The Brit. Empire E. held in Buenos Aires in 1931 showed a very modern tendency in its display of films. In 1931 the Fr. held a very beautiful colonial Exposition at Paris to show the progress of the Fr. colonial empire, and among the many notable buildings was a reproduction of the famous temple of Angkor. The most recent Brit. Empire E. was that held at Glasgow in 1938 (attendance 12½ million), and contrary to usual experience it involved no financial

loss. In 1951, the centenary year of the Great E. of 1851, the Festival of Britain was opened at South Bank, London. The economic circumstances of the time precluded the original intention of an E. on a scale not previously attempted, and the result was an E. of the Brit. way of life and achievements since 1851. It was linked with other Es throughout the U.K. The attendance was 8 million, with the same figures for the Festival Pleasure Gardens at Battersea, but costs were £11 million as against receipts of only £2½ million. A permanent feature of the Festival was the Royal Festival Hall.

Nearly the whole year round in London there are Es of a specialised nature, e.g. there are rose, chrysanthemum, and other shows at the Horticultural Hall; cattle, horse, and dog shows at the Agricultural Hall—where may also be seen the ann. Drapers' E.—in addition to bakery, confectionery, brewery, and other trade Es. Olympia (q.v.) is the setting for many trade Es, and at Earl's Court there are held the Brit. Industries Fair (q.v.), the royal tournament, the radio, motor, and Smithfield cattle shows. Before the Second World War book Es were held in London, and after the war they were resumed. In general these are more in the nature of national trade fairs, the modern equivalents of the fairs that go back a long way in hist. See FAIR.

Owing to the work and expense of international Es many countries do not take part in some of them. As a result a Convention Relative to International Es was signed at Berlin in 1912, but with the intervention of the First World War it was never ratified, and a further convention, including most European countries, was signed at Paris in 1928. The convention set up an international E.s bureau which deals with the recognition, patronage, and authorisation of these Es. It divides them into 2 groups, special and general, the 1st including the products of one kind and the 2nd the products of many kinds.

The term E. is also used for a bounty or endowment for a period of years given to a student in a school, college, or univ.

Exhumation. Under the Eng. law it is a misdemeanour as well as sacrilege to disinter or interfere with a human body in any way, without lawful authority for so doing, when the corpse is buried in consecrated ground. The eccles. courts have power to grant faculties for removing interred remains, but only that they may be re-interred in other consecrated ground. In cases of suspected foul play, the coroner may order disinterment for medical inspection, and E. may also be ordered by the Home Office, but otherwise no body may be disinterred without licence.

Exile, banishment from one's country by authority, either permanently or for a limited period. Outlawry and transportation involved E. Magna Carta abolished outlawry of freemen otherwise than by the law of the land. Transportation of

convicts was finally abolished in 1864. See also BANTISHMENT.

Existentialism, post-war philosophy which became the vogue in France after the liberation (1944), especially among intellectuals of the Lat. Quarter. The chief apostle of E. is Jean-Paul Sartre (b. 1905), who gave the world his creed in a series of successful plays, books, and essays. Briefly, E. may be defined as a school of thought based on a conception of the absolute inanity of existence, absurdity of the universe, negation of all creation and, therefore, of all morale; or, as Sartre has put it, 'all human activities are equivalent, all are destined by principle, to defeat.' One of the basic principles of E. is that man can shape his own destiny by the exercise of his will in the face of the given set of potentialities which is his life. The main premise and point of departure is the concrete fact that man *exists*. Predetermination is denied. Man has freedom of choice and action; and each man's actions, while subjectively inspired, influence other people, so every individual is responsible to humanity as a whole. No dogmatic solutions of the eternal questions of ultimate origins or endings are offered. A man can choose his faith. An existentialist, says Sartre, can be Christian or atheist. Sartre is an atheist, though his disciples included even Catholics until the condemnation of E. by Rome, 1948. Sartre supports his philosophy with the theory of complete atheism and the blind following of one's instincts and primitive impulses, in contradiction to that of Man Alone on Earth with God as his Judge. E. refutes the sublime in man and chooses to portray only his misery. Hence Sartre's play *Morts sans Sepulture* which tells of the extreme mental and physical suffering of a group of Frenchmen in the resistance movement who have been captured by Fr. traitors and thugs employed by the Ger. police during the occupation. His *Huit Clos* is a quasi-philosophical drama of frustration staged in an existentialist conception of hell, which was produced in London as *Vicious Circle* and in New York as *No Exit* with considerable success. Sustained criticism of E. has come both from Communists, who consider it incompatible with Marxist dialectical materialism, and from Catholics.

The familiar contrast between 'existence' and 'essence' suggests that the existentialist philosophy is not entirely novel; for, in the hist. of philosophy, it is implicit that we cannot derive the particular existent from its supposititious abstract properties or from those of which it is said to be an 'instance.' The existentialists of to-day are insistent that we must disregard the abstractions, generalisations, and inquiries into 'essential' qualities, and concentrate on existence in and for itself. To the existentialists, it is the particular experiences in which we make choices that are significant; for it is *choosing* rather than *thinking* that is explanatory of the existentialist attitude, because it is just those experiences which

enable us to feel and exhibit our individual distinctiveness. These experiences are, therefore, revelatory of our true nature: they are moments when we truly *exist*, they are experiences of *Existenz* (Kierkegaard). E. is, therefore, a philosophy which claims it is concerned with actual life as it is lived, and not with abstractions, and that it is specially concerned with the implications of those moments when life is lived in some revealing way, which is somehow different from mere living. But the difficulty in this logical analysis comes when the existentialist selects as revealing experiences such as are in no way universal, and upon them founds repellent systems as if they were revelatory of the predicament of 'mankind' in general. This was essentially the attitude of Kierkegaard, from whom, really, the existentialist movement borrows its distinctive features. Karl Jaspers, whose thought more resembles that of Kierkegaard than does that of the other existentialists, discusses in his *Philosophie*, 1938, the study of *Existenz* as a mode of philosophy, and in his work too we come again upon the contrast between mere existence and significant existing; but Jaspers introduces other persons and the interplay of mutual communication and stresses the experience of *another* person as a separate other person, whereas Martin Heidegger, whom Sartre follows, eschews an Other and argues, with consistent existentialist logic, that there is nothing there and that existence is somehow born from Nothing. See J.-P. Sartre, *L'Être et le néant*, 1943, and *Existentialism and Humanism*, 1948; G. de Ruggiero, *Existentialism*, 1946; E. Mounier, *Introduction to Existentialist Philosophies*, 1948; N. Bobbo, *The Philosophy of Decadentism: A Study of Existentialism*, 1948; R. Friedmann, *Kierkegaard and other Existential Studies*, 1949.

Exmoor, dist. on the border of Somerset and Devon, England, near the Bristol Channel, mainly moorland and marsh, the hills rising to 1100-1700 ft. The chief heights are Dunkery Beacon and Exe Head. Sheep and ponies are largely raised, and the E. breed is famous, while the red deer is still found, carefully preserved, and hunted. The R. Exe rises among the uplands. There are many prehistoric barrows. E. is the scene of Blackmore's romance of *Lorna Doone*.

Exmouth, Sir Edward Pellew, 1st Viscount (1757-1833), adm., entered the navy at the age of 13, and very early in his career proved himself capable and gallant. He rose rapidly in the service and in 1816 he won world-wide recognition by his bombardment of Algiers when the Bey refused to abolish Christian slavery. For this service he was made viscount. There is a biography by Edward Osler, 1835.

Exmouth, seaport of Devon, England, at mouth of R. Exe, on the Eng. Channel, 9 m. SE. of Exeter. It is a noted watering-place, having beautiful surroundings and a sheltered climate. There are good docks, which are 630 ft long and were opened in 1869. E. is worth visiting

for its matchless sunsets. A 15th-cent. mill-wheel called Marpool Mill is still in motion. There is a wealth of pleasure grounds and shaded walks and a spacious esplanade 2 m. long. Pop. 18,000.

Exocoetus, see FLYING-FISH.

Exodus, The Book of, the 2nd book of the Pentateuch (q.v.) (see also GENESIS). It continues the hist. of the Israelites after the death of Joseph, with the birth and training of Moses, the exodus from Egypt, and the sojourn in the wilderness. The book ends with the account of the construction of the tabernacle and its fittings. See J. Jack, *The Date of the Exodus*, 1926;

VISCOUNT EXMOUTH

D. Davidson, *The Exodus of Israel*, 1933; H. H. Rowley, *Israel's sojourn in Egypt*, 1938; P. Adams, 'The Mount of God' in *Palestine Exploration Fund Quarterly*, 1930.

Exogamy, term applied to custom compelling marriage outside the tribe or clan, and the converse of endogamy (q.v.). It thus leads to the creation of ties of kinship between groups, and also prevents close in-breeding. It is found in every part of the world. The term was coined by J. McLennan in his *Primitive Marriage*, 1865.

Exogens, almost obsolete term for plants thickening in the stem by the activity of a cambium ring, such as the coniferae and dicotyledons (q.v.).

Exon Domesday, see EXETER DOMESDAY.

Exophthalmic Goitre, see GOITRE.

Exorcism (from a Gk word meaning 'to conjure out'), the act of conjuring evil spirits to depart out of the person possessed, the term being specially applied to the freeing of an individual from a possessing spirit. There are numerous

examples of the exercise of E. in the N.T. and in the early Church, Tertullian and Origen speaking of it as an ordinary occurrence. The professional exorcist was known among the Jews, and the art was practised by women in Greece. The anc. rite of E. in connection with baptism is still retained in the Rom. ritual, which contains also a special rite for the E. of possessed persons. See G. Mylius, *De Abrogatione Exorcismi in Baptismo*, 1591; R. Woolley, *Exorcism and the Healing of the Sick*, 1932.

Exoterie, see ESOTERIC.

Exotic Plants are those introduced from a foreign country, as opposed to indigenous or native ones.

Expansion: 1. An E. or increase of bulk due to the action of forces from within is a notable effect produced by heat on matter. It has been found by experiment that most bodies expand when they are heated. The length of a metallic bar varies with change of temp., and is always the same at the same temp. This mere increase of length is more correctly called 'elongation' or 'dilatation.' The tire of a cart-wheel is thus fixed by enlarging the iron hoop by heat. As it cools it contracts, and clings closely to the wooden framework. In structures such as bridges and arches E. and contraction likely to ensue from changes of temp. must be taken into account. Watches and clocks are liable to go faster in cold weather, and slower in hot, as a result of the E. or contraction of their balance-wheels and pendulums (see article on HEAT for method of correction). Exceptions to the ordinary rule of E. on heating are vulcanised rubber, oxide of copper, and the diamond at low temp., iodide of silver and iron beyond red-heat. Water begins to expand when its temp. is taken below 40° F. (ca. 4° C.); otherwise most bodies contract when the temp. is lowered. Among solids metals are the most expansible by heat. The observed E. of a liquid or gas within a containing vessel is called its 'apparent expansion,' the 'true expansion' being found by correcting for the changed E. of the vessel. When homogeneous bodies are uniformly heated E. takes place equally in all directions, resulting in change of vol. but not of form. In all bodies or systems that are not homogeneous, E. is not equal in all directions, and change of form results from the changes of temp. See also BAROMETER; HEAT; THERMOMETER.

2. In mathematics, the detailed working out of a contracted expression contained in a short statement; the writing out in full of its meaning, or the result thus obtained. Thus the E. of $(a+b)^2$ is $a^2+2ab+b^2$. Among theorems for E. may be mentioned Taylor's and Fourier's (q.v.). See I. Todhunter, *Algebra*, xxxvi., Fourier series.

Expectation of Life is the technical term used to indicate the number of years which any one from any group of persons (males, females, sailors, plumbers, etc.) may live, the attendant circumstances being normal. In other words, it is the mean time which a number of persons at

any moment of age will live after that moment. The same idea is expressed by the Fr. *vie moyenne*, average life—or by the Eng. expression *after life-time*, meaning the duration of life after any particular moment of life. Tables showing E. of L. have been compiled and issued at intervals from 1843, when A. W. Farr, the Deputy Registrar-General, pub. Eng. L. Table No. 1. This was followed in 1853 by Eng. L. Table No. 2, and in 1864 by Eng. L. Table No. 3. These pubs. are also known as Farr's L. Tables, and comprise a large number of tables of annuities and anniversary tables for the estimation of different kinds of life contingencies. Tables showing the E. of L. are used by insurance companies in fixing their premium terms for policies payable at death or at a stipulated age and also their terms for annuities.

Expectorant, drug which aids expectoration and facilitates the removal of secretions from the air passages. The simplest ways of aiding expectoration are: by inhaling steam, medicated sprays containing ammonia, creosote, iodine, carbolic acid, eucalyptus, etc. The drugs taken internally are: ipecacuanha, iodides, and chlorides of potassium, sodium, and ammonium. E.s are used for colds, bronchitis, and other affections of the air passages.

Expeditionary Force, British, see BRITISH EXPEDITIONARY FORCE.

Expenditure, Government. The gross E. of Great Britain in recent years in thousands of pounds (each ending 31 Mar.) is:—

Year	Expenditure
	2000
1904-5	151,769
1913-14	197,493
1914-15 (F. World War)	560,474
1915-16	1,559,158
1916-17	2,198,113
1917-18	2,696,221
1918-19	2,579,301
1919-20	1,685,773
1920-21	1,955,428
1921-22	1,079,187
1922-23	812,497
1923-24	788,840
1924-25	795,777
1925-26	826,100
1926-27	842,395
1927-28	838,585
1928-29	818,141
1929-30	748,712
1930-31	799,170
1931-32 (Two Budgets)	770,599
1932-33	777,070
1933-34	693,419
1934-35	688,879
1935-36	749,979
1936-37	802,886
1937-38 (Nat. Defence)	847,024
1938-39	943,649
1939-40 (S. World War)	1,325,122
1940-41	3,884,288
1941-42	4,775,694
1942-43	5,637,367
1943-44	5,798,421
1944-45	6,082,904

Year	Expenditure
	2000
1945-46 (Exchequer issues)	5,484,400
1946-47	3,910,300
1947-48	3,209,500
1948-49	3,175,600
1949-50	3,375,300
1950-51	3,257,300
1951-52	4,053,600
1952-53	4,350,600
1953-54	4,274,500
1954-55	4,304,700

Experience, really a philosophical term, but a very ambiguous word, and often used in an historical sense referring to the process in the past by means of which we have gained present knowledge. It is a continuous process, widening and extending the knowledge of an individual, and embraces both present and future. Pain, sorrow, pleasure, good and evil, and any change of sentiments and views all come under the heading of E. It is employed in a religious sense also; thus people talk of 'experiencing' religion, that is, becoming converted. The work of the mind, by means of which knowledge grows, is a work of discovery; and actual E., whether it be wide or narrow, is not mere data only, but concrete, definite knowledge. The widest conception of the term is when the whole race is substituted for the individual. Then we obtain a collective E. embracing life as a whole and the knowledge gained by living it. From this all-comprehensive meaning, all other meanings in which the term is used are more or less legitimate abstractions. Primary E. may be reduced to the barest minimum of sensation and feeling, that is to say, a distinction is drawn between what is directly perceived and what is only inferred, and E. can be explained as manufactured out of these immediate or primary data of sense. When regarded in this way, controversy arises between false empiricism and its counterpart, rationalism.

Experiment (Lat. *experiri*, to try), literally the action of trying anything, putting it to the proof or test. It is an important method of scientific inquiry, as opposed to observation; an operation, in science, undertaken either to discover something unknown, or to test an hypothesis and illustrate truths already proved and known. It consists in the arrangement of the elements or essential features of some process, so as to allow observation at will. Laboratory E.s serve to distinguish purely accidental circumstances from the really essential conditions of any phenomenon. In meteorology, biology, and even astronomy E.s play an important part. Newton's law of gravitation was founded on E.

Experimental Embryology is that branch of embryology concerned with the conditions necessary for the development of ova into new individuals, the mode of development, the functions of the various cells formed by the div. of the ovum, and the relative importance of the nucleus and the cytoplasm, both in development and heredity.

Although fertilisation is generally essential for the formation of embryos, there are sev. animals and plants in which the unfertilised ovum develops (parthenogenesis). Fertilised ova of the honey-bee produce females (workers and queens); unfertilised ova develop into males (drones). Aphids produce 2 kinds of ova, one parthenogenetic (see EMBRYOLOGY) the other requiring fertilisation, and many other invertebrates are frequently reproduced by parthenogenetic ova. Experimentally the unfertilised eggs of sea-urchins have been activated by chemical methods. Starfish eggs exposed for a time to a comparatively high temp. develop without fertilisation, and a frog's egg pricked with a needle, will develop parthenogenetically. Such experiments might lead to the conclusion that the egg in itself contains all that is necessary for actual development, and sperms, or physical or chemical stimuli, merely enable the reactions to begin. An additional rôle of the sperm is to carry hereditary factors (see CELL and HEREDITY) and hence the inheritance of the embryo formed by a fertilised ovum is biparental.

The relative parts played by ova and spermatozoa in heredity have been investigated mainly by experimental hybridisation and by inducing sperms to enter enucleated eggs. The general results of such experiments, carried out mainly with various Echinodermata, show that that some characters are transmitted through the nucleus, and therefore inherited from both parents. Characters distinctive of the group to which the animal belongs may be transmitted through the cytoplasm of the ovum, but experiments on the development of enucleated ova activated by the sperm are not yet conclusive, especially since such ova do not usually develop beyond the larval stage. The small amount of cytoplasm provided by the sperm is negligible as an agent in inheritance.

On the other hand, by exchanging the nuclei between 2 species of *Amoeba* the resulting 'hybrid' has properties of both species, so that the cytoplasm must contain inheritance characters here.

When the sperm has entered the egg, a fertilisation membrane is formed, but the view that this prevents, mechanically, the entry of further sperm is doubted, and sev. may indeed enter in larger eggs. The surface of many unshelled eggs has a covering of a hyaluronic acid, which can be broken down by enzymatic secretion of the sperm. A concentration of sperm is needed to break this down before one can enter, which may explain nature's apparent prodigality of sperm, and it has been suggested that the specific nature of the acid and its enzyme may help to prevent accidental cross-fertilisation between species.

By centrifuging eggs it has been shown that some, e.g. *Ascaris*, are of the 'mosaic' type, having their materials arranged in a definite pattern, which is destroyed by the experiment, and consequently the egg develops abnormally. Eggs of frogs and

sea-urchins are not damaged by centrifuging, and in such eggs differentiation of the cells may not take place until after the 5th div. of the ovum.

The stage at which cells become differentiated has been determined by interchanging cells from various parts of the embryo at different stages of development. Undifferentiated cells produce tissue normally formed in the region to which they are transplanted, but differentiated cells, even though the differentiation be invisible, will develop into the kind of tissue they would have produced before transplantation. Since some parts of the embryo induce in the area to which they are transplanted the development of structures which do not normally arise there, they are regarded as 'organisers.' These grafting experiments, and

BLASTULA OF THE AMPHIBIAN FROM THE SIDE, SHOWING THE PRESUMPTIVE AREAS (AFTER VOGT)

Ant. A.P., the animal pole and future anterior end of the embryo; Post. V.P., the vegetative pole and future posterior end; D.L., dorsal lip of blastopore

the discovery of organisers, is associated particularly with Spemann and his collaborators.

Prof. C. M. Child has shown the existence of definite metabolic axes generally approximately coincident with the axes of symmetry in the egg and the embryo. An axial gradient, i.e. a fall in metabolic rate, extends from the anterior to the posterior pole, and from this primary gradient secondary gradients extend laterally, particularly in limb-forming regions. The existence of metabolic gradients has an important bearing on development.

The action of external environment upon the growth of embryonic cells is studied by growing them in culture media. Tissue culture also serves to determine the degree of self-differentiation reached by the cells. Canti and Fell, for instance, have shown that the rudiment of a fowl's leg is capable of development into the various bones, joints, and other parts even when completely isolated in a nutrient solution.

E. E. shows that stages of development are conditioned each by the preceding one. The functions are not irrevocably fixed from the initiation of the cells, but are determined mainly by the relations between the cells themselves and by other environmental factors.

Recently a new technique of *intra-rital staining* has been developed by Prof. Vogt of Zurich, and has cleared up previous obscurities in the process of gastrulation in the heavily yolked egg of Amphibia. Patches of cells on the outside of the segmenting egg (blastula) are coloured by harmless dyes, so that it is possible to observe the subsequent fates of these regions. Thus the egg has been mapped out into *presumptive areas* of ectoderm (sub-divided into skin and neural plate), notochord, mesoderm, and endoderm. The presumptive skin remains on the outside; the remaining areas flow to the blastopore where, in process of being tucked inside the embryo, they come under the influence of the primary organiser, and their fates are then no longer presumptive but are finally sealed. Once the main parts of the embryo have been blocked out, secondary organisers come into play, imparting the detailed structure to the individual organs; the best-known example is the production by the optic cup (rudimentary eye) of a substance which stimulates the overlying ectoderm to sink down and become the lens. See also BIOLOGY.

Experimental Medicine, see MEDICAL RESEARCH.

Experimental Psychology. It has not been found possible to submit all the questions of P. to the test of laboratory experiment, but the method may nevertheless be applied to a considerable number. E. studies of the processes of remembering and forgetting have been carried out, whilst hearing, seeing, feeling, tasting, and smelling have been investigated experimentally.

In the last few years attention has been concentrated upon E. studies of abilities of various kinds. Typically, these studies have proceeded from the devising of tests of various kinds, which have then been applied to large groups of individuals. The wide applications of the tests, and the study of the individuals tested, have enabled the experimenter to know something of the implications of the various scores given for success with the tests. He may then apply them to new individuals, and, from the scores they make in connection with the tests, predict with some confidence the extent to which the individual will show the ability which the test is designed to discover. The application of statistical methods to the interpretation and standardisation of the tests has resulted on the one hand in improvement of the validity and reliability of tests; and, on the other, in the development of new views regarding ability.

In the educational field, educability is estimated by means of intelligence tests. In the industrial field, certain tests have been devised which show whether the person tested possesses the necessary ability to follow callings which demand proficiency in certain operations. In industry, not only have tasks been analysed into combinations of simple operations, but the ability for performing such operations has been experimentally

investigated, and the optimum conditions under which such operations may be carried out by persons with the ability to perform them have also been studied. As a result, the industrial psychologist is finding himself increasingly in possession of reliable information which enables him to advise employers as to whom to engage or reject for specific tasks, and further to inform them as to the conditions in which their output may be raised to an optimum and their work maintained at a constant standard of maximum efficiency. Studies have been, and are being, made of the effect of temp., ventilation, noise, lighting, and other factors on the general behaviour and output of workers. The introduction of bright colours into the decoration of industrial premises, and to the machines in them, has been found to reduce the strain on the worker engaged in repetitive operations. The increasing importance of this dept of P. led to the foundation of the National Institute of Industrial Psychology. See M. Collins and J. Drever, *Experimental Psychology*, 1926; Rex Knight, *Intelligence and Intelligence Tests*, 1933; P. Vernon, *The Measurement of Abilities*, 1939; M. Smith, *An Introduction to Industrial Psychology*, 1943; R. H. Thouless, *General and Social Psychology*, 1951.

Expert Witness, see EVIDENCE.

Exploration, see GEOGRAPHY.

Explosion, the sudden and forcible expansion of certain substances through the action of heat or other cause. This expansion may take the form of the conversion of solids or liquids into gases, or the increase in bulk of gases themselves through chemical changes.

Explosives, compounds or mixtures which can readily undergo chemical changes of an explosive nature. According to the official Brit. list of authorised E., the classes recognised are: gunpowder, nitrate mixture, nitro-compound, chlorate mixture, fulminate, ammunition, firework.

Gunpowder is an intimate mixture of potassium nitrate, charcoal, and sulphur in the proportions 75 : 15 : 10, mainly used for blasting. Gun-cotton (q.v.), or trinitro-cellulose, discovered by Schonbein, 1845, is prepared by the action of a mixture of nitric and sulphuric acids on cotton; other forms of cellulose besides cotton, when nitrated, give nitro-celluloses. Nitro-glycerine (q.v.), chemically glycerine trinitrate, discovered by Sobrero, 1846, is made by the action of nitric and sulphuric acids on glycerine. Kieselguhr (q.v.), a siliceous earth, absorbs it (see DYNAMITE). Blasting gelatin is a mixture of nitro-cellulose and nitro-glycerine. Picric acid (q.v.) (trinitro-phenol) has been used as a filling for high explosive shells. Trinitrotoluene (q.v.) is safer to handle than picric acid and has replaced it in many of its uses. Amatol is composed of trinitrotoluene 20 to 40 per cent and ammonium nitrate 80 to 60 per cent. Ammonal contains powdered aluminium in addition to trinitrotoluene and ammonium nitrate. Cheddite (q.v.) contains potassium chlor-

ate, castor oil, and a nitro-body. Sprengel mixtures contain an oxidising agent such as nitric acid or potassium chlorate, together with a combustible substance like nitrobenzene, petroleum, etc., often admixed just before use.

See ATOM BOMB; BLASTING; BULLET; CARTRIDGE; CORDITE; DETONATOR; FIRE-ARMS; INFERNAL MACHINE; LYDDITE; PYROXYLIN; and the subsidiary articles referred to above.

Exponent, or Index. In algebra, the E. or index is a symbol placed just above and to the right of another (termed the base) in order to indicate the power to which that base is to be raised. Indices may be positive, negative, or fractional. Thus a positive index a^1 indicates $a \times a$, i.e. a raised to the second power; a negative index a^{-1} indicates $\frac{1}{a^1}$, or the reciprocal of

a to the second power; while a fractional index $a^{\frac{1}{2}}$ indicates \sqrt{a} , or the square root of a . More generally $a^m \times a^n = a^{m+n}$. This is one of the fundamental laws of algebra, and is the principle behind the logarithm (q.v.) which transforms the practical process of multiplication into addition. A logarithm is merely an E. Similarly $a^m \div a^n = a^{m-n}$, $(a^m)^n = a^{mn}$ and $a^0 = 1$.

The *Exponential Series* depends on the transcendental number e which is derived from the value of $(1 + \frac{1}{n})^n$ when n is indefinitely increased. The expansion of this expression is

$$1 + \frac{n}{n} + \frac{n(n-1)}{2!} \frac{1}{n^2} + \frac{n(n-1)(n-2)}{3!} \frac{1}{n^3} + \dots$$

$$= 1 + 1 + \frac{1}{2!} \left(1 - \frac{1}{n}\right) + \frac{1}{3!} \left(1 - \frac{1}{n}\right) \left(1 - \frac{2}{n}\right) + \dots$$

$$= 1 + 1 + \frac{1}{2!} + \frac{1}{3!} + \frac{1}{4!} + \dots$$

when n is infinite. Then the number

$$e = 1 + 1 + \frac{1}{2!} + \frac{1}{3!} + \dots = 2.71828 \dots$$

and is the natural logarithmic base for theoretical purposes. See LOGARITHM; HERMITE, CHARLES.

Export-Import Bank of Washington, estab. in 1934 and reincorporated in 1945 as an independent agency of the U.S.A. Gov. to aid in financing and to facilitate the exports and imports of the country. In the 21 years to 1955 it authorised a total of \$7,200,000,000 in loans or guarantees in 65 countries.

Exports, see TRADE AND COMMERCE; FREE TRADE; PROTECTION.

Express, see POST OFFICE, *Express Delivery Service*.

'Express, L', Paris weekly, founded in 1953 as a left-wing political paper. After having been enlarged by literary and other pages, its circulation rapidly rose from a few thousand to 150,000 in 1955. Among its contributors are the Fr. politician Pierre Mendès-France (q.v.), and the writers François Mauriac, Albert Camus, André Malraux, and Alfred

Savvy; contributors in England include Aneurin Bevan (q.v.) and the cartoonist Vicky.

Expressionism, form of art which endeavours to express the inner life of the artist, in which process the objective content is but a means to that end, wherein the subjectivity of the artist engrosses the interest so much that the external object may not dispute its supremacy, and either disappears or becomes much changed. In brief, subjective presentation accompanied by distortion of nature which may be pressed to the point of unrecognisability or suppression of all external reality. According to Max Raphael 'Art should merely reproduce the artist.' For a proper appreciation, or perhaps interpretation, of a picture, the critic will require to translate the detail of the picture as symbolic of some experience, whether physical, intellectual, or spiritual, of the artist, much as psycho-analysts interpret the recollected incidents of dreams. The movement towards E. arose in the last quarter of the 20th cent. as a reaction against Impressionism (q.v.) chiefly in Germany, Russia, and the Scandinavian countries. The Norwegian, Edvard Munch (q.v.), thus expressed a pessimistic or melancholy outlook repeated in some followers in Germany. Kandinsky, Klee, and Kokoschka are expressionists, so also was Vincent van Gogh. Variations of E. are to be found in the products of Cubism, Futurism, Constructivism, and Surrealism, while the cinema had its expressionist film in *The Cabinet of Dr Caligari* (Robert Wiene, 1919).

The term E. properly belongs to painting, but can be loosely applied in music to composers who aim at the interpretation of moods and states of mind, not by the accepted symbols of romanticism, but by apparently unrelated abstractions, and in literature to writers like Kafka and James Joyce and many modern poets who express their inner truth in the raw symbols that spring from the unconscious. See C. Marriott, *Modern Movements in Painting*, 1921; A. Pope, *The Painter's Mode of Expression*, 1929-31; S. W. Cheney, *Expressionism in Art*, 1948.

Extension, a term used of any given term to describe the total number of objects to which it may be applied, being practically synonymous with 'Denotation,' and opposed to 'Intension' or 'Connotation,' which are used of the attributes essential to the conception of the term. See CONNOTATION AND DENOTATION.

Extortion, in Eng. law, the term applied to the improper, premature, or excessive exaction of money or money's worth by public officers; also to such exaction by means of threats of personal violence or blackmail (q.v.). E. is regarded as a misdemeanour by the common law. See THEFTS.

Extra-territoriality, or Exterritoriality, term of international law, which denotes the exclusion of certain individuals from the rule that everybody within the

boundaries of a state is subject to the laws of that state. It is also used to describe the quasi-E. of the dwelling-place of an accredited diplomatic agent, and of public ships of one state when cruising in other waters than their own. Generally speaking, all cases where a state refrains from enforcing its laws within its own ter. are cases of the operation of the principle of E. The persons who come under this rule are those of foreign sovereigns, whether travelling under an incognito or not, ambas., ministers plenipotentiary, and other accredited diplomatic agents. Not only are the persons of these included, but their suites also, and their belongings. Public ships in foreign waters also enjoy the rights of E. Consuls are not as a rule included, save in some non-Christian countries. In certain non-Christian states also E. has been granted by treaty to the subjects of contracting Christian states who are resident therein (*see* CAPITULATIONS). Brit. settlements in the Far East were subject to the conditions of the treaties by which they came into being. In the period 1928-37 the Nationalist Gov. of China had 2 main lines of policy: to achieve uniformity of political structure and administrative control within China, and to strengthen and modernise the country. The gov. showed a high degree of skill in dealing with foreign interests. Here the primary problem was the old yearning of the foreign interests for a 'strong man' to run China on their behalf. These interests were then still conservative in their attitude and disposed to resent any attempt of the Chinese Gov. to make foreign enterprise respect the national interests of China. They obstinately clung to the theory that the foreign concessions and the system of E. were essential safeguards of 'law and order'—although disorder and corrupt politics were still fostered by the ability of all Chinese war lords, and others who got rich in unpatriotic ways, to put their money in foreign banks in the foreign concessions, safe from taxation or any form of Chinese control. These foreign interests would have liked nothing better than to make Chiang Kai-shek their strong man. But Chiang Kai-shek built up the strength of the gov. and its international credit without allowing foreign control to increase either politically or financially. Gradually he succeeded in committing America and Britain, among the great powers, not only to the support of the Chinese Gov. but to progressive relinquishment of their privileges and restoration of the sovereignty of China, so that Japan stood more and more isolated both as the advocate of territorial and political imperialism in China and as a rival threatening Amer. and Brit. interests. As early as 1931 the Chinese National Gov. announced the abolition, as from 1932, of extra-territorial rights of foreigners resident in China. This announcement followed China's refusal to accept the Powers' demands that foreign jurisdiction should continue at Shanghai, Canton, Tientsin, Peking, and Hankow. It was

further announced that courts for the trial of criminal and civil cases involving foreigners were to be estab. in special areas, including Shanghai, Tientsin, Mukden, and Canton; but these decisions could not then be implemented owing to the capture of all these cities by the Jap. invaders. In 1942, however, the Brit. and U.S.A. Govs. relinquished extra-territorial rights in China, Gen. Chiang Kai-shek in Oct. of that year sending messages of appreciation to Mr Churchill and Mr Roosevelt for their gesture of friendship and goodwill manifested in their determination to abrogate E. in China and thereby to allow China to assume the full stature of an independent democratic nation. There were formerly similar agreements or capitulations with Turkey for securing immunity to foreigners in that country or in its dependencies, including Egypt. An exceptional case of E. was that granted to the residence of the pope by an It. law. When armies are allowed by another gov. to cross the borders of their own state, they thereby come into possession of extraterritorial rights. It was laid down in the arbitration of the *Alabama* case that the extension of E. to ships was not the law of nations or an absolute right, but simply an act of courtesy; such a view is not in accord with the universal practice. The extension of immunity to vessels owned by states and engaged in trade was an issue before the Eng. courts in *The Porto Alexandre*, 1920, in which case the Court of Appeal, in spite of the commercial difficulties that might arise, felt bound in view of the prevailing fashion of internationalisation to follow the decision in *The Parlement Belge*, 1878, where the fact that a ship had been declared by a foreign sovereign to be in his possession as sovereign was held to be conclusive and to confer immunity from the local jurisdiction.

Extracts are solutions or syrups containing one or more substances that have been removed from admixture with others by means of a solvent. The methods of extraction depend on the particular case, but as a rule the solvent, which may be water, alcohol, ether, acetic acid, etc., is poured over the crushed or powdered substance and, after standing, is strained off. The substance is said to be macerated if the solvent is cold, and digested if warm. When the substance is boiled with the solvent a decoction results. Many forms of apparatus for performing extractions have been devised, with a view to minimising the amount of solvent used, and thus rendering the subsequent concentration of the E. a less tedious process.

Extradition (Lat. *ex*, out, and *traditio*, handing over), the giving up of a person accused of crime to the gov. in whose ter. the offence was committed by the gov. in whose ter. he has taken refuge. Great Britain has entered into E. treaties with practically all civilised nations; the offences for which E. is permissible are naturally all of a serious nature, including arson, murder, piracy, embezzlement, etc. In most states offences of a political nature

do not allow of E.; such offences are not those with a political motive; but those which 'are incidental to and form part of political disturbances.' Criminals are not given up unless some specific treaty is in existence with the gov. requiring them, and in Eng. law the gov. has no power to surrender a fugitive criminal without express statutory authority. It is necessary to show the offence enumerated and the specific treaty, and also that the acts with which the fugitive is charged amount to the alleged offence according to the laws of both the gov. concerned. The authority in Great Britain is contained in the Extradition Acts of 1870-3. The fugitive can be tried only on the specific charge for which he was given up. Whether a state is called upon to give up its own subjects varies with different nations; the procedure followed between Great Britain and other nations is briefly as follows. With France and Germany neither gov. surrenders its own subjects; with Spain and Switzerland Great Britain only surrenders them; with Russia, Belgium, and the Netherlands it is optional. If a Sp. subject committed a crime in Switzerland and took refuge in England, the Brit. Gov. would surrender him to Switzerland only after the consent of Spain had been obtained. A fugitive is committed on the same evidence as for an ordinary crime, but is not surrendered until a diplomatic representation of the gov. demanding him has been addressed to the secretary of state. In the U.S.A. foreign E. is not regulated by the individual states but by the Federal Gov. When a demand is made for E., the accused is handed over if his probable guilt is estab. at a preliminary examination before a commissioner or judge. An E. treaty embraces all previous crimes committed by the same person. Inter-state E. is provided for by Act of Congress under the Constitution. The fact that an act may be no crime in one state does not debar another where such act is a crime from demanding surrender. Release by writ of *Habeas Corpus* is the procedure on an improper surrender. See also FUGITIVE OFFENDERS ACT, 1881; POLITICAL OFFENCES.

Extrados, in architecture, the curved upper surface or back of an arch. See ARCH.

Extravasation, passage of fluid from a vessel. The term is also applied to the passage of fluid from a hollow organ by bursting or perforation. E. of blood is the most commonly seen, as in a bruise, the size of which depends upon the amount of blood that leaves the damaged vessels, and the changes that a bruise goes through are caused by the alteration in the blood pigments. The extravasated blood is either absorbed or remains fluid, and may have to be drawn off in the case of a haematoma (see BRUISE). Haematoma may become infected with bacteria and form an abscess.

Extremadura, see ESTREMADURA.

Extreme and Mean Ratio, in geometry, a phrase used of the proportional div. of

straight lines. Thus if AB is a straight line, and the point of div. is at C, the line will be divided in extreme and mean ratio, or medial section, if the ratio $AB : AC = AC : CB$, or $AB : BC = AC^2$. The term is used by Euclid, who states the problem in Book II, problem 11, where the case of internal section alone is considered, but a line can also be divided externally, in medial section.

Extreme Unction, sacrament of the Rom. Catholic Church, reserved to those at the point of death. It is believed to give spiritual aid to the person receiving it and also, when God so wills, to restore bodily health. The custom of anointing the sick with oil doubtless had its origin in the counsel of St James (James v. 14), but it is noteworthy that this passage makes the cure of the sick person the object of the act. There are still traces of this primitive view in the Rom. rite of unction. In the Gk Church the ceremony is known as 'The Holy Oil,' or 'The Oil of Prayer,' and the primitive view has remained more fully. In the 1549 Book of Common Prayer, a form of unction was given, but this has since been omitted. The practice of unction of the sick with the primitive intention has lately been revived in the Eng. Church with episcopal consent.

Exuma, Great and Little, 2 is. of the Bahamas (q.v.). Exumas is the name of a dist. comprising sev. is. (area c. 100 sq. m.; pop. 3800). Tongue of Ocean separates the Exumas from Andros Is. on the W.; Exuma Sound separates them from Eleuthera Is. and Cat Is. on the E. The chief tn is Georgetown, to the NW. of which is the U.S.A. airfield, facing Exuma Sound.

Eyam, vil. of W. Derbyshire, England, 10½ m. NE. of Buxton, in a dist. noted for its geological interest and its Brit. and Saxon antiquities. In E. churchyard is a 8th or 10th-cent. runic cross, restored by John Howard in 1788. Three-quarters of the pop. of E. d. of plague in 1665-6. Anna Seward, the 'Swan of Lichfield,' Richard Furness the poet, and John Nightbroder, founder of the Carmelite Priory at Doncaster, were b. here. Industries include the manuf. of shoes and fluorspar, and lead mining. Pop. 1200.

Eyassas, see FALCONRY.

Eyck, Hubert Van (c. 1379-1426), early Flem. painter, probably b. Maaseyck on the R. Maas, who lived at Bruges and later at Ghent. He is presumed to have worked in conjunction with his brother Jan (q.v.), being appointed together with him by Philip of Charolais as court painter at the Hague in 1422. It is incorrect to say that they invented painting in oils, but certainly the Van Eyck technique is remarkable for transparency and brilliance of colouring. To Hubert is attributed the general design and some part of 'The Adoration of the Lamb,' the famous altarpiece in the cathedral at Ghent, which an over-inscription ascribes to both painters; but it is only on evidence of style that any other work can be attributed to him, and on this evidence expert opinions differ. See studies of the

Van Eycks by Weale, 1908; Weale and Brockwell, 1912; C. de Tolnay, 1939.

Eyck, Jan Van (c. 1390-1442), early Flem. painter, brother of Hubert (q.v.), and like him b. at Maaseyck. During Hubert's lifetime he is presumed to have worked with him, and to have completed their joint work, 'The Adoration of the Lamb.' He also became court painter to the duke of Burgundy in Lille. He d. at Bruges. Some experts ascribe a greater power of conception to Hubert, but Jan is undoubtedly a great master in his own right, superb in portraiture, detail, and technical brilliance. His prin. signed and dated works include the famous pictures in the National Gallery, 'Portrait of "Timotheus"', 1432, 'The Man with the Turban,' 1433, the wonderful masterpiece 'The Marriage of Giovanni Arnolfini and Giovanna Cenami,' 1434, the 'Vierge du chanoine van der Paele,' (Bruges), 1434, the 'Vierge à la fontaine' (Antwerp), 1439, and 'Portrait of the Artist's Wife (Bruges), 1439. See studies by Weale, 1908; Weale and Brockwell, 1912; C. de Tolnay, 1939. For comment on the technical 'Secret of the Van Eycks' see Appendix to Sir Charles Holmes's *National Gallery*, vol. II, The Netherlands.

Eyck, Margaret Van, a painter, sister of Hubert and Jan. She lived a retired life as a member of the order of Our Lady of Ghent, and d. before 1431, being buried in the cathedral of Ghent. She is believed to have executed some miniatures in the missal of the duke of Bedford.

Eye. Tn of Suffolk, England, on a trib. of the R. Waveney, 20 m. N. of Ipswich. Formerly a centre of the pillow-lace industry. Its charter was granted in the reign of King John. Pop. 2000.

Eye. The E. is one of the higher sense organs, and like those of hearing and smell, it consists of an essential part and an accessory part. The organ of vision, strictly speaking, consists only of the eyeball, but it is also necessary to discuss its many important appendages. The eyelids, fringed by the eyelashes (*cilia*), consist of integument with a thin layer of dense fibrous tissue strengthening their margins. They are closed by the *orbicularis muscles*, and the upper is raised by the *levator palpebrae*. The *meibomian glands*, which secrete sebum, open on the free margin of the eyelids. A layer of mucous membrane (*conjunctiva*) lines their inner surface and is continued over the front of the eyeball. The upper lid is the larger and more movable, and joins the lower at the inner and outer *canthi*. Near the inner *canthus*, on each lid, will be seen the slight elevation (*papilla lachrymalis*) pierced by the *lachrymal canal*, which is the drainage channel for the fluid from the conjunctiva; this fluid is continuously secreted by the *lachrymal glands*, which are situated in the outer angle of the orbit, one above and one below. The reflex action of winking distributes the fluid over the ball and thereby washes it. The lachrymal canals from

above and below converge and open into the *lachrymal sac*, the upper slightly dilated end of a duct, about $\frac{1}{4}$ in. in length descending to the nose. Stimulus of the lachrymal gland by pungent vapours or the stress of strong emotions may result in an excessive secretion of the fluid exceeding the capacity of the *lachrymal duct* and tears result. The conjunctival mucous membrane becomes continuous with the nasal mucous membrane by means of the lachrymal canal. The globe of the E. is not perfectly spherical, its antero-posterior diameter being about $\frac{3}{4}$ of an in., as also is its vertical, but the transverse diameter is usually a little longer, about 1 in. The eyeball consists of 3 concentric coats and of certain fluid and solid parts enclosed by them, viz. (a) the tough, firm, fibrous external coat, the *sclerotic* and *cornea*;

DIAGRAMMATIC SECTION OF THE EYE

ON, optic nerve; A, retina; B, choroid; C, sclerotic; D, cornea; E, crystalline lens; F, pupil; G, iris; VH, vitreous humour; AH, aqueous humour.

(b) a middle vascular pigmented and in part muscular membrane, the *choroid* and *iris*; (c) an internal nervous and epithelial layer, the *retina*. The corneo-sclerotic case is kept in shape by (i) the *aqueous humour* which distends the cornea; (ii) the *vitreous humour* which fills the less convex sclerotic chamber; these 2 humours are separated by the *crystalline lens*. The whole may be represented as a 'water-camera' of the highest degree of perfection and adaptability.

A brief description of each of the above parts follows. The sclerotic coat is a strong, opaque, fibrous structure extending over about five-sixths of the eyeball. Its outer surface is pearly white; its inner is of a light brown colour. The remaining sixth, although not changed essentially in character, is transparent, and is termed the cornea. The cornea is normally from $\frac{3}{8}$ to $\frac{5}{8}$ in. in thickness. The choroid coat is a thin membrane, and supports in its outer layers the larger arteries and veins of the E. Its inner stratum is covered by hexagonal pigmented cells; these, which were formerly considered as part of the choroid, belong in reality to the retina. Near the corneo-sclerotic junction the choroid becomes raised up into a number of longitudinal ridges or puckers (*ciliary*

processes) arranged meridionally and forming a circle. The *iris* at its circumferential border is continuous with the choroid. It is a curtain with a round hole (pupil), and is provided with circular and radiating unstriped muscular fibres which adjust the size of the pupil. (Though unstriped, these fibres contract with extreme rapidity.) The pigment cells of the iris vary in different individuals, and the different colours of E.s are partly dependent on the amount and distribution of the contained pigment. The retina is the delicate membrane containing the expanded termination of the *optic nerve*. It varies in thickness from $\frac{1}{16}$ to $\frac{1}{8}$ of an in., and forms the lining between the choroid and the vitreous humour extending nearly to the outer edge of the ciliary processes; its indented border is termed the *ora serrata*. It, for the most part, is of even texture and smooth surface, but almost exactly opposite the middle of the posterior wall is a slight circular depression (*yellow spot*), and not far from this, towards the nasal side of the eyeball, is a radiating appearance produced by the spreading of the optic nerve at its point of entrance.

It is impossible within the limits of this account to deal with the microscopic structure of this wonderful membrane. No less than 8 distinct strata build it up, of which only 4 are here mentioned. The innermost layer is one of nerve fibres, and lying next to this is the layer of nerve cells; the outermost layer consists of the pigment cells previously mentioned, and immediately within is the layer of *rods* and *cones*, the former far exceeding the latter, except in the yellow spot. These bodies are closely packed, and it is suggested that each rod or cone conveys but one impression, so that any image, even microscopic in size, must be the result of combined impressions from a number of rods and cones. The *aqueous humour* is a watery solution of saline and organic material, while the *vitreous humour* is of a soft gelatinous consistency, and serves as a support for the delicate retina from which, in most parts, it may be readily separated. The crystalline lens, about 11 millimetres in diameter and 3.6 to 3.9 millimetres thick at the centre, is a transparent solid body, double convex in shape and enclosed by an elastic capsule, with attached suspensory ligaments subject to varying tensions. Its posterior convexity is the greater. It is composed of a number of concentric laminae, resembling the coats of an onion, and each lamina is composed of ribbon-shaped fibres built together in a peculiarly curved manner. The lens, which is practically spherical in the foetus, becomes more and more flattened with advancing age.

The action of the E. is roughly as follows: beams of light (parallel if from an object 20 or more ft away and divergent from nearer objects) from any one point in an object strike all over the surface of the cornea which gathers them slightly together, refraction follows in the aqueous humour, and the lens brings them to a focus in normal vision on the retina. The

rods and cones are affected by the image, and in consequence cause disturbances and stimuli in the nerve fibres and an impulse is transmitted via the optic nerve to the brain. The adjustment of the dioptrics of the E. whereby it is able to focus the image of both far and near objects is called *accommodation*. It is brought about by a change in the convexity of the anterior surface of the lens. When the E. is accommodated for distant vision the ciliary muscles draw the suspensory body taut, which results in a flattening of the anterior surface of the lens. Conversely, in accommodation for near vision the ciliary muscles relax and the anterior surface of the lens becomes more convex. The complete act of accommodation for a near object comprises, besides an increased convexity of the lens, convergence of the E.s and constriction of the pupil. The muscles which move the eyeball are 6 in number, 4 *recti* and 2 *obliqui*; and by means of the contractions of these six muscles the eyeballs may be moved in any desired direction.

Double vision, or *diplopia*, is the name given to an optical abnormality in which 2 images of the same object are seen. If the diplopia concerns 1 E. only it may be the result of some abnormality of refraction in the E. concerned, but if it disappears when either E. is closed, thus showing that both E.s are concerned in its production, it is true diplopia, and may be due to a transient weakness of the ocular muscles which will pass off, or to a squint (see SQUINTING). It may be the first warning of the disorder called disseminated sclerosis, or of the rare condition known as myasthenia gravis. A case of diplopia should therefore receive expert attention. The so-called double vision found after alcoholic excesses, in attacks of migraine, after the taking of drugs, etc., is really only blurred and muddled vision. *Nystagmus*, a condition in which the E.s are continually moving in a rhythmical fashion, from side to side, or up and down, or with a circular motion, is present in disease of the labyrinths or semi-circular canals which control the balance of the body. Sometimes it is due to disease of the E.s or of the parts of the nervous system which are connected with them. A form of nystagmus, known as miners' nystagmus, used to be common in miners and in many cases was thought to be due to a neurosis. The *Argyll Robertson pupil*, called after the Edinburgh physician who first described it, is the name given to the condition in which the pupils do not react to light but do contract in accommodation.

Wounds and foreign bodies.—Any irritation to the E. causes such intense pain to the individual that he usually seeks to remove the cause at once. This is one of Nature's ways of safeguarding sight, which is among man's most precious possessions. Every injury to the E. should receive immediate attention. Careful treatment of injury or inflammation in the early stages may avoid loss of sight in the damaged E. The most frequent accident to the E. is undoubtedly

the entrance of a foreign body such as a small particle of dust, splintered wood or metal, or coal, or road grit. When a particle falls on it, the E. will water and thus the article may be washed to the corner of the E., where it can be removed. Never rub the E. which has grit in it, but blow the nose and the particle may be dislodged so that it can be removed with the corner of a clean rag or handkerchief. If the foreign body be wedged under the upper lid, a few drops of a bland oil, such as castor oil, may be dropped into the E. in the hope that the particle will float out. If this is unsuccessful, gently grasp the rim of the lid and pull it out and downwards, pushing up the lower lid under it. Release the upper lid, and as the lids slide apart again, the particle is very often carried out on the lashes of the lower lid. If these first-aid measures are unsuccessful, no further attempt should be made, but the patient should be taken at once to the doctor. In the case of larger particles which are apt to enter the E.s of workers in such places as steel works, expert advice should be obtained at once. The cornea is subject to ulceration of various kinds. Even such a small wound as a tiny scratch may lead to inflammation and ulceration. Children from poor and dirty homes often develop these ulcers, sometimes in conjunction with tuberculous glands in the neck. Older people in poor health are prone to corneal ulcerations. When inflammation is present in the cornea without actual ulceration, the condition is called keratitis. All corneal inflammations require expert advice and treatment.

Wounds of the Eye.—Any sort of wound may happen to the E., and accidents in which rods of metal or wood, such as prongs of pitch-forks, tools of all sorts, projecting parts of cars or furniture, stones, golf-balls, elbows and fingers at football, etc., enter the E. and lacerate it are fairly frequent. First-aid treatment only should be attempted, and the patient should as soon as possible be taken to the doctor, or the doctor be sent for if there is collapse from the shock and pain, which is often severe. The E. may be covered with a pad of wet boracic lint, and bound up with a bandage. Hot tea or coffee or other stimulant may be given to restore the patient. The worst aspect of an E. accident is the risk that the other, sound, E. may become involved, and loses its sight, even though the damaged E. may recover. The reason why this condition, known as *sympathetic ophthalmitis*, should occur is not known.

Black eyes, in which the tissues round the E. become suffused with blood and discoloured, are common. The usual cause is a bruise (q.v.) in the region of the E. caused by a blow or knock, but sometimes black E.s occur after such happenings as operations on the nose. In a few days the blood which has collected in the tissues will be absorbed, and the dark colour will fade through shades of yellow to a normal colour again. Immediately after a blow has been struck on the E.,

cold wet cloths should be applied, or the part should be covered with pads of cotton wool soaked in weak lead lotion. This treatment, if applied soon enough, may prevent a black E. from forming. If a black E. develops in spite of these precautions, hot compresses may be used to relieve any pain.

Other conditions and diseases of the E. and eyelids are described under: **ASTHENOPICIA; ASTIGMATISM; CATARACT; CONJUNCTIVA AND CONJUNCTIVITIS; EYELIDS; SORE; GLAUCOMA; MYOPIA; OPHTHALMIA; PINK EYE; SQUINTING; STYE; TRACHOMA.** See also **BLIND; COLOUR-BLINDNESS; OPTICS; SPECTACLES; VISION, DEFECTS OF; REFRACTION, ERRORS OF.**

Eyebright, see **EUPHRASIA.**

Eyelids, Sore or Inflamed, see **BLEPHARITIS.**

Eyemouth, burgh of Berwickshire, Scotland, at the mouth of the R. Eye, 8 m. NW. of Berwick. It has a fishing industry. Pop. 2270.

Eyes, Propagation by, in plant culture, consists in carefully cutting out the eye, as it is called, and planting it afresh; this soon shoots out and becomes a new plant. The best-known example of this form of propagation is the potato.

Eyra, native South Amer. name for a species of wild cat, *Felis eyra*, which ranges through the W. hemisphere from Mexico to Paraguay. It is reddish-yellow, with white spots on the face, and is about the size of the domestic cat.

Eyre, Edward John (1815-1901), Brit. colonial governor and Australian explorer, son of a Yorks vicar. He emigrated to Australia, becoming a squatter on the Lower Murray R., a stipendiary magistrate, and protector of the aborigines. He undertook difficult journeys to prove the possibility of an overland route between S. and W. Australia. Starting in 1841, he reached Albany in about 5 weeks, publishing an account of his journey in England as *Discoveries in Central Australia*, 1845. In 1846 Grey appointed him lieutenant-governor of New Zealand. He was transferred to the West Indies in 1854, governing St. Vincent and Antigua, and finally became governor of Jamaica in 1862. E. took stern measures to suppress the negro rising there (1865). For this he was superseded by Grant, and prosecuted by a committee of which J. S. Mill was president. Carlyle and Kingsley were on the committee for his defence. He was acquitted in 1867, and retired with a pension. See W. L. Mathieson, *The Sugar Colonies and Governor Eyre*, 1849-1856, 1936; Lord Olivier, *The Myth of Governor Eyre*, 1933; M. J. L. Uren, *Waterless Horizons: Life-story of Edward John Eyre, Explorer, Overlander and Pastoralist in Australia*, 1948.

Eyre, Sir Vincent (1811-81), gen. who served in Afghanistan (1841-2). His *Military Operations at Cabul . . . with a Journal of Imprisonment in Afghanistan*, pub. in 1843, gave an account of his 8 months of captivity with Akbar Khan. He fought in the Indian Mutiny, being with Havelock and Outram at the relief of

Lucknow. See memoir by Malleson (*Recreations of an Indian Official*, 1872).

Eyre, Lake, lake in S. Australia. It is 4000 sq. m. in area, but in the dry season it becomes a mere salt marsh. Lakes Gairdner and Torrens are similar in character—i.e. when the supply of water is least the evaporation is greatest, whereas in the case of most lakes both supply and evaporation are more or less constant at all seasons.

Eyre-Todd, George (1862-1937), author and editor, b. Glasgow. Educ. at Glasgow High School and Univ., he was editor of *The Scottish Field* from 1908 to 1913, and later of *Scottish Country Life*. Most of his pubs. deal with Scottish hist. and topography. They include *A Sketchbook of the North*, 1890, *Byways of the Scottish Border*, 1892, *Scotland, Picturesque and Traditional*, 1895, *Byways of Scottish Story*, 1900, *The Glasgow Poets*, 1902, *The Story of Glasgow*, 1911, and *The Highland Clans of Scotland*, 1928. *The Legend of Languoreth*, 1922, is a book of verse. He also made a trans. of Harbour's *Bruce*, 1907, and pub. eds. of Ossian's *Poems*, 1888, and *Ancient Scottish Ballads*, 1894.

Eyres Peninsula, triangular piece of land on the S. coast of S. Australia, lying between Spencer Gulf and Anxious Bay, its base being formed by the Gawler range.

Eysteinn Asgrímsson (d. 1361), Icelandic monk, author of *Lilya* (The Lily, i.e. Our Lady), the greatest religious poem of medieval Iceland (twice trans. into Eng.).

Eyston, George Edward Thomas (1897-), racing motorist and consulting engineer; educ. at Cambridge Univ., where he was a rowing blue. After service in the First World War he took up motor racing and in Nov. 1937 he broke the world's land speed record with an average speed of 312.20 m.p.h., and again in Sept. 1938 at Bonneville Salt Flats, Utah, U.S.A., in his 'Thunderbolt' with an average speed of 357.5 m.p.h.

Ez Zebdani, prosperous tn of Syria, about 20 m. NW. of Damascus, surrounded by celebrated apple orchards and vineyards. Not far off is a remarkable rock-pinnacle, resembling an uplifted finger, which appears to have been a sacred pillar worshipped as a Symbol of Baal Moloch.

Ezekiel ('El (God) will make strong'), the prophet described (Ezek. iv.) as 'the priest, the son of Buzi,' by his editor, the only extant reference by an auct. writer to him. He was carried into Mesopotamia by Nebuchadnezzar with Jehoiachin, king of Judah, and settled at Tel-abib on the R. Chebar in 597 bc. Here (592 bc) the call to prophesy came to him. He did so for 22 years. E. was both prophet and priest, and the influence of Jeremiah is particularly strong in his writings. The authenticity of the book of E. has never been seriously questioned. It falls into 2 parts, the div. coming at the end of chapter 32 or chapter 39. Chapters 1-39 fall into 3 divs.: (1) before the siege of Jerusalem, threatening the complete overthrow of the kingdom of Judah on account of its alienation from God; (2) during the

siege, threatening the surrounding nations with divine punishment for their scorn of Judah; (3) after the siege, an exultant prophecy of the future. See J. Smith, *The Book of Ezekiel*, 1931; J. Harford, *The Book of Ezekiel*, 1935; A. Guillaume, *Prophecy and Divination*, 1938; H. W. Robinson, *Two Hebrew Prophets: Studies in Hosea and Ezekiel*, 1948.

Ezo, see YEZO; HOKKAIDO.

Ezra and Nehemiah, the Books of, naturally form 1 work, both being continuations of the books of Chronicles compiled by the same author (see CHRONICLES). The book of E. falls into 2 parts, of which the first, chapters i-vi., tells the hist. of the Palestinian Jews from the 1st year of Cyrus down to the 6th year of Darius Hystaspes. Of this section, the portion from iv. 8 to vi. 18 is written not in Hebrew, but in Aramaic, the common tongue of the Semitic peoples at this time. The second div. of the books, chapters vii-x., describes the return of E. and his company in the 7th year of Artaxerxes, and his action with reference to the mixed marriages. In the original, chapter vii. 12-26 is in Aramaic. The book of N. tells how that Jewish leader was sent by the Persian king as governor of Jerusalem to restore the walls of the city, and describes the manner in which he carried out his work in face of the opposition of Sanballat. There are some difficulties in regard to the chronology of the 2 books which have not yet been cleared up. It has been agreed (see L. E. Browne, *Early Judaism*, 1920) that N. historically preceded E., but if Albright is correct in ascribing the authorship to E., that cannot be maintained. See H. H. Howorth, *Unconventional Views*, 1901; G. Bosc and W. Sanday, *The Ezra Apocalypse*, 1912.

Ezra (Esdras), the Scribe, descendant of Sherajah the high-priest put to death after the taking of Jerusalem by Nebuchadnezzar, first appears as an exile in Babylon during the reign of Artaxerxes Longimanus. After the 7th year of the reign of Artaxerxes, he was permitted to lead 1400 to 1600 men, women, and children back to Jerusalem. On arrival at Jerusalem, E. found that the Jews had intermarried with the surrounding nations contrary to the Law of Moses and he called upon them to put away these wives. E. is noted as a restorer of the text of the law, and was held in high repute by later Jews. According to an erroneous Jewish tradition the canon of the scripture was fixed by him presiding over 'The Great Synagogue,' and no book could be thought inspired after his date. This may have led to the adoption of pseudonyms by Jewish religious authors (cf. the apocryphal 2 Esdras xiv. 42 ff. of c. AD 95). See W. Robertson-Smith, *The Old Testament in the Jewish Church*, 1892; C. C. Torrey, *Ezra Studies*, 1910; L. E. Brown, *Early Judaism*, 1920; J. Stafford-Wright, *The Date of Ezra's Coming to Jerusalem*, 1946.

Ezzelino la Romano (d. 1259). It. Ghibelline leader with such a reputation for cruelty that he was called 'the tyrant,' and he is so pictured in Dante's *Inferno*.

F

F: 1. Sixth letter of the Eng. alphabet, had originally (i.e. in the Semitic alphabet) the phonetic value of *v-w*, and was called *waw*. A form of it became the Gk *digamma*, which was a consonant having the value of *w*. In some Gk dialects, however, there was no need for this letter, and it was given up; in others it survived, but gradually it was discontinued and finally it only survived as the numeral 6. Another form of the Semitic *waw* became the Gk *upsilon* (see the letter U). The Etruscan alphabet, being of early Gk origin, contained the *digamma*. The Etruscans, however, expressed the sound *f* either by a sign having the form of figure 8, or by the combination *w-h*. Also the Romans adopted this combination to express the sound *f*, but at a later stage the *h* was dropped. Thus the Gk *digamma* (F) came to represent the Lat. sound *f*, whereas the Gk *upsilon* was adopted both for the consonant *v* (q.v.) and the vowel *u* (q.v.). The Lat. F was taken over by all alphabets descended from the Rom. character.

F is a 'voiceless labio-dental spirant.' Etymologically it corresponds in general to the Gk π . Cf. Eng. 'father,' Gk *pater*; 'foal' and *pólos*; 'five' and *pente*; 'fire' and *pur*. In O.E., if between 2 vowels, *f* was pronounced like *v*. In Mod. E., the word 'of' is the only example of this sound for *f*. See ALPHABET.

2. In music, the 4th note in the ascending diatonic scale of C, major and minor, the sub-dominant of the key of C. The bass or F clef is on the 4th line of the staff, the note on that line being F, and the other notes above and below being named accordingly (*g, a, b*, etc.). The scale having the note F as its tonic is the scale or key of F. F major has 1 flat as its key signature, F minor 4 flats. A lower-case italic *f* represents 'forte' (loudly) in music; *ff* stands for 'fortissimo.'

F., **Fahr.** (abbreviation for Fahrenheit), name of a thermometer, and of a scale of temp. on which the melting-point of ice is 32° F. and the boiling-point of water is 212° F. See FAHRENHEIT THERMOMETER.

Fabroni, A., see FABRONI, A.

Faber, Cecilia Francisca Josefa Böhl von (1797-1877), Sp. novelist, who used the pseudonym 'Fernan Caballero,' b. Morges, Switzerland, of a Ger. father and a Sp. mother. In 1813 her parents settled in Cádiz. Her first novel, *La Caviota*, 1849, created the type of the Andalusian vill. romances in Spain. She also pub. *Cuentos y Poesías populares Andaluces*, 1859, the earliest collection of Sp. folk-tales and songs. Her *Obras completas* were ed. in 18 vols., 1893-1914. See A. Palma, *F. Caballero, la novelista novelable*, 1931.

Faber, Frederick William (1814-63),

Oratorian and hymn-writer, nephew of G. S. Faber, b. Claverley, Yorks. Till 1845 he remained a clergyman of the Anglican Church, and was then converted to Rom. Catholicism, and was ordained priest. He founded a religious community at Birmingham, later merged in the oratory of St Philip Neri, with Newman at the head. In 1849 a branch was formed in London, with F. as superior. His *Collected Hymns* were pub. in 1861, including 'O Gift of Gifts, O Grace of Faith,' and 'Paradise, O Paradise'; and his complete works in prose and verse in 1914. See J. E. Bowden, *The Life and Letters of Frederick William Faber*, 1869; G. Faber, *Oxford Apostles*, 1933.

Faber, Sir Geoffrey (1889-), publisher and author, b. Great Malvern. He was educ. at Rugby School and Christ Church, Oxford, elected a Fellow of All Souls, and called to the Bar. In 1925 he founded the firm of F. & Gwyer, which now operates successfully under the name of F. & F. Ltd. As president of the Publishers' Association (q.v.), 1939-41, F. organised the campaign which freed books from purchase tax; he was later the 2nd chairman of the National Book League (q.v.). His prin. writings include *Oxford Apostles*, 1933, and *Jowett*, 1957. He was knighted in 1954.

Faber, George Stanley (1773-1854), celebrated Anglican divine, uncle of F. W. Faber, b. Yorks. He graduated from Univ. College, Oxford, became fellow and tutor of Lincoln College, Oxford, 1793; Bampton lecturer, 1801; rector of Stockton-on-Tees, Durham, 1805, and of Long Newton, 1811. In 1832 F. became master of Sherburn Hospital. His greatest book is *The Origins of Pagan Idolatry*, 1816. Among his other works are: *Horae Mosaicæ*, 1801, *On the Mysteries of the Cabiri* . . . , 1803, *View of the Prophecies Relating to Judah and Israel*, 1808, *Difficulties of Infidelity*, 1824, *Difficulties of Romanism*, 1826, *The Sacred Calendar of Prophecy*, 1828, *The Primitive Doctrine of Justification*, 1837, and *Eight Disquisitions upon the Prophetic Promises of a Mighty Deliverer*, 1845. See G. S. Faber's memoir in *Many Mansions in the House of the Father*, 1854.

Faber, or Fabri, Jacques (c. 1455-1536 or '37), Fr. humanist and precursor of Protestantism; properly, J. Lefèvre d'Étaples, latinised into J. Stapulensis; b. Étaples. Went early to Paris to study; in 1486 to Italy, where he remained sev. years. On his return, he propagated Aristotelian principles, by trans. and paraphrases. F. met an old pupil, Guillaume Briçonnet, who had become bishop of Lodève, and who accommodated him in the abbey of St Germain-des-Prés. He made a Fr. trans. of the N.T., and his

biblical commentaries aroused the antagonism of the Sorbonne. Removed to Meaux (of which Briçonnet had become bishop), he was protected by Francis I. Later accompanied Marguerite of Valois to Blois, where he finished a trans. of the Bible. In 1531, Marguerite removed him for greater safety to Nérac, where he d.

Faber, or Fabri, Johannes (1478-1541), Ger. theologian, b. Leutkirch, Swabia, his real name being Heigerlin. Studied theology and canon law at Tübingen and at Frieburg im Breisgau, became doctor in canon law. In 1518 he was appointed vicar-general of the diocese of Constance. He was friendly with Erasmus, Melancthon, and Zwingli; but, when the breach came, he chose the orthodox side, and became known as the Hammer of the Heretics—from his work, *Malleus . . . in Haeresim Lutheranam* (Cologne), 1524. He was prominent in many disputations and in 1531 became bishop of Vienna, where he d.

Faber, John (Johan), the Elder (c. 1680-1721), Dutch mezzotint engraver and draughtsman, b. at The Hague. One of the first artists to work in mezzotint, he came to London about 1687, and d. at Bristol. His pen-portrait of 'Simon Episcopus' on vellum is in the Brit. Museum. Among his other chief works are 'Portraits of Founders of Colleges at Oxford and Cambridge' (begun 1712), 'The Heads of the Philosophers' (after Rubens), 'Humphrey Lloyd of Denbigh, Antiquary', 1717, 'Dr Wallis, Mathematician' (after Kneller), and portraits of Bishops Aterbury and Hough, of John Caspar and Dr Sacheverell.

Faber, John, the Younger (1684-1756), see ENGRAVING.

Fabia gens, one of the oldest and most distinguished patrician clans or houses of auct Rome, probably of Sabine origin, claiming descent from Hercules and a daughter of the Arcadian Evander. It was one of the 2 gentes entrusted with the management of the 'Lupercalia' (Ovid, *Fasti*, ii. 375). Among its most famous members were:

Quintus Fabius Vibulanus, Rom. gen., consul in 484, 481, and 479. He espoused the cause of the plebeians; but as he was opposed by the patricians, he and his house, to the number of 300, quitted Rome, built a fortress on the Cremera, and began to wage war on the ter. of Veil. They were at length defeated by the Volentes (477 bc), when the whole gens perished, except one individual from whom all the later Fabii descended.

Quintus Fabius Maximus Rullianus, a famous gen., consul 5 times between 322 and 295 bc. Twice dictator, he fought in the 2nd Samnite War, gaining victories (326, 322), and at Sentinum, over united Gauls and Samnites (295). (See Livy, viii., ix.)

Quintus Fabius Maximus (nick-named Verrucosus and Ovilula), known to fame as 'Cunctator' (delayer), described by Ennius as 'unus qui nobis cunctando restituit rem,' was repeatedly consul, censor, and dictator (221, 217 bc). As

consul (233) he conquered the Ligurians and was granted a triumph. In 217 he was appointed dictator and led the Rom. armies against Hannibal. His slow, defensive policy, known ever after as 'Fabian policy' (cf. FABIAN SOCIETY), did not at first find favour with his contemporaries, but after the crushing defeat at Cannae (216), it was at once resumed. In 215 Maximus ravaged Campania, was consul for the 5th time (209), and recaptured Tarentum. He opposed Scipio's aggressive policy, and d. in 203 bc.

Quintus Fabius Pictor (b. c. 254 bc), 1st Rom. prose historian, the 'father of Latin history.' He served in the Gallic War (225), and in the Second Punic War, dying after 216. His works (written in Greek) were known as *Annals of F. Pictor*. Only fragments of his hist. (from the time of Aeneas to the Hannibalic war) survive.

Fabian Society, organisation founded in London in 1884 for the advancement of Socialism by democratic means. It was formed out of the 'Fellowship of the New Life,' an association started by the wandering Amer. philosopher Thomas Davidson with the object of reconstructing society 'in accordance with the highest moral possibilities.' The S.'s name was an allusion to the victorious policy of the Rom. gen. Fabius 'Cunctator,' the 'Delayer,' and indicated the S.'s intention to fulfil its aims gradually. Amongst its earliest members were George Bernard Shaw, Sidney Webb, Sydney Olivier, and Graham Wallas. The S. was put on the map by the pub. in 1889 of *Fabian Essays*, ed. by Shaw, and by its series of *Tracts* to which he and Sidney Webb were frequent contributors. It was instrumental in the formation of the Labour Representation Committee in 1900, out of which grew the Labour party, and remained active until 1914, claiming James Keir Hardie and H. G. Wells amongst its many distinguished members. By 1914 it had over 2500 members organised nationally, and about another 1000 organised in local societies throughout the U.K. In the 1920's and 30's the F. S. passed through a less active phase, although its popular autumn series of lectures remained a feature of the London political scene. Its summer schools, begun in 1907, also continued. Revival came in 1939 with amalgamation with the New F. Research Bureau, which had been formed 8 years earlier with Mr C. R. (later Lord) Atlee as chairman and Mr (later Prof.) G. D. H. Cole as honorary secretary. Since 1939 the F. S. has remained active and influential, both through its pubs. and its lectures, schools, and conferences. It has a Home Research Dept and International and Colonial Bureau, publishes 2 journals, a monthly news-sheet, and regular pamphlets. In addition to the national organisation there are 80 local F. S.s. Forty-one F.s held gov. office after the 1945 General Election, sev. in the Cabinet. Total membership of the F. S. in 1957, both nationally and organised through local F. S.s, was over 4000, of

whom some 130 were members of Parliament. These included Mr Hugh Gait-skill, leader of the Labour party. Recent books pub. by the S. have included *New Fabian Essays*, 1952, ed. R. H. S. Crossman, M.P., and *Fabian International Essays*, 1957, ed. T. E. M. McKitterick and Kenneth Younger, M.P. London H.Q. are at 11 Dartmouth Street, S.W.1. See E. R. Pease, *The History of the Fabian Society*, 1925; G. D. H. Cole and Margaret Cole, *The Fabian Society Past and Present*, 1952; W. T. Rodgers and others, 70th anniversary number of *Fabian Journal*, 1954.

Fabiana, a genus of S. Amer. evergreen shrubs, family Solanaceae, about 20 species. *F. imbricata* and *F. violacea*, heath-like in habit and flowering, are grown in mild Brit. gardens.

Fabii, see FABIA GENS.

Fabius, Planiades, see FULGENTIUS.

Fable (Lat. *fabula*, tale), a short story in which the characters are usually animals, to which human actions and feelings are attributed; a moral is generally appended at the end, the teaching of the F. being eminently practical and making no pretence of high ideals. The F. has affinities with the proverb and, like it, is very widely disseminated. An early collection of F.s is the Sanskrit *Panchatantra* of the 3rd or 2nd cents. BC, from which sev. other F. collections are derived. But Greece appears to have the oldest tradition of F.s. Some are found in Herodotus, and their reputed composer Aesop (q.v.) was said to have come from Phrygia in the 6th cent. BC and to have been a slave in Samos. Two centuries later a collection of his F.s was made by Demetrius of Phalerum, but this has perished, and it was left to the Rom. writer Phaedrus (1st cent. BC) to preserve Aesop's work in a Lat. rendering which we still have. Phaedrus's work was in turn transmitted to the Middle Ages in a Lat. prose version by Romulus, made in the 10th cent. There was also a Gk collection made in the 2nd cent. by Babrius and put into Lat. in the 4th cent. by Avianus.

The F. was especially popular in France, where the *Roman de Renart*, a beast-epic of 30,000 lines, took shape in the 12th cent.; later this became popular all over Europe, part appearing in England as *Reynard the Fox*. France also produced the greatest of all modern writers of F.s in Jean de La Fontaine (1621-95), whose work shows great feeling, sly fun, and delicate humour. He had various Fr. successors, but in Germany G. E. Lessing (1729-81) led a reaction against his literary handling of the F. and advocated a return to the directness and simplicity of the Aesop tradition. Other notable writers of F.s were Tomás de Yriarte in Spain, Lorenzo Pignotti in Italy, and Ivan Kryloff in Russia. In Eng. literature the F. made an early appearance. Walter the Englishman (fl. 1177) versified the F.s of the Romulus collection, and a vol. of F.s was pub. by Caxton in 1484. In the same century collections of F.s

were written by Lydgate and Henryson, the work of the latter being much the more spirited and colourful. In 1692 Roger L'Estrange pub. a collection of some 500 prose F.s. Dryden's *Fables*, 1699, are a misnomer, for they are simply tales taken from Ovid, Boccaccio, and other writers. The most important Eng. writer of F.s was John Gay, whose *Fifty-one Fables in Verse*, 1727, became highly popular. Later pubs. in the tradition of the animal F. were the *Uncle Remus* stories of J. C. Harris (1848-1908) and Kipling's *Just So Stories*, 1902. G. Orwell's *Animal Farm*, 1945, is a political satire cast in the form of a F. See H. Taine, *La Fontaine et ses fables*, 1860; E. T. Murray, *Selected Fables*, 1920.

Fabliaux, group of entertaining compositions, in the form of tales in 8-syllable rhymed verse, numbering over 100, and forming a marked section of Fr. medieval literature. The word 'fabliau' is really a diminutive of 'fable.' A fabliau always had reference to some event and was usually satirical and comic in quality, and frequently coarse. F. seem to have existed as early as the 8th cent.; but all the early examples are lost. The oldest preserved appears to be *Richeu*, about 1156, and the most modern are those of Jean de Conde and Watrquet at the beginning of the 14th cent. See J. Bédier, *Les Fabliaux*, 5th ed. 1925.

Fabre, Jean Henri (1823-1915), Fr. entomologist, b. Sainte-Léone in Aveyron. In middle life was prof. at the Natural Philosophy College of Ajaccio and the Lycée of Avignon. He was an opponent of evolutionary theory. He retired in 1871 to Sérignan where he d. F. wrote some of the most fascinating books on insects ever produced. They are filled with acute observations on the life and death of the creatures and are of deep interest to laymen. They have been trans. into all modern languages. Among his works are *Life and Love of the Insect*, 1911, and *Social Life in the Insect World*, 1912.

Fabre d'Eglantine, Philippe François Nazaire (1755-94), Fr. dramatic poet, b. Carcassonne. In spite of the hostility of his many enemies, he was successful with his *Le Collatéral* and was thereby encouraged to follow it up with his *Philinte de Molière ou la Suite du Misanthrope*, 1791, which remains his masterpiece, *L'Intrigue épistolaire*, 1791, and *Les précepteurs*, 1800. In 1794 he was arrested by the Committee of Public Safety, and later guillotined, together with Danton. His plays are noteworthy for their lively situations and good characterisation. He is also the author of the popular song 'Il pleut, il pleut bergère.' See L. Jacob, *F. d'Eglantine, chef des fripons*, 1946.

Fabri, Jacques, see FABER, JACQUES.

Fabri, Johannes, see FABER, JOHANNES.

Fabriano, Francesco di Gentile Da (c. 1360-c. 1428), It. painter, b. Fabriano, and called after his bp. He belongs to the early Umbrian and Sienese schools, and painted chiefly in Florence, one of his

finest extant pictures being the 'Adoration of the Kings' painted for the church of the Holy Trinity in Florence. A 'Madonna with Saints,' now in Berlin Museum, belongs to the same period. In 1426 he executed paintings for Pope Martin V in the church of San Giovanni, Rome, but these, together with other works, have been destroyed. His pictures indicate, for the most part, a joyful and cheerful disposition, and he had a great love of splendour and rich colouring. F. belongs to the transition period of the 15th cent.

Fabriano, It. tn in the Marches (q.v.), 35 m. SW. of Ancona (q.v.), at the E. end of the Apennines (q.v.). It has anct walls and a splendid 14th cent. bishop's palace. Many of its buildings, including the cathedral, were damaged during the Second World War. There is an anct parchment and paper-making industry. Pop. (tn) 14,000, (com.) 27,600.

Fabritius, Gaius, surnamed **Luscinus** (i.e. 'the one-eyed'), Rom. gen. and statesman, renowned as a model of incorruptibility; consul in 282 bc. He was the first member of the Fabrician gens to settle in Rome. After the defeat of the Romans by Pyrrhus in 280 at Heraclea, F. was sent to treat for ransom, and though Pyrrhus endeavoured to bribe him, all attempts were vain. During his 2nd consulship (278), F. was successful in negotiating terms of peace with Pyrrhus. He gained a series of victories over the Samnites, Lucanians, and Bruttians, and on his return to Rome received a triumph. In 276 F. was censor, and carried out with great vigour the old Rom. sumptuary laws.

Fabritius, or Fabrizio, Girolamo (1533-1619), It. anatomist and surgeon, b. Acquapendente and educ. at the univ. of Padua, where he later became prof. of anatomy and surgery. He was one of the greatest of all teachers of anatomy. Wm Harvey (q.v.), discoverer of the circulation of the blood, was one of his pupils. F.'s best work was in the field of embryology; he wrote *De formato foetu*, 1600 (reprinted with Eng. trans. 1942), and *De formatione ovi et puli*, 1621. He described the valves of the veins, practised surgery, and invented many surgical instruments.

Fabritius, Jan (1871-), Dutch dramatist, b. Assen. He went to Batavia in 1892 and took up journalism, taught himself Eng., Fr., and German, and returned to Holland in 1902. After an unsuccessful venture with a tourist agency and a return to the Dutch East Indies he came back home in 1914 and made a great success as a dramatist. His works include *Met de handschoen getrouwd*, 1906, *Onder één Dak*, 1914, *Nonni*, 1916, *Demon*, 1922, *Cesare als Gastheer in de Gevangenis*, 1927, *Mrs Jim*, 1938, and short stories (*Kimpes of Java*, 1939). He lives in England.

Fabritius, Johannes Albertus (1688-1736), Ger. classical scholar and bibliographer, b. Leipzig. His great reputation is founded on his 2 literary synopses, the *Bibliothecae*. At different times of his life he studied both medicine and theology, and he is known among theologians for his

collections of apocryphal and pseud-epigraphical literature.

Fabrics, Textile, the name applied to those F. produced by weaving, knitting, bonding, or braiding fibres, and embracing the production from various raw materials of cotton, wool, silk, flax, hemp, jute, and synthetic materials of more recent origin (rayon, nylon, etc.), which provide remarkable variety of surface. The simplest form of T. F. is the primitive manuf. in which the threads cross at right angles, regularly passing over and under one another, and a great variety of goods can be made in this way. The checks and stripes in the Scottish clan tartans are thus produced, and the thick, corded effect obtained in materials of the *repp* nature. Still greater variety in cloth types has developed in association with the use of the newer synthetic materials. See CLOTH MANUFACTURE AND FINISHING. Historically, T. F. are of anct date. Homer and other early writers speak of the weaving of the Greeks, who used to work (principally in wool) designs and patterns of mythological subjects on their tapestries. The Egyptians also were celebrated from quite early times for their T. F.

The supply of raw material and the adaptability of the people to a manufacturing life are the chief influences which control the estab. of the T. industry in any particular country. The earliest forms of machinery used were the handloom and spinning wheel, and the manuf. of homespun from wool was one of the first of T. industries to spring up among the people. It has now secured a foothold in nearly all countries in which wool F. are required for clothing. The fabrication of cotton had its greatest growth from the development of the factory system in the U.K., but after the First and Second World Wars Japan and India had estab. large industries, and there is scarcely any industrial country without its own cotton industry to-day.

To China and Japan we owe our fine and beautiful F. of silks. The silkworm flourishes in these countries and labour is relatively cheap and plentiful. These nations (in normal pre-world-war years) produced F. of a costly and beautiful nature, which could not be equalled by the more highly industrialised nations; though the introduction of the silkworm into central and W. Europe caused a wonderful increase and advance in the manuf. of silks in France, Italy, Switzerland, Germany, and Austria. But in all these countries, as in the U.S.A., where the silk industry was developed in 1870, there was a sharp decline in silk manuf. following the rapid growth of the rayon and nylon industries between the First and Second World Wars. Throughout this period the growth of the T. industry was influenced by the rapid changes of fashion and the eagerness of the people to seize upon novelty.

T.s may be said to reflect the life of nations, and in the Victorian era people became insensitive to beauty in their

scramble for wealth; pattern and design were ignored, and there was a lack of taste and need for selection. Much is owed to Wm Morris (q.v.) and a few of his contemporaries for giving us, among other things, beautifully designed T.s. In the early 20th cent. there was a marked distaste for patterned T.s. (with the exception of the Morris productions) and the 'Art Nouveau' evolved plain T.s., wall coverings prevailing. However, in 1911 Picasso and the first post-impressionists exhibited their work in London, and as a result colour and abstract design became the vogue. To an increasing extent distinctive painters were commissioned as designers, and the local art schools began to wield an influence hitherto unheard of. Throughout the first half of the 20th cent. the main emphasis was on texture and construction—with an ample variety of materials and processes available—and the results could be seen with equal pleasure in both traditional and contemporary styles. Although actual construction underwent little change there was rapid development in the performance of T. F. due to skilful blending of natural with synthetic fibres and new finishing processes. New treatments were introduced which gave F. distinct qualities, such as resistance to creasing, shrinking, and moisture. See R. Glazier, *History of Textile Fabrics*, 1923; Noel Carrington and Muriel Harris, *British Achievement in Design*, 1946; A. T. C. Robinson, *Rayon Fabric Construction*, 1951; A. J. Hall, *Standard Handbook of Textiles*, 1954; W. Watson, *Textile Design and Colour*, 1954.

Fabrizi, Nicola (1804–85), It. patriot, b. Modena. He was an ardent republican, and helped Crispi in the revolutions of 1848 and 1860. Landing at Pizzolo, he joined Garibaldi at Palermo, and was governor of Messina and minister of war under the Garibaldi dictatorship. In 1866 he was chief of staff to Garibaldi. His political aims were to secure the return of Crispi to power and to obtain agreement among the leaders of the Left.

Fabroni (Fabbroni), Angelo (1732–1803), famous It. biographer, sometimes called 'the Plutarch of modern Italy'. Educ. at Faenza and Rome, he was a Lat. scholar, and was appointed tutor to the sons of Leopold of Tuscany (1773). His chief work is *Vitae Italorum Doctrina excellentium qui Saeculis XVII et XVIII floruerunt* (20 vols.), 1778–1805. He also wrote *Laurentii Medicei Vita*, 1784, and *Vita Magni Cosimi Medicei*, 1788–9.

Façade (Fr., from the It. *facciata*, *faccia*, the face), front exterior of a building. It is generally used in referring to the front elevation of more important buildings of considerable magnitude, though the term is not necessarily restricted to these. The back elevation is spoken of as the 'rear' F., and the side as the 'lateral' F. The sides of a court are also called F.s., and distinguished as the E. or W. F.s. etc.

Faccioliati, Iacopo (1682–1769), It. savant, b. Torreglia, near Padua. Prof.

of Logic in the univ. of Padua (from 1723). With the assistance of his pupil, Egidio Forcellini, he revised the *Calepinus septum linguarum*, pub. posthumously, 1772 (see CALEPINO), and began the compilation of the *Lexicon totius latinatis* (see FORCELLINI). He also pub. *Ortografia italiana*, 1718, *Syntagmata*, 1752, *Fasti*, 1757, as well as *Il giovane cittadino*, etc., 1740. Many of his beautiful Lat. orations were pub. in the Leipzig *Acta eruditiorum*. **Fachinetti, Giovanni Antonio**, see INNO-CENT (popes), Innocent IX.

Facia, see FASCIA.

Facility, in Scots law, a word applied to mental deficiency to differentiate it from idiocy. If a person voluntarily places himself and his property under the care of one or more trustees, the case is called one of *voluntary interdiction*. The persons so engaged are called interdictors, and a facile person may not transact business—or, if he does, it is null—without the consent of the interdictors. If the court of session appoint interdictors for a facile person, the case is called one of *judicial interdiction*. Even in cases where there has been no interdiction, a contract signed by a facile person is null if it can be proved that such a person was imposed upon contrary to his own interests.

Factor, mercantile agent employed to transact business for another. He is entrusted with the management and disposal of goods, his remuneration for which is called *factorage* or commission. Unlike a broker, a F. buys and sells in his own name. The first F. act was passed in 1825, in the reign of George IV. It enacted that a F. entrusted with the goods of another should be recognised as the legal owner of those goods, so far as to give validity to any contracts made by him with any persons dealing on the faith of that ownership. See COMMISSION.

Factor, in mathematics, any one of a group of numbers whose product is a given sum. Thus 2 and 3 are F.s. of 6. In algebra it is often useful to be able to express the sum and difference of unlike terms as the product of F.s. e.g. $x^2 + 2xy + y^2 = (x+y)^2$, $x^2 + (a+b)x + ab = (x+a)(x+b)$, $x^2 - y^2 = (x+y)(x-y)$. The *F. theorem* states that if $f(x)$ is such that $f(a) = 0$, then $x-a$ is a F. of $f(x)$. This theorem enables the F.s. of complicated binomials to be found by trial and error. **Factorial** n is written $n!$ or $\text{!}n$ and is the continued product of $n(n-1)(n-2) \dots 3 \times 2 \times 1$.

Factor, Judicial (from Lat. *facere*, to do), in Scotland, is an officer appointed by the court of session or sheriff court for the purpose of managing the assets heritable or movable of one who is for some cause or other incapable of managing them himself.

Factory Inspectors, see FACTORY LEGISLATION.

Factory Legislation in Great Britain. The F. and Workshop Acts (all of which were repealed and in part re-enacted in the Act of 1857, see below) have for their object the amelioration of the

conditions under which the various classes of workers conduct their operations. The foremost provisions of these Acts are those which regulate the sanitary or hygienic condition of the workplaces, and those which relate to the safety of workpeople, with especial reference to industrial injury, the limitation and control of working hrs, particularly of child workers, the protection of child labour, and the more efficient administration of the Acts by means of F. inspectors. In the middle of the 18th cent. the country still reposed on the ruins of the medieval hierarchy of classes, with its taint of serfdom and bondage. The rise

of the factory system was the application of steam power to manuf. that the wholesale employment of children called for the Cotton Mills Act in 1819. This Act, which Robert Owen was partly instrumental in passing, limited the age at which children might work in F.s, and the time of their labour to 72 hrs per week. From that year to 1856 a series of Acts such as the Act of 1844, limiting the labour of children in calico print works to 6½ hrs a day, and Ashley's Act of 1845, forbidding night work to women, contained regulations respecting the safety, hrs, meal times, and holidays of children, young persons, and women.

J. S. Fry and Sons, Ltd.

FACTORY AND SUNSHINE: SOMERDALE, BRISTOL

A modern factory for the manufacture of cocoa and chocolate

of the 19th cent. was slowly dissolving the ties of inborn status, but the movement from Status to Contract was only complete with the industrial revolution brought about by the almost synchronous invention of labour-saving devices by Arkwright, Crompton, and others. The view that with these came a new evil of bad working conditions has been challenged. The domestic workshop was replaced by the factory. Long hrs, poor conditions, woman and child labour, and other evils were common in the domestic system. But when workers were congregated in cotton mills and factories, public attention was drawn to these conditions and it was possible for the first time to bring them under public control by Act of Parliament.

The first piece of F. L. was the Morals and Health Act, 1802, which provided for the ventilation and cleansing of cotton mills and F.s, and for the clothing, hrs of labour, and religious education of appren-

tices. But so far L. only affected the textile and allied industries. The early Acts were almost totally deficient in provisions for enforcing the law, this matter being left entirely to the local magistracy. In 1833, however, the efforts of Lord Ashley were successful in securing the appointment of the first skilled inspectors.

From 1860 to 1864 Acts were passed to include in the existing F. L. a number of non-textile industries. The Act of 1864 was remarkable for a departure in two directions: (1) it included provisions that benefited all classes of labour irrespective of sex or age, e.g. by providing for more effective ventilation so as to remove injurious gases, dust, or other impurities; and (2) it assimilated its provisions in some respects to those of the Coal Mines Regulation Acts, by adopting the special rules system of these Acts, especially in regard to 'safety' precautions. By the combined operation of the Sanitary Act, 1866,

and the Workshops Regulation Act, 1867, local authorities were invested with powers of administration to secure the general sanitation not only of F.s but of all places where manual labour was employed in the manuf. or finishing of articles for sale.

The course of the L. up to the great Consolidating Act of 1878 was unscientific. Acts of Parliament were passed *ad hoc* to deal with evils only occasionally brought home by the inquiries of successive commissions or the representations of men

efficient application of the ordinary Public Health Acts to F.s and workshops by successive transference of powers from the F. inspectors to local sanitary authorities; (3) the development of provisions for securing a greater measure of safety against accidents, e.g. by the adequate fencing of machinery in F.s; (4) the development of the system of regulating by special requirements the conditions under which certain occupations scheduled by the Home Office as unhealthy and dangerous might be carried

FACTORIES AND SMOKE: A POTTERIES LANDSCAPE

The Times

From the tower of Hanley Parish Church, looking towards Burslem

like Robert Owen. Up to 1878 there were a score of more or less unrelated statutes with a mass of regulations framed by inspectors or others avowedly in pursuance of the provisions of these statutes. In 1878, however, the Consolidating Act appeared. Like all Consolidating Acts (q.v.) this Act made some changes; it increased the minimum age of child labour in textile F.s to 10; it made provision for holidays and pauses in the continuous hrs of the fixed working day. Into the detailed provisions of this Act it is not necessary to enter, because the additional L. of 1883, 1889, 1891, 1895, and 1897 soon led to a second Consolidating Act in 1901. The Acts from 1878 to 1895 were directed mainly to: (1) the development of a specialised hygiene in factory life; (2) the more

on; (5) the restriction of the employment of women shortly after childbirth; (6) control of overtime work; and (7) the reduction of the hrs of labour for children.

A striking feature in 1893 was the first appointment of women inspectors. Up to 1937 the only parts of the F. and Workshop Act which applied to men were those respecting sanitation and safety, such as cleanliness and ventilation, means of escape in case of an outbreak of fire, and fencing of machinery, and regulations in regard to dangerous trades. Greater stringency in these latter respects came in the F. and Workshop Act, 1895, and still more in the codifying Act of 1901. The departures of the Act of 1895 in the requirements as to the sanitary condition of premises in which outworkers were employed and the maintenance of a

proper temp. in workplaces of great humidity, and ann. returns of persons employed, the investigation of accidents, and the particulars of wages due to piece-workers, were strengthened in the Act of 1901. This repealed and re-enacted with new features all the pre-existing Acts. Notable additions were made in the direction of more efficient means for securing sanitation, and for ensuring safety in dangerous trades. The minimum age of child employees was raised to 12.

THE FACTORIES ACT, 1937, which consolidates and amends all former legislation, lays down general principles for the health, safety, and welfare of factory employees. The Minister of Labour (before 1946, the Home Secretary) is empowered to make regulations to meet the needs of particular industries and changing industrial processes. The Ministry's inspectors are responsible for inspecting factories, enforcing the Act, and prosecuting for any statutory offences. Parliament has intended that factory workers should be made aware of the law passed for their protection. It would be impracticable to exhibit copies of an Act having 160 sections and 4 schedules, but factory occupiers must display at prin. entrances to their premises in places where they can be conveniently read by employees a prescribed abstract of the Act, the names and addresses of the dist. inspector and the appointed factory doctor, and every other notice or document required by the Act. The statutory definition of 'factory' includes not only the popular meaning of this term, but also many varied types of premises such as shipyards, dry docks, gasholders having a storage capacity of not less than 5000 cub. ft, and certain building and civil engineering construction sites. This definition is important to an injured workman wishing to know whether he can sue his employer for a breach of the Act or must rely on an action for common law negligence (q.v.). The brevity compelled by an article of this length permits reference only to the more important matters dealt with by the Act.

Health.—Factories must be kept clean; accumulated dirt and refuse must be removed daily from floors, work benches, staircases and passages, and floors must be effectively cleaned at least once a week. Each employee must be allowed at least 400 cub. ft of space. Workrooms must be adequately ventilated and, so far as is practicable, all dust and noxious fumes must be rendered harmless. There must be a reasonable temp. in workrooms; where light sedentary work is performed, a temp. of at least 60° must be maintained after the first hr. A thermometer must be placed in a suitable position in each workroom. Every part of a factory in which persons work or pass must be adequately lit; the minister may prescribe particular standards of lighting but cannot insist on a particular illuminant. Employees must be provided with suitable and clean sanitary accommodation. The

requisite standards are prescribed by the minister and are enforceable by the dist. council. The Factories Act, 1948, empowers the minister to make regulations for medical supervision in factories where the health of workers is likely to be injured by any substance or material used there. An underground room may not be used as a factory if certified by an inspector as unsuitable. New underground rooms cannot be used as work-rooms unless the inspector is first notified, and his written consent is required if the room is to be used for any process of a hot, wet, or dusty nature, or which is likely to give off fumes.

Safety.—The Act provides that dangerous machinery should be adequately fenced, and that every hoist and lift should be securely fenced, be of sound mechanical construction, of sound material and adequate strength, and be properly maintained. There are specific safety precautions to be observed in the use of certain materials and processes, e.g. where steam boilers, vessels containing dangerous liquids, gasholders, cranes and other lifting machinery, or explosive or inflammable substances are used in the course of work. Young persons must be properly trained and adequately supervised in the use of dangerous machinery. An employer's overall duty to provide his employees with safe access includes the proper construction and maintenance of stairs and passages, and security of ladders. Most factories must have a certificate from the dist. council that the fire escape is adequate 'having regard to the circumstances of the case.' If an inspector considers that the condition of a building is too dangerous to be used as a factory, he may apply to a magistrates' court for an order prohibiting its use for that purpose.

Welfare.—Factory employees must be provided with an adequate supply of drinking water, washing facilities, and accommodation for clothing not worn during working hrs. At least one first-aid box must be provided for each 150 workers. Employees must be given suitable seating accommodation if they can conveniently perform their work in a sitting position. The minister can make regulations for the welfare of factory workers on such matters as first aid and rest rooms, canteens, and the provision of protective clothing. Accidents must be recorded in an accident book kept at the factory and notified to the inspector.

Employment of Women and Young Persons.—The Act limits the maximum working week for young persons to 44 hrs, which, in certain industries, may be increased to 48 hrs if the minister is satisfied that this is not likely to be harmful to health. With these exceptions, the maximum hrs to be worked by women and young persons is 48 per week and 9 per day; the maximum daily 'period of employment' (i.e. the whole time from starting to finishing work) is 11 hrs, and there must be no work after 1.00 p.m. on Saturdays. Young persons under 16

may not work more than 48 hrs per week, but other young persons and women may work up to 100 hrs' overtime per year. The maximum permitted overtime worked by women and children over 16 may be increased in certain factories subject to seasonal or other special pressure. The minister may prohibit the overtime employment of young persons in any process if he is satisfied that it would prejudice their health. A young person being taken into employment must be affirmatively certified as fit for employment (i.e. not merely as not unfit). The Act also contains certain restrictions on the night employment of women and young persons. See J. Thompson and H. R. Rogers, *Redgrave's Factories, Truck, and Shop Acts*, 1952; W. M. Cooper, *Outlines of Industrial Law*, 1954; and H. Samuels, *Factory Law*, 1957.

Faculty: 1. A term formerly applied in philosophy to a fundamental function of the mind. Modern psychologists, however, regard the mind as a unity, not possessing F.s, but different activities.

2. In eccles. law, a F. is a dispensation or licence. *The Court of Faculties* is the court of the archbishop of Canterbury for granting certain dispensations, such as marrying without pub. of banns. Its chief officer is called the master of faculties, who is usually also the dean of arches (q.v.). *A Grant of Faculty by the Ordinary* is given by the consistory court of the bishop of the diocese, and is necessary in order to effect any alterations in or additions to a church or parsonage. See R. Phillimore, *Ecclesiastical Law*, 1895.

3. The word is also applied to a branch of learning. In this sense it is derived from Lat. *facultas*, which was used in medieval times to translate Gk *dunamis*. Thus, the F.s of medieval univs. were art, theology, medicine, and law. This use has since been further extended to include the body of members of a profession. Thus, in Scotland, certain groups of profs. are called 'faculties.'

Fadden, Sir Arthur William (1895-), Australian statesman, b. Ingham, Queensland, member of the House of Representatives from 1936, deputy leader and acting leader of the Australian Country Party from Nov. 1940. He held various ministerial offices in the Liberal-Country Party gov. 1940-1, was prime minister Aug.-Oct. 1941, and leader of the federal opposition 1941-3. He was a member of the advisory war council, 1940-5. In 1949 he became Commonwealth Treasurer and deputy prime minister in a Liberal-Country Party coalition. He was appointed a privy councillor, 1942, created K.C.M.G., 1951, and G.C.M.G., 1958.

Fadeyev (real name *Bulyga*), **Aleksandr Aleksandrovich** (1901-56), Russian novelist, an outstanding representative of the group of proletarian writers, much influenced by L. Tolstoy—particularly his psychological realism. F.'s 2 best books are *The Rout*, 1927, about Siberian Red guerrillas during the Civil war, and *The Young Guard*, 1945, about a resistance group of young patriots behind the Ger.

lines in the Donets Basin (see **YOUNG GUARD**). A Communist party member since 1918 and a member of the party's central committee, F. strongly influenced the development of Soviet literature; from 1946 to 1955 he was general secretary of the Soviet Writers' Union. He took a prominent part in the post-war campaign led by Zhdanov in the name of 'socialist realism' against all traces of freedom and realism in literature. He was himself attacked in 1947 for having failed to show, in *The Young Guard*, the leading role of the party, and was forced to produce a revised version in 1951. In the last years of his life F. became an alcoholic, and he finally shot himself.

Fading, decrease or fluctuation of intensity in output of radio receivers, usually due to variations in the rate of decrease of the index of refraction with height in the atmosphere, which cause variations in the bending of the trajectory of radio waves towards the earth. It is particularly noticeable at a distance from the transmitter when the surface wave and the sky wave are of about the same intensity and their fluctuating phase difference causes distortion as well as decrease in signal strength.

Faed, John (1819-1902), painter, son of a millwright, b. Kirkcudbright; was elected an A.R.S.A. in 1847 and R.S.A. in 1851; his paintings, such as 'The Cottar's Saturday Night,' are genre studies of humble Scottish life.

Faed, Thomas (1826-1900), painter, brother of John F., b. Burley Mill. He studied at the Edinburgh School of Design, and is best known as a painter of domestic genre, his pictures of this kind being 'Reading the Bible,' 'Mitherless Bairn,' etc. Consult W. D. McKay, *The Scottish School of Painting*, 1906.

Faenza (anc't *Faventia*), lt. tn, in Emilia-Romagna (q.v.), on the Lamone, 18 m. SW. of Ravenna (q.v.). It has 15th-cent. ramparts, a 15th-cent. cathedral (never completed), an arcaded market place, and anc't palaces. It has been famous since medieval times for its majolica ware (see **FAIENCE**), and it has a school of ceramics. The International Museum of Ceramics suffered severely (along with other buildings) during the Second World War, and many of its specimens were destroyed; these have, to a large extent, been replaced. The tn also has textile, furniture, iron-ware, and sulphur industries. Pop. (tn) 15,200, (com.) 48,000.

Faerøe Islands (Dan. *Færøerne*, sheep is.), group of self-governing Dan. is., situated in the N. Atlantic between the Shetland Is. and Iceland, 200 m. NW. of the former. They number 22, of which 18 are inhabited. They almost all present a steep and precipitous coast seaward, the cliffs being 1000 to 2000 ft high. The harbours do not afford a very safe anchorage, but they are washed by warm currents, and are always free from ice; the currents which run through the sounds are swift and dangerous, and storms and whirlwinds are very frequent. The

surface is almost everywhere hilly, attaining the height of 2502 ft in Strøme and 2756 ft in Østere. All timber for building purposes is imported from Norway, as there are no trees in the is., but the rocks are covered with moss and ferns and the soil is rich in peat and coal. There is little cultivable soil, and only hay and potatoes can profitably be produced. The inhab. rely chiefly on the sea for their animal food. The ann. massacre of whales, schools of which are driven into the harbour of Thorshaven and there slaughtered, is an important event. The chief sources of wealth are fish (both fresh

started in opposition to the Unionist party. Home rule was granted in 1948. Total area 540 sq. m.; pop. 31,780.

Faesi, K. Robert (1883-). Swiss poet and playwright, b. Zürich. He was prof. of Ger. literature in Zürich Univ. from 1922 to 1953. He is one of the few successful dramatists that Switzerland has produced. His tragedy *Odyseus und Nausikaa*, 1911, his drama *Opferspiel*, 1925, and his comedies *Die offenen Türen* and *Die Fassade*, 1918, are of a quality unusual in the Swiss theatre. As literary historian he has written on A. E. Fröhlich, Paul Ernst, Carl Spitteler, Rainer

FAEROE ISLANDS: KVIVIK

Royal Danish Embassy

and dried), fish oil, skins, wool, and sea-bird feathers (especially loons). The largest is. are Strøme, Østere, Vaaga, Sande and Sudere. The cap. and chief port of the group is Thorshaven in Strøme; Kirkeboe on the same is. was formerly the seat of a bishop. The inhab. are almost exclusively of Norwegian descent, and speak an old Norse dialect, although up to 1948 Dan. was the only language used in the law courts, churches, and schools. Their religion is Lutheran. The F. I. were first colonised in the 9th cent., and belonged to Norway until 1380, when they passed to Denmark. After the seizure of Denmark by the Germans in April 1940, Brit. troops occupied the F. I., but it was announced that they would be given back to Denmark after the war. In Sept. 1946 the people of the F. I. voted in favour of the is. separating from Denmark, and becoming a rep. The plebiscite was the culmination of a struggle dating from 1906 when a Home Rule party was

Maria Rilke, and C. F. Meyer; also *Gestalten und Wandlungen der Schweizer Dichtung*, 1922. In 1928 he received the Swiss Schiller Prize for his collection of poems, *Der brennende Busch*. Other poems, *Aus der Brandung*, 1917, were inspired by the First World War. He was awarded the Zürich Literaturpreis in 1946.

Faesoiae, see FIESOLE.

Fagan, James Bernard (1873-1933), Brit. dramatist. Educ. at Oxford, he became an actor in the companies of Frank Benson and Herbert Tree. His first play was *The Rebel*, 1899; others were *The Prayer of the Sword*, 1904, *Under Which King*, 1905, and *The Earth*, 1909, but his most successful was *And So To Bed*, 1926, with Peppys the diarist as chief character.

Fagging, a system prevalent in Eng. public schools by which a junior boy performs certain duties for a senior, such as running errands, stopping balls at cricket, tidying his study. The system was fully estab. at Eton and Winchester during the

16th cent.; it usually has the full approval of the authorities. The arguments in its favour are that it gives a certain amount of autonomy to the boys, and that it prevents bullying. It tends to make the younger boys helpful and willing, and devolves responsibility upon the elder boys, who are accountable for the good conduct of their fags and must protect them against bullying. A similar system known as *Pennalism* was introduced into the Ger. univs. during the 17th cent., and is estab. in Amer. colleges, where it is known as *hazing*.

Fagopyrum, see BUCKWHEAT.

Faguet, *Emile* (1847-1916), Fr. critic and essayist, *b. La Roche-sur-Yon*. He was a master in schools at La Rochelle and Bordeaux; in 1897 he became a prof. at the univ. of Paris, and was appointed a member of the Fr. Academy in 1900. He was dramatic critic to the *Soleil* and literary critic to the *Revue bleue*, and one of the most famous critics of his time. Among his works are: *Histoire de la littérature française depuis le XVII^e siècle jusqu'à nos jours*, 1900-1; and monographs on Voltaire, 1895, Flaubert, 1899, Zola, 1903; *Propos de théâtre*, 1903-10, and *Histoire de la poésie française de la Renaissance au Romantisme*, 1923-34. See A. Schéclé, *Emile Faguet*, 1904; also A. Bella, *La Critique à la fin du XIX^e siècle*, 1926.

Fagus, genus of Fagaceae, 10 species of deciduous trees, of which *F. sylvatica* is the beech native to Britain; *F. grandiflora*, Amer. beech; *F. japonica*, Jap. beech; and *F. engleriana*, *F. longipetiolata*, and *F. lucida* are Chinese beeches. *F. orientalis*, E. Europe, is the largest-leaved beech.

Fahlore, grey copper ore of 2 varieties, *arsenical* and *antimonial*. The former occurs crystallised and massive, and consists chiefly of arsenic, copper, iron, and sulphur. The latter occurs crystallised in modified tetrahedrons, and consists chiefly of antimony, copper, iron, sulphur, and zinc.

Fahlun, see FALUN.

Fahlunite, or *Tricklasite*, hydrous silicate of aluminium and iron, being an alteration product of the mineral *iolite*, due chiefly to its hydration. It usually occurs in regular hexagonal prisms, though its primary form is a right rhombic prism. Its colour is yellowish, greenish, and blackish-brown.

Fahrenheit, *Gabriel Daniel* (1686-1736), Ger. physicist, *b. Danzig*. He lived in England and Holland, studying physics and the manuf. of meteorological instruments. He introduced certain improvements in the construction of thermometers, notably the use of mercury. He divided the interval between the temp. of a mixture of ice and salt and normal body temps. into 96 parts, the present F. scale, freezing point 32°, boiling point 212°, being a later modification. He was elected F.R.S., London, 1724, and contributed papers to the *Philosophical Transactions*. See METROLOGY.

Fahrenheit Thermometer, a T. named after its inventor, *Gabriel Daniel F.* (q.v.), in which mercury is used instead of alcohol. It can measure higher temps. than alcohol; up to 570° C. If the upper part of the stem is filled with nitrogen under pressure. See THERMOMETER.

Faidherbe, *Louis Léon César* (1818-89), Fr. gen., *b. Lille*. In 1852 he went to Senegal, of which he was appointed governor. The work he accomplished in Fr. West Africa, culminating in his defeat of El-Hadj Omar, is his best memorial. When he d. he had just put the finishing touches to his book *Le Sénégal: La France dans l'Afrique Occidentale*. It is through Senegal that France plays a decisive part, political and moral, in West Africa, and it was F.'s colonisation that really led to control over a vast continent. In the Franco-Ger. War he commanded the N. Army. He withstood the attack near the R. Hallue, but was severely beaten at St Quentin in 1871. When peace was signed F. was sent by the Fr. Gov. to Egypt to study the monuments and inscriptions. His archaeological works include *Collection des inscriptions numidiques*, 1870, *Epigraphie phénicienne*, 1873, *Essai sur la langue poul*, 1875. See lives by Fulcrand, 1890, by I. M. Brunel, 1897, and Villard, and also 'Faidherbe,' by Robert Delavignette, in *Les Techniciens de la Colonisation* (ed. C. Julien), 1946.

Faidit, *Gaucelm* (c. 1160-c. 1215), Provençal troubadour, *b. Uzerche*, Limousin. He was at first a *jongleur*, and wandered about with his wife, Guilhelma Monja, to the different European courts. In 1202 he accompanied Boniface III of Montserrat to the crusades. Sev. of his songs are exhortations to the young and the strong to take part in the Holy War. Among his masters were Richard Coeur de Lion (whose death he lamented in a beautiful *planh*), Raymond d'Agout, and Geoffrey of Brittany. Sev. songs and fragments of love lyrics are extant and are of great beauty. See R. Meyer, *Das Leben des Troubadours G. Faidit*, 1876.

Faience, name given on the Continent to tin-glazed earthenware; a Fr. word derived from the It. tin, *Faenza*, famed for its Maiolica (q.v.). In England F. has the same meaning as Delftware (q.v.). For its hist., see EARTHENWARE, *European*. See A. Lane, *French Faience*, 1948.

Faifo (Phai-phô), port in the prov. of Quang-nam, Annam, standing on the N. bank of a riv., 5 m. from the sea. To-day F. is a tn of 10,000 inhab., engaging in the export of local products (sugar, tea, silk, etc.). During the 17th cent. it was the centre of trade between Cochinchina and Japan, and had a considerable Jap. merchant community. European ships also called to trade, and there was a Christian mission.

Fallsworth, tn of Lancs, England, 4 m. N.E. of Manchester. Its chief industry is cotton manuf. Pop. 18,540 (1954).

Fain, *Agathon Jean François*, Baron (1778-1837), Fr. historian, and secretary to Napoleon I, *b. Paris*. He was a member of the Committee of Public Safety

during the Revolution, and later held office under the Directory and the Consulate. He became archivist and secretary to Napoleon, whom he accompanied on all his campaigns, until the emperor's abdication in 1814. In 1830 Louis Philippe made him first secretary of the cabinet. His works on the military and diplomatic events of his time are valuable for their accuracy, the years 1812-14 being particularly well covered.

Fainéants, Rois, the 'Do-nothing Kings,' nickname of the later Merovingians of France, namely Thierry III, Clovis III, Childbert III, Dagobert III, Childeric II, Thierry IV, and Childeric III. They were so called because during their reigns the rule of the country virtually lay in the hands of the mayors of the palace.

Fainting, or **Syncope**, sudden loss of sensibility due to arrested circulation. The term is particularly applied to minor cases of shock where the condition of insensibility is transitory. The observable symptoms of F. are a sudden pallor of the face and loss of control over the muscles. The patient falls more or less suddenly and remains inert without any movement whatever. The eyes are half-closed or shut, the limbs are limp, the pulse is very weak or disappears altogether. It may distinguished from epilepsy by the lack of movement and from catalepsy by the characteristic pallor. A feeling of faintness may not proceed as far as collapse; the patient feels dizzy, staggers for a moment, and suddenly recovers. The immediate cause of F. is an insufficient supply of blood in the brain. This may be brought about by actual loss of blood due to injury, or by poverty of blood due to a weakened condition, or may be preceded by a nervous disturbance. When F. is due to mental emotion, the medulla oblongata is over-stimulated to a condition of partial paralysis; the respiratory functions are sluggishly performed, the heart contracts feebly, and the circulation fails.

Treatment.—When assailed by a feeling of faintness, the patient should sit down and press the head downwards between the knees, when the flow of blood to the brain should be re-established. If the patient has already collapsed, he should be laid down with the head as low as possible and the respiratory functions stimulated by cold water on the face, by pungent aromatic vapours in the nostrils, etc.

Fair (Lat. *feriae*, holidays), large market, held periodically. A F. was usually held on a holiday or a saint's feast to take advantage of the concourse of people. According to Cicero, the Greeks utilised the religious games for trading purposes; and the Romans, too, traded during the ann. feast at the temple of Voltumna in Etruria. During the reign of Edward I of England it was felt that the churchyards or immediate precincts of the churches and abbeys were being desecrated by F.s, and a law, embodied in the Statute of Winton, was passed to check the custom of holding F.s near a place of worship. Courts of summary jurisdiction

were formed to deal with any disputes or questions that might arise during a F., the date and duration of which had to be publicly made known beforehand. The traders who managed the F. were usually itinerant merchants, who went from place to place with their wares. At the time when means of communication were few, the F. was of great importance, but with new methods of transport it has almost passed away. St Bartholomew F. was held in London at Smithfield till 1855. Other famous F.s were Stourbridge F. near Cambridge, which lasted for 3 weeks, Glasgow F., and Greenwich F. In England the F. has in many cases developed into a market for livestock. One of the largest horse F.s is held annually at Horn-castle, in Lincs; Exeter has a F. in Dec. for horses and cattle; Ipswich has one for lambs in Aug.; and Nottingham has an Oct. goose F. Some F.s, such as that of Gloucester, are famous for the agric. produce sold. In some country tns, such as Witney, the old-fashioned F. still remains.

In Ireland the famous and commercially important 'Puck Fair and Pattern,' which lasts 3 days, is held annually in Killorglin (q.v.) during the 2nd week in Aug. and attracts thousands of visitors. On the evening of the first or 'Gathering Day' a pook goat, usually a magnificent animal, is 'crowned' and, enclosed in a spacious cage, is enthroned on the top floor of a 3-tiered platform some 40 ft high, which is erected in the tn square. Here for the next 2 days (i.e. 'Puck Fair Day' and 'Scattering Day'), catered for by watchful attendants, he presides over a great cattle, sheep, and horse F. as well as the huge throng of people engaging in commerce or amusing themselves at side-shows of every conceivable kind. Shops and business premises are kept open day and night during the 3 days. Some hold that the custom of enthroning a goat is a survival from pagan times, but local tradition has it that 'Puck' commemorates an occasion when the stampeding of herds of mt goats gave warning of the approach of Eng. forces.

F.s are still common on the Continent. Leipzig, before World War II, had 3 ann. F.s, each lasting 3 weeks, where leather, cloth, and furs were the chief commodities sold. Other F.s of note were those of Frankfurt-on-Main and Frankfurt-on-the-Oder, Beaune in France, Bergamo in Italy, Debreczen in Hungary, and Corky in Russia. Siberia had F.s at Kaskhta and Irbit, and Arabia at Mecca. The F. has many points of similarity with the *mela* of India. See H. Morley, *History of the Fair of St Bartholomew*, 1859; C. Walford, *Fairs, Past and Present*, 1883; and *The Law relating to Markets and Fairs*, by Pease and Chitty, 1899. This term in the U.S.A. applies now solely to industrial exhibitions and what are known in England as fancy bazaars. In the former are included the 'state' and 'county fairs,' one of the first of which was the New York World's Fair opened in 1853 by a company formed in 1851. See also EXHIBITIONS.

Fair Isle, small isolated is. of the Shetlands (q.v.), Scotland, situated between that group and the Orkneys (q.v.), 24 m. SW. of Sumburgh Head, area 6 sq. m. Its sandstone cliffs are high and rocky, and it has an extremely indented coastline. Prin. industries are fishing and the production of knitted goods with characteristic intricate patterns in many colours. The patterns of the hosiery and other garments seem to be Moorish and may have reached the is. through the wrecked crew of one of the Armada vessels in 1588. Some copper is found. The is. has a bird-watching station for research into the origins, routes, wintering areas, feeding habits, etc., of spring and autumn migrators. Pop. 100.

Fair Maid of Kent (1328-85), Joan, daughter of Edmund, earl of Kent, granddaughter of Edward I; so called on account of her beauty. Her marriage to the earl of Salisbury was declared null, and in 1361 she married the Black Prince (q.v.) and was the mother of Richard II (q.v.). She is said to have mediated between her son and John of Gaunt (1385).

Fair Maid of Norway (1283-90), titular queen of Scotland. She was Margaret, daughter of Eric II of Norway, and granddaughter of Alexander III of Scotland, and she d. on her way from Christiania to succeed Alexander on the Scottish throne.

Fair Oaks, or **Seven Pines**, railway station of Virginia, U.S.A., situated 7 m. E. of Richmond. It is noted as the scene of a battle of the Civil war in 1862, when the Union forces under McClellan gained a victory over the Confederates under Johnston. The former lost 5031 men, while the latter lost 6134.

Fair Rosamond, see CLIFFORD.

Fairbairn, Andrew Martin (1838-1912), theologian, b. near Edinburgh, and educ. at Edinburgh and Berlin Univs. In 1877 he was appointed principal of the Airedale Congregational College, Bradford, a post which he gave up in 1886 on receiving a similar appointment at Mansfield College, Oxford. Author of *Studies in the Philosophy of Religion and History*, 1876, *Studies in the Life of Christ*, 1881, *Christianity in the First and Nineteenth Centuries*, 1883, *The City of God*, 1883, *Religion in History and in Modern Life*, 1884, *Christ in Modern Theology*, 1893, *Philosophy of the Christian Religion*, 1902, and *Studies in Religion and Theology*, 1909.

Fairbairn, Sir William (1798-1874), Scottish civil engineer, b. Kelso, Roxburghshire. In 1804 he began his apprenticeship at the Percy Main Colliery, North Shields, where he became a friend of George Stephenson. In 1817 he began a business of his own in Manchester, entering into a partnership with James Lillie, which lasted till 1832. He introduced improvements in mill works and water wheels, substituting iron for wood in the shafting. He was one of the first to build iron ships, which he floated on the Forth and Clyde Canal. In 1835 he estab. shipbuilding works at Millwall, London, and was consulted by the Brit.

Association on the supposed defects in iron caused by hot-blast furnaces. He carried out the construction of the tubular bridge across the Menai Straits, designed by Robert Stephenson, and himself invented the rectangular structures of the Britannia and Conway bridges. He wrote extensively on engineering subjects. See *Lives* by W. Pole, 1877, and S. Smiles (in *Lives of the Engineers*), 1861.

Fairbanks, Douglas (1883-1939), Amer. cinema actor (real name Douglas Ullman), b. Denver, Colorado. He was educ. at Jarvis Military Academy, Denver, E. Denver High School, Colorado School of Mines, and Harvard Univ. He then took to the stage, under the tragedian Frederick Warde—his first part being François the lackey in *Richelieu*. After a period of Shakespeare, in whose plays F. did not shine, he joined the company of Herbert Kelcey and Effie Shannon. He next became a clerk in a broker's office in Wall Street. After that he and 2 acquaintances went as 'hay-stewards' in a cattle-boat to Liverpool—tramped through England, France, and Belgium, working at odd jobs, for 3 months—then returned to America. For a little while F. was in a machine-shop; next, rambling in Cuba and Yucatan. When he returned to the U.S.A. he took up acting again. His first appearance on the New York stage was in 1901. He starred in *Man of the Hour* and *The Gentleman from Mississippi*. Married Anna Beth Sully, of Providence, Rhode Is., in 1907. After 1915 he confined himself to films, which included *The Half-Breed*, *The Habit of Happiness*, *The Good Bad Man*, *Reggie Mixes In*, *The Mystery of the Leaping Fish*, and *Manhattan Madness*. In 1917 he owned his own producing company. His outstanding pictures include *The Mark of Zorro*, *The Three Musketeers*, *Robin Hood*, *The Thief of Bagdad*, *Don Q.* and *The Black Pirate*. Divorced, 1918. Married, secondly, 28 Mar. 1920, the film-actress Mary Pickford (who obtained a divorce, 1935); third, Lady (Sybil) Ashley.

Fairfax, Edward (1580-1635), translator, b. Denton, Yorks, son of Sir Thomas F. His trans. of Tasso's *Gerusalemme Liberata*, pub. in 1600 with the title *Godfrey of Bulloigne, or the Recoverie of Jerusalem*, is one of the few trans. which themselves are literature, and was highly praised by Dryden and Waller. F. also wrote *A Discourse of Witchcraft*, 1621, and number of eulogues. See W. George, *Daemonologia*, 1882.

Fairfax, Sir Henry (1837-1900), adm. He distinguished himself as a lieutenant on the *Ariel* in suppressing the slave traffic of the E. coast of Africa, and in 1872 acted as naval attaché to Sir Bartle Frere in an expedition to the sultan of Zanzibar. In 1877 he was appointed to the command of the *Britannia*, when he personally superintended the studies of Prince Albert Victor and Prince George (afterwards George V). He was in command of the *Monarch* at the bombardment of Alexandria, 1882.

Fairfax, Thomas, 3rd Baron Fairfax of Cameron (1612-71), soldier, son of Ferdinando, 2nd Lord F. (q.v.), b. Denton, Yorks, and educ. at St John's College, Cambridge. He fought in the siege of Bois-de-duoc (1629), and later in the 1st Scottish war, but it is as a parl. gen. during the Civil war that he is best remembered. He captured Leeds and Wakefield in 1643, and in the following year had a command at Marston Moor. In 1645 he was appointed commander-in-chief of the parl. army, and in that year defeated Charles I at Naseby. He was appointed one of the king's judges in 1649, but refused to sit at the trial, and, as a Presbyterian, was bitterly opposed to Charles's execution. In 1650 he retired from public life, but headed the commission to invite Charles II to return to England, 1660. See life by C. R. Markham, 1870.

Fairfax of Cameron, Ferdinando, 2nd Baron (1584-1648), soldier, son of Thomas F., 1st baron, of Denton, Yorks. His name is associated chiefly with the Civil war conflict in Yorks. When Charles I established his quarters at York, the Commons sent F. to report on the king's movements, and F., by protesting against the presentment of the grand jury of Yorks, received the thanks of parliament. He commanded the parl. forces in Yorks, but was severely defeated at Adwalton Moor.

Fairfield: 1. City of Jefferson co., Alabama, U.S.A., 5 m. W. of Birmingham, an industrial suburb of Birmingham founded in 1910 to provide for the employees of the U.S.A. Steel Corporation. Pop. 13,200.

2. City of SE. Iowa, U.S.A., with important manufs., the site of Parson's College (Presbyterian). An ann. Chautauqua assembly is held here. Pop. 6700.

Fairford, vil. of Gloucestershire, England, on the Colne at the foot of the Cotswold Hills, 9 m. E. of Cirencester. It is noted for its old church in the Perpendicular style, built by John Tame in the 15th cent. It has fine stained-glass windows of Flem. workmanship. See J. G. Joyce, *The Fairford Windows*, 1872. Pop. 1380.

Fairhead, or Benmore Head, promontory on the N. coast of Ireland, co. Antrim, 5 m. NE. of Ballycastle. It is of columnar basaltic rock, 636 ft. high.

Fairies and Elves (Fr. *fée*; Low Lat. *fata*, from *fatere*, to enchant; Lat. *fatum*, fate; O.E. *elf*; Icelandic *álfr*), supernatural beings existing in the mythology and folklore of all nations. They have often been represented as tiny, winged sprites, sometimes malignant, sometimes benign, who possess a mysterious power over human destinies. They need not, however, be diminutive beings, and have often appeared in the shape of humans. The F. of Teutonic and Celtic lore probably owe much to the sirens, nymphs, and fauns of classical mythology.

They have often taken the form of beautiful women who have beguiled men by their charms. Such were the Sicilian

Sirens, whose singing on the rock near Cape Pelorus had a fatal attraction for all seafarers until Ulysses, by an artifice, sailed safely past them, and they then drowned themselves in the sea. There are fairy lemans in Homer, elf-maids in Scandinavian literature, and R. L. Stevenson, in *Island Nights' Entertainments*, says that they are not uncommon in Samoa. F. are soulless beings, but by marriage with a man may attain immortality. When F. have left their own country to marry and live with men, they have generally been bound by some restriction, which, when disregarded, brings great misery. An example is in the story of Melusina (q.v.). According to another superstition, F. have to pay a yearly tribute to the powers of hell, and for this purpose they are always trying to steal little children, leaving changelings in their place. Moreover adults, too, have sometimes been lured to fairyland, and can seldom return from that country. A human being is doomed if he eats fairy food, and Falstaff, it will be remembered, dared not speak to F. or be a witness of their deeds: 'He that speaks to them shall die; I'll wink and couch: no man their works must eye.' F. can be very malicious—Falstaff was pinched by his friends disguised as F. and hobgoblins. There have always been good and bad F. As in the old nursery fairy tale of the *Sleeping Beauty*, so at the birth of Ogier le Danois (q.v.) 6 F. were present, 5 of whom gave good gifts, but the 6th was a bad fairy. In England, the fairy has been, in general, a domestic spirit, who visits houses at nights, sweeps the floor, threshes the corn, or skims the milk. Considerable interest has been aroused of late years in Celtic fairy legends through the writings of Andrew Lang, W. B. Yeats, Ernest Rhys, and others. Irish F. dwell in crevasses and underneath old tumuli, in some ways the Irish leprechaun thus resembling the black earth E. of Scandinavia, who burrowed underground dwellings, where they retreated with stolen treasure. Scottish F., brownies, kelpies, and the like, are supposed to be more malignant than their Irish brethren, and are creatures of storms and tempests.

Consult L. F. Maury, *Les Fées du Moyen Age*, 1843; T. Keightley, *Fairy Mythology*, 1850 (new ed. 1910); W. Sikes, *British Goblins*, 1879; J. Grimm, *Deutsche Mythologie* (Eng. trans.), 1880-1888; T. Goker, *Fairy Legends of Ireland*, 1882; W. B. Yeats, *Celtic Twilight*, 1883, 1902; and *Fairy and Folk Tales of the Irish Peasantry*, 1888; W. Craigie, *Scandinavian Folk-lore*, 1896; Sir J. Rhys, *Celtic Folk-lore*, 1901; R. Hunt, *Popular Romances of the West of England*, 1923; G. Willoughby-Meades, *Chinese Ghouls and Goblins*, 1928; M. W. Latham, *Elizabethan Fairies*, 1930; J. MacCulloch, *Were Fairies an Earlier Race of Men?*, 1932; L. Spence, *The Minor Tradition of British Mythology*, 1948.

Fairless, Michael, pseudonym of Margaret Fairless Barber (1869-1901), essayist, b. Castle Hill, Rastrick, Yorks. For

some time she worked as a nurse in a London alum, but an affection of the spine rendered her a semi-invalid living in a country cottage, where she occupied her time with writing reflective essays. *The Roadmender*, which she completed on her deathbed, had a great vogue in the early years of the century. The best-known of her other books are *The Gathering of Brother Hilarius*, 1901, and *The Grey Brethren*, 1905. Her *Complete Works* were pub. in 1932. See W. S. Palmer and A. M. Haggard, *Michael Fairless: Her Life and Writings*.

Fairlie, vil. of N. Ayrshire, Scotland, situated on the E. shore of the Firth of Clyde, 2½ m. from Largs. It is noted for yacht-building. Pop. 1400.

Fairmont, tn of W. Virginia, U.S.A., and the cap. of Marion co. It is situated on the Monongahela, 55 m. SE. of Wheeling, at an important railway junction. It ships great quantities of coal and manufs. glass, textiles, aluminium, mining machinery, fibre board, coke, chemicals, and clay and tobacco products. Pop. 29,346.

Fairy Rings, bare or green circles in pastures or meadow lands which were once thought to be the scene of the midnight revels of fairies. However, a scientific explanation of the phenomenon is that the rings are caused by the growth of the subterranean mycelium of fungi, which radiates outward to find fresh soil and nourishment. The circles are bare because the *Agaricus campestris* (common mushroom), or *Marasmius oreades* (the F. R. champignon), has exhausted the fertility of the earth, so that grass cannot grow, but as soon as the fungi begin to decay the ground becomes refertilised by the rich nitrogenous products of putrefaction and the grass grows greener than ever.

Fairy Tale, see CHILDREN'S BOOKS.

Faisal, king of Iraq, see Faisal.

Faisans, *ils des*, or *île de la Conférence*, is. in the Bissagos (q.v.) on the frontier between France and Spain. Here was concluded the Peace of the Pyrenæes (q.v.).

Faith is one of the 3 Theological Virtues (as they are called) of which 1 Cor. xiii. speaks, and the first in order of necessity (though not of importance). Jesus Christ insisted on F. in those who sought his help; and Heb. xi. 6 says that without it it is impossible to please God. One of the major principles of St Paul is that we are justified by F. and not by works. There are 2 prin. definitions, corresponding to 2 different kinds, of F.: Theological and Fiducial. (1) *Theological F.* is the assent of the mind to a truth on the authority of God as revealing it. This is F. in the Catholic sense; an intellectual act, but one commanded by the Will (with the assistance of Grace) since revealed Truth transcends Reason and often perplexes it, though it cannot contradict it in the end, since Truth is necessarily one.

(2) *Fiducial F.* is an act of trust and confidence in a person, i.e. in Christ as the Saviour; and Luther and the other Reformers following him declared that this F. alone (*sola fide*) is necessary to

justification (q.v.). Appealing to St Paul's teaching in the epistle to the Romans, and elsewhere that we are justified by F. without works, they radically denied the value and authority of the whole eccles. system, with its hierarchy, sacraments, penitential discipline, etc. The meaning of F. in the N.T. does in fact range from intellectual assent (Jas. 11. 19 and Heb. xi. 6) to complete surrender to a Person, Jesus Christ (2 Tim. 1. 12). In quoting the scripture, therefore, it is important to study the meaning of the particular passage carefully. So also with the expression 'works,' St Paul condemns the works of the Law (Rom. iii. 20); St James requires (11. 15-17) the works of charity. St Paul is contrasting trust in Moses and the Mosaic Law with its observances, with trust in Christ, which does not of course exclude obedience to His law. 'St Paul writes, as a theologian, against the theories of human merit; St James, like a prophet, against a barren and unsympathetic orthodoxy' (Kidd). There is in fact much common ground between Lutheran and Catholic F., in the Lutheran sense, is equivalent to what the Catholic calls *Fides Formata*, F. informed by charity, without which F. is dead (as James says). Moreover, the Council of Trent affirmed as strongly as Luther that 'the meritorious cause of Justification is our Lord Jesus Christ who merited Justification for us by His Passion.' The real contrast in the N.T. is not between faith and works but between our merits and Christ's (Rom. iv. 4, 5, 24, 25). See LUTHER; JUSTIFICATION; see also B. J. Kidd, *The Thirty-nine Articles*, 1899; M. Prummer, O.P., *Manuale Theologiae Moralis*, vol. 1, 1915.

Faith-healing is a mind cure, resting on the firm conviction that, as suggested in Jas. v. 14, pain and disease may be dispelled without medical aid, a lively faith in Divine Power being the one *sine qua non*. The miraculous recoveries which took place in the temples of the Gk god Aesculapius may be regarded as instances of F.; so also may some of the cures brought about by belief in the efficacy of relics, shrines, and holy places. The Waldenses, Moravians, and the Peculiar People of a later date all trusted to prayer and anointment with oil for the relief of sickness, while faith cures were an integral part of the beliefs of Pietists, and many sects of Puritans and Methodists, as well as afterwards of the Irvingites and Mormons. Prof. Blumhardt and Dorothy Trudel conceived of healing rather in the sense of the medicine men of savage tribes, that is, as the expulsion from the body of an evil and tormenting spirit, whilst modern Christian Scientists go so far as altogether to deny the existence of physical suffering and disease. (See CHRISTIAN SCIENCE.) Psychologists attribute so-called cures by faith to powers of suggestion which are peculiarly developed in any assemblage where the nervous and emotional activity is high. In Jan. 1931 the Lower House of Convocation of Canterbury passed a resolution in favour of

spiritual healing. The resolution petitioned the Archbishop of Canterbury to appoint a joint committee to draw up a provisional service for Unction (anointing the sick with oil) and Imposition of Hands for temporary use until a permanent and fully authorised form could be issued under Synodical sanction. In 1955 the Archbishop of Canterbury set up a commission to examine and report on the question of Divine Healing. The commission is expected to report in 1957. See J. M. Hickson, *Heal the Sick*, 1924; G. G. Dawson, *Healing; Pagan and Christian*, 1925.

Faithfull, Emily (1835-96), Eng. philanthropist, devoted her life to the improvement of the status, remuneration, and sphere of labour of working women. In 1860 she started the Victoria Press, in which the printing was in the hands of women, and from 1883 to 1881 she continued to publish the *Victoria Magazine*, and to plead in its columns for greater equality between the sexes. Her lectures, both in Great Britain and the U.S.A., revealed to the public her noble aims and the disinterested nature of her work. Her pubs. include *Change upon Change*, 1868, and *Three Visits to America*, 1884.

Faithorne, William (1616-91), painter and engraver, b. London. He was imprisoned as a Royalist in the Civil war, and when released he went to France. He returned to England about 1650 and carried on work as an engraver and print-seller. His engraved portraits include those of Oliver Cromwell and Charles I. F. wrote *The Art of Graving and Etching*, 1662.

Faiyûm, fertile prov. of Upper Egypt, lying W. of the Nile, a little above the head of the delta, and 65 m. from Cairo. Cap. Medinet-el-F. Geographically it is a S. oasis in the Libyan desert, irrigated by means of a canal (Bahr-Yusuf) running through a narrow gorge to the Nile valley. Its area is about 670 sq. m., a portion of which is occupied by a sheet of water, the Birket-el-Kerun (35 m. long), known to the ancients as Lake Moeris, by the shores of which stood one of the wonders of the world, the famous 'Labyrinth.' The chief crops are cereals and cotton, but the prov. is also noted for its figs and grapes. Olives, too, and rose trees, from which the inhab. manuf. attar of roses, are grown. Other products are sugar, flax, hemp, oranges, peaches, and pomegranates, and F. also has a good breed of sheep. The cap., Medinet-el-F., is a great agricultural centre. Important explorations have been made by Flinders Petrie at the sites of ancient cities in this prov. Dr Johnson, Librarian of Oxford Univ., has also made interesting discoveries of papyrus rolls in excavated tombs in this region in the years immediately preceding the First World War. Pop. (prov.) 671,800. See R. H. Brown, *Faiyûm and Lake Moeris*, 1893; P. Viereck, *Faiyûm*, 1928; C. Canon-Thompson and E. W. Gardner, *The Desert Faiyûm*, 1935; J. Ball, contribution to *The Geography of Egypt*, 1939.

Faizabad, or Fyzabad, cap. of the Badakhshan prov., Afghanistan, on the Koksha R., 87 m. ENE. of Kunduz, and N. of the Hindu Kush. Murad Beg deported all its citizens to Kunduz in 1821 and razed the tn, but it is now once more a flourishing entrepôt. Pop. 26,000. See also BADAKHSHAN.

Fajardo, tn on the E. coast of Puerto Rico. There are sugar plantations and orange groves in the fertile environs, whilst the tn itself is a busy entrepôt. It manufs. cigars, soft drinks, and furniture. Pop. 15,336.

Fakaofu, see TOKELAU.

Fakenham, tn 20 m. WSW. of Cromer, Norfolk, England. It has an important cattle market and a 14th-cent. church. Pop. 3,000.

Faking, see FORGERY IN ART.

Fakir (Arabic *faqir*, poor) came to mean pious, one who takes his religion seriously;

Canadian Pacific
AN INDIAN FAKIR

with this usage may be compared the name Ebionites. Another name for such people is dervish (q.v.). The F.s of India

are properly Hindu ascetics, who belong to strict religious orders, but F. is also applied to wandering charlatans, who profit by the villagers' superstitions to gain nefarious livelihoods.

'Falaba,' S.S., liner of over 4000 tons belonging to the Elder Dempster Company, torpedoed by a Ger. submarine off the S. coast of Ireland on 27 Mar. 1915, with the loss of over 100 lives. Indignation in America was widespread over this outrage.

Falaise, Fr. tn in the dept of Calvados, on a cliff (*falaise*) above the R. Ante. It is 22 m. SSE. of Caen, and is famous for the great castle of the dukes of Normandy, in which William the Conqueror was b. in

W. F. Mansell

FALAISE CASTLE

The birthplace of William the Conqueror

1027. There is a church dating back to the 11th cent., and another dating back to the 13th cent. The tn suffered very severely during the Second World War. In the SE. suburb of Guilbray a famous fair is held annually in Aug. There are textile manufs. and a trade in horses. Pop. 4600.

Battle of the 'Falaise Pocket.'—The name given to the Ger. débâcle on the W. Front, 12-22 Aug. 1944. On 7 Aug. the Germans, on Hitler's orders, attempted to drive through from Mortain to the coast at Avranches; 5 panzer divs. and 2 infantry divs. took part. After 5 days of heavy fighting, and relentless attacks by the allied air forces upon the Ger. troops, the Ger. commanders decided to attempt to extricate their forces and re-form a N.-S. line further to the E. Already, however, on 8 Aug., Montgomery had ordered an encirclement ancillary to the general allied enveloping strategy, and on 13 Aug., when the Germans started to withdraw E., the Amer. Third Army was

already at Argentan and the Canadians were near F. Thus the Germans were in a pocket between the Brit. and Canadians in the N. and the Americans in the S. Their task was to keep the sides of the pocket apart, and the mouth, between F. and Argentan, open; this they succeeded in doing for some days under fierce allied air and artillery attack, and, despite the mounting pressure of the allied encirclement, they extricated a proportion of their armour. By 16 Aug. the Ger. forces in the pocket were in chaos, and on 19 Aug. the mouth of the pocket was closed. On 20 Aug. the Germans made one last, unsuccessful, attempt to escape. By 22 Aug. the pocket had been eliminated. In the battle the Ger. Army lost the greater part of 8 infantry divs., and part of 2 panzer divs. See Gen. Eisenhower's Report to the Combined Chiefs of Staff, H.M.S.O., 1946. See also WESTERN FRONT in SECOND WORLD WAR; INVASION OF NORMANDY.

Falangists, Sp. Fascists, who co-operated with Gen. Franco in the Sp. Civil war, 1936-9. Their tendency towards social radicalism brought them up against the Conservative military caste and they were repressed in 1938. Franco, however, assumed the leadership of the F. and they were soon the only political organisation tolerated in Spain. Their former leader, Antonio Primo de Rivera, son of the one-time Sp. dictator, was shot by the Republicans. The F. were undoubtedly under Ger. and It. influence during the Civil war. Since the end of the Second World War the F. have tended to resist the more conservative trend in Franco's policy, such as his improved relations with representatives of the Sp. royal family.

Falashes (from Ethiopic *falas*, a stranger), tribe of Hamitic stock and Jewish religion, who were subject to the kingdom of Tigre in Ethiopia. They speak Ethiopic (or Ge'ez), and their O.T. and other sacred books are written in this language, not in Hebrew. Though their religion is infected with pagan beliefs, such as faith in the potency of the evil eye, they practise a higher morality than their Christian rulers. Unlike their co-religionists, they live by agriculture, not by commerce. Until 1800 they had their own king, and are remarkable for their voluntary segregation from other tribes or sects. Their musical instruments are adduced as further evidence of a close link with the Jewish culture.

Falchion, see SWORN.

Falco, Gian, see PAPINI, GIOVANNI.

Falcon (Lat. *falco*, Teutonic *valken*), a name given to certain members of the Falconidae (q.v.), a family of birds of prey which catch their quarry on the wing. They have short curved beaks with 1 notch in the upper mandible; the wings are long and pointed, and the toes elongated. *Falco rusticolus candicans*, the Greenland F., is white in colour, and is sometimes called the white gerfalcon; *F. rusticolus rusticolus*, the Scandinavian F.,

and *F. rusticolus islandicus*, the Iceland F., migrate southward in winter, the latter occasionally reaching Britain; *F. peregrinus*, which, together with the N. F. and other species, is used in falconry, ranges over Europe, China, Japan, NE. Africa, and NW. India. This species is resident and a passage migrant in England, and is found nesting on lofty cliffs; it is amazingly swift in flight and kills game and birds of all kinds. See also FALCONRY.

Falcón, most northerly state in Venezuela, bounded N. and W. respectively by the Caribbean Sea and the Gulf of Venezuela (also by Zulia), and southward by the state of Lara. Tropical bogs and sandy levels line the coast. Inland trade passes through Coro (q.v.), the cap., the main seaport being La Vela de Coro. Coal and an increasing amount of petroleum are produced. Coro is now being linked by rail with the main system at Barquisimeto. Pop. 258,760.

Falcon Island, one of the Is. of Tonga, lying to the westward of Haapai. A volcanic, 'jack-in-the-box' is., which has disappeared and re-appeared sev. times since a reef was first observed in 1781. Named after H.M.S. *Falcon*, which observed it in 1865. The submarine volcano was again in eruption early in 1955. Each time the is. appears, the Tonga Gov. annexes it.

Falcone, Aniello (1800-65), It. battle painter, is the most famous of Ribera's (q.v.) pupils, and himself the founder of a school. In his battle-scenes, taken both from biblical and secular stories, he shows himself capable of suggesting animation. During Massaniello's revolt (1647), he organised his pupils into the 'Compagnia della Morte' (company of death), and paraded the streets by night to murder Spaniards. F. wisely went into exile in France on the restoration of peace, and won the patronage of Louis XIV, but d. in Naples.

Falconer, Hugh (1808-65), botanist and palaeontologist. During his first stay in India (1830-42) he was superintendent of the botanic garden at Saharanpur, and during his second (1847-55) held a similar post at Calcutta. He discovered the *asafoetida* medicinal plant in India, and urged the cultivation there of tea and the cinchona bark. During his invaluable geological researches in the tertiary deposits of the Siwalik hills he made a splendid find of fossils including the Mastodon and an enormous pre-historic tortoise. His *Fauna Antiqua Sivalensis*, 1846-9, was never finished. He is justly regarded as a martyr to science, for overwork undoubtedly undermined his health.

Falconer, Sir Robert Alexander (1867-1943), Canadian clergyman and educationist, b. Charlottetown, Prince Edward Island, Canada. Educ. at Queen's Royal College, Trinidad, and at London and Edinburgh Univs. Also studied at Berlin, Leipzig, and Marburg. Ordained Presbyterian minister, 1892. Taught N.T. Greek at Pine Hill Presbyterian College, Halifax, from 1893 to 1907, and was principal there from 1904 to 1907.

Appointed President of the univ. of Toronto at the age of 40, being there from 1907 to 1932. Under his guidance the univ. was organised into a highly efficient whole. In 1925 in England he gave the Sir George Watson Lectures on Amer. Hist. President of the Royal Society of Canada and of the Royal Canadian Institute.

Falconer, William (1732-69), poet, b. Edinburgh. He belonged to a large family, all of whom were deaf and dumb except himself. His famous *Shipwreck*, first pub. in 1762, was based on a personal experience, for he was one of the few survivors of a merchant vessel which foundered off Cape Colonna, Greece. In spite of the somewhat incongruous mixture of the artificial, elegant style of Pope with the breezy, technical dialect of a sailor, the life and vivid descriptive passages of the poem are ample excuse for its popularity. In 1764 he directed a rhymed lampoon, *The Demagogue*, against Wilkes and Churchill, and in 1769 pub. his *Marine Dictionary*.

Falconet, Etienne Maurice (1716-91), Fr. sculptor, b. Paris. He spent 12 years in St Petersburg (1766-78), where he executed for Catherine II a colossal statue in bronze of Peter the Great, which stood in the square of the senate. He held the anct sculptors in small esteem, which perhaps accounts for the somewhat meretricious taste apparent in even his fine 'Milo of Crotona'.

Falconet, name given to a small field gun introduced in the 15th cent. With culverins, sakers, and demi-cannons, etc., F.s formed the lighter ordnance until the 17th cent.

Falconidae, family of diurnal birds of prey, comprising the falcons, hawks, kestrels, etc., and constituting, with the eagles, vultures, etc., the typical Accipitrines (q.v.). The head is crowned with feathers, and the femur is larger than the male; the 2 sexes associate in pairs and mate for life.

Falconry (from O.F. *falconnerie*), the art of training falcons and hawks for the chase. Hawking is commonly regarded as a synonym, but is properly restricted to the practice of F. in the field. Its antiquity is an estab. fact, but no one knows where or when this 'aerial warfare' was first introduced. There are records proving its early popularity in Asia Minor, Turkey, Persia, Tartary, and China, and it is interesting to read Marco Polo's almost incredible yet undoubtedly veracious account of how Kublai Khan, the great emperor of Tartary and China, went hawking in the 13th cent. Pennant has suggested Scythia as the bp. of F., arguing that thence it spread all over N. Europe and especially to Norway, where falconers attained such remarkable proficiency. In India the art seems to have been practised from time immemorial, the hawks being trained to the boldest flights, to stoop at the antelope and wild boar, as well as at the gazelle and the stag. Here, moreover, as in the E. generally, these birds are still used for hunting, and the

native Indian gentry still train their largest falcons to fly gazelle with the assistance of greyhounds. To turn to Europe, it is written how even in the 8th cent. the 'grand fauconnier' in France was 'an officer of great eminence,' with an ann. salary of 4000 florins, and as many as 300 hawks. In England there is mention of F. in the reign of Ethelbert (760). King Alfred is commended as a falconer, and from the Norman Conquest till the 17th cent., kings, princes, barons, lords, and even ladies were affected with the hawking mania, William I, Stephen, Edward III, Henry VIII, Queen Elizabeth, and James I being the most enthusiastic of its royal devotees. Change in fashion, but above all the introduction everywhere of the fowling-piece, which so vastly increased the quarry, whilst at the same time doing away with the difficulty and expense of training and keeping the hawks, led to the rapid decrease of the sport after the Commonwealth, so that, by the end of the 17th cent., F. had fallen into general decay. The last owner of heron-hawks d. in 1871, yet the foundation of the Old Hawking Club about the same time served to prevent the art becoming entirely obsolete. The Old Hawking Club was succeeded by the Brit. Falconers Club, 1926.

Stringent and oppressive laws were early made respecting F., as all other forms of field sport. Thus, under the Normans the privilege of keeping hawks was reserved only for persons of the highest rank, and it was not till the Carta de Foresta had been wrested from King John that the privilege was extended to all freemen. In Edward III's reign, every person finding any species of hawk was instructed by statute to take the same to the sheriff of the co., or to suffer 2 years imprisonment; moreover, the stealing of a hawk was made a felony. According to a decree of Henry VII, the stealing or destruction of falcons' eggs brought on the offender a penalty of imprisonment for a year and a day, the term being reduced under Elizabeth to 3 months. A 16th-cent. ordinance, which forbade hawking from Easter till after the harvest, is of interest as indicating a consideration for agriculture and a smaller regard for the falconers' interests. Tradition assigned the sort of hawk proper to persons of different ranks: thus the eagle was for an emperor; the gersfalcon and tiercel of the gersfalcon, for a king; the falcon gentle and the tiercel gentle, for a prince; the falcon of the rock, for a duke; the falcon peregrine, for an earl; the bastard, for a baron; the sacre and sacret, for a knight; the lanner and lanneret, for an esquire; the meriyon or merlin, for a lady; the hobby, for a young man; the goshawk, for a yeoman; the tiercel (of the goshawk), for a poor man; the sparrow-hawk, for a priest; and the musket (male sparrow-hawk) for a holy water clerk.

'Eyasses,' or 'eyesses,' are birds taken from the nest and reared wholly or partially in confinement. Eyass peregrines may be flown at grouse, partridges,

wild duck, pheasants, rooks, and magpies. 'Passage,' or wild-caught, falcons were trapped during the migration or passage from N. to S. in the autumn by means of a decoy-pigeon and a bow-net. They are usually better-tempered, swifter, and higher-couraged than the eyass, and are especially used for rooks, herons, and gulls. The training of the eyass differs initially from that of the passage-hawk, as it has everything to learn, including the way to catch and kill its own prey. The nestling is put on a straw-covered platform in an outhouse, and is fed 3 times a day on lean beef or other suitable raw meat. If it receives insufficient food, 'hunger-traces' will appear like knife-marks across the growing feathers. Before the young hawk is allowed to fly, 'jesses,' that is, leather straps are set round its legs, and above them bells are attached with thongs called 'bewits.' It is then allowed some weeks of liberty, when it is said to be 'flying at hack,' the object being to give it strength on the wing; desire for food brings the bird, at intervals, back to its home.

The training for eyasses after hack is practically the same as that for wild-caught falcons. 'Hooding,' that is blind-folding it by means of a leathern cap, is the first operation as a 'hooded' bird will sit quite quietly, and will not ~~_____~~ her feathers or, otherwise get out of hand by 'bating,' that is, fluttering from the fist or perch. Feeding is always upon the gloved hand. Soon the hawk is 'called off' to the 'lure.' The most common kind of 'lure' consists of a flat leather-covered piece of lead, to which pigeon's wings are attached, and also on either side a piece of raw meat. This is later used for luring the falcon back to its owner after a fruitless flight, and this is why the bird is made acquainted with it from the very first. During the training, the hooded hawk is perched on an assistant's hand, being fastened thereto by a line, whilst the falconer, at a distance of 20 yds or more, flourishes the lure. When the bird is unhooded, it flies to the lure and is encouraged to feed on it. After a time it can be trusted to do this without being held by the line. It is then ready to be flown at wild game. The elaborate processes which belong to the management of a hawk are responsible for the development of a whole technical language to describe them. A few have already been mentioned; whilst as regards the behaviour of the hawk in the field, 'to wait on' means to circle round the falconer's head (the higher the better) in the expectation of game being flushed; 'to bind,' to fasten on the quarry in the air; 'to stoop,' rapidly to descend on her prey from a height.

Hawking has an extensive bibliography including Dame Juliana Berners' *of St Albans*, 1486; G. Turberville's *Booke of Falconry*, 1575; H. Schlegel and A. Wulverhorst, *Traité de Fauconnerie*, 1844-53; and the standard Eng. work entitled *Falconry in the British Isles*, by F. Salvin and W. Brodrick, 1855. See

also G. E. Freeman and F. H. Salvin, *Falconry: its Claims, History and Practice*, 1859; G. Lastelles, *Falconry* (Badminton Library), 1892; E. B. Michell, *The Art and Practice of Hawking*, 1900; G. Blaine, *Falconry*, 1936.

Faldstool, originally a folding seat, which a bishop would use when not enthroned in his own cathedral. The word was later applied to a prayer desk.

Falémé, important trib. of the Senegal in Senegambia, W. Africa. Rising in Futa-Djalón, it flows northward to the confluence above Bakel. Cascades and rapids impede all navigation 120 m. from the mouth.

Falerii (modern Civita Castellano), one of the 12 chief cities of Etruria, situated on a

A GATE AT FALERII

height 32 m. N. of Rome. Reduced by Camillus (q.v.) in 394 B.C. it revolted at the end of the 1st Punic war, and was destroyed by the Romans (241 B.C.). A new town was built in the plain.

Falernian Wine, famous Rom. wine grown in Campania. Wine is still grown near Falerno under Vesuvius, but is of no great quality.

Falguères, Jean Alexandre Joseph (1831-1900), Fr. sculptor and painter, studied at the Ecole des Beaux-Arts. His statues are superior to his work in oils, but in these latter he displayed a fine appreciation for delicate gradations of light and shade. Of his oil paintings 'Acis and Galatea' deserves mention; his 'Wrestlers' and 'Fan and Dagger' were acquired by the Luxembourg. Splendid and arresting vitality animates all his sculpture, notably in his 'Triumph of the Republic', 1881-6, a quadriga for the Arc de Triomphe in Paris. 'Joan of Arc', 'Belshazzar', and 'Lamartine' exhibit his skill in portraiture.

Faliero, Marino (c. 1274-1355), doge of Venice. He gained a decisive victory in 1346 over the Hungarians who were trying

to storm Zara, but after his election as doge in 1354 his good fortune deserted him. He sided with the mob in an attempt to destroy the power of the nobility and make himself prince of Venice. But the plot failed, F. was executed, and the Council of Ten became stronger than ever. Byron and Swinburne wrote poems on the theme of F.'s downfall.

Falk, Paul Ludwig Adalbert (1827-1900), Prussian statesman. It was F. who, as minister of education under Bismarck (q.v.) (1872), drafted the 4 measures known as 'Kulturkampf,' by which the state arrogated to itself direct control over eccles. matters. A reaction in governmental policy forced F. to resign in 1879.

Falkenhayn, Erich Von (1861-1922), Prussian gen., b. Thorn. Was in the China Expedition, 1900. Chief of staff of the XVI and later of IV Army Corps. Appointed in 1911 commander of 4th Guards (infantry) regiment. Gen., 1913. Ger. minister of war in 1914. Chief of the Ger. H.Q. staff and successor to Gen. Von Moltke, the frustration of whose plans at the first battle of the Marne and in E. Prussia called for a reconstruction of the staff. His staff work was undeniably good, and though aided by Von Mackensen and the popular idol Hindenburg, credit is mainly due to him for the battle of Tannenberg on the E. Front, the repulse of the Allies at Loos, Neuve Chapelle, and elsewhere on the W. Front, and the failure on the Gallipoli peninsula. In 1916, however, the Ger. armies met with disaster at Verdun, where Pétain repulsed probably the heaviest blows delivered in the war, and on the Somme, where the great retreat to the Hindenburg Line had to be organised. These Ger. failures were capped by the sudden entry of Rumania into the war; but F. proved equal to this new belligerent, and gradually reduced its army to a negligible quantity. In these operations he was commander of the Tenth Army. The Ger. Press, however, were disappointed over the general results of 1916, and F. was accordingly shelved for Hindenburg, going on a mission to Turkey. After this he dropped out of public notice, and was put on half-pay at his own request in 1919. See life by H. v. Zuehl, 1926.

Falkenhorst, Nikolaus von (1886-), Ger. soldier in the First and Second World Wars. Lieutenant-gen. in command of the 21st Army Corps in the Polish campaign (1939). Promoted gen. of infantry and put in command of the forces which seized Norway and expelled the Brit. forces (May 1940). Commander in the White Sea region in the Russo-Ger. campaign, July 1941. Superseded in 1944 by Lothar Rendulic (Nov. 1944). Tried by a war crimes tribunal in 1946 and sentenced to death, the sentence later being commuted to one of life imprisonment.

Falkirk, municipal burgh and mkt tn, 11 m. SE. of Stirling, in Stirlingshire, Scotland. It stands high and overlooks

the fertile Carse of F. To the N. and S. respectively pass the Forth and Clyde and Union Canals, whilst its port, Grangemouth, is $2\frac{1}{2}$ m. to the NE. Within 3 m. of the tn are the Carron ironworks and some extensive coal-fields, which account for the supremacy of F. in the light casting trade of Scotland. Local market days have reduced the importance of its 3 ann. trysts or fairs. Historically F. is noteworthy as the scene of 2 battles, one in 1298, when Edward I defeated Wallace, and the second in 1746, when the miserable performance of the Brit. dragoons under Gen. Hawley secured an easy victory for Prince Charles. The remains of Sir John de Graehame, a friend of Sir Wm Wallace, and those of Sir John Stuart, who were slain at the battle in 1298, lie in the churchyard. F. with Stirling and Grangemouth send a member to parliament. Pop. 38,000.

Falkland, Lucius Cary, 2nd Viscount (c. 1610-43), royalist, educ. at Trinity College, Dublin. He succeeded to his father's Scottish viscounty in 1633, and entered parliament in 1640. The excesses of the Opposition gradually forced him to the Royalist side, and when the Civil war broke out he loyally supported the king, being appointed secretary of state, 1642. But he was out of sympathy with most of those around him and he was killed at Newbury, having previously declared his desire to be 'out of it' ere night.

F.'s character is vividly and lovingly described by his friend, Clarendon, who wrote 'mankind could not but admire and love him.' He was a scholar in his own right, a lover of literature and the arts, and a patron of poets. He has become the example of the ideal cavalier. See life by J. A. R. Marriott, 1907.

Falkland, Samuel, see **HEIJERMANS**.

Falkland, royal burgh, 9 m. R.N.E. of Kinross, in E. Fife, Scotland, created in 1458 by James II. It is an old-world vil., noted for its anct palace, which was the hunting seat of the Royal Stuarts from 1400 to 1603. The S. wing was completed by James V, who d. there in 1542; it is still intact. Linen weaving by power, and linoleum manuf. are carried on. Pop. 1000.

Falkland Islands, group forming a Crown colony of Great Britain in the S. Atlantic Ocean, lying some 300 m. E. and somewhat to the N. of the Straits of Magellan between 51° and 53° S. lat., and 57° and 62° W. long. In addition to the 2 main is., known as E. and W. F., which are divided by the F. Sound, the group comprises about 200 smaller is. clustered around them within a space of 120 m. by 80 m. The area of the group, according to the Admiralty chart, is: E. F. and adjacent is. 2580 sq. m.; W. F. and adjacent is. 2058 sq. m. The coast line is deeply indented, and has many fine harbours and anchorages. The surface of the is. is hilly, reaching a maximum elevation of 2315 ft in Mt Adam on W. F. There are no riva. navigable at any distance from the coast. The whole area is wild moorland

interspersed with outcrops of rock and angular boulders called 'stone runs' the origin of which is conjectural. The soil is mainly peat varied by large areas of sand. The general appearance of the land is one of bleak inhospitality. Trees are almost entirely absent and the scenery is not unlike that of parts of Scotland. There is no cultivation except near the farm settlements and shepherds' houses where vegetables, oats, and hay are grown. The climate is characterised by the same seasonal variations as in the U.K., though the winters are slightly colder and the summers much cooler than in London. The ann. rainfall averages only 30 in. The only tn is Stanley, the cap., situated on a natural harbour entered from Port William, at the NE. corner of the group. The whole acreage of the colony is divided into sheep farms. The colony has no resources of known value apart from the production of wool, skins, and tallow. A large number of sheep are exported to Chile. The pop., which in 1955 was 2249, is entirely white and has been derived largely from the U.K. There is a considerable element of Scandinavian blood. The F. I., called by the Fr. 'Iles Malouines' and by the Spaniards 'Islas Malvinas,' were discovered on 14 Aug. 1592, by John Davis in the *Desire*, one of the ships of the squadron sent to the Pacific under Cavendish. Capt. Strong in the *Welfare* sailed between E. and W. F. in 1690 and called the passage the F. Sound in memory of Lucius Cary, Lord F., and from this the group afterwards took its Eng. name of 'Falkland Islands,' although this name does not appear to have been given to it before 1745. The first settlement was estab. in 1764 by de Bougainville on behalf of the king of France at Port Louis on E. F., but in the following year Capt. Byron took possession of W. F. and left a small garrison at Port Egmont on Saunders is. The Spaniards bought out the Fr. and forcibly ejected the Brit., 1766-70. Later the group remained without voluntary occupation until in 1829 Louis Vernet, who enjoyed the nominal protection of the Rep. at Buenos Aires, planted a new colony at Port Louis. Finally, in 1833, Great Britain, who had never relaxed her claim to the sovereignty of the F. I., expelled the Argentine soldiers and colonists, and resumed occupation, which has been maintained without interruption to the present day. In 1844 the H.Q. of the gov. were removed from Port Louis to Stanley, then called Port William. On 8 Dec. 1914 the F. I. were the scene of the naval battle in which Adm. Sturdee destroyed Adm. Graf von Spee's squadron (see next article). A memorial commemorating this victory was unveiled at Stanley in 1927.

See L. B. Mackinnon, *Account of the Falkland Islands*, 1840; G. Schulz, *The Falkland Islands*, 1891; J. R. St Johnston, *The Falkland Islands*, 1920; V. F. Boyson, *The Falkland Islands* (with notes on the natural hist. by R. Vallentin),

1934; J. Goebel, *The Struggle for the Falkland Islands: a Study in Legal and Diplomatic History*, 1927; F. C. Macdonald, *Bishop Stirling of the Falklands*, 1929; L. Harrison Matthews (of the *Discovery Expedition, 1924-7*), *South Georgia: The British Empire's Sub-antarctic Outpost*, 1931; F. D. Ommamey, *South Latitude*, 1938.

Falkland Islands. Battle of. Naval battle of the First World War, fought on 8 Dec. 1914, in which the Brit. Adm. Sturdee, completely avenged the defeat of Rear-Adm. Cradock off Coronel (q.v.). The Ger. squadron comprised the armoured cruisers *Scharnhorst* (flagship) and *Gneisenau*, light cruisers *Leipzig*, *Dresden*, and *Nürnberg*, under the command of Adm. Graf von Spee. The Brit. squadron consisted of the 2 battle cruisers *Invincible* and *Inflexible* (17,250 tons, 25 knots, carrying 8 12-in. and 16 4-in. guns), the armoured cruisers *Cornwall* and *Kent* (each 9800 tons and carrying 14 6-in. guns), and the light cruisers *Glasgow* and *Bristol* (4800 tons, 2 6-in. and 10 4-in. guns). The *Scharnhorst* and *Gneisenau* carried 12 8-in. guns. The intention of the Ger. squadron was to bombard the Falkland Is. and von Spee reached the vicinity of this Brit. colony on 8 Dec. The appearance of the Brit. squadron was a complete surprise and the Ger. ships promptly took to flight. Their speed, however, was inadequate, and they were brought to bay, the Germans being outmanoeuvred for position and out-ranged in gunfire. All the Ger. ships, with the exception of the *Dresden* (q.v.), were sunk. The Ger. casualties were 2000 officers and men, the Brit. 7 killed and 4 wounded. There were no survivors of the *Scharnhorst*, while of the *Gneisenau*'s complement of 700, fewer than 100 were rescued. Von Spee himself perished. The vital importance of this victory lay in the fact that it prevented von Spee from establishing himself in the W. Indies and thereby raiding 20 million tons of sea-borne grain and meat supplies intended for Great Britain. On the defeat of Cradock's squadron at Coronel, the Brit. Admiralty had at once prepared this counterstroke, and Adm. Sturdee, on 11 Nov., steamed away with the cruisers *Inflexible* and *Invincible*, reaching the Falklands with almost unprecedented speed. By 7 Dec., when anchored in Port Stanley, he had been reinforced by Adm. Stoddart in the *Carnarvon* and by the cruisers *Cornwall*, *Kent*, and *Glasgow*. The Brit. squadron coaled all night, and was still coaling when the look-out station reported that the Ger. squadron was approaching, it being then nearly 8 a.m. By 10 a.m. all the Brit. ships were under way, and the first shots were fired just before 1 o'clock. In 8½ hrs from that time the battle was over; the Ger. squadron having no reasonable chance against the attacking squadron. The whole campaign in these waters is of importance in that it illustrates Great Britain's essential vulnerability. There was no parallel in Brit. maritime hist. to the dangerous economic

consequences that threatened Coronel. Brit. national security was actually in danger through a more or less obscure defeat in a remote corner of the Pacific at the hands of a detached raiding squadron, and only the prompt extinction of the raiders could have restored confidence to the merchant navy.

Falkland Islands Dependencies. area in the Antarctic (q.v.) between longs. 20° and 80° W., claimed by Great Britain and also by Argentina and Chile. There is no permanent pop. in the Dependencies except in S. Georgia where the figures fluctuate with the seasons of the whaling industry. Apart from sealing on a small scale, the only industry in the Dependencies is whaling, and whale and seal oil and by-products of the whale are their sole products. S. Georgia has had since 1909 an administrative officer who is also resident magistrate. The N. Is. were largely explored by Brit. and Amer. whalers in the early 19th cent. The S. peninsula (Graham Land, q.v.) was visited by Fr., Brit., Norwegian, and Amer. expeditions, but has been mapped since 1943 by the Brit. F. I. D. Survey, which sends out young men for 2- and 1-year periods to Brit. bases at Port Lockroy, Deception Is., Hope Bay, Argentine Is., Admiralty Bay, and Siguy Is. as surveyors, medical officers, meteorologists, etc. The F. I. and D. Meteorological Service was estab. in 1950 and has reporting stations at Stanley, Grytviken, and the F. I. D. bases. A series of scientific reports is pub., and the geological structure is written up in the Geology Dept of Birmingham Univ. See also SOUTH GEORGIA; SOUTH NETHERLANDS. See E. W. Hunter Christie, *The Antarctic Problem*, 1951; E. W. K. Walton, *Two Years in the Antarctic*, 1955; and the jour. *Polar Record*, 1943 ff.

Falkner, William Harrison, see FAULKNER.

Fall, The, the first sin of Man, and the cause of Man's moral and spiritual infirmity, described in the Bible as the yielding of Adam and Eve to the Temptation of the Serpent in the Garden of Eden. This account of the entrance of sin into the world is a fundamental doctrine of a theology professed by Christians—Catholics and Protestants alike. By sin, Adam lost the divine life of supernatural grace which was his heritage. Inasmuch as Adam is the supreme head or source of humanity, all mankind bears the defect transmitted as the consequence of Adam's primary transgression of God's will. To deliver man from the power of this 'Original Sin' Jesus Christ (the Second Adam) by his Incarnation and Atonement restored divine life to mankind and provided a saving remedy for the F. See ORIGINAL SIN; see also N. P. Williams, *The Doctrine of the Fall and Original Sin*, 1928.

Fall River, city and port of entry on Mt Hope Bay, at the mouth of the Taunton R., in Bristol co., Massachusetts, U.S.A. It is one of the chief centres for the manuf. of cotton goods in the U.S.A. Other

industries include the dyeing and finishing of textiles and the manuf. of rubber, paper, brass, bronze, and silver products, gas ranges, hats, and clothing. The F. R., a small affluent of the Taunton, which here makes a descent of about 130 ft in half a m., furnishes water power for the city's industries. Many of the buildings of F. R. are of red granite, quarried in the vicinity. It is the seat of the Bradford Durfee technical institute. Pop. 112,000.

Falla, Manuel de (1876-1946), Sp. composer, b. Cadiz. At the Madrid Conservatory he studied composition under Pedrell, the founder of the modern national Sp. school of composition, and the piano under Tragó. In 1905 his *La vida breve* won the prize offered by the Academia de Bellas Artes for a national opera but it waited 8 years for its first performance. From 1907 to 1914 F. lived in Paris, receiving friendly encouragement from Debussy, Ravel, Dukas, and others, but he returned to Spain at the beginning of the First World War. His ballet *The Three-Cornered Hat*, was first performed by the Diaghilev Russian Ballet in London in 1919, being very popular. The ballet *El amor brujo* (*Magician Love*) was also successful, and other compositions are *Master Peter's Puppet Show* (*El retablo de Maese Pedro*), a marionette opera; *Nights in the Gardens of Spain*, 1916, for piano and orchestra, a harpsichord concerto, and *Seven Spanish Popular Songs*, 1922. F. left Spain in 1940 for Argentina, where he d. at Alta Gracia.

Fallacy (from Lat. *fallax*, deceptive), false reasoning or argument. In spite of the countless varieties of confused thought and ambiguity, it is customary to adopt some classification of F. Thus Bacon in his *Novum Organum* divides them into 4 *Eidōla* (False Appearances), whilst Mill regards all F.s as belonging to one of the 5 following categories: (1) Fallacies of Simple Inspection, which embrace all Natural Prejudices; (2) Fallacies of Observation; (3) of Generalisation, including Induction; (4) of Syllogism or Ratiocination; and (5) of Confusion, under which come all cases of ambiguous language. But by far the most famous subdivisions of F. are those based on Aristotle. According to him all F.s are either material, that is misstatements of facts, said therefore to be *extra dictionem*, or *in re*; verbal that is arising from the misuse of words; or formal or logical, that is arguments which transgress the laws of true demonstration, technically called the Syllogism. Fallacies of the second and third species are said to be *in dictione*, or *in voce*. Under the first heading come *Petitio principii* (q.v.), or *Circulus in probando* (arguing in a circle); *Non sequitur*, or the F. of false cause; *Ignoratio Elenchi*, or irrelevant conclusion; and F. of Accident from the general to the particular.

Fallada, Hans (1893-1947), Ger. writer, b. at Greifswald. His real name was Rudolf Ditzen. His novels depict in a realistic fashion the everyday problems of the ordinary man, as in his famous

Kleiner Mann, was nun?, 1932, trans. as *Little man, what now?* Both this and his *Alles Hers geht auf die Reise*, 1936, were made into films. Others works include *Wer einmal aus dem Blechnapf frisst*, 1934, *Wir hatten mal ein Kind*, 1935, *Der ungeliebte Mann*, 1945. See also his autobiographical works *Damals bei uns daheim* 1942, *Heute bei uns zu Hause*, 1943, and *Der Alptruck*, 1947.

Fallerleben, Hoffmann von, see **HOFFMANN, AUGUST HEINRICH**.

Fallières, Armand (1841-1931), Fr. statesman, b. near Agen, S. France, son of a blacksmith. He studied law and became a barrister at Nérac. F. entered the chamber of Deputies in 1876, and was under-secretary of the interior to J. Ferry in 1880, and then, successively, minister of the interior and prime minister. He was president of the Fr. Rep. 1906-13 and president of the Senate 8 times.

Falling Stars, see **METEOR**.

Fallopian Tubes, The, from Gabrielle Falloppio (q.v.), canals which lead from the peritoneal cavity into the uterus, there being one on each side. The free, peritoneal cavity ends of the F. T. have finger-like fringes, known as fimbriae, and these are thought to assist in directing the ovum liberated from the ovary (q.v.) into the canal, and thence into the uterus. The F. T. function is that of an oviduct. If the tubes are blocked no ova can reach the uterus (q.v.). See **STERILITY**.

Falloppe (or Fallopius), Gabriele (1523-1562), It. anatomist, prof. of anatomy at Pisa and Padua. His chief discovery was the function of the tubes now called Fallopian after him, whilst in the anatomical field he made careful studies of the sphenoid and ethmoid bones, the internal structure of the ear, and the female generative organs. The *Observationes anatomicae* (Venice), 1561, was the only treatise by F. to appear in his lifetime. His collected works, under the title *Opera genuina omnia*, also pub. at Venice, appeared in 1584.

Fallow (probably derived from the O.E. *fealg*, a harrow), land ploughed and tilled but not sown for a certain period, usually a year. It was early discovered—witness the Mosaic injunction that every 7 years the land must have a 'Sabbath rest', i.e. 'lie fallow'—that the soil decreases in fertility if continually sown with grain. Thus farmers resorted to the practice of 'fallowing', a practice which may well be as old as agriculture itself, the object being to destroy the weeds, such as couch grass (*Triticum repens*), to disintegrate the soil, and to give it a thorough aeration. The Romans left their cultivated fields F. every alternate year, but improved crop rotations have well-nigh done away with the need of 'bare fallow', except, perhaps, for extremely clayey soils which cannot otherwise be adequately cleansed. The need for a F. has also been reduced by the discovery of weed-killers such as T.O.A. and 'Dalapon' which kill couch, but these must be applied on bare ground some time before sowing a crop because of harmful residual effects. Sometimes a half or

bastard F. is taken in the late summer following an arable silage crop or ploughed-up ley, and although this is less effective than a full F. it does not leave the land bare for the whole year.

Fallow Chat, see **WHATEAR**.

Fallow-deer, name given to sev. species of Cervidae, a family of ruminant artiodactyl mammals; they are characterised by the expansion of the upper part of their antlers into palmate form. Usually they stand about 3 ft high, and have small heads, large ears, and rather long tails. In colour they are fawn, with a number of large white spots, or they may be yellowish-brown, or, more rarely, dark brown. *Dama dama*, the commonest species, is a native of N. Africa and the countries bordering the Mediterranean, but was introduced into Britain at an early period; *Cervus mesopotamicus* is a native of the mts of Laristan; *C. giganteus*, erroneously called the Irish Elk, is a fossil deer of enormous size, the antlers having in some cases a span of 11 ft.

Fallow Finch, see **WHEATEAR**.

Falls, Cyril Bentham (1888-), military historian, educ. at Bradfield College, Portora Royal School, Enniskillen, and London Univ. He served with distinction in the First World War and from 1939 to 1953 was military correspondent of *The Times*. He was Chichele prof. of the hist. of war at Oxford, 1946-53. Pubs. include the official hist. of the Brit. campaigns (First World War) in Egypt, Palestine, Macedonia, and France; and *A Short History of the Second World War*, 1948.

Falmouth: 1. Seaport and mkt tn in Cornwall, England. It lies 7 m. S. by W. of Truro, and its harbour is one of the finest in England. There are 4 graving docks, and foundries, engineering works and ship repairing yards. F. has a wonderful climate, and nowhere in the S. of England do tropical plants flourish more luxuriantly. It has become a popular holiday centre. Pendennis Castle was built in 1543 for the defence of the harbour, which was formerly the anchorage of the once-famous tea clipper, the *Cutty-Sark* (q.v.) (now moored in the Thames at Greenwich), and is now a favourite yachting water. Millions of oysters are dredged from the harbour every year. Pop. 17,036.

2. Tn 18 m. E. of Montego Bay in Cornwall co., Jamaica. Sugar, coffee, and bananas grow in the dist. Pop. 2560.

False Bay lies 25 m. S. of Table Bay, in the SW. of the prov. of the Cape of Good Hope, South Africa. The first Brit. occupation of the Cape took place here, 1795, when a force landed under the command of Gen. Craig. Recently the heights dominating F. B. have been heavily fortified.

False Hellebore, see **VERATRUM**.

False Imprisonment, the unlawful detention anywhere of any person against his will. In Scots law, the term is 'wrongous imprisonment.' The remedies are an application for *habeas corpus* (q.v.) to procure release, a civil action for

damages, or a prosecution of the unlawful detainers. See **MALICIOUS PROSECUTION**.

False Money, see **COINING**.

False Position, in arithmetic, a former method of solving a problem by one or two suppositions (also called the 'rule of trial and error'), now largely replaced by the direct method of equations.

False Pretences, see **FRAUD**.

False Swearing, see **PERJURY**.

Falsetto, expression denoting an artificial high register of the male singing-voice, such as the male alto or the top notes in yodelling. The counter-tenor (q.v.) is a natural high voice, not obtained by F.

Falsification of Accounts was made a misdemeanour, punishable with penal servitude for 7 years, under the Larceny Act of 1861, and in Scotland is an offence under the Debtors Act of 1880. By the terms of the former Act every director or officer of a public company or body corporate is liable to the above penalty if he omit to make a full and true entry of properties received in the proper books or accounts, his purpose being to practise fraud; or if he falsify, mutilate, or destroy any book or valuable security belonging to his company or corporation; or if he make a false entry or omit to set down an important particular, or if he concur with others in doing either of these two things; or, again, if he make, circulate, or pub. any written statement of account which he knows to be untrue in any important particular, or if he concur in doing any of these three things. By the F. of A. Act of 1875 the terms of the above Act, with the penalties attaching thereto, were extended to clerks, officers, or servants who may try in any of the above ways to defraud their employers. See **EMBEZZLEMENT**.

Falster, Dan. is., 30 m. long, and varying from 2 to 13 m. in breadth, off the S. coast of Zealand (Shelland) in the Baltic Sea. The chief tn is Nykøbing. The soil is well watered and yields good crops. Area 200 sq. m.; pop. 47,100.

Fălcieni, or **Folcieni**, tn 65 m. S. by E. of Chernovtsy on an affluent of the Seret, in the prov. of Suceava, Rumania. Pop. (1948) 10,503, one-quarter Jewish.

Falun, or **Fahlun**, tn and cap. of the dist. (län) of Kopparberg, 50 m. W. of Gävle in Sweden. The Kopparberg Mining Company, which has been in existence since 1284, controls the oldest copper mines of Europe. Up to the year 1900 there had been mined some 35 million tons of copper ore. Its present copper output is insignificant, but the company owns many iron-ore mines and large sulphate and sulphite and paper mills. F. has 2 medieval churches and a 17th-cent. tn hall. It has also an excellent industrial museum. Pop. 18,127.

Fama, in classical mythology, the personification of Rumour, later identified with Evil Report, and worshipped at Athens and Smyrna. Sophocles represented her as the daughter of Hope.

Famagusta (Gk *Ammochostos*), the chief port of Cyprus, on the E. coast, 2½ m. S. of the anc. Salamis. F. was founded as Arsinoe by Ptolemy II in 247

so and grew in importance after the sack of Salamis by the Arabs c. 849. The primal see of Cyprus was then transferred to F. where it remained till the Lusignan period. After the Crusaders had been expelled from Syria F. became one of the richest trading cities of the Levant. It decayed rapidly after its capture by the Genoese in 1373. F. fell to the Turks in 1571 after a costly siege; thereafter no Christians could live within the walls. The Greeks built and still inhabit the suburb of Varosha. The superb Venetian walls, built in the 16th cent., the Gothic cathedral of St Nicholas, now a mosque, and the remains of numerous churches give F. very great antiquarian interest. The harbour is being improved. There is a good road to Nicosia; the former railway is now disused. Estimated pop (1954) 20,900.

Familiar (from Lat. *familiaris*, to do with the family), a demon or supernatural spirit, who is the slave of wizards, magicians, and all necromancers, and who responds to his master's call and carries out his wishes. The idea of such an attendant spirit is world-wide. Thus the Arabs used to believe in Aladdins or genii of the lamp. F.s are frequently animals.

Familiars of the Holy Office were lay officers of the Court of Inquisition whose chief duties were to apprehend and imprison the accused.

Familists, see FAMILY OF LOVE.

Family. The F. in some form or other seems to be a universal human institution, although there are forms of legitimate union that only just merit the term; e.g. the group of woman, her lovers, and her children among the Nayers (q.v.), the woman and the children dwelling in permanent households but being visited by a succession of lovers who are not husbands in any usual sense of the term. During the 19th cent. a great deal of conjecture was made in order to establish a scheme showing the evolution of the F. from an original primitive promiscuous union, through forms of polyandry (q.v.) to polygyny (q.v.) and so to the Christian ideal of the F., the monogamous union of a man, his wife, and their legitimate offspring. Such schemes are still discussed, although modern anthropology has shown them to be almost completely ill-founded and far too conjectural to be demonstrated satisfactorily. We may classify various types of F. and see them against varying social backgrounds, rather than attempt to build up pseudo-historical schemes that have no basis in fact at all.

The F. as an institution has sev. functions. It permits the procreation and rearing of children of legitimate status (i.e. children whose family affiliation is known and who may later accept their full social roles without conflict or doubt as to their rights to do so); it makes for efficient organisation of units for the production and consumption of food; it may have political and ritual functions also, as among most primitive peoples to-day and as among the anc. Roms. and the Chinese, with both of whom the F. was the basic

religious unit. All these functions may be performed by institutions that vary in form from one society to another, but in general we may distinguish the F. of orientation—that in which children are reared—and the F. of procreation—that in which a man and woman unite to produce legitimate offspring. Every person who marries is a member of each type of F. during his or her lifetime. The F. as a child-bearing unit may be the elementary F. of man, wife, and children, as among ourselves. For economic, ritual, and other purposes a larger unit may be more satisfactory, and many societies have as basic social units the joint F. or extended F., consisting of kinsmen over 3 or 4 generations and their wives and offspring. Such are found in most primitive peoples, and among such as the Hindus, among whom the joint F. was, and to some extent still is, a perpetual corporation owning property generation after generation and not dissolving after every death of a husband. One of the outstanding features of the F. is its instability, a trait that distinguishes it from clans and other descent groups, which are persistent units through time. The joint F. is far less ephemeral than is our own elementary F., and so has certain advantages in many situations. Many societies have institutions which have as their function the extension of the F. in time to avoid its dissolution at the death of one of the spouses; such are the levirate (q.v.), by which a dead husband is replaced by his heir, and the sororate (q.v.), by which a wife is replaced if barren, or, sometimes, at her death.

The W. F. is an unusual type, consisting solely of the elementary F. and being extremely unstable and ephemeral. In some parts of the W., indeed, such as parts of U.S.A. and the W. Indies, the F. is so unstable that a man or woman may be a member of many F.s, consecutively, during his or her lifetime, owing to ease and frequency of divorce. This would seem to be a consequence of the decline in importance of social status ascribed at birth and the greater importance of status achieved by a man's own efforts during his lifetime; of the decline in importance of inherited property; and of certain factors to do with modern industrial life, such as the necessity for social mobility, both in space and up and down a class system, the increasing ability of women to earn their own living and so no longer be economically dependent upon their husbands, and so on. With these go changes in ideals and morals, which make for the acceptance of mobility, divorce, etc. It should, however, be remarked that, whatever the anthropological view, the Christian Church has always regarded the F. as the fundamental unit or keystone of society, deriving its sacred character from the sacrament of matrimony. See L. H. Morgan, *Ancient Society*, 1877; B. Malinowski, *The Family among the Australian Aborigines*, 1913; B. S. Philpotts, *Kindred and Clun in the Middle Ages and After*, 1913; E. B. Goss, *Hebrew Families*, 1927;

P. Reed, *The Modern Family*, 1929; F. C. Muller-Lyer, *The Family*, 1931; E. B. Reuter and J. R. Runner, *The Family*, 1931; F. Engels, *The Origin of the Family, Private Property and the State*, 1940; E. W. Burgess and H. J. Locke, *The Family*, 1945; J. K. Folsom, *The Family and Democratic Society*, 1945; R. H. Lowe, *Social Organisation*, 1948; R. N. Ashen (ed.), *The Family: Its Function and Destiny*, 1949; G. Emerson (ed.), *The Family in a Democratic Society*, 1949; T. Parsons and R. F. Balos, *Family: Socialization and Interaction Process*, 1956. See also references under MARRIAGE.

Family Allowances, the principle of supplementing wages by a payment in respect of dependent children. The Family Allowances Act, 1945, provided for financial assistance from the Exchequer to over 2,500,000 F.s in which there was more than 1 child. Under this measure, an allowance of 5s. a week was paid to parents for each child after the first in the F. In 1952 the allowance was raised to 8s. for each child after the first, and in 1956 to 10s. for each child after the second. These increases do not, however, indicate improved endowment of the F., but rather the effort, sometimes belated, to offset the persistent fall in the value of money (or the removal of other state benefits). See Eleanor Rathbone, *Disinherited Family: a plea for the Endowment of the Family* (new ed. under the title *Family Allowances*, 1949), which contains a complete survey of the system in various countries.

Family Compact, name given to various treaties between the reigning Bourbon dynasties of France and Spain, also including Naples and Parma, during the 18th cent. These treaties were made in 1733, 1743, and 1761. They aimed at establishing the Bourbon dynasties in Italy, and also at checking the expansion of England in the colonies of the Amer. continent at the expense of France and Spain.

Family of Love, or **Familists**, religious sect founded by David Joris (1501-56) at Delft in the Netherlands. They taught that religion was nothing but L. which united man with God, and that there was no need for any doctrine or ceremony. Blunt in his *Dictionary of Sects*, 1874, avers that they also denied the reality of sin, and were Antinomians (q.v.); he divides them into 2 congregations, known as the 'Family of the Mount' and the 'Essentialists.' Their doctrines were brought to England by Henry Nicolai; and in 1575, having been attacked by the Puritans, the members petitioned parliament for toleration. This was not, however, granted, and 5 years later we find Elizabeth ordering them to be put down as a 'damnable sect.' They are mentioned in the writings of George Fox and Henry Moore, but seem to have disappeared during the 17th cent.

Family Welfare Association, voluntary society, founded in 1869 as the Charity Organisation Society to give a definite aim to, and to direct into the most

effectual channels, the large number of benevolent forces at work in England, and particularly in London. The F. W. A. consists of a federation of area committees serving sections of metropolitan London. General policy and principles of action are determined by a central council formed by representatives of area committees and certain additional members. The area committees consist as far as possible of ministers of religion, local administrators, and representatives of the prin. local charities. Some of the main functions of the F. W. A. are to provide a service of advice and guidance in F. and personal problems, to help those who are unable to take advantage of the resources provided by the community and who are in difficulties, to initiate and conduct research into social problems, particularly those affecting F. life, to undertake pioneer work in the field of social service, to provide training for students in F. case-work, etc. The F. W. A. has 7 area offices, administrators 13 citizens' advice bureaux, maintains an old people's homes dept, and an information dept which deals with the status, work, and financial resources of charitable societies generally, and makes enquiries about agencies and individuals for the guidance of persons to whom an appeal for help has been made. The head offices of the council are at Denison House, 296 Vauxhall Bridge Road, London, S.W.1.

Famine, scarcity of food-products of such a nature that the pop. of a dist. or country is reduced to starvation, or the serious danger thereof. The causes are principally meteorological, i.e. prolonged drought, or excessive rainfall and storms, leading to floods and the destruction of crops and stores. Crop diseases and the ravages of locusts and other pests are among other causes. The decimation of an agric. pop. by war, plague, etc., and economic causes which deprive a pop. of means of purchasing food-stuffs, have also contributed to a state of F. The opening up of the world's food products to all nations by the development of transport has been the main reason why the risk of F. has materially declined, and transport facilities are the prin. factor in combating a F. when it occurs to-day. Though serious F.s occurred in Russia in 1892 and 1905, it is chiefly in the E., in such a vast and unorganised country as China, that F. on a large scale is dreaded. Still more marked is the ever-present threat of F.s in India, where the people are to a large extent dependent on agriculture, and where a failure of the monsoon for a single year may result in a total failure of the crop. It is not so much the want of food-supplies that must be combated, as the immediate want of purchasing power resulting from cessation of the only money-producing labour. Thus the great Indian schemes of F.-fighting include not only constant development of irrigation and transport, but elaborate relief works, loans, etc. Problems of food supply and distribution loomed large in Bengal during the Second World War, owing to the rise

in prices of agric. produce and raw material and hoarding of supplies. This was advantageous to the peasant cultivator but fatal for the general pop. of Bengal. It is estimated that 1,500,000 men, women, and children *d.* in Bengal in 1943 and 1944 as a direct result of the F. and the consequent epidemics (see report of Sir John Woodhead's Famine Inquiry Commission, pub. in India 1945).

Famund, or **Fæmund**, see **FEMUNDEN**.

Fan. This term, derived from Lat. *vannus*, the F. used for winnowing chaff from grain, is used for various devices for creating a current of air, and thus cooling the atmosphere of a room, as in the propeller-shaped electric F. or in other elaborate devices for regulating the temp., driving fresh air into or otherwise ventilating a room or building. The punkah of the E., attached to a rope which is steadily pulled by a servant, is familiar to all travellers and residents in India. It is, however, as a light implement, carried in the hand and used for cooling the face, that the F. has historical and artistic interest. Of these F.s there are 2 main types, the rigid and the folding F.; the first consisting of a circle or segment of a circle of light material fixed to a handle by radiating plats of wood, etc.; the second in which these radiating plats fold together and bring the flexible leaf into a small flat compass. The folding F. came originally from Japan, and was thence brought to China and so to Europe. In the E., F.s were used by both sexes, and were the central feature in many elaborate ceremonies. The Japanese had war-F.s, coloured bright red, and there are some fans which possess a small pondard concealed in the handle. The Chinese devoted much marvellous art to carving the ivory, tortoise-shell, etc., sticks of the handle. The fixed F. dates from very ancient times. A wooden handle, which once held ostrich feathers, is in the museum at Cairo; it belonged to Amenhotep, the Pharaoh of Egypt of the 17th cent. BC. Feather-F.s carried by slaves and servants are found on monuments of all ages. They were used in the medieval Church to keep flies from the chalice; large feather F.s, *fiabella*, are borne behind the pope in processions; and in many E. and other countries the state-F.s are attributes of royalty and power. The folding F. was used in England in the reign of Henry VIII. They were introduced from Italy to France by Catherine de' Medici. Spain was the centre for the decoration of F.s, while the carved and decorated framework was made in France and sent to Spain. In the 18th cent. many of the best artists, Boucher, Watteau, Lancaut, etc., designed the decorations and scenes to be painted on F.s, and Fr. F.s of this period, painted on fine vellum, called 'chicken skin', silk, etc., are highly prized. Charles Conder painted many exquisite silk F.s. a fine collection of F.s of every age and country in the Victoria and Albert Museum, S. Kensington, London.

The design of a F. depends mainly upon

the amount of air which it is required to move and the pressure against which it has to move. F.s for moving large vols. of air against very little pressure, such as ventilating F.s, have either large blades (about 3 ft long) and revolve slowly, or small blades and revolve quickly. F.s which have to compress or exhaust air against a pressure of 2-in. water gauge or more are usually centrifugal and are constructed on much the same principle as the centrifugal pump. Centrifugal or paddle-wheel F.s are those in which the impeller discharges air in a direction at right angles to the axis of the shaft. These F.s are used for dry apparatus, forcing draughts for boilers, dust exhausting, and the conveying of grain and other similar materials. The h.p. of the motor required to drive the F. depends on its use; a small domestic F. only requires a motor of $\frac{1}{2}$ h.p., but large forced draught blowers, such as are used in power-houses, require anything up to 50 h.p. To secure economy of power the right type of F. must be chosen. For ventilation purposes a propeller F. should be used. Propeller or air-screw F.s are those having impellers which discharge the air in a direction parallel to the driving shaft, the impeller being that part of the F. which in rotating imparts movement to the air. One of the most common uses of a F. is on the engine of a motor vehicle, where it is situated behind the radiator. Belt-driven from the crank-shaft, its purpose is to increase the efficiency of the cooling system by accelerating the flow of air through the radiator tubes. Where the air is sucked down a duct the duct should be at least of the same diameter as the F. blades, and sharp bends should be avoided in the ducts; but where sharp bends and small ducts have to be used, a centrifugal F. is the best.

Fan-bearer, see **FLABELLIFERA**.

Fan Vaulting, in architecture, a method of vaulting employed in the Perpendicular style, and so called on account of its resemblance to a fan. The ribs radiate from one point in the same curve, and are equidistant, terminating at the apex of the ceiling. The intermediate spaces between the ribs are generally filled in with smaller ribs and with decorative ornaments which give it the name of *fan-tracery*. The ceiling of Henry VII's chapel in Westminster Abbey is one of the finest examples. Others may be seen over the staircase of Christ Church, Oxford; in the cloisters at Gloucester; and at King's College Chapel, Cambridge; St George's Chapel, Windsor; Sherborne Abbey; and the Divinity School, Oxford.

Fanariots, or **Phanariots**, descendants of the Greeks of noble birth who remained in Constantinople after its capture by Mohammed II in 1453; so called from Fanar, the quarter in which they dwelt, they rose at one period to great influence in Turkish affairs. The *Ypsilantis* (q.v.) were F.

Fandango, one of the many Andalusian folk dances in 3/4 or 6/8 time, danced with, or without, castanets, and needing

very quick footwork. It was known in Europe in the 17th cent. Normally danced by a single couple, it is sometimes performed as a solo.

Fanestris, Colonia Julia, see FANO.

Fanfara (from Sp. *fanfarria*), flourish of trumpets, used at public ceremonies to announce the approach of some important personage or merely to make a festive opening. It is also used for military signalling, and artistically exploited, in opera, by Beethoven in *Fidelio*, Bizet in *Carmen*, etc.

Fanlight, a glazed sash or window over a door, usually semicircular with radiating bars, suggesting a fan; much used in Eng. Georgian and Regency architecture.

Fanning, coral is. belonging to Britain, situated in the Pacific Ocean in lat. 3° 30' N. and long. 159° 13' W.; area, 15 sq. m. The name is derived from Capt. F., an American who discovered the group; the is. was annexed by Great Britain in 1888. F., together with Washington Is. (66 m. NW. by W. of F. Is.), was included in the Gilbert and Ellice (q.v.) colony by an order in council of 27 Jan. 1916. Pop. of both is., 30 Europeans, employed on Pacific cable station, and 300 Pacific islanders in copra plantations.

Fano (anc. *Fanum Fortunae*; later *Colonia Julia Fanestris*), It. port and bathing-resort, in the Marche (q.v.). It is on the Adriatic, 8 m. SE. of Pesaro (q.v.). It has a fine cathedral, with valuable frescoes, a ruined white marble triumphal arch of Augustus, and a Malatesta (q.v.) castle. During the Second World War considerable damage was caused when the retreating Ger. Army mined sev. buildings, including the bell-towers of 5 churches. There are silk and brick manufs., and a trade in agric. produce, and oil. Pop. (tn) 29,300; (com.) 37,900.

Fane, an is. of the N. Frisian group, situated in the North Sea off the W. coast of Jutland. It belongs to Denmark, and has an area of 20 sq. m. The cap., Norby, is a summer watering place, and contains a school of navigation. The inhab. are engaged in fishing and boating. Pop. 2620.

Fans, Fangs, or **Ba-Fan**, race occupying the dist. between the Gabon and Ogowe riva. in Fr. Congo, W. Africa. They have a fine physique, woolly hair, and a chocolate complexion, lighter than that of the negroes. They wear practically no clothing, but tattoo their bodies and deck themselves in jewellery. The men are warlike, and good hunters; they are skilled in iron, brass, and copper work. They are believed to be moving westwards in large numbers. Cannibalism has diminished since their contact with civilisation, but their morals have deteriorated. See Mary Kingsley, *Travels in West Africa*, 1897, and Sir R. Burton, 'A Day with Fans' in *Transactions of the Ethnological Society* (vols. iii and iv).

Fanhawe, Sir Richard (1808-86), diplomat and poet, b. Ware Park, Herts, and educ. at Jesus College, Cambridge. He entered the Inner Temple in 1826, and

afterwards travelled in France and Spain. Until 1838 he was secretary to the Brit. embassy at Madrid, and on the outbreak of the Civil war fought on the Royalist side. He became secretary to the prince of Wales, and in 1848 naval treasurer under Prince Rupert. At the battle of Worcester (1851) he was taken prisoner, but was released, and took refuge on the Continent, returning to England at the Restoration. He d. in Madrid, where he had been sent as ambas. in 1664. He trans. Guarini's *Pastor Fido*, 1647, Camoens's *The Lusiad*, 1655, and wrote some original verse.

Fantasia (It. signifying fancy, caprice) is the name applied to musical compositions in which the composer follows his fancy, and is not bound down by fixed forms. A F., however, is not shapeless; it generally consists of sev. sections, each being independent of the others in form. Frequently one section interrupts a previous one, and often a brilliant cadenza is used; but the whole is united. An example of this is to be seen in Mozart's F. in C minor. The student of music should examine variants in the F.s by Mozart, Mendelssohn, and Schumann. See also FANTASY.

Fantasy, or **Fancy**, in music an Eng. instrumental form, cultivated in Elizabethan and Stuart times, and later practised as a kind of archaic exercise by Purcell. It is an earlier variant of the fantasia (q.v.), but differs from it in being polyphonic in texture and as a rule chamber music written for consorts of viols or 'broken consorts' of mixed string and wind instruments, though F.s for keyboard instruments also exist. There is usually a strictly fugal opening, after which the polyphony is more freely handled. See also IN NOMINE.

Fanti, a negro tribe inhabiting Ghana, W. Africa. In the early 19th cent. the F. were subjugated by the Ashanti, a people belonging to the same stock as themselves. They fought on the side of the Brit. in the Ashanti war (1873-4), but although of strong physique proved cowardly allies. See A. B. Ellis, *The Tshi-speaking People of the Gold Coast*, 1887; and Sir H. Brackenbury and G. Huyshe, *Fanti and Ashanti*, 1873.

Fantin-Latour, **Ignace Henri Jean Théodore** (1836-1904), Fr. artist, b. Grenoble, the son of a pastel painter. He studied under Couture, and first exhibited in the Salon in 1861. He moved in the artistic circles of Paris and London, and numbered among his friends Corot, Delacroix, Courbet, and Whistler (qq.v.). His 'Homage to Delacroix' is a portrait group containing Whistler, Baudelaire, Legros, Champfleury, and himself. His other notable portrait groups are 'Un Atelier à Batignolles,' 1870, 'Un coin de table,' 1872, and 'Autour du Piano,' 1885. He also exhibited some fine lithographs, and some beautiful paintings of still life. See lives by G. Hédard, 1906; A. Julien, 1909; G. Kahn, 1926.

Fantocini, see MARIONETTES.

Fanu, Joseph Sheridan Le, see LE FANU.

Fanum Fortunae, see FANO.

Fanum Voltumnae, see MONTEFIASCONI.

Far East, Russian, comprises the Maritime and Khabarovsk Krays and the Chita, Amur, Magadan, Kamchatka, and Sakhalin Oblasts of the Russian Federal Rep. It was annexed by Russia gradually between 1649 and 1875, parts being temporarily lost to Japan; its present frontiers have existed since 1945. The area is rich in natural resources, but sparsely populated. The inhab. are mostly Russian and Ukrainian colonists. Indigenous Tungus and Paleo-Asiatic (q.v.) peoples are almost extinct or assimilated. Before 1938-45 there was also a considerable Japanese, Korean, and Chinese pop., now expelled or deported. In the early 20th cent. the F. E. colonists developed strong regional tendencies which found partial expression in the creation of the F. E. Rep. (q.v.) and the somewhat special position of the F. E. ter. in 1926-38. It is an area of banishment and labour camps and important development projects. See also DAL'STOY; W. Kolarz, *The Peoples of the Soviet Far East*, 1954.

Far East Campaigns in Second World War, see PACIFIC CAMPAIGNS.

Far Eastern Republic, ephemeral 'buffer' state between Soviet Russia and Japan which existed in the Russian Far East, 1920-2. Formally an independent democratic rep., it was in fact one of the first 'people's democracies' dominated by Communists. It was annexed to Soviet Russia after the Japanese left Vladivostok.

Farad, unit of capacitance (q.v.), i.e. the capacitance of a conductor charged to 1 volt by 1 coulomb. In practice the subdivision microfarad, $\mu F = 10^{-6}$ farad, or $pF = 10^{-12}$ farad (picofarad), is used. The name derives from Faraday (q.v.). See UNITS, ELECTRICAL.

Faraday, Michael (1791-1867), distinguished natural philosopher, chemist, and electrician, b. at Newington Butts, near London, his father being a blacksmith. He was early apprenticed to a bookbinder, but all his spare time was devoted to scientific reading and experiment to the best of his opportunities. He managed to attend some lectures by Sir Humphry Davy, and in 1813 the great scientist acceded to his requests and made him an assistant in the laboratory of the Royal Institution. He then travelled for some time with Davy on the Continent, and on his return devoted himself to chem., in which study he greatly assisted Davy, in many ways. In 1832 he was made D.C.L. In 1833 he succeeded his benefactor as Fullerian prof. of chem. in the Royal Institution. From this period he continued his work not only on chem., but also on the manuf. of glass for optical purposes, and the study of electricity and magnetism. Perhaps his greatest discovery was the principle of the dynamo, that a current can be induced in an electrical circuit by moving it relative to a magnetic field. Among his other numerous discoveries may be named those

of the condensation of gases into liquids by pressure (1823), the decomposition of hydrocarbons by expansion (1827), electro-chemical decomposition (1834), magnetic rotary polarisation (1845), and various later researches in connection with diamagnetism. In 1829 he commenced a series of Christmas lectures at the Royal Institution, which were primarily addressed to young people. They found, however, a much wider audience. F.'s pubs. are numerous, the most important being: *Chemical Manipulation*, 1827 (2nd ed. 1842); *Experimental*

National Portrait Gallery

MICHAEL FARADAY

A painting by Thomas Phillips

Researches in Electricity, 1844-7; *Lectures on the Non-metallic Elements*, and *Lectures on the Chemical History of a Candle*, 1861. See J. Tyndall, *Faraday as Discoverer*, 1868; B. Jones, *The Life and Letters of Faraday*, 1870; and lives by J. H. Gladstone, 1872; W. Jerrold, 1891; S. P. Thompson, 1898; W. Ostwald, 1924.

Faraday's Laws, see ELECTROLYSIS.

Faradisation, application for medical purposes of a faradic current of electricity. Whereas a galvanic current is continuous, a faradic current is interrupted, the interruptions occurring regularly. Both kinds are used diagnostically and therapeutically; in the former case faradism being used for the diagnosis of nervous and muscular disorders, in the latter in cases of general exhaustion, acute articular rheumatism, etc.

Farazi, Muslim sect formed in Bengal during the 19th cent. to check the abuses into which the Muslim world had fallen. Its adherents base their doctrines and rules of life solely on the Koran.

Farazdaq, Al- (nickname; real name Hammām ibn Ghaliḥ) (c. 641-c. 728), Arabic poet, b. Basra. His nickname means The Fat. His writings are chiefly satirical—written against people in Basra. He had to flee—first to Kufa, then to Medina, whence he was expelled by the Khalīf for licentiousness. He was permitted to return to Basra, where he d.

Farce (It. *farsa*, from Lat. *farciare*, to stuff), form of dramatic art which makes no pretence of holding the mirror up to nature, aiming at exciting laughter by means of absurd situations and extravagant buffoonery. While the province of comedy is to reveal the humorous interplay of character upon character, and that of burlesque is to caricature some particular fashion, style, or human type, the object of F. is solely to amuse. Rude pantomimes and F.s prevailed in very early times among the Greeks and Romans. F. exists in the primitive drama of all nations. *Gammer Gurton's Needle* is an early form of Eng. F. In the hands of Shakespeare, F. developed into true comedy.

Farciennes, tn in the prov. of Hainaut, Belgium, 6 m. E. of Charleroi, with coal and metal industries. Pop. 11,300.

Farcy, outward manifestation of glanders, a contagious disease that attacks horses. It takes the form of ulcers or F. buds which appear on the limbs. See HORSE (DISEASES).

Farham, mkt tn of Hants, England, 5 m. NW. of Portsmouth. The industries include shipbuilding, and the manuf. of bricks, earthenware, leather, and ropes. There is a flourishing trade in corn and timber. Pop. 44,740 (1954).

Faré, Guillaume (1489-1565), Fr. reformer, b. near Gap in Dauphiné, France; studied in Paris, where he was converted from an ardent Catholic into an equally ardent Protestant. He preached with fervour throughout France and Switzerland and made many converts. His friend Calvin was the organiser, while he was the preacher, of the Genevan Church (1535-8) until the 2 reformers were expelled from the city. He wrote some polemical works on purgatory (1534) and the Lord's Supper (1555). See lives by Ancillon, 1691, and F. Bevan, 1893.

Farwell Cape, see KAP FARVEL.

Fargo, largest city of N. Dakota, U.S.A., cap. of Cass co., on the Red R. of the N. It is the seat of the N. Dakota Agric. College, Oak Grove Seminary, and Concordia Conservatory of Music, and is a busy grain-trading centre and distribution point for farm implements. It manufs. luggage, electrical apparatus, fur coats, and steel, wool, and glass products. Pop. 38,355.

Faria y Sousa, Manuel de (1590-1649), Portuguese historian and poet. The work of his life was a compilation of a hist. of the Portuguese in all parts of the world;

but it was never completed, although sev. vols. appeared after his death: *Europa Portuguesa* (3 vols.), *Asia Portuguesa* (3 vols.), *Africa Portuguesa*. His sonnets and eclogues are mostly contained in *Noches claras* (Madrid, 1624-6; and the *Fuente de Aganipe*.

Faribault, city, co. seat of Rice co., Minnesota, U.S.A., on the Cannon R., 45 m. S. of St Paul, in grain and livestock area. It manufs. food products, foundry products, and agric. and household equipment. Minnesota School for the Blind, School for the Deaf, and School for the Feeble-Minded are here. Pop. 16,000.

Farid ud-Din 'Attar, Persian mystic and religious poet of the last half of the 12th and beginning of the 13th cent. AD. There is no certainty as to the precise period of his life. He wrote *Maniq' ut-Tayr*: i.e. Language of the Birds—a long, mystical and allegorical poem. The Shi'ite tendencies of his *Madhar ul-'Ajd'ib* (Manifestation of Wonders) caused his expulsion from Nishapur. He afterwards lived chiefly in Mecca. He also wrote the *Pand-nama* (Book of Counsels), the *Tadhkirat ul-Awliya* (Memoirs of Saints), and many other works. F. is said to have perished in the invasion of Persia by the Mongols.

Faridun, or Feridoun, in Persian legend, an Iranian king, one of the chief heroes of the Shahnamah. He was the son of Abtin and Firanak, and the story goes that on his birth he was sought out by Tohak, whom he was destined to dethrone. Abtin was killed, but Firanak escaped with F. and reared him in Mt Albury, and when he grew up he overthrew Tohak, captured his cap. on the Tigris, and ruled long and prosperously.

Farigoule, Louis, see ROMAINS, JULES.

Farina, Johann Maria, inventor of the celebrated perfume, Eau de Cologne (q.v.).

Farina, Salvatore (1846-1918), It. novelist, b. Sardinia. He began by studying law, but afterwards devoted himself to literary work and settled at Milan. His many books, very popular at the time, are written in a simple style, remarkable for their sentimental humour (in this F. has been compared with Dickens) and their cunning irony. His best works are *Mio Figlio*, 1879-82, and *Il Signor Io*, 1880.

Farinacci, Roberto (1893-1945), It. politician, b. Cremona. He was a railway worker; he joined the Fascist movement in its early days and created a strong Fascist party in Cremona. In 1924 he was made secretary of the Fascist party and soon exceeded his predecessors in violence. For 2 years he ran the political machine of the Fascist party and then was suddenly dropped for no stated reason; but after 2 years' exile from power he was brought back into active life by being made a minister of state. In his newspaper, the *Regime Fascista*, he became one of the best-known Fascist publicists, adopting an extreme pro-Nazi attitude. A strong supporter of imperial expansion, he volunteered for service in Abyssinia and fought through part of a campaign.

In the Second World War he fought in Albania as commander of the Blackshirt battalion. He escaped the purge of the Fascists and remained one of Mussolini's most fanatical supporters, but was executed in 1945 following the defeat of the Ger. armies in Italy.

Farinaceous Foods are those which contain starch. The word 'farina' means literally meal or flour formed from grain, when ground, and consists, therefore, of starch, gluten, etc.; but it is generally applied to the farinaceous matter contained in vegetable products, such as the potato, when it consists almost entirely of starch or fecula, or beans and peas, etc. Among the many F. F., sago, arrowroot, and tapioca are types of the large class of dried foods which are imported into the country, and these consist practically of pure starch and are very nutritious when cooked with milk. Maize, too, used for making corn bread in America, has very considerable nutritive qualities, since it contains more carbon and nitrogen than is found in an equal weight of wheat flour, besides a considerable quantity of free hydrogen, which is found in the fat, a substance in which the grain is rich. Besides this, it exceeds all other grains in point of economy. It is used in Ireland and very widely in America. F. F. give heat and energy to the body, but are not flesh formers, although very often an excess of such foods is stored up as fat.

Farinati, Paolo (c. 1522-1606), It. painter of the family of the Uberti, b. Verona. He was a pupil of Niccolo Gionfano and A. Badile, but studied also the works of Parmigiano. He formed his style partly on Titian and Giorgione, although in colouring he is inferior to both, but in form he learned more from the works of Giulio Romano. Of his pictures 'The Miracle of the Loaves and Fishes' (S. Giorgio, Verona) is generally considered to be his best. His other notable works are: 'Presentation in the Temple' (Berlin); 'The Marriage of St Catherine,' 'The Massacre of the Innocents' (Verona).

Farinelli (1705-82), Neapolitan male soprano singer of great eminence, whose real name was Carlo Broschi, b. Andria. He studied under Porpora, and went from Rome to Vienna, which he visited 3 times between 1724 and 1731. In 1734 he came to England, and so delighted his audiences with his singing that Handel was obliged to dismiss a rival company over which he presided. From England he went to Spain, where he remained 25 years, and was much appreciated by Philip V and his son Ferdinand VI, both of whom suffered from chronic melancholia. In 1759 he retired to Bologna, where he d.

Farington ('fern hill'), or Great Farington, mkt tn in the Abingdon parl. div. of Berkshire, England. It has trade in corn, sheep, and cattle, and is interesting for its church of All Saints, a large cruciform building of the Early Eng. period, and for Farington House, built by Henry James Pye (1745-1813), the poet. Pop. 3237 (1954).

Farington, Joseph (1747-1821), artist and diarist. He executed many engravings of scenes in the Eng. Lake Dist. His diary, of great value in its account of the art world of his day, was first pub. in 1921-2.

Farini, Luigi Carlo (1812-66), It. statesman and historian, b. Russi, near Ravenna. He was banished from the papal states because of his political opinions, and became an ardent supporter of Cavour (q.v.), who in 1859 sent F. to negotiate the transfer of Modena, Parma, and Tuscany to Piedmont. In 1861 he became minister of the interior in the last ministry of Cavour, and was himself premier, 1862-3. His chief pub. was *Lo Stato Romano dal 1815 al 1860* (4 vols.) 1851, partly trans. by Gladstone. See his letters to Gladstone in *Mémoires sur les Affaires d'Italie*, 1859; *Lettres sur les Affaires d'Italie* (Paris) 1860; and life by E. Parri, 1878.

Farjeon, Herbert (1887-1945), critic and playwright, b. London. Educ. at Univ. College School, he became dramatic critic for sev. papers in succession, including the *Sunday Pictorial*, *Sphere*, and *Graphic*. His plays include *Friends*, 1917, *Picnic*, 1927, *Many Happy Returns*, 1928, *Why Not To-night?* 1934, *Spread It Abroad*, 1936, *Nine Sharp*, 1938, *Rig Top*, 1942, and (in collaboration with his sister Eleanor) *The Two Bouquets*, 1936, and *The Glass Slipper*, 1944. With his sister he also wrote *Kings and Queens*, 1932, a child's rhyming hist. of England.

Farm (Fr. *ferme*, from medieval Lat. *firma*, fixed payment), term used to denote a piece of land let or rented for cultivation or pasture, together with the necessary buildings. In Britain about half the farmers rent their land, and half own it. In America the farmer generally owns the land he cultivates.

Farm holdings consist of the residence for the farmer, cottages for the F. labourers, the F. steading, and the F. land itself. An important feature of farming in this country is a great diversity in the size of individual holdings. Whereas at one extreme 5 per cent of the land is shared between one-third of the farmers, at the other extreme less than 5 per cent of the farmers F. more than one-quarter of the land. Thus almost three-quarters of the holdings over 5 ac. in size are less than 100 ac. In the interest of domestic peace and happiness the F. house should be appropriate to the size and quality of the F. The typical F. dwelling-house on holdings of 200 ac. or more is large and comfortable, though lacking in external appeal. Ideally it overlooks the F. stead and is adjacent to it. *Farm cottages* should be, if possible, within easy reach of the farm. Grants are available from local authorities for the approved construction or improvement of cottages. Whilst housing is short it may be necessary to allocate the cottages near the steading to those tending the live-stock, tractor drivers, etc., perhaps living in the local vil. The *farm steading* is the term used to denote the buildings, etc., used for storing crops and housing stock and

machinery. The type and extent of the buildings will depend on the size of the holding, the system of farming pursued, and the resources or fancies of the owner. The site of the steading is important in the efficient running of the F., and the best place is at the centre of the holding on free draining land but with a good water supply. It is also advantageous to be near a good hard road as F. lanes are notoriously difficult to maintain. A common layout has the buildings on 3 sides of

partments of the steading to be under one roof, often in 2 storeys.

In Britain to-day many cottages are out of date and F. buildings still more so. In many cases buildings were constructed to meet needs which have now passed or changed in character and importance. Thus in some cases it will be found that the large barn was really designed for the use of the flail. The increasing use of electricity and internal combustion engines in old wooden and thatched build-

A NEW FARM AT LITTLE BERKHAMSTED, HERTFORDSHIRE

A, Bull boxes and yards; B, calf pens; C, mixing room; D, cowhouse; E, dairy and sterilising room; F, office and staff room; G, foaling box; H, saddle room; I, calving box; K, stable; L, loose boxes; M, tractor shed; N, tool room; O, implements; P, implements; Q, stock pens and cattle shelters; R, granary; S, silos. Built by George W. King Ltd., Hitchin (architect, L. A. Hartless).

a square with the open side facing S. For economy in labour use, straw and hay bays, stores, etc., should be near to the point of utilisation of their contents and should be easily accessible from good F. roads.

Construction.—Existing buildings are often of very solid stone construction with poor ventilation and lighting; frequently they are very old. The modern tendency in Britain is towards less permanent structures, with steel or pre-cast concrete frames and walls, and roofs of concrete blocks and asbestos or iron sheeting. In America F. buildings are generally of wood. It is common there for all com-

ings introduces a serious fire hazard. When labour was cheap little attention was paid to economy in its use, but now farmers cannot afford the time wasted in carrying sacks of corn and fertilisers long distances on men's backs. Tractor machinery, combine harvesters, etc., are much bigger and heavier than the old horse machinery and may make existing implement sheds inadequate. Also between the 2 world wars many cow-houses and piggeries were erected with little attention to design, and these do not come up to present production standards. The problem is to replace these buildings or adapt them to modern requirements.

In some cases replacement is the procedure adopted. For example, many progressive milk farmers, in order to economise in labour, prefer to have a small milking parlour, in which the cows are merely milked, combined with covered yards where the cows lie in and are fed. In adapting old buildings use can be made of time and motion study to cut down wastage in labour use. When planning new buildings consideration must be given to cost, adaptability, durability, simplicity of erection, economy of maintenance, possible changes in farming methods, place in the general layout, animal health, comfort and economy of labour, and last but not least appearance.

The farm land is best arranged round the stading within a ring fence, i.e. with fields isolated from the main block of land. The fields should be rectangular or square. For arable cropping large fields are desirable, but if livestock is to be grazed smaller units are better. The provision of good fences, hedges, roads, and ditches is obviously a matter of great importance.

See M. E. Seebohm, *The Evolution of the English Farm*, 1927; F. Sykes, *This Farming Business*, 1944; E. Gunn, *Farm Buildings—New and Adapted*, 1945; H.M.S.O., *Farm Buildings*, 1952. See also AGRICULTURE; DAIRYING; GARDENING.

Farm Management. In the U.S.A. it was soon recognised that, to be successful, the farmer had not only to be an artist in husbandry but also a businessman. This was particularly important on the vast corn farms and ranches. Chairs in the subject were estab. in various univs. early in the 20th cent. Recently the importance of F. M. has been appreciated in Britain, and the subject is already being taught at univ. level, e.g. at Reading. Students are instructed in the most profitable methods of producing crops and livestock; the effects of soil and climate on farming; the use of capital; problems of labour use and mechanisation; simple accounting and book-keeping; and the marketing of produce. See K. W. Campbell, *Farm Management*, 1940; H.M.S.O., *Principles of Good Farm Management*, 1955; H.M.S.O., *The Farm as a Business*, 1955; J. Scott Watson and J. More, *Agriculture: The Science and Practice of British Farming*, 1956; and also reports from the various univ. agric. economics depts.

Farman, Henry (1874–), Anglo-Fr. aviator, b. Cambrai. After learning to fly in a Voisin machine in 1907 and winning many honours, he built (1909) the aircraft called after him which did more than any other to popularise practical flying in Europe. Although not the inventor of the alleron, he was the first to incorporate it in the practical form in which it is still used.

Farmer, Richard (1735–97), scholar, b. Leicester. He was educ. at Cambridge, where he ultimately became Master of Emmanuel College. He wrote an *Essay on the Learning of Shakespeare*, 1767, in which he maintained that Shakespeare's

knowledge of the classics was got through trans.; it is a work of great ability. F. was a clergyman, a D.D., and a prebendary of St Paul's.

Farmers' Clubs exist for the twofold purpose of furthering agric. interests and promoting social intercourse among men who are following the same agric. occupation. Meetings take place usually on market days, in most of the big agric. centres throughout the country. The Farmers' Club, estab. at 2 Whitehall Court, London, S.W.1, has a large membership of farmers, stockbreeders, landowners, and other persons interested in agriculture. It was estab. in 1843 at the instance of sev. members of the Royal Agric. Society of England and the Smithfield Club. Meetings are held annually there, when papers are read on current agric. subjects and on legislation affecting agriculture. The National Federation of Young Farmers' Clubs has its H.Q. at 55 Gower Street, London, W.C.1, where is pub. the monthly paper *The Young Farmer*. The first of the Young Farmers' Clubs was estab. by the United Dairies in Jan. 1921 at Hemyock, Devon, and attracted the interest of Lord Northcliffe, who set aside a section of the Ideal Homes Exhibition at Olympia for their show in 1922, and offered a gold cup for competition among the young farmers of America and of Britain. Later the Ministry of Agriculture interested itself in clubs in which each young farmer personally rears his own stock. F. C. are a feature in the U.S.A., and of Canada, especially in the 3 prairie provs. of the dominion. There are also in the U.S.A. a number of boys' and girls' clubs in connection with agric. extension work. In America, experimentation, improvement in marketing, discussion of anti-pest methods, and the organisation of co-operative marketing are all prominent activities in F. C., while demonstrations in educational work and agric. competitions are periodically organised for the common benefit of members.

Farmers-General, those individuals who sought from the state or controller of taxes the privilege of collecting the taxes in return for a certain fixed sum paid into the treasury, such as the 'publicani' of classical and N.T. times. The system of *fermiers-généralx* was very prevalent in France before the Revolution of 1789. It was largely responsible for the Revolution, and was swept away in it.

Farmers-General (Ancient Rome), see PUBLICANI.

Farnaby, Giles (c. 1565–c. 1640), composer. He lived in London where he married in 1587, and took the B. Mus. at Oxford in 1592. He composed canzonets (madrigals), a setting of the Psalms for 4 voices, and over 50 virginal pieces.

Farnaby, or Farnable, Thomas (c. 1575–1647), grammarian and schoolmaster, the son of a London carpenter. He was educ. at Merton College, Oxford, and at a Jesuit College in Spain. His school in Goldsmith's Rent, London, became famous all over Europe. As the chief

classical scholar and schoolmaster of his time, he prepared a new Lat. grammar and an annotated ed. of most of the great classical authors. These elaborately annotated eds. were extraordinarily popular throughout the 17th cent. Ben Jonson (q.v.) was a friend of F. and contributed commendatory Lat. elegies to his ed. of *Juvenal and Perseus*. John Owen, eulogises F.'s Seneca in his 'Epigrams'.

Farnborough, Baron, see MAY, SIR T.

Farnborough, urb. dist. and par. of Hants, England, situated in the Aldershot parl. div., 2½ m. N. of Aldershot, and 32 m. SW. of London. Part of the Aldershot camp is in the par., and also the Royal Aircraft Estab., the country's chief centre of scientific research and experimental development in aeronautics, together with the Empire Test Pilots School and the Institution of Aviation Medicine. The remains of Napoleon III and the Prince Imperial are buried in a mausoleum built by the ex-Empress Eugénie at F. Hill. There is a Benedictine community at the Abbey of St Michael in F. Pop. 28,420.

Farne Isles, group of 26 small basaltic islets and rocks in the North Sea, almost 2 m. from the mainland and forming part of Belford rural dist. in Northumberland, England. On Longstone Is. stands the lighthouse from which Grace Darling's heroic rescue took place in 1838. Inner F. was for a time the residence of St Cuthbert, who returned to it to die in 687; after him a succession of hermits occupied the is. From 1255 to 1536 the House of F. was a monastic house comprising 2 Benedictine monks. There were 2 chapels, that to St Cuthbert having been restored. On the probable site of his Oratory stands a 16th-cent. tower now used as a study centre. The group is famous as a bird sanctuary, particularly for gullmots, and as the only breeding station of Atlantic seals on the E. coast of Britain. The is. were acquired by the National Trust in 1925, as a result of a public appeal.

Farnese Family, The, powerful It. family whose early hist. is obscure. Its importance dates from 1534, when Cardinal Alessandro Farnese was elected pope as Paul III. He obtained (1545) the duchy of Parma and Piacenza for his natural son Pierluigi Farnese. Piacenza was occupied by Charles V in 1547, but the duchy of Parma was ruled by the F. for over 2 centuries. *Alessandro Farnese* (1545-92), the 3rd duke of Parma, was a famous statesman and gen., and became governor-gen. of the Netherlands under Philip II of Spain. His son and successor, *Ranuccio I* (1569-1622), instituted the savage persecutions against supposed 'witches' and 'heretics'. He was succeeded by his 2nd son, *Odoardo* (1612-46), who quarrelled with Pope Urban VIII about the possession of Castro, which was eventually razed to the ground during the reign of his son *Ranuccio II* (1630-84). *Ranuccio's* 2 sons, *Francesco Maria* (1678-1727) and *Antonio* (1678-1731), both d. childless and

were the last of the male line of the F. The duchy of Parma passed to Don Carlos of Bourbon, son of Philip V of Spain and *Elizabeth Farnese* (1693-1786).

Farnese Palace, palace in Rome (q.v.), on the Piazza F., one of the finest specimens of Rom. Renaissance architecture. It was begun on the order of Cardinal Alessandro F. (later Pope Paul III, q.v.) in 1514, and was completed under the direction of Michelangelo (q.v.). It was inherited by Don Carlos of Bourbon (see FARNSESE FAMILY), later Charles III (q.v.) of Spain, and most of its pictures and antique sculpture were removed to Naples. It now houses the Fr. embassy to Italy.

Farnham, mrkt tn of Surrey, England, situated on the R. Wey, 38 m. SW. of London. It is the centre of a hop dist. Wm Cobbett was b. here in 1762, and is buried in the par. churchyard. F. is historically interesting. Its castle was built by Henry of Blois, brother of King Stephen, destroyed by Henry III, and rebuilt and garrisoned by Charles I. It was restored in 1884 by Dr Morley, bishop of Winchester. The ruined keep was repaired in 1913-14. Moor Park was the last retreat of Sir Wm Temple, who d. here on 27 Jan. 1699, and it was here that Dean Swift wrote many of his works. The cottage in which Miss Johnson lived is still called Stella's Cottage. Mother Ludlam's and Foot's caves are near by, also the remains of earth-works called Caesar's Camp. Many Rom. coins have been found. Pop. 24,100 (1954).

Farnol, John Jeffrey (1878-1952), novelist, b. Aston, Warwickshire. He studied art and for 2 years worked as a scene painter at the Astor Theatre, New York. His novel, *The Broad Highway*, 1910, a picaresque romance, was so successful that he was able to return to England and make writing his career. *The Amateur Gentleman*, 1913, *The Chronicles of the Imp*, 1915, and *Our Admirable Betty*, 1918, were also very popular. Others of his flamboyant novels are *Beltane the Smith*, 1915, *The Geste of Duke Jocelyn*, 1919, *Peregrine's Progress*, 1922, *The Loring Mystery*, 1925, *Charmian*, *Lady Vihar*, 1932, and *My Lord of Wrybourne*, 1948.

Farnworth, bor. and tn of Lancs, England, 3 m. SE. of Bolton and 9 m. NW. of Manchester, in the heart of the S. Lancs industrial area, forming the parl. constituency of F. Local industries include the weaving and finishing of textiles, manuf. of hosiery and knitted goods, engineering and printing, bleaching and dyeing works. Pop. (1954) 28,614.

Faro: 1. Dist. of S. Portugal, co-extensive with Algarve prov. (q.v.).

2. Most southerly city of Portugal, cap. of F. dist. and of Algarve prov., 135 m. SSE. of Lisbon (q.v.). It is near Cape Santa Maria, on an inlet of the Atlantic, behind 3 is. The city was taken from the Moors by Alfonso III in 1249, it was burned by the Eng. in 1596, and it was severely damaged in earthquakes in 1782 and 1755. The tn walls are probably

Moorish, and there is a cathedral with a fine 18th-cent. tower. Cork and fruit are exported, there are tunny and sardine fisheries, and there are manufs. of food-stuffs. Pop. 20,000.

Faro (from 'Pharaoh,' picture of an anet Egyptian king on one of the cards of the old Fr. pack), a game of hazard with a full pack of cards, popular in France in the reign of Louis XIV and still in the U.S.A. The 'bank' is held against an indefinite number of players.

Faroe Islands, see FAEROE.

Farquhar, George (1678-1707), dramatist, b. Londonderry. He went on the stage after leaving Trinity College, Dublin, and in that city, about 1695, made his debut as Othello. He is generally supposed (on the authority of his biographer, Thomas Wilkes) to have left college in 1695 on account of the death of his patron, Bishop Wiseman of Dromore, to become a corrector of the press. In a subsequent appearance he accidentally stabbed a fellow-actor, and was so distressed that he retired from the stage, on which in any case he had met with little success. He now turned his thoughts to play-writing, and his *Love and a Bottle* was successfully produced at Drury Lane in 1699. In the following year *The Constant Couple* was performed, and was an even greater success. This was followed by *Sir Harry Wildair*, 1701, in which play at his own benefit at Dublin he played the title-rôle, *The Inconstant*, or *The Way to Win Him*, 1702, *The Twin Rivals*, 1702, and *The Stage Coach*, a farce in 1 act (with Motteux), 1704. His last plays were *The Recruiting Officer*, 1706, and *The Beau's Stratagem*, 1707, which are marked by a good-humoured realism different from the usual artificiality and cynicism of Restoration comedy. He got into financial difficulties and the duke of Ormonde, whom he styles his 'general' in the dedication to *The Recruiting Officer*, advised him to sell the lieutenant's commission which he then held, in order to pay his debts, promising to give him a captaincy. He acted on this advice, but the duke failed him and F. sickened and d. in despair. He belonged to the Congreve school of dramatists, with qualities of wit and gaiety, but little more sense of morality than the majority of the playwrights of his time. His *Complete Works* were ed. by C. Stonehill, 1930. See W. Connely, *Young George Farquhar*, 1948.

Farquharson, Martha, see CHILDREN'S BOOKS.

Farragut, David Glasgow (1801-70), first adm. of the U.S.A. navy, b. at Campbell's Station, near Knoxville in Tennessee. He entered the navy in 1810, became lieutenant in 1825, commander in 1841, and captain in 1855. Although a southerner by birth, on the outbreak of the Civil war in 1861 he adhered to his allegiance to the gov. at Washington, and in 1862 was appointed as rear-adm. to the command of the W. Gulf Blockading Squadron, with which he forced the passage of the Mississippi and captured Orleans. In 1864 he captured

Mobile and in the same year was invested with the newly created rank of vice-adm. He was made adm. in 1866. In 1867 he was chosen to command the European Squadron. The cruise came to an end on 10 Nov. 1868.

Farrant, Richard (1-1581), composer of church music. He became a gentleman of the Chapel Royal under Edward VI; became organist of St George's Chapel in 1564, and rejoined the Chapel Royal in 1569, retaining the Windsor post. Of his church music only a Cathedral Service in A minor and 2 anthems are preserved and can be attributed to him with certainty.

Farrar, Frederic William (1831-1903), divine, b. Bombay, and educ. at London Univ. and Trinity College, Cambridge. From 1855 to 1870 he was assistant master at Harrow, and from 1871 to 1876 headmaster of Marlborough College. He was elected fellow of the Royal Society in 1866, univ. preacher in 1868, honorary chaplain to the queen in 1869, and Hulsean lecturer in 1870. He became canon of Westminster and rector of St Margaret's in 1876, archdeacon in 1883, and dean of Canterbury in 1895. In 1858 he began his literary work with the schoolboy story, *Eric, or Little by Little*, followed by *Julian Home*, 1860, and *St Winifred's*, 1862. He pub. a number of books on classical and modern philology, but it was by his theological writings that he attained his greatest popularity. *The Witness of History to Christ* (Hulsean Lectures) appeared in 1871. Other works include: *The Life of Christ*, 1874 (12th ed. 1875), *Life of St Paul*, 1879, *Early Days of Christianity*, 1882, *Lives of the Fathers*, 1888, *Darkness and Dawn*, 1891, and *The Bible, its Meaning and Supremacy*, 1896.

Farrar, Geraldine (1882-), Amer. operatic soprano, b. Melrose, Massachusetts. She studied singing with Mrs J. H. Long in Boston, Mine Thursty in New York, Trabaddello in Paris, and Lilli Lehmann in Berlin. On 15 Oct. 1901 she made her debut at the Royal Opera, Berlin, as Marguerite in Gounod's *Faust*, with such success that she immediately had a 3 years' contract. From 1906 till her retirement from the stage on 22 April 1922, she was a leading soprano at the Metropolitan Opera House, New York.

Farnell, James Thomas (1904-), Amer. novelist and critic, b. Chicago. Educ. at Chicago Univ., he worked for a time in a petrol station and as a salesman, and in 1936 obtained a Guggenheim fellowship. His experiences as a baseball enthusiast and as a student in Catholic schools on the S. side of Chicago are the background of his novel *Young Lonigan*, 1932. This was followed by *Gas House McGinty*, 1933, and the trilogy *Studs Lonigan*, 1925, for which he was awarded \$2500 from the Book of the Month Club. Other novels are *No Star is Lost*, 1938, *Father and Son*, 1940, *My Days of Anger*, 1943, *Bernard Clare*, 1946, *The Road Between*, 1949, and *The Face of Time*, 1953. He also pub. sev. vols. of short stories. He has made a detailed and constant use of the naturalistic technique, especially in his chief book,

Studs Lonigan. His characters live in the depressed areas of the S. side of Chicago and among street gangs and petty criminals. Most of them are casual in their morality and many merely vicious. His writing shows the influence of James Joyce, Dreiser, and Proust, but he reveals his keen interest in the ordinary facts of modern Amer. life and his impatience with social and economic inequalities. Others of his works are *A Note on Literary Criticism*, 1936, and *Literature and Morality*, 1947.

Farrell, bor. in Mercer co., Pennsylvania, U.S.A., on the Shenango R., close to Sharon city, with which it is industrially conjoined. It has steel and tin-plate manufs. Pop. 13,640. The name has been changed from Sharon since 1910.

Farren, Elizabeth, Countess of Derby (c. 1759-1829), actress, and daughter of George F., an actor. She made her first appearance in London at the Haymarket in 1777, as Miss Hardcastle in *She Stoops to Conquer*. This success was followed by Rosina in Colman's adaptation of *The Spanish Barber*, and many others. In 1782 she succeeded Mrs Abingdon at Drury Lane. In 1797 she married Edward, 12th earl of Derby.

Farren, Ellen, commonly known as **Nellie Farren** (1848-1904), actress, came of an old theatrical stock, and made her first appearance on the stage at the age of 5. She played many parts at Sadler's Wells, the Victoria, and the Olympic theatres, and earned the reputation of being both clever and versatile. When she went to the Gaiety in 1868 and played prin. boy parts in burlesque she became famous. She was a great 'draw' in London until 1891, when ill-health compelled her retirement.

Farrer, Sir Thomas Henry, 1st Baron (1819-99), statistician and civil servant, b. London, and educ. at Eton and Balliol College, Oxford. He was called to the Bar in 1844, but ceased to practise on entering the civil service as secretary to the Marine Dept of the Board of Trade in 1850, a post which he held until 1886. He was an advanced Liberal in politics, and a strict free-trader. His theories on trade and finance are embodied in his writings: *The State in its Relation to Trade*, 1883, *Free Trade versus Fair Trade*, 1886; and his letters and essays appeared in *The Times* and *Contemporary Review*. He pub. *Study in Currency* in 1898. He was created a baronet in 1883 and a baron in 1893.

Farrer, William James (1845-1906), agric. scientist, b. Kendal, England, migrated to Australia 1870. F. for some time acted as surveyor for the lands dept of New South Wales; later he bought land and, becoming interested in the problem of breeding a rust-resistant wheat, he began a series of experiments which were largely successful in developing drought and disease resistant wheats suitable for Australian climatic conditions. See A. Russell, *W. J. Farrer*, 1949.

Farriery, art of horse-shoeing. It is of anct origin, and there is evidence that the

art was practised by the Celts. It does not seem to have been in use among the Greeks or Romans. The art probably came into general use after the overthrow of the W. empire towards the close of the 5th cent. In modern times the art has undergone many changes and improvements, as the methods formerly adopted were considered injurious to the animal and a source of considerable loss to the owner. The following were some of the chief causes of these evils: (1) paring the sole and frog; (2) applying shoes which were too heavy and of the wrong shape; (3) using too many and too large nails; (4) applying shoes too small and removing the wall of the foot to make the feet fit them; (5) rasping the front or wall of the hoof. These were often due to lack of skill on the part of workmen who combined the duties of blacksmith and shoemaker in one trade, and who lacked the necessary basic knowledge of the anatomy and function of the horse's foot. According to modern principles, (1) shoes should be as light as compatible with the wear required of them; (2) the ground face of the shoe should be concave, and the face applied to the foot plain; (3) heavy draught horses alone should have toe and heel calks on their shoes to increase the foot-hold; (4) any excess of growth of the wall or outer portion of horny matter should only be removed in re-shoeing. Care is to be taken to keep both sides of the hoof of equal height; (5) the shoes should fit accurately to the circumference of the hoof and project slightly beyond the heel; (6) as few nails as possible should be used; (7) the nails should take a short, thick hold of the wall so that the old nail holes may be removed in the natural growth and paring of the horny substance. The foot is composed of a horny substance which becomes brittle and breaks away, especially as a result of extra strenuous work. In order to prevent this, the rim of iron is placed on the foot and can be renewed from time to time. The shoes and nails are now manufactured very economically by machinery. The advent of modern methods of locomotion and means of transport has greatly impeded the art of F. In the 18th and 19th cents. every vil. had its shoemaker, who, as mentioned above, combined his art with that of the blacksmith, thus causing evils which were only stamped out by modern systems of F. See J. Jeffray, *Address on the Present State of Farriery*, 1786; W. Douglas, *Horse-shoeing*, 1873; W. Hunting and A. Mattinson, *The Art of Horse-shoeing*, 1922; C. Holmes, *The Principle and Practice of Horse-shoeing*, 1928.

Fars, prov. of Persia (Iran), extending along the N. shore of the Persian Gulf, bounded by Isfahan and Yazd on the N., on the E. by Kerman, on the W. by Khuzistan, and on the S. by the Persian Gulf. The name is the same as the Gk 'Persia', which, originally the name of the prov., came to be the name by which the whole empire was called. The prov. is traversed by mt chains running parallel with the coast, intersected by fertile

valleys, rich in pasturage, vines, and fruits. The riva. are small and seldom flow into the sea. The climate varies greatly according to the altitude. The prin. products are dates, rice, olives, cereals, cotton, opium, tobacco, fruit, and vines. The cap. is Shiraz (pop. 169,100). The prin. occupations are agriculture and stock raising. The area of F. is about 53,000 sq. m. and the estimated pop. 1,500,000.

Farshut, or **Farshiout**, tn. of Upper Egypt, situated near the R. Nile, 20 m. S.E. of Girgeh, in a picturesque country of astonishing fertility.

Farsley, part of the bor. of Pudsey (q.v.), in the W. Riding of Yorks, England, 3½ m. from Bradford. It has scribbling, spinning, and cloth manufacturing mills. Samuel Marsden, who first introduced Australian wool into England, and passed his life as a missionary in Australia and New Zealand, was b. here. Pop. 7000.

Farthing (A.-S. *feortha*, a fourth, and *ing*, a diminutive) is the smallest Eng. bronze coin, and is equal in value to the 4th of a penny. It was instituted as a silver coin in the reign of Edward I, in which form it continued until the time of Mary. James I granted a patent to Lord Harrington of Exton in 1613 for the manuf. of brass F.s, but it was not until 1672 that copper F.s came into circulation in any number. In the reign of James II tin F.s were also in circulation for a short time. In 1860 copper F.s gave place to bronze, in which form they have continued. The experiment of issuing half-F.s was tried in 1842, but not proving successful, the coins were demonetised in 1869. In 1853, the last year in which they were minted, 913,920 half-F.s were coined. The present value of these coins is up to 1s. 6d. each according to date and condition. Half- and quarter-F.s were minted between 1839 and 1856 for use in Ceylon, and in 1844 one-third F.s were also struck for Malta. In 1897 the practice was adopted of darkening F.s before issue, that they might not be mistaken for half-sovereigns.

Farthingale (O.F. *verdugalle*, corruption of Sp. *verdugado*, from *verdugo*, a stick), case or hoop upon which were hung voluminous skirts. The material of the F. was originally wood and later whalebone. It first appeared in Spain at the end of the 15th cent., and reached its most exaggerated form in the 17th cent., when it consisted of a flat circular surface, projecting from the bodice. It was the forerunner of the crinoline (q.v.) of the 18th and 19th cents.

Farwell, Sir George (1845-1915), judge; 2nd son of Frederick Cooper F., of Tottenham, Staffordshire; graduated from Balliol College, Oxford, and called to the Bar in 1871. He decided the crucial point in the Taff Vale railway case, 1900, concerning the liability of trade union funds to attachment for damages. In 1906, after being for 7 years judge of the high court, he was made lord justice.

Fascés, bundles of rods bound with a red strap, carried on the left shoulder by

lictors (q.v.) in auct Rome before the chief magistrates of the rep. and later before the emperors, to symbolise their authority. The rods were generally made of birch or elm, and an axe protruded at a point above the centre. This axe, however, represented the power of life and death, and was therefore removed (except when borne before a dictator) within the city precincts, where an appeal lay to the sovereign people when a man's life was at stake. Twenty-four F. were carried for a

FASCÉS

dictator, 12 for a consul, and 6 for a praetor.

Fascia, or **Facia**, in architecture (i) the bands into which the architrave of the Ionic and Corinthian orders is subdivided (see ORDERS OF ARCHITECTURE); (ii) any long flat strip of wood, stone, or metal.

Fasciation, a phenomenon in plants arising when sev. lateral shoots fail to separate normally from the main axis in growth, but remain banded together, producing a broad flattened stem or stems. The precise cause is unknown, but is associated with over-nutrition and accumulation of plastic materials with the plant.

Fascinés are brush-wood faggots used for military purposes. They are generally about 18 ft in length, not quite a ft in thickness, and are bound tightly together

by means of wire or withes. They are used for roofing magazines, for bridge and road making, and also for revetting the steps and slopes of field-works. When cut up into one-third of the length they can be utilised in filling up a ditch, trench, etc., and are especially useful for supporting structures in marshy ground. During the Second World War F. laid by E.E. tanks facilitated the passage of wheeled and tracked vehicles over swamps and ditches.

Fasciola, parasite which causes liver rot in sheep, see LIVER-FLUKE and TREMATODES.

Fascism, name given to the political movement which arose in Italy soon after the First World War and which claimed that it would deliver the country from Bolshevism, restore its economic equilibrium, and raise it to its rightful place in the family of nations. The movement was led by Benito Mussolini (q.v.), and successfully dominated administration in Italy from 1922 until 1943. The symbol of F. (*Fascismo*) was the fasces (q.v.) and the *Fascista* salute was that of ancient Rome—by outstretched arm. The military organisation of the National Fascista party—as it was officially constituted, with its Great National Council—was on pseudo-Rom. lines, with Rom. names like 'legion,' 'consul,' 'centurion,' 'tribune,' 'senior,' and so forth. The coins bore on one side the Rom. fasces, and special gold coins were issued to celebrate the anniversary of the famous 'March on Rome' of Oct. 1922, which carried F. triumphantly into power. Discipline was rigorous; and the motto of F., 'No discussion, only obedience,' serves to explain the rapidity of the sudden mobilisations and demobilisations carried out by the organisation. F. also possessed a large and powerful Press and a publishing house in Milan. But the decisive factor in the victory of F. was over and above all the personality of its leader, the so-called *Duce*, Mussolini, the main-spring of the movement.

F. did not, however, present an absolutely new political phenomenon, but was really part of the general historical development of nations, and it reveals the theoretical influence of Machiavelli and Nietzsche (q.v.) and also of Sorel and Pareto. It has been compared to the 'krypteia' of Sparta, and the 'eterie' of Athens, and other similar expressions of self-defence of strong active groups or classes, uniting and forming centres of resistance. It came as a reaction to the complete apathy and disorder in parl. State functions in Italy and to the attraction (probably exaggerated) of the It. working classes to the gospel of Lenin following the First World War. It came at a time when economic chaos was rife; foreign exchanges were disorganised; the police impotent; the Carabinieri insulted and even killed by the Communists. Resistance came from the patriots of the Trentino, the Carso, and other battlefields of the war, and the first encounter between them and the Communists was in 1921 at Bologna, which

date marks the wane of Bolshevism and the rise of F. Progress was at first slow; but masses of the working classes were soon enrolled among the Fascist syndicates scattered all over Italy, and these began activities by settling many important economic disputes and strikes. The army was secretly or openly in favour of F., and, contrary to the hopes of the Communists, would never have marched against the Fascist. The very generals of the regular army wore the black shirts of the organisation, and themselves directed the March to Rome. In the closing months of 1922 the members of F. increased by leaps and reached even to the Alps and S. Sicily. Finally, in 1922, after a great meeting at Naples and after the March to Rome, Mussolini and his influential quadrumvirate, formed by de Bono, de Vecchio, Balbo, and Bianchi, the secretary-gen. of the party, were summoned by the king to form the first Fascist cabinet.

The Fascist Party (as in other European totalitarian states) was the only authorised political organisation in Italy during the period of the prevalence of F. The social system aimed at was the Corporative State (q.v.). F. claimed to be neither capitalistic nor socialistic. It maintained private property but subjected its use to State control. Trade unions and manufacturers' associations, both Fascist-controlled, were bound to co-operate in the Corporation. Spirit and organisation in the Party were militaristic. The statute of the Party described it as a civil militia at the orders of the *Duce* or leader and dedicated to the service of the State, with its chief aim the achievement of the greatness of the It. people. The Party was anti-liberal and anti-democratic, and stood for nationalism and imperialism. F. upheld violence, rejected civil liberties, and claimed the monopoly of education in its youth organisations. The party maintained its own army with a training and standing almost equal to those of the regular army.

F. served as a model to a number of similar political movements in other countries, notably, of course, to National Socialism (q.v.) in Germany and Falangism in Spain, and, indeed, in a broader sense the term 'Fascist' came to be used to describe almost any reactionary or authoritarian ruler, irrespective of profound diversities; as, e.g., Dollfuss (q.v.), Pétain (q.v.), whose policy as leader of the Vichy Gov. was increasing collaboration with Hitler; Salazar, the prime minister of Portugal, whose policy was formed on mildly Fascist lines; and Peron, the former dictator of the Argentine Rep. See further under ITALY, History; MUSSOLINI, BENTO.

See *Mussolini's Political Speeches*, trans. by Barone di San Severino, 1923; G. Gentile, *Origini e dottrina del fascismo*, 1930; G. Bourgin, *L'Etat Corporatif en Italie*, 1935; H. Finer, *Mussolini's Italy*, 1935; A. Rossi, *The Rise of Italian Fascism*, 1933; W. Ebenstein, *Fascist Italy*, 1939; P. Nathan, *Psychology of Fascism*, 1943.

Fashion (adapted from Fr. *façon*; Lat. *factio*, making, *facere*, to do, or make), used in the sense of the pattern or mode in which a thing is done, particularly employed in the sense of the customary or usual way in which a thing is done, and hence applied to the manner or custom prevalent at or characteristic of a particular period. All man-made works, except those of an exclusively utilitarian nature such as scythes or needles, are subject to changes of F., and to judgment from the point of view of prevailing F. And even aspects of nature—mts, the sea—have been esteemed differently at different times. Because clothes wear out quickly F.s in clothes change more frequently than F.s in, say, music or architecture, but slang phrases and popular songs, like dress, become quickly outworn and disappear from F. The commonest application of the word is to dress (q.v.), hence 'fashion-plate,' 'fashion magazine.'

Fashoda, post on the W. bank of the Upper Nile, Sudan, 459 m. S., by riv., of Khartoum. It is the cap. of the *muḍirīa* (prov.) of the Upper Nile. The climate is most unhealthy. F. is the residence of the 'Mek,' or king of the Shilluk tribe. An Egyptian military post was estab. at F. in 1865, which was also an important trading station. In 1883-4 the post fell into the hands of the Mahdists. In 1898 the Fr. commandant, Marchand, with a force from the Congo, hoisted the Fr. flag there. Sir Herbert Kitchener, having just captured Khartoum, re-hoisted the Brit. and Egyptian flags at F., and invited Marchand to withdraw. The latter refused, and the matter was referred to London and Paris. For a while the tension between the 2 countries was extreme, but in Dec. of the same year France, uncertain of the support of Russia, ordered the withdrawal of the Marchand expedition.

Fast and Loose, also called **Pricking at the Belt**, a cheating game much practised by sharpers at the fairs, especially by gypsies in the time of Shakespeare. A leathern strap is rolled or doubled up with a loop in the centre, and placed edgewise on the table. The sharper then seeks for someone to bet that he can catch the loop with a skewer, which looks easy: he then unrolls the belt in such a way that the catching of the loop is an impossibility. From this game comes the expression 'to play fast and loose'; the modern name of the game is 'Prick the Garter.'

Fasti (Lat. *fastus*, lawful), the days on which it was lawful to do business. In early Rom. times such days were declared by the priests, but were set up in the Forum on tables called F., which were practically the equivalent of calendars. They were of 2 kinds: the 'F. diurni,' strictly the calendars of the year, containing the list of lawful and unlawful days, the days for festivals and courts, etc.; and the 'F. annales,' or 'historici,' which contained the names of the consuls and other magistrates, and such historical events as were considered worthy of note.

Fasting, strictly abstinence from all

food and drink for a given period, but much more commonly used for abstinence from certain kinds of food only.

1. **Religious**.—It is an accompanying feature of nearly every known form of religion; its motives and modes of practice varying, of course, according to race, climate, and civilisation. The origin of the practice is buried in obscurity; some authorities suggest that it arose from the custom of providing food for the dead, others that it was a preparation for the receiving of sacramental food, and others that it is the subjection of the lower nature in order to exalt the higher for the seeing of visions. Whatever the motive, partial or complete abstinence from food at stated periods was practised at a very early date by Parsees, Hindus, Egyptians, Assyrians, Greeks, and Romans. It was a prominent and inseparable feature of the Jewish ritual. The solemn national fast on the 10th day of every 7th month (the Day of Atonement), the penalty for the non-observance of which was death, was the only public fast ordained in the Books of Moses (Lev. xvi. 29-34; xxiii), but the practice of private and occasional public fasts, at periods of national calamity, is frequently recorded (Judges xx. 26; 1 Sam. vii. 6; 2 Sam. xii. 16). During the captivity the fasts of the 4th, 5th, 7th, and 10th months were instituted to commemorate certain incidents in the downfall of the nation. The number of special fasts mentioned in the N.T. and practised by the Pharisees and the disciples of St John the Baptist (Luke xviii. 12; Mark ii. 18), although insisted upon by the Pharisees, were really voluntary, and were probably never practised by the sect of the Sadducees and others. There is no reason to doubt that our Lord observed the one great national fast, but He neither upheld nor practised the fasts ordained by the Pharisees. The apostles and the fathers of the early Christian Church, however, influenced probably by such passages as Matt. ix. 15, not only practised F. themselves, but instituted it as an obligatory practice for all the members of the Church. In the Rom. Catholic Church there are the great 40 days' fast of Lent, the quatermber fasts of 3 days in 1 week of each of the 4 seasons, while every Friday and on the eves of certain feasts there is abstinence from all flesh foods. The new legislation (1957) governing the eucharistic fast includes the following provisions: abstention from solids and alcoholic liquids for 3 hrs before communion, from non-alcoholic beverages for 1 hr. Water may be taken at any time up to the moment of reception. In the Gk Church the practice is followed with much greater severity, and the fast days cover about three-quarters of the year. In the Anglican Church F. is regarded only as a useful exercise, praiseworthy, but never obligatory, and not in itself a means of grace; the Prayer Book, however, enumerates the 40 days of Lent, all the Fridays in the year with some exceptions, Ember days, Rogation days, and the eves or vigils of certain festivals.

In Scotland the sacramental fast days so long observed have almost entirely fallen into disuse. The Moslems, as an offshoot of the Jewish and Christian communities, adopted the practice of F. with many others; they regard it as an efficacious means of averting the wrath of Allah in national calamities, and of mitigating the penalties of sin. The month of Ramadan, in which Mohammed brought the Koran from Heaven, is strictly observed as a complete fast for all the faithful, eating, drinking, and smoking being forbidden from sunrise to sunset, and voluntary

surveillance made it impossible for her to have secret access to food and water; whereas in 1888 a Frenchman named Jacques, who partook freely of water during his fast, abstained from solid food for 30 days, and under similar conditions an Italian named Lucci in 1890 fasted successfully for 40 days. Emaciation and a lowering of body temp. are invariable accompaniments of starvation, the wasting occurring first in the fatty tissues and later in the muscles. The wasting process takes place less rapidly when the body is kept warm and exertion is limited

D. Rowlands

FASTNET ROCK AND LIGHTHOUSE

fasts are common. See R. Nelson, *Festivals and Fasts of the Church* (24th ed.), 1782; E. I. Lane, *Modern Egyptians*, 1836; Liesmayr, *Die Entwicklung der Christlichen Fastendisziplin*, 1877; E. Westermarck, *The Principles of Fasting*, 1907; R. Arhesmann, *Das Fasten bei den Griechen und Römern*, 1929. See also JEWS and MOHAMMEDANISM.

2. *Medical*.—By F. is usually meant the abstinence from solid food, the term total abstinence being used when water also is withheld. It has been proved by experiments that, whereas the human body cannot survive total abstinence for longer than 8 days, the free administration of water makes it possible to sustain life for 30 or 40 days or even longer. In 1859 a Welsh girl who pretended that she had lived for 2 years without food failed to survive for 8 days when strict medical

to a minimum. Apoplexy and intestinal ulceration frequently occur in the course of a prolonged fast. The insistent craving for food diminishes after the first few days and is succeeded by torpor.

3. *Political or Contumacious*.—F. has, in modern times, been frequently resorted to as a means of securing political ends. Thus, in the earlier days of the Feminist movement, 'suffragettes' fasted in the hope of furthering the attainment of their political goal. In the past hunger-strikes have frequently been undertaken by Irish patriots and Indian nationalists. Forcible feeding is generally attempted in these cases, but in others the attempt has been unsuccessful and the 'hunger strikers' have either yielded or died.

Fastnet Rock, in lat. 51° 23' N. and long. 9° 36' W., situated about 4 m. SW. of Cape Clear, off co. Cork, Ireland. A

lighthouse erected in 1854 stands on the R., and the light, which is revolving and 160 ft above high-water mark, is visible for 18 m.

Fat, in chem., mixture of glycerides. When the suet of beef or mutton is heated in a muslin bag in water, and kneaded so that the membranes of the F. globules are broken, the melted F. may be collected in the form of a liquid which rapidly cools to tallow. If this tallow be heated to about 200° C. under pressure, it decomposes into glycerol or glycerin, a sweet syrup used in toilet preparations, and certain acids known as fatty acids. All the F.s, butter, lard, bone-F., etc., and the liquids known as olive-oil, linseed-oil, palm-oil, etc., behave in this way. Glycerol is a trihydric alcohol, and, like the alcohols generally, reacts with acids to form ethereal salts, or esters. The esters of glycerol are termed glycerides, and are distinguished, according to the acids with which they are associated, as triacetin, tripalmitin, tristearin, triolein, etc. The chief glycerides present in F.s are the solids tripalmitin and tristearin, and the liquid triolein. The relative proportions of solid and liquid glycerides determine whether the substance is a F. or an oil at ordinary temps. Tallow, for instance, contains a preponderating proportion of tripalmitin and tristearin; lard, which is much softer, contains more triolein, while olive-oil contains a preponderance of triolein. At moderately high temps. the glycerides are decomposed by water into glycerol and their corresponding acid; thus, tristearin yields glycerol and stearic acid, triolein yields glycerol and oleic acid, and so on. The chief uses of F.s are in the manuf. of soaps, as ingredients in articles of food, as lubricants, and as media for colouring matter, etc. In the first 2 of these uses, solid fats are preferable to liquid ones and so natural F.s and oils are hardened by hydrogenation, usually using hydrogen and a nickel catalyst. Vegetable oils are often partially hardened to the consistency of lard. Long chain alcohols for the preparation of detergents are made by hydrogenating glycerides under pressure and temp. using copper chromite as a catalyst. F.s constitute an important item in an ordinary diet. They contain a relatively higher proportion of carbon than protein, which is the chief constituent of lean meat; and as carbon is discharged in large amounts from the body, it is desirable to replace it by a corresponding preponderance of F.s and carbohydrates in the diet. In Arctic regions, where the heat of the body has to be kept up by a plentiful supply of combustible material, human beings crave for F. to an extent incomprehensible to dwellers in temperate climates. See E. R. Bolton, *Oils, Fats, and Fatty Foods*, 1928; H. K. Dean, *The Utilisation of Fats*, 1938; T. P. Hilditch, *The Chemical Constitution of Natural Fats*, 1940. For F. in the digestive process, see **Digestion**. See also **ADIPOSE TISSUE**.

Fata Morgana, lt. name for a curious kind of mirage frequently observed in the

Straits of Messina, and so called because it is supposed to be caused by the fairy (*fata*) Morgana of the Arthurian legends. An observer on the shore frequently sees men, ships, or houses sometimes in the air, sometimes in the water, the same object frequently having 2 images, one inverted. The cause is the same as that of the desert mirage. See **Mirage**.

Fatalism, philosophic doctrine of the futility of human struggles against destiny. It is the basis of such different systems as those of Hegel and Herbert Spencer. The Stoics associated it with the idea of necessity, and contended that as such it was a power unalterable even by God. Theologically, it is the belief that life is governed by inevitable laws which depend on the arbitrary decrees of an Almighty, and also by the laws of nature; it is exemplified in Spinozism and in the later ideas of predestination. F. is essentially an Oriental conception, and is the predominating spirit of E. philosophy, literature, and religion, finding its strongest expression in the Mohammedan idea of Kismet.

Fatehpur Sikri, tn of Uttar Pradesh state, India, former cap. of the Mogul empire, 23 m. W. of Agra, founded in 1569 by Akbar as a thank-offering for the birth of his son, Selim. The magnificent architectural ruins, enclosed by a high wall 7 m. in circumference, include a splendid mosque and sev. palaces, including that of Akbar. It was deserted within 50 years of its foundation owing to lack of water, and is in a remarkable state of preservation as a whole.

Fates, The, see **MOIRAE**.

Father, see **FAMILY**; **PARENT**.

'Father Divine', Amer. negro, b. (according to the most reliable information) c. 1880 on a rice plantation on Hutchison Is. in the Savannah R. His original name was George Baker, and he became a devoted assistant to Samuel Morris in the Baptist Church Coloured, Baltimore, Maryland. Morris claimed to be indwelt by God, and conferred on Baker his 'Messenger' the title of 'God in the Sonship Degree' in 1907. In 1915 Baker arrived in New York and eventually proclaimed that he alone was God, F. D. He demanded renunciation of all family attachments and of all sexual relationships, though himself twice married (in what is claimed to be a purely spiritual union). His followers are called 'angels,' and he maintains 'heavens' for them in various places. His main centres are in New York, Philadelphia, and Newark. His worshippers are chiefly negroes, but include some whites, and their numbers are considerable; they provide substantial revenues. See Sara Harris, *The Incredible Father Divine*, 1954.

Father of the Chapel, name bestowed on a person in any printers' trade society who is held responsible for seeing to the faithful performance of the duties and regulations by the members of that society in any printing office. A C. exists for each section of the trade, i.e. composing-room, stereotyping, etc., within

each printing-house. When Equity was formed the organisation was based on the practice in the printing industry. Therefore to-day every theatre has its own C., complete with F. and clerk.

Fathers of the Church. The patriarchs are described in the O.T. as the 'Fathers of Israel,' and the early Christians, as spiritual Israelites, still so regarded them; but for long they would not give the name 'father' to their own spiritual heads, remembering our Lord's warning, 'Call no man your father upon the earth' (Matt. xxiii. 8). Yet the mob of Jews and pagans at the martyrdom of Polycarp cried out, 'This is the Christians' father.' In the 4th cent. Athanasius defends the term *homousios* as earlier used by certain 'fathers,' and after this the word frequently occurs in councils, such as those of Constantinople and Chalcedon. Strictly speaking, the F. of the C. are those writers of the early centuries who were remarkable for their perfect orthodoxy, and great sanctity, and whose writings have ever been regarded as, after the Bible, the most valuable portions of Christian literature. The term is, however, also used to include Tertullian and Origen, and other writers who were slightly or entirely heterodox. In the great *Patrologia* of the Abbé Migne, writers such as Theodore of Mopsuestia and Pelagius are included, but these come under the last head of the sub-title, *Scriptorum ecclesiasticorum*. Thus the study of patristics or patrology is not restricted to orthodox writers. Rom. Catholic theology regards the unanimous consent of the F. as infallible. The Anglican Church also appeals to them as depositaries of the true primitive tradition. Almost invariably the F. of the 1st cent. are considered apart from the rest under the title 'Apostolic Fathers' (q.v.), as being the immediate friends and disciples of the Apostles, while the *patristic* period proper may be said to start with the 2nd cent., no definite date marking its termination. Migne, in his *cursus completus*, carries his patrology down to about 1200 for the Latins and to the Fall of Constantinople for the Greeks, but for ordinary purposes this range is too extensive. A more usual limit is the time of Gregory the Great (d. 604) in the W. and that of John of Damascus (756) in the E. After this the freshness and spontaneity of thought which mark the early writers almost entirely disappears. Two groups of the F. stand out above the rest, and receive the title 'Doctors of the Church.' The W. or Lat. Doctors are Ambrose, Augustine, Jerome, and Gregory the Great; the E. or Gk. Doctors are Athanasius, Basil the Great, Gregory of Nazianzus, and John Chrysostom. The chief div. after the Apostolic F. and in the Patristic age comes with the Council of Nicaea and the Conversion of the Empire. Chief among the ante-Nicene F. are: Justin Martyr, Clement of Alexandria, Origen, Dionysius, Gregory Thaumaturgus, Methodius, Tertullian, and Cyprian. Chief among the post-Nicene F. are

Eusebius of Caesarea, Athanasius, Cyril of Jerusalem, Basil, Gregory of Nazianzus, Gregory of Nyssa, John Chrysostom, Theodoret, Cyril of Alexandria, Photius, Hilary of Poitiers, Ambrose, Augustine, Jerome, Rufinus, Leo the Great, John Cassian, Hilary of Arles, Vincentius, and the English Bede. See J. G. Dowling, *Notitia Scriptorum ss. Patrum*, 1839; F. J. Hort, *Six Lectures on the Ante-Nicene Fathers*, 1895; H. G. Krüger, *History of Early Christian Literature in the First Three Centuries*, trans. 1897; H. B. Swete, *Patristic Study*, 1902; E. Leigh-Bennett, *Handbook of the Early Christian Fathers*, 1920; L. Prestige, *Fathers and Heretics*, 1940; S.C.M., *Library of Christian Classics*, vols. 1-8, 1956 f.

Fathom, see METROLOGY.

Fathometer, instrument for measuring the depth of the ocean, by measuring the interval of time that elapses between the production of a sound at the surface of the sea and the arrival of the echo from the bottom. Great strides have been made in recent years in the development of these instruments, first suggested in 1912 after the disaster to the *Titanic*. To-day every important ship is equipped with a F. See A. Wood, *Sound Waves and their Uses*, 1930, for an excellent account of the various types now used.

Fatigue: 1. In physiology, 'muscular F.' is the diminishing of the contractions brought about by stimuli. The muscle is a machine for utilising the energy contained in its own chemical compounds; if the excitations of the muscles are continued beyond a certain point the muscle cells are poisoned by the accumulation of the waste chemical products of their own activity. The muscle recovers if allowed to rest unstimulated for a time, or more quickly if washed with an innocuous but unnutritious solution such as 6 per cent NaCl in water. The same waste-products of the muscles produce 'F.' in the unsheathed ends of the nerve-plates, and the central sensor and motor nerve cells exhibit the same phenomena and a general irresponsiveness to ordinary stimuli.

2. In materials, F. is the term used to denote the weakening of a metal bar by a repeated succession of the strain of loads considerably less than the breaking weight of the bar, as when a car-axle breaks from the continual strains and blows which it experiences, or a member of machinery, such as a piston-rod, which is constantly in alternate tension or compression. F. of metals is due to a molecular change in the metal due to vibration or the constant application of a varying strain.

Fatigue-duty is that part of a soldier's work which is distinct from the use of arms and military drill, such as loading stores. 'Fatigue call' is the bugle note which calls to such duty, and 'fatigue dress' the uniform worn while engaged in it.

Fatima, daughter of Mohammad and Khadija. She married her cousin Ali (q.v.) and so is the link through whom sayyids and sherifs claim descent from Mohammad. For Muslims she is one of

the 4 perfect women, and for the Shi'a (q.v.) especially 'the incarnation of everything divine in the nature of woman, the most noble ideal attainable by man.' The date of her birth is not known and she d. a few months after her father.

Fatima, vil. of Portugal, in Santarém dist., 22 m. N. of Santarém (q.v.). It is a place of pilgrimage, on account of the believed appearance of the Blessed Virgin here to 3 children in 1917. Many thousands from all over the world now visit F. each year. See C. C. Martindale, *The Message of Fatima*, 1954; E. L. Klimeck, *A Modern Crusader*, 1956; R. F. Hume, *Our Lady Came to Fatima*, 1957.

Fatimids, or Fatimites, name given to a dynasty of Arabia which reigned for nearly 2 centuries over Egypt. Its founder, Obaidallah, claimed to be descended from Fatima, daughter to the prophet Mohammad, and Ismael, great-grandson of Ali. But later it was suggested that the founder of the dynasty had no right to the sovereignty, and that he was in reality descended from a family of heretics known as the Karmathian sect. The F. were an extremely militant sect; under Al Mo'izz (973-5) their rule extended to the shores of the Atlantic. In 969 they finally conquered Egypt and founded Cairo. Al Hakim, 6th caliph, founded the Druse sect, and the 'Assassins' came into being owing to a split over the succession in 1094.

Fattening Foods, Fodder, and Forage Crops, terms used to denote those foods used for feeding animals for meat or milk production. Compared with other types of foods, the 'concentrates' contain a high proportion of certain nutrients. They include food of both animal and vegetable origin and can be subdivided into carbohydrate and protein-rich foods. Carbohydrate concentrates are usually of fairly low protein content but high carbohydrate content, and include the cereal grains. The protein concentrates consist of some foods of animal origin such as whey, dried blood, meat meal, etc., and some of vegetable origin such as brewery and distillery products, peas, beans, and cakes and meals from the oil-milling industry.

The bulky fodder crops are characterised by a high fibre and low protein content and include hay, straw, and chaff. Hay (q.v.) is the most valuable of these, but oat-straw cut before it is quite ripe is also quite a valuable bulky food. In contrast to these rather coarse fodders there are also bulky foods of a very succulent nature. They contain 75-90 per cent of water and include forage crops (lucerne, clovers, grasses, kale, and rape) and other crops such as mangolds, swedes, and potatoes. The comparative richness in protein of the green fodders makes them the natural supplements to carbohydrate-rich foods.

In feeding animals a consideration of the animal's maintenance and production requirements must be made. The maintenance requirement includes energy and

protein used for the vital processes of life. Productive food is supplied in addition to the maintenance ration and is utilised for work, growth, or the production of milk, eggs, fat, or young. But the food must also satisfy the animal's appetite and the 'bulk' of the ration must be considered. If the bulk is too little then the animal will feel hungry, and if it is too much the animal's appetite will be satisfied before it has ingested sufficient energy and protein for production purposes. Generally speaking the ration should include both concentrated and bulky foods in suitable proportions just to satisfy appetite and production needs. If the diet is compounded in this way shortages of essential vitamins or minerals are unlikely. It can be seen that there is a variety of foods of each type and by using these in various mixtures some welcome variety will be introduced into the ration.

A proportion of the food which is voided in the faeces and urine contains a certain amount of fertiliser in the form of unretained nitrogen, phosphate, potash, and lime. The concentrated foods rich in protein give a dung rich in nitrogen, but the actual amount depends so much on the type of stock that it is impossible to predict exactly what proportion of the nitrogen, say, will appear in the dung. Using quite arbitrary figures it is possible to work out the residual manurial values of different foods fed to particular classes of stock. On the whole these calculations are unreliable but they are used when valuing farms before sale.

See B. H. Schneider, *Feeds of the World*, 1947; Commonwealth Agricultural Bureau, *Five Hundred Varieties of Herbage and Fodder Plants*, 1948; H.M.S.O., *Rations for Livestock*, 1952; E. J. Sheehy, *Animal Nutrition*, 1955; F. B. Morrison, *Feeds and Feeding*, 22nd ed. 1956.

Fatty Acids, an important group of related organic acids which occur in nature, the higher members being combined with glycerol (q.v.) in the form of esters known as triglycerides, various mixtures of which constitute the natural fats and oils. They are compounds of carbon, oxygen, and hydrogen, characterised by the acidic or carboxyl group ($-\text{COOH}$) attached to a hydrocarbon chain. In the latter, the carbon atoms are linked together with single or double bonds while their remaining valencies are satisfied with hydrogen atoms. F. A. in which the carbon atoms are joined by single bonds are designated as 'saturated' and are stable and relatively unreactive; in nature they all contain an even number of carbon atoms and have the general formula $\text{C}_n\text{H}_{2n+1}\text{COOH}$. Those with double bonds or 'ethylenic' linkages are referred to as 'unsaturated' acids, and are subdivided into mono-, di-, tri-unsaturated acids, etc., according to the number of double bonds present in the hydrocarbon chain. Prin. F. A. are—saturated: acetic, butyric, caproic, caprylic, capric, lauric, myristic, palmitic, stearic, arachidic, behenic, and lignoceric; unsaturated: oleic (1 d-bond), linoleic (2 d-bonds), and

linolenic (3 d-bonds). The higher members (containing more than 10 carbon atoms—lauric, myristic, palmitic, stearic, oleic, linoleic, etc.) in chemical combination with glycerol form the main constituents of animal and vegetable fats and oils, while the lower members (caproic, caprylic, and capric) form a minor constituent in only a few natural fats and oils. Lower acids up to and including caprylic and the unsaturated acids oleic, linoleic, and linolenic are liquids, whereas capric and higher saturated acids are solids; also the lower acids are water-soluble while the higher acids are relatively insoluble in water but soluble in ether, alcohol, and other organic solvents. F. A. required for industrial applications are obtained chiefly from natural fats and oils by hydrolysis, producing F. A. and glycerol; others, not found in nature, and including those with an odd number of carbon atoms in the chain, may be prepared by organic synthesis or by chemical or physical treatment of natural fats and oils or their F. A. F. A. are used extensively in most branches of industry; in the reconstruction of glycerides with special properties; in the production of compounds by neutralisation, esterification, modification or complete replacement of the carboxyl group while maintaining the long hydrocarbon chain, and in the formation of products by chemical combination of the unsaturated acid or its ester with other molecules through the reactivity of the double bonds. Poly-unsaturated F. A. are capable of linking together either by oxidation or polymerisation, and where 2 or more are present in a tri-glyceride, combination of the molecules to form a complicated lattice structure becomes possible. Oils of this type are called 'drying oils' and form the basis of the paint, printing ink, linoleum, and other industries. The addition of hydrogen to the double bonds of unsaturated glycerides by catalytic hydrogenation raises their melting points and makes them suitable for use in margarine, cooking fats, etc. The many hundreds of derivatives produced include soaps or salts, halides, esters, anhydrides, ketones, aldehydes, alcohols, amides, nitriles, amines, etc., which are used particularly in the production of household and industrial cleaners, cosmetics, lubricants, protective coatings, leather dressings, synthetic fibres, edible products, printing inks, plastics, synthetic resins, polishes, etc. See also OLEIC ACID; PALMITIC ACID; STEARIC ACID.

Fatty Compounds, see ALIPHATIC.

Fatty Degeneration, a derangement of metabolism by which the protein matter of the tissues is replaced by fat. Under normal conditions, globules of fat pass from the digestive tract into the tissues, where they are either oxidised to keep up the heat of the body, or are stored in the cells of adipose tissue. Under certain morbid conditions, however, the oxidising capability of the cells seems to be interfered with. The cytoplasm is invaded by granules of fat which can be recognised

by the usual fat-staining reagents. The manner in which the change is brought about is somewhat obscure, but it is always associated with some toxic agent. All dead and decaying matter in the body undergoes F. D.

Faucher, Léon Joseph (1803–54), Fr. statesman and economist, b. Limoges. He edited and contributed to various journals on economic and political problems. In 1842 he visited England in order to study industrial conditions there, and afterwards compiled his *Études sur l'Angleterre*, 1845. After the Revolution of 1848 he was appointed minister of public works and, later, minister of the interior. He served under Louis Napoleon, but resigned his office when the emperor advocated universal manhood suffrage (1851). He was a firm upholder of free trade.

Faucht, Helena Saville (1817–98), actress, daughter of John Saville F. She took the Shakespearian parts of Juliet, Imogen, and Hermione, and made such an impression on Macready that he engaged her to take the leading characters in Lytton's *Duchesse de la Vallière* and *Lady of Lyons*, and in Browning's *Strafford*. She married Theodore Martin (q.v.) in 1851; he was knighted in 1880.

Faulkner, or Falkner, William Harrison (1897–), Amer. novelist, b. New Albany. He was educ. at the univ. of Mississippi, of which his father was treasurer. In the First World War he joined the Canadian Air Force and was wounded in France. Afterwards in New Orleans he formed a friendship with Sherwood Anderson (q.v.) and wrote *Soldier's Pay*, 1926, and *Mosquitoes*, 1927. In 1929 he pub. *The Sound and the Fury*, first of his novels to employ the 'stream of consciousness' technique, which describes thoughts and reactions instead of actual happenings; it and *As I Lay Dying*, 1930, made his reputation, though *Sanctuary*, 1931, a horror story, was the first of his books to be really popular. *Sartoris*, 1929, was the first of a series of novels dealing with a single family who form the centre-piece of a saga of S. decadence. In 1939 F. won first prize in the O. Henry Memorial Award, and in 1950 he was awarded the Nobel Prize for Literature. Among his later novels are *Light in August*, 1932, *Abolom, Abolom!* 1936, *The Wild Palms*, 1939, *The Hamlet*, 1940, *Intruder in the Dust*, 1948, and *Requiem for a Nun*, 1952. *Idyll in the Desert*, 1931, *Dr Martino*, 1934, and *Go Down, Moses*, 1942, are vols. of short stories, while books of his verse include *The Marble Faun*, 1924, *Salmagundi*, 1932, and *The Green Bough*, 1933. Grotesque and often obscure, F.'s work has been described as in the tradition of Poe.

Faults: 1. In electric networks, accidental alterations in the state of the network or of any machines, switch-gear, or other apparatus connected thereto. Reduction of the insulation resistance, i.e. flashover, spark, or arc between a conductor and earth or between 2 conductors, deterioration of insulating material or of

insulating properties of insulators or bushings, may be caused by thunderstorms, strong wind causing swinging of overhead lines, snow, or hoar-frost, fog, salt, or dust deposits on insulators, or by internal conditions: overload with excessive temp. rise, or switching operations (see TRANSIENTS). Alterations (not intended) in switching-positions, leading to isolation of sections of the network or of machines, or to connections causing overloading, may result from the above-named phenomena or from interference from other networks. F. may be intermittent, as in the case of re-closing circuit-breakers, or cause lasting disturbance, interruption of supply, or damage to lines or machines which must be repaired before supply can be restored.

Detailed records of F., with data on location, network characteristics, load conditions, analysis of cause and effects, are kept in most countries. In W. Germany the records are now standardised.

2. In geology, fractures of the earth's crust along which rock masses have been

DIAGRAM OF FAULT (FF)

The angle made by the slope of the strata with the horizontal line AB is the angle of dip of the strata.

displaced. Movement along F. is the cause of earthquakes. The displacement produced at any one time is generally small, but repeated movements along the same lines may ultimately produce displacements of many m. Faulting breaks the continuity of sedimentary strata, of igneous intrusions, and of ore bodies, and its effects are therefore of considerable importance in mining operations—for example, a coal seam that is crossed by a fault may be shifted upwards, downwards, or sideways, and a study of the whole geological structure may be needed to locate its new position. 'Normal' F. are steep fractures along which subsidence took place on the side towards which the fault dips; they are formed largely by movements under the influence of gravity. 'Reversed' F. show an upward movement on the side towards which the fault plane dips. They are commonly the result of compression and pass into gently-dipping thrust-F. along which one rock mass overrides another.

Tear-F., also products of compression, are steep fractures along which lateral movements took place. Faulting produces lines of weakness in the crust which are often excavated by erosion; the Great Glen of Scotland, in which the Loch Ness and the Caledonian Canal, follows the line of a large fault. The San Andreas Fault, the site of the San Francisco earthquake of 1906, defines part of the coast of the Gulf of California.

Faun, Faunus, Rom. god and protector of shepherds. Later identified with the Gk Pan. F. was supposed to have been the 3rd sovereign of the Laurentines; his predecessors were Picus, god of storm and lightning, and Saturnus, god of seedtime and harvest.

Fauna, term used by naturalists in reference to the collective animal life of any dist. or of any period in hist. Thus we have the F. of the Brit. Isles, or the F. of the Antediluvian age. F. is derived from Faun (q.v.), protector of shepherds and therefore of wild animals.

Faure, Edgar (1808-), Fr. politician, became a lawyer, and was an assistant delegate at the Nuremberg Trials, 1945. In 1946 he was elected Radical Socialist deputy for the Jura. He held office in sev. govts. from 1949, was premier for a short time in 1952, and again premier Mar.-Dec. 1955, succeeding Mendes-France (q.v.) and becoming leader of the faction of his party which had dissociated itself from Mendes-France's policies.

Faure, François Félix (1841-99), Fr. politician, b. Paris, son of a furniture maker. He became a successful merchant at Havre. Elected to the National Assembly in 1881, his knowledge of economics and of commercial affairs soon made him a prominent figure. He held various ministerial posts from 1883 and became president of the rep. in 1895 upon the resignation of Casimir-Périer. The Franco-Russian alliance was one of the chief events of his presidency, which also saw the beginnings of the Dreyfus affair.

Fauré, Gabriel (1845-1924), Fr. musical composer, b. at Pamiers. He studied at the School of Sacred Music, directed by Niedermeyer, under Dietrich and Saint-Saëns. After minor organist's posts at Rennes (1866-70) and in Paris, he became choirmaster at the church of the Madeleine in 1877, and organist in 1896; and director of the Conservatoire, 1905-20. His music includes the operas *Prométhée* and *Pénélope*; incidental and church music; pieces for solo instrument and orchestra; 6 chamber works; 2 violin and 2 cello sonatas. His numerous piano pieces (impromptus, barcarolles, nocturnes, etc.) are among the most subtle works for the instrument, and his 97 songs rank with those of the greatest masters. See C. Koechlin, *Fauré*, 1927 (Eng. trans. 1946); P. Fauré-Fremiet, *Gabriel Fauré*, 1929; V. Jankélévitch, *Gabriel Fauré et ses mélodies*, 1938; N. Suckling, *Fauré* (Master Musicians), 1946.

Fauriel, Claude Charles (1772-1844), Fr. historian and philologist, b. St Etienne.

He was a student of Sanskrit and Arabic, as well as of Lat. and Greek, and was appointed a prof. in the Paris Faculté des Lettres. His most outstanding work is *Histoire de la Gaule Méridionale sous la Domination des Conquérants Germains*, 1836.

Fausset, Hugh l'Anson (1895-), critic, b. Killington, Westmorland, son of a clergyman. Educ. at Sedburgh and Cambridge, he worked as a critic and reviewer, and pub. penetrating studies of Keats, 1922, Tennyson, 1923, Donne, 1924, Coleridge, 1926, Tolstoy, 1928, Wordsworth, 1933, and Whitman, 1942. He also wrote some vols. of poetry and ed. *Minor Poets of the Eighteenth Century*, 1930. *Between the Tides*, 1943, and *The Last Days*, 1946, are novels, while *A Modern Prelude*, 1933, and *Towards Fidelity*, 1952, are autobiographical.

Faust. The legend of F. is held by many historians to be of E. origin, but its European interest derives from a 16th-cent. magician, F., or Faustus, of Suabia, reputed to have studied necromancy in Krakow and to have exploited Germany in the rôles of astrologer, diviner, medium, alchemist, and swindler, a veritable ally of Mephistopheles. The earliest hist. of F. appeared at Frankfurt in 1587, and was speedily followed by numerous and varied versions, each more embellished than the previous one, the chief of these being G. R. Widmann's, 1599. From this J. N. Pätzsch compiled an encyclopaedic version of which 6 eds. appeared between 1874 and 1786. The chief Ger. ed. of the period was pub. in 1712, under the authorship of 'Christlich Meynenden' (A Christian Believer). Meanwhile the story had appeared very rapidly in foreign trans., Dan. being the first, 1588, Eng., Fr., Dutch, and Flem. following during the next 6 years, and Czech in 1612. The Eng. trans. was the basis of Marlowe's *Tragic History of Doctor Faustus* (performed in 1594, pub. 1604), the finest of the early F. dramas. In Germany every little puppet-show had its own version of the legend, right up to the middle of the 18th cent. In 1759 Lessing's dramatised version was written, but has since been destroyed save for a few sheets of MS.; it was in his hands that the legend first assumed the shape which has become accepted, a more modern and tolerant spirit superseding the stern uncompromising attitude of the earlier eds.

Goethe was the first to introduce the Gretchen incident in his magnificent work (1798). This violation of the legend had no apparent reason, beyond broadening the secular dramatic interest to meet modern demands; and the innovation was condemned by purists as unjustifiable. However, it is Goethe's version—well called the 'divine comedy' of 18th-cent. humanism—that has become recognised as the greatest literary achievement of the vast number that have been attempted on the same subject, and round it has arisen an important and extensive musical literature. Music was written for a production at Stuttgart, 1832, by Lind-

painter, and a score by Prince Radziwill was pub. in 1846. A choral dramatic legend by Berlioz, *La Damnation de Faust*, was performed at Paris in 1846, the text being derived by the composer and Gaudonnières from De Nerval's adaptation. The most famous setting is Gounod's *Faust*, performed at Paris in 1859—a very beautiful 5-act opera to a libretto by Barbier and Carré. Boito's *Mefistofele* (Milan, 1868) is also from the same source as those of Gounod and Berlioz. On a lower plane altogether, and quite estranged from Goethe's masterpiece, is the *Faust* of Spohr, a romantic 2-act opera to a wretched and vulgar text by Bernhard, produced at Frankfurt in 1818. Goethe's work has also inspired some 'absolute' music, notably the *Faust Symphony* of Liszt, and Wagner's *Faust Overture*. See H. G. Meek, *Faust, Man and Myth*, 1930; G. Bianquis, *Faust, à travers quatre siècles*, 1934; F. Palmer and R. Moore, *The Sources of the Faust Tradition*, 1936; E. M. Butler, *Fortune of Faust*, 1952.

Faust, Johann (a printer), see FUST.

Faustina, Anna Galeria: 1. The Elder, wife of Antoninus Pius (q.v.).

2. The Younger, daughter of Antoninus Pius by the above, and wife of Marcus Aurelius (q.v.). She is alleged to have been profligate and even guilty of high treason; but both charges rest upon slender evidence, for she founded institutions for the relief of poor girls, and retained the emperor's devotion until her death (AD 176).

Fauvism, movement in art which originated in Paris in 1903 as a revolt against Impressionism. It became the name of a group of artists among whom were Matisse, Dufy, Derain, Lhote, Vlaminck, Marquet, and Friesz. These sought to invest colour with an emotional value of its own apart from being descriptive of colour in nature. The name F. is derived from a slighting reference by the Parisian art critic, Louis Vauxcelles, to the gallery of works of the artists of the group. He called it a 'cage aux fauves,' or cage of wild-beasts.

Favara, tn in Sicily (q.v.), 4 m. E. of Agrigento (q.v.). There are sulphur mines and marble quarries in the dist. Pop. 25,200.

Favart, Charles Simon (1710-92), Fr. dramatist, b. Paris. He was educ. at the college of Louis-le-Grand, and his poem, *La France Délivrée par la Puellle d'Orléans*, obtained a prize at the Académie des Jeux Floraux. He became director of the Opéra Comique, which, under him, became very successful. In 1746 he went with Maurice de Saxe to Flanders with a troupe of comedians, where he became very popular. In 1750 he returned to Paris and resumed his writing. Some of his works (all written 1754-63) are: *L'Anglais à Bordeaux*, *Les Trois Sultanes*, *Ninette à la Cour*, and *Mémoires et Correspondance Littéraire*, which gives valuable information on the literary and theatrical world of the 18th cent.

Faventia, see FAENZA.

Faversham, municipal bor. and riv.-port of Kent, about 10 m. from Canterbury. It dates back to about 811, and was a seat of the Saxon kings. It contains the remains of a Cluniac abbey, founded by King Stephen, in which he is buried, and has a grammar school which was started in 1527. It is important for its oyster fisheries, which were formerly under the direction of an ancient guild and now of a statutory company, as well as for its shipping trade in coal, timber, and agric. produce, including especially hops and cherries. There are large fruit canning, grading, and packing stations; brewing and brick-making are carried on. Pop. 12,294 (1954).

Favighana *see* AEGADIAN ISLANDS; AETHUSA.

Favonius, Lat. name of the W. or SW. wind which prevailed in spring. Gk *zephyrus*.

Favre, Jules Claude Gabriel (1809-80), Fr. statesman, b. Lyons, and studied for the Bar at Paris. He took part in the Revolution of 1830, openly declaring himself a republican. He became an implacable opponent of Louis Napoléon, and in 1851 tried to organise armed resistance to him in the streets of Paris. He estab. his reputation by his defence of Orsini, 1858, and in 1870, after the defeat at Sedan, proposed the deposition of the emperor. F. was minister of foreign affairs under the Rep., and told Bismarck (1870) that he would not 'yield to Germany an inch of territory nor a single stone of fortresses.' But he proved no match for Bismarck's diplomacy, and resigned after the treaty of Frankfurt, 1871.

Favus, contagious skin disease, caused by a fungus parasite. It usually affects the scalp in man, but is occasionally found on other parts of the body. It also affects cats, dogs, cattle, mice, rabbits, and other animals. The growth consists of a number of yellow, circular saucer-shaped scabs, each surrounding a single hair. The scabs grow and become encrusted; ultimately they break off, leaving a bare patch without a trace of hair. The characteristic scab may then develop again, as it is extremely difficult to get rid of all traces of the parasite. The fungus was first described by J. L. Schönlein in 1839, and from the name of its discoverer is called *Acherion Schönleini*. It is more common in the E. parts of Europe than the W., and is often associated with uncleanly habits. Contagion may take place from animal to man. The treatment involves removing the crusts with every consideration for cleanliness. The parts should then be dressed with an efficient parasiticide.

Fawcett, Edward Douglas (1866-), philosopher, b. Hove and educ. at Newton College, Devon, and Westminster School. In philosophy he is an idealist whose distinctive mark is the discussion of imagination as the fundamental reality of the universe (*see Contemporary British Philosophy*, vol. II, 1925). Pubs.: *Divine Imagining*, 1921, *The Zermatt Dialogues*,

1931, *From Heston to the High Alps*, 1936, *The Oberland Dialogues* (on the soul), 1939.

Fawcett, Henry (1833-84), economist and politician, b. Salisbury. He was educ. at King's College, London, Peterhouse, Cambridge, and Trinity Hall, where he became 7th wrangler in 1856, and was elected to a Fellowship. He entered at Lincoln's Inn with the intention of becoming a member of parliament through a career at the Bar, but was unfortunate to lose his eyesight in 1858. However, he kept up all his recreations, fishing, rowing, skating, as well as his studies. He was a disciple of Mill, and pub. in 1865 a *Manual of Political Economy*, the result of which was the election of F. to the chair of political economy at Cambridge. In 1865 he was elected member for Brighton, and re-elected in 1868-74, and is spoken of as being a thorough Radical. In 1873 he took a prominent part in opposing Gladstone's scheme for univ. education in Ireland. He was a great advocate of the preservation of commons, especially those near large towns, and showed a marked interest in Indian affairs. In 1880 he was offered the place of postmaster-general by Mr Gladstone, and estab. in 1882 the parcels post. He is also responsible for the introduction of postal orders, 6d. telegrams, stamp slip deposits, and the increased facilities for life insurance and annuities. His pubs. include *The Economic Position*, 1865, *Pauperism*, 1871, *Free Trade and Protection*, 1878, *Indian Finance*, 1880.

Fawcett, Millicent Garrett, Dame (1847-1930), b. Aldeburgh, Suffolk, famous for her social and literary work, especially as an advocate of women's suffrage and the higher education and employment of women. In 1867 she married Henry F., the politician. She held the degree of LL.D. (Hon.), St Andrews, and was president of the National Union of Women's Suffrage Societies. Pubs.: *Political Economy for Beginners*, 1870, *Tales in Political Economy*, 1875, *Some Eminent Women of our Time*, 1889, *Women's Suffrage*, 1912.

Fawkes, Guy (1570-1606), conspirator, b. York of Protestant parents. He became a zealous Rom. Catholic, and served in the Sp. Army in the Netherlands from 1593 to 1604. He gained a reputation for courage and coolness, and Catesby (q.v.) invited him to England to play the leading part in his Gunpowder Plot. F. himself apparently took no part in working out the scheme; but he was captured in the vault under the House of Lords, the plot having been betrayed to the gov. He was terribly tortured, and eventually disclosed the names of his fellow-conspirators, protesting to the end that no priests were involved in the plot. He was subsequently executed.

Fawn, *see* DEER.

Fay, Morgue de, *see* MORGAIN LE FAY. **Fay, William George** (1872-1947), Irish actor and theatrical producer, one of the founders of the modern Irish dramatic movement which grew into the Abbey

Theatre, and one of the creators of the style of quiet acting which made that theatre famous. After acting with a travelling circus company in Ireland and England, he took leading parts in Abbey plays until 1908, when he left, with his brother Frank, after a disagreement with the directors on policy. The F.s took a company to the U.S.A. but it had indifferent success. F. from 1910 acted in various London theatres and in repertory in the prov.: in Glasgow he was in charge of the Scottish National Players. In his late years he deserted the stage and took only occasional parts in films; his most successful part was that of Father Tom in the film *Odd Man Out*, 1947.

Fayal, see AZORES.

Fayette, Comtesse de la, see LA FAYETTE, MARIE MADELEINE, COMTESSE DE.

Fayette, Gilbert M. de la, see LA FAYETTE.

Fayetteville: 1. City in Arkansas, U.S.A., cap. of Washington co. It is the seat of the univ. of Arkansas, and a trade and distribution centre for a fruit-growing, stock- and poultry-raising area. It manufs. clothing and wood products, and there are also dairies, canneries, and poultry-packing plants. Pop. 17,070.

2. City in N. Carolina, U.S.A., cap. of Cumberland co., situated on Cape Fear R., which has been rendered navigable as far as the coal mines of Chatham co. The former name of F. was Campbelltown, the change being made in memory of Lafayette. It is a trade centre with textile and lumber mills. Fort Bragg and Pope Air Force Base are NE. It was the scene of a terrible flood in 1908. Pop. 17,248.

Fayolle, Marie Émile (1852-1928), marshal of France, b. Le Puy. Entered the École Polytechnique in 1873, and afterwards joined the artillery. Instructor at École de Guerre, 1897. Brigadier-gen. on retired list when the First World War broke out. On mobilisation, was given command of 70th Reserve div. Succeeded Pétain in command of Sixth Army, Feb. 1916. Transferred to First Army in Dec. In May 1917 was in command of group of armies in centre, and in autumn was in Italy to assist after Caporetto. Soon recalled, did excellent work until armistice; was retained as gen. of div. on Gen. Staff, and made marshal 21 Feb. 1921.

Fayrer, Sir Joseph (1824-1907), surgeon-general and author. In 1850 he became assistant-surgeon in Bengal, and his connection with the Indian medical service lasted for 45 years. He was a prolific writer on subjects connected with the practice of medicine in India, and above all on the venomous snakes of that country. His great work on *The Thanatophidia of India*, 1872, is the best book on the subject.

Fayrfax, Robert (1464-1521), composer, b. Lincs, became a Gentleman of the Chapel Royal about 1496 and organist of St Albans Cathedral at the turn of the century. He took the Mus.B. (1501) and Mus.D. (1504) at Cambridge, and the D.Mus. at Oxford (1511), as one of the

earliest graduates in music. In 1520 he was in France at the Field of the Cloth of Gold with Henry VIII and the royal singers. Among his preserved church music (some incomplete) are 6 masses, 2 magnificats, 13 motets, etc., and he also wrote secular part-songs for 3 voices.

Faz, see FEZ.

Fazogil, mountainous dist. of the Sudan, which is traversed by the Blue Nile. It produces gold, senna, gum, tamarinds, and ivory. Pop. about 500,000 (Funj negroes).

Faalty, the service or duty served by a tenant to his superior lord in feudal times. Lands were granted on the conditions of F., suit of court, and rent, it being stipulated that tenants and their heirs should take the oath of F. or fidelity to their lord, which was the feudal bond between lord and tenant; should attend the lord's courts and give assistance by serving on juries, etc.; and should pay certain ann. returns in military attendance, provisions, money, or whatever was required of them.

Fear, Cape, promontory on the Atlantic coast, forming the S. point of Smith Is., in the S. of N. Carolina. This is, stands at the mouth of Cape Fear R. and has a lighthouse on its W. end.

Fear, an emotion which is normally the response to a situation of danger. Physically it is characterised by a secretion of a substance called adrenalin into the blood stream from the suprarenal glands. This produces observable effects on the circulation of the blood of which the most noticeable is pallor due to contraction of the minute blood vessels in the skin. These changes may be regarded as a physical preparation for meeting the dangerous situation, e.g. the lessened blood supply to the skin reduces the risk from bleeding. There is also release of glycogen from the liver which increases the physical effort that can be made to avoid danger. The impulse towards such escaping behaviour is the conative element in F. On the subjective side there is a distinctive and unpleasant system of feeling, and the escaping behaviour is reinforced by the tendency of the organism to seek reduction of this unpleasantness. F. of extreme strength is often called 'terror.' In terror, effective escaping behaviour tends to disappear and to be replaced by bodily collapse.

Many nervous disorders are characterised by *anxiety* or neurotic F. In such states the emotion of F. develops without external cause. Methods of psychotherapy such as psycho-analysis may be needed to overcome the disabling effects of neurotic F. Neurotic F. may also be reduced by the surgical operation on the brain of pre-frontal leucotomy. See C. Darwin, *The Expression of the Emotions in Man and Animals*, 1873; W. B. Cannon, *Bodily changes in Pain, Hunger, Fear and Rage*, 1915; S. Freud, *Inhibitions, Symptoms and Anxiety*, 1936.

Feast, or Festival. Throughout the whole world, wherever the general or official religion of the country has been dear to

the whole of the nation, the fixed state festivals have been associated with religion. Probably the Persians are alone among the world's nations in having no regular feasts, and this condition of theirs is artificial rather than natural. Egypt had many festivals, days consecrated to the Nile, Osiris, Ptah, and all her countless deities. The Hindu still observes his ancient festivals in the ancient way, except that he no longer offers human sacrifice. The earliest account of Gk festivals—that in the *Iliad*—speaks of 2 alone, but in later times these increased greatly in number. The expenses of the festivals were met from the public purse. In the later days of the Rom. empire the city revelled in innumerable feasts, not only of her own ancient gods, but also of the deities imported from the E. Different feasts became important at different times, but we may name the *Sementinae*, the festival of the seed-time in January; the *Lupercalia*, in honour of the god Pan; and the *Saturnalia*. Almost all of these festivals were celebrated by the pagan world with phallic ceremonies. The Hebrews, however, kept their feasts, described in the O.T., with the strictest purity. (See PASSOVER; PENTECOST; PURIM.) The Christian Church associated some of her festivals with the Jewish and some with the old pagan festivals, to which she gave a new, purified, and spiritual significance. See M. Dresser, *De Festis diebus*, 1590; J. B. Tillot, *Mémoires pour servir à l'histoire de la Fête des Fours*, 1741; T. Thistleton Dyer, *British Popular Customs*, 1911; W. Mead, *English Medieval Feasts*, 1931; F. Martin, *Observing Natural Holidays and Church Festivals*, 1940. See also under the names of particular feasts.

Feather Grass, see STIPA PENNATA.

Feather River, in N. central California, U.S.A., trib. of the Sacramento, which it joins about 18 m. above the city of Sacramento. It has a length of 80 m., and is navigable for steamers to Marysville. Gold is found on its banks.

Feather-star, or *Sea-lily*, popular name of Crinoidea (q.v.), a class of Echinodermata. The commonest species is *Antedon rosacea*.

Feathers, horny outgrowth of the skin which is peculiar to birds, and which corresponds to the scales of reptiles and the hair of mammals. F. as a rule consist of 2 main parts, axis and barbs, the former of which is divided into the quill, which is bare and hollow, and the shaft, which bears the barbs. The quill is embedded in the skin, and has at its base a small hole through which the nutritive sap passes during the growth of the F. The barbs which constitute the vane are lath-shaped and taper to a point, and each one supports a series of outgrowths known as barbules, so that each barb is like a tiny feather. As a rule the barbs are linked to each other by means of the barbules, but in the running birds, e.g. the ostrich, they are free, hence the familiar loose plume. Many F., too, have an 'aftershaft' or second shaft springing from the under side near where the quill passes into the true

stem. This is as a rule small, but in some birds, viz. the cassowary and emu, the aftershaft is as large as the mainshaft. There are sev. kinds of F.: contour F., which form the general outline of the body and of which the 'flight F.' are most developed; down F., which are hidden by the contour F., and often form a very thick covering, as in gulls and ducks; filoplumes, which are found in all birds in clusters at the bases of the contour F.; and powder-down F., which occur in patches, especially in birds of the heron tribe, and exude a fine dust or powder which gives a peculiar bloom to the plumage. As

1, quill of pigeon; 2, quill feathers; 3, left wing of thrush; 4, contour feather of pigeon; 5, contour feathers

regards the colour of F., it is usually most prominent in the male birds. F. have been put to various uses. Of these perhaps the chief is their employment for stuffing beds, cushions, and quilts, and for this the F. of the eider-duck are most highly esteemed, those of the goose and swan coming next. F. are also used as quilts for writing, and for personal adornment.

Featherstone, urb. dist. in the Pontefract parl. div. of the W. Riding of Yorks, England, about 2½ m. from Pontefract. Large collieries are in the neighbourhood, and these afford employment for the inhab. Some miners were shot dead during a riot in 1893. Lord Bowen and his fellow-commissioners in the report on the F. riots dealt with the duty of soldiers called in to suppress riots and this report is the *locus classicus* on the point. (Parl. Paper, 1893-4, c. 7234.) Pop. 14,080.

Featherweight, see PAPER.

Febronianism, powerful movement started in 1763 in Germany by Johann Nicholas von Hontheim (1701-90) under the pseudonym of 'Justinus Febronius' with the object of restricting the papal power, and of giving independence to the national Churches.

Febronius, see HONTHEIM, JOHANN NICHOLAUS VON.

February, 2nd month of the year, containing 28 days in ordinary years, but 29 in leap years. The name is derived from Lat. *februa*, a Rom. festival of purification held on the 15th of the month.

February Revolution: 1. See FRANCE—History.

2. 1917, the fall of the Russian monarchy and its replacement by the 'double power' of the Provisional Gov. (q.v.) and the Soviets of Workers' and Soldiers' Deputies (see SOVIETS). The country's loss of confidence in Nicholas II and his gov. was such that a few negligible disturbances in the cap. induced him to abdicate. The changeover was peaceful throughout the country and was welcomed by the majority of the people, but the task of democratic reconstruction proved too difficult for the country in the middle of the war, and it failed to stand up to the small but determined party of Bolsheviks, who seized power in October. See also DUMA; KERENSKY; L'VOV; NICHOLAS II; OCTOBER REVOLUTION; A. F. Kerensky, *The Catastrophe*, 1927; M. T. Florinsky, *The End of the Russian Empire*, New Haven, 1931; L. Trotsky, *The History of the Russian Revolution*, 3 vols., 1932; Sir B. Paree, *The Fall of the Russian Monarchy*, 1939; W. H. Chamberlin, *The Russian Revolution*, vol. 1, N.Y., 1954; N. Sukhanov, *The Russian Revolution*, 1955.

Fécamp, Fr. seaport and watering place, in the dept of Seine-Inférieure, on the Eng. Channel, about 22 m. N.E. of Le Havre. It is on the R. Fécamp, and occupies the bottom and sides of a narrow valley opening out between high cliffs. It grew up around a 7th-cent. nunnery, later a Benedictine abbey. It is said that the Benedictine liquor, for which the tn is famous, was first distilled in the 16th cent. by the monks from herbs gathered on the cliff-tops of F. The abbey church of La Trinité dates from the 12th cent. Fishing is important and includes cod-fishing in Newfoundland; there is boat-building, and there are sugar refineries and tanneries. Pop. 17,000.

Fechner, Gustav Theodor (1801-87), Ger. psychologist, b. Gross-Särchen, near Muskau, Lower Lusatia. He graduated in medicine, 1822, but turned to physics and was appointed to the chair of that subject at Leipzig in 1834. He resigned through ill-health in 1839. He recovered and spent the rest of his life in the study of psychology and general science. He was one of the founders of experimental psychology. He applied mathematical physics in his investigation of the physiology of sensation and stated E. H. Weber's law in its modern form—in a series of sensations the stimulus has to

increase in geometrical proportion if the increase in sensation is to be sensed ('Fechner-Weber law'). He wrote the first treatise on psychophysics (*Elemente der Psychophysik*, 2 vols., 1860); his *Vorschule der Aesthetik*, 1876, is memorable for its contributions to the experimental psychology of aesthetics. *Atomenlehre*, 1845, describes the materialism of things, *Nanna*, 1848, the soul-life of plants, and *Zendavesta*, 1851, star-life. He also investigated the theory of colour. An account of his philosophy is in W. James's *A Pluralistic Universe*, 1909. See lives by W. Wundt, 1901, K. Lasswitz, 1910, and I. Hermann, 1926.

Fechter, Charles Albert (1824-79), Fr. actor, b. London. He made his début at the Comédie Française as Seide in Voltaire's *Mahomet*, after which he went to Berlin, where he achieved great fame by playing the part of Armand Duval in *La Dame aux Camélias*. In London his impersonations of Hamlet and Othello were extraordinary triumphs. He did much to improve stage settings and effects.

Feciales, or **Fetiales** (etymology uncertain), a college of 20 priests holding office for life in ant. Rome. Their duty was 'to maintain the laws of international relationship.' When a state was considered to have acted in a manner hostile to Rome, 2 members of the college were sent to make a formal demand for redress. If this was not forthcoming within 30 days, the F. reported back to Rome; and if war was declared they crossed the enemy border and cast a twin-pointed javelin of cornel wood. Somewhat later, in order to avoid long journeys for the performance of this latter rite, a column (*columna bellica*) was erected at Rome to represent hostile ter., and into this the javelin was flung. F. also performed certain rites at the conclusion of peace-treaties.

Feundation, see FERTILISATION.

Federal Bureau of Investigation (F.B.I.). Created in 1908 as the B. of I., a branch of the U.S.A. Dept of Justice, it served at first only the justice dept. In 1924 J. Edgar Hoover became its director, and Congress increased the scope of its duties; it was reorganised in 1934 as the Div. of I, in the Dept of Justice. In 1935 it received the designation of the F. B. of I. It now investigates violations of all F. laws, except counterfeiting and postal, customs, and internal revenue offences, with special emphasis on such crimes as sabotage, conspiracy, and treason. Its H.Q. are in Washington, and in 1955 it had offices in 50 cities of the U.S.A. and Puerto Rico, Hawaii, and Alaska.

Federal Council of Evangelical Free Churches, an organisation representing most of the Protestant denominations in the U.S.A., formed in 1908 to act in matters of common interest to the constituent churches. The council acts through commissions. Its objects include social service, research and education, the improvement of industrial relations, the promotion of international justice, and the improvement of relations with the

negre pop. The council also acts as the liaison between the churches and such national social agencies as the Red Cross and the Child Welfare (q.v.) Movement.

Federal Deposit Insurance Corporation, U.S.A. Gov. agency estab. in 1933 to insure D.s up to \$5000 (later \$10,000) in all member banks of the F. Reserve System and in qualifying non-member banks, with an ann. assessment on each bank. In 1955 the D. I. fund, representing accumulated assessments and investment income in excess of all past losses and expenses, was \$1,590,540,867.

Federal German Republic, rep. comprising the W. Ger. *Länder* of the former U.S., Brit., and Fr. zones of occupation (see *GERMANY, History*), with an area of 94,820 sq. m. and a combined pop. of 52,100,000 people (1955 estimate). The former W. zones of Berlin (186 sq. m.) are also part of the F. G. R. Its constitution, which is of federal form and owes much to Brit. parl. precept and procedure, was approved on 12 May 1949 by the Amer., Brit., and Fr. military governors and ratified by a two-thirds majority of the constituent *Länder* soon afterwards, Bonn being chosen by the parl. council as the seat of gov. The rep. came into existence on 23 May, when the basic law or constitution was signed by members of the parl. council in the presence of the Allied military governors (thereafter to be called commissioners). First elections to the Bundestag (q.v.) or Lower House of the F. G. Parliament were held on 15 Aug., the Christian Democrats emerging as the strongest party. Theodor Heuss (q.v.) was elected first president of the rep. and Konrad Adenauer (q.v.), leader of the Christian Democratic Union, was elected first F. chancellor (16 Sept.). The first gov. of the rep. was a Right-wing coalition. In the declaration of policy of his gov., 20 Sept., Adenauer voiced the determination of his ministers to co-operate closely with the W. powers. In retaliation for the institution of the F. G. R., an E. Ger. State or 'German Democratic Republic' (q.v.) was estab. under Russian auspices in the E. zone of Germany in Oct. 1949. In their note of 1 Oct., protesting against the formation of the F. G. R., the Soviet Gov. alleged that the Brit. Gov. had violated the Potsdam agreement (see *EUROPE, History*), as well as the decisions of the council of foreign ministers at Paris and must assume responsibility for splitting Germany and delaying the conclusion of a peace treaty. In reply the Brit. Gov. pointed out that it was only when the Soviet Gov. refused to treat Germany as a unit in accordance with the decisions of the Potsdam conference that the Brit. Gov. was compelled, in conjunction with the govs. of the U.S.A. and France, to unify Germany in so far as it lay within their power and to take progressive steps towards the unification of their respective zones.

The new rep. was soon playing an active part in W. European affairs. It was admitted to O.E.E.C. in 1949; and became a full member of the Council of Europe in

1951. It was one of the founder members of the European Coal and Steel Community. Economically, the F. G. R. prospered. It did not have the rearmament burden of the other prin. W. countries; and, increasingly freed from post-war restrictions, its industries boomed. In May 1952, for example, the F. G. R. was the largest creditor in the European Payments Union; and W. Ger. manufacturers competed successfully with those of other European countries. Adenauer's gov. fully supported the F. G. R.'s proposed participation in W. European collective defence; and this subject, raising the question of a re-created Ger. Army and possible conscription, caused considerable controversy in the rep. over the next few years, and in many other countries, especially France, where the prospect of a new Ger. Army was viewed with much popular misgiving, in the light of past hist. The Ger. Social Democrats were opposed to the F. G. R. tying itself militarily to the W., primarily because they claimed that this would prejudice any chance of future Ger. reunification with the Ger. Democratic Rep.; and this fear was played on increasingly by Soviet propaganda. The Social Democrats under Schumacher and, after his death, his successor, Ollenhauer (q.v.), kept up a sustained campaign, but Adenauer had the necessary majority to carry through his policy, with only minor modifications. In the elections of 1953 his party increased their majority.

In 1952 it was agreed that on F. G. R.'s formal joining of the European Defence Community (E.D.C.) the Allied occupation should end, although Allied troops would continue to be stationed in the R. for Ger. and European defence purposes. In 1954, however, France rejected E.D.C. The London and Paris agreements which followed resulted in the F. G. R. being invited to join N.A.T.O. and officially restored to the rep. full sovereignty. Fr. distrust of the Ger. rearmament that this involved was allayed by various safeguards. As a result, Western Union, of which the F. G. R. was a member, came into being in its present (1957) form on 7 May 1955; and 2 days later the F. G. R. formally joined N.A.T.O. A small regular army was soon being built up; but conscription was not brought into being until 1956-7. In 1955 Adenauer visited Moscow. As a result, diplomatic relations were estab. between Russia and the F. G. R. and Russia agreed to send back to Germany sev. thousand Ger. prisoners still detained in Russia. When in 1955, against Adenauer's advice, the Saarlanders voted against 'Europeanisation', and by implication, in favour of union with the F. G. R., relations between France and the F. G. R. were temporarily strained. Agreement on the Saar was eventually reached, however, as a result of which the Saar was united to the F. G. R. at midnight on 31 Dec. 1956. Early in 1957 the F. G. R. was still enjoying great economic prosperity. There were signs, however, that the

relative industrial tranquillity of the preceding years might be ending, as unions began to formulate increasingly stringent demands on pay and conditions of work. Though Ger. reunification seemed as distant as ever, Russian intransigence on the subject at Geneva in Nov. 1955 giving little hope of any solution to the problem in the foreseeable future, it still remained the ideal of every F. G. citizen, and there were increasing signs of a popular demand for the return to the future reunified Germany of the 'lost' provs. beyond the Oder-Neisse line. In 1957 Adenauer was again returned to power at the general election. See H. Mangoldt, *Das Bonner Grundgesetz*, 1950; A. Horne, *Back into Power*, 1955; A. Grosser, *Western Journey*, 1955; and A. C. Wallich, *Mainsprings of the German Revival*, 1956.

Federal Reserve System, U.S.A., estab. by Congress in 1913 to prevent regional money panics and other monetary problems such as had arisen from time to time with the development of the national economy since the Civil war. It consists primarily of 12 regional banks and 24 branches, each with its own board of directors which has authority to provide for flexible operations and to meet regional needs. The S. as a whole is under the supervision of a board of 7 governors appointed by the President with the advice and counsel of the Senate. Assisting the F. R. Board are the F. Open Market Committee and the F. Advisory Council. The S. is, in effect, the central bank of the U.S.A.: it is the fiscal agent for the Treasury; it issues the currency; it maintains a nation-wide S. for clearing cheques between banks; and it controls the supply of money and credit through its power to regulate the R. that banks hold against deposits and by setting the rate banks pay for borrowing at the regional F. R. banks. While the F. R. S. is completely under the control of the U.S.A. Gov., the cap. of the R. banks was supplied by member banks through assessments. Membership in the S. is required of all national (federally chartered) banks, and state-chartered banks that qualify can voluntarily become members. Of the nation's 14,186 unit banks, 6476 were members of the S. at the end of 1956. Aggregate assets of member banks were \$178,043,000,000 compared with total U.S.A. banking assets of \$242,940,000,000. See also **BANKING in the U.S.A.**

Federal Trade Commission, an organisation set up by the Amer. Gov. in 1914 to check the growing menace of trusts and monopolies (see **TRUSTS—Commercial**). The struggle between the gov. and the trade combines ever since 1890, when the Sherman Act was passed, has been a record of legal victories for the gov. that have been practically nugatory; and the action of 1914 was evidently an endeavour to control and influence powers that could not be broken. After the First World War the Wells-Pomerane Act mitigated some of the older restrictions of

anti-trust legislation by legalising the alliance of great firms with each other for the purpose of marketing their goods in foreign lands. The F. T. C., which was estab. to prevent unfair business practices in inter-state commerce, has investigated alleged violations of the anti-trust laws. See I. L. Scharfman, *The Inter-state Commerce Commission*, G. C. Henderson, *The Federal Trade Commission*, and T. C. Blunsdell, *The Federal Trade Commission*.

'Federalist, The' was a collection of essays pub. in 1787-8 in New York, at the instigation of Hamilton, to defend the new gov. They appeared in the semi-weekly *Independent Journal* of New York under the above title, and were written by Alexander Hamilton, James Madison, and John Jay. There were in all 85 essays, which were collected and subsequently pub. in book form. The collection is still regarded as a classic text-book of political science. See *Everyman's Library* ed.

Federalist Party, The, was in power in the U.S.A. 1789-1801; d. about 1820. Its chief leaders were Alexander Hamilton and John Adams; Washington was closely identified with it. The P. reorganised the executive depts, created the federal judiciary and the territorial system, and introduced excise laws, a U.S.A. bank, a protective tariff and bounty system to develop manufs. and agriculture, and a postal system.

Federated Malay States, see **MALAYA, FEDERATION OF**.

Federation (Lat. *foedus*, a league), a union between 2 or more states, in which each retains its autonomy, while a central representative gov. controls matters of general concern. The Amphictyonic League of ancient Greece, the earliest on record, seems to have been religious rather than political. Among other Gk leagues were: the Thessalian, very powerful about 370 BC; the Aetolian, a well-organised F. composed of tribes living N. of the Gulf of Corinth, having a general assembly which met yearly, and a permanent committee acting as an executive gov.; the Achaean, which became a great political force about 251 BC: originally comprising 10 cities of Achaia, it ultimately included Athens, Megara, Aegina, and almost all the Peloponnesus; this, too, was a real F. The Hanseatic League was first formed by the cities of Hamburg and Lübeck about AD 1247 to protect their commerce against pirates and robber-barons. Gradually over 80 tns joined them, and the Hansa F. (Old Teutonic *hansa*, a defensive league), though never formally recognised by the empire, was for centuries a great power. It held courts of justice, enforced obedience among its members, and bargained and fought with kings and princes, on one occasion equipping a fleet of 248 ships with 12,000 men. The Hanseatic Diet, held triennially at Lübeck, was not dissolved until 1630. Modern civilisation with its improved means of communication and transport, and with many highly organised communities capable of political combination on equitable terms, has facilities for more extensive F.s. Bavaria

and Saxony could federate with Prussia, but no power of old could federate with Rome, and the holding together by mutual agreement of immense ters., like those of the U.S.A., would have been beyond human conception. But the principles remain the same. A F. is not a mere alliance from which either of the contracting parties can withdraw at will, nor is it a union in which one predominant power can assume control in local as well as general affairs. Safety and efficiency require a strong central gov., which must be fully representative, and must have command of foreign relations and of those internal matters which are of general concern, such as postal and telegraphic services, money, and national defence. But this central gov. cannot administer innumerable local details over immense areas or among thickly populated ters. with varying interests; therefore each federal country or state must have a large share of autonomy.

The rep. of Switzerland was first founded in 1307 by the men of Schwyz, Uri, and Unterwalden, and in about a century attained its present size, but remained communal rather than federal until 1848, when it was reorganised somewhat on its present lines. As the benefits of a solid gov. were realised, the powers of the federal parliament were strengthened in 1874, 1898, and again in 1907.

The medieval Ger. empire was a bulky and loose combination of states, sadly lacking in unity. It was broken up by Napoleon, but re-estab. with alterations in 1815. After the war of 1866 Austria was excluded, and in 1871 a federal empire was inaugurated at Versailles, with the king of Prussia as hereditary Ger. emperor. The abdication of the Kaiser and the monarchs of the other Ger. states in 1918 led to the formation of the new reps. of Prussia, Bavaria, Saxony, Württemberg, and others. But the F. of the Ger. states remained in being, under a president (Field-Marshal Paul von Hindenburg, who assumed office in May 1925); and later, under Hitler (q.v.), the last vestiges of autonomy of the sev. states of the Zollverein were merged in the Reich. For a thousand years the problem of unification versus federalism has been the main issue of Ger. hist. It has lost nothing of its poignancy under the quadripartite system of the occupying powers, and some indeed maintain that its solution is of prime importance for the future of Central Europe. But the problem of making F. living and workable is not confined to Germany. The adoption of federalist principles for the post-war reconstruction of the European Commonwealth was advocated by Winston Churchill as early as 1943.

Among the many national and geographical consequences of the First World War was the estab. of 3 new European countries which had many of the characteristics of federated states. These were: (1) Poland, which, before 1939, consisted largely of the ter. divided between Prussia, Russia, and Austria in 1772, and

reconstituted as a nation after 1918; (2) Czechoslovakia, a number of states or parts of states, of which the old kingdom of Bohemia is the chief, including roughly the Slav pops. that lie between Germany and Poland on the N. and Austria on the S.; and (3) Yugoslavia, consisting of the old kingdoms of Serbia and Montenegro, Croatia, Slavonia, and parts of the Banat, Bosnia, Herzegovina, Carniola, and Styria. Syria and Lebanon, consisting of the 4 states of Damascus, and Aleppo (q.v.), the Alaouites, and Lebanon are federated for certain purposes, but the constitution in each part is still in a rather unsettled condition.

The U.S.A. originally consisted of the 13 colonies which united in 1775 to free themselves from Brit. rule; to these others have gradually been added. The struggle between centralisation and local autonomy has led to sev. great crises in their hist. Excessive claims of state sovereignty put forward by Kentucky and Virginia in 1798 and by S. Carolina in 1832 almost led to fighting, and in 1861 the great Civil war broke out over the same question, the S. states refusing to obey the federal gov., and claiming the right to secede.

Included in the Brit. Commonwealth are 3 great federated colonies now called dominions. The dominion of Canada was the first example in history of a F. within an empire, free and autonomous, yet acknowledging the supremacy of the crown. The Commonwealth of Australia was constituted in 1901, the Union of South Africa in 1909.

Brazil and Argentina are both federal reps., with constitutions resembling that of the U.S.A.

In modern F.s some factors seem always to have been operative; the need for a common defence; resentment of foreign interference and a realisation that independence can be secured only through union; some political association of the constituent communities prior to their federal union either in a loose confederation (q.v.), as with the 13 Amer. states and the Swiss cantons, or as parts of the same empire, as with the Brit. dominions; the hope of economic advantage, especially by way of protective tariffs; geographical propinquity; and similarity of political institutions. These factors were operative in America, Canada, Australia, and Switzerland. They indicate how far a federal form of gov. can be expected to succeed in India, the states which form the Arab League, Brit. Malaya (or the Malayan Union), Indonesia, and Fr. Indo-China. Some factors are unexpectedly absent: thus community of language, or of race, of religion or of nationality has not been accounted a probable essential pre-requisite of the desire for union. Common language or race contributed to union in the U.S.A., Australia, and Germany; common nationality operated strongly in Italy and Germany. Conversely, in Canada and Switzerland F.s were formed in spite of diversity of language and race. See also CONFEDERATION.

Wright, *The Growth of American Constitutional Law*, 1942; G. F. Shirras, *Federal Finance in Peace and War*, 1944; K. C. Wheare, *Federal Government*, 1946.

Federation of British Industries, voluntary association, founded in 1916 'for the encouragement, promotion and protection of British Industries of all kinds.' Membership comprises individual firms (numbering 7500 in 1956) and trade associations (386). The F.B.I.'s functions are (a) to formulate and promote policy on all matters affecting Brit. industry as a whole, except labour matters (e.g. taxation, transport, technical legislation); (b) to provide members with individual services (especially in the export field, e.g. appointment of agents, etc.); (c) to promote activities within industry itself for the common benefit (e.g. education, research, trade promotion overseas). The F. publishes *FBI Review* (monthly), *FBI Register* (an ann. classified list of members and their products), *Fuel Economy Review* (ann.), and about 12 booklets a year on miscellaneous subjects. It has 14 dist. offices in the U.K. and representatives in 140 centres overseas; its subsidiary company, Brit. Overseas Fairs, Ltd., has organised all-Brit. trade fairs at Baghdad, 1954, and Copenhagen, 1955, and the Brit. pavilion at the Damascus International Fair, 1956. H.Q. are at 21 Tothill Street, London, S.W.1.

Federation of Rhodesia and Nyasaland, see RHODESIA AND NYASALAND.

Federici, Camillo (1749–1802), It. dramatist, whose real name was Giovanni Battista Viassolo, b. Garesio, Piedmont. He was educ. at Turin, and spent the early part of his life on the stage, but in 1773 settled at Padua and devoted himself to literature. He acquired a great reputation by his comedies, most of which were melodramatic in character. His *Opere teatrali*, 10 vols., were pub. in 1794–7, and another ed. in 26 vols. at Florence in 1826.

Fedin, Konstantin Aleksandrovich (1892–), Russian novelist, a Fellow Traveller (q.v.). His *Cities and Years*, 1924, revived the realistic novel in post-revolutionary Russia. Later he wrote *The Brothers*, 1928, *The Abduction of Europe*, 1934–5, *First Joys*, 1945, and *An Extraordinary Summer*, 1948. His main themes are the Russian revolution and civil war and the impact of revolutionary Russia on Europe.

Fëder, the name of 3 Russian tsars.

Fëdor I (1557–98), son of Ivan the Terrible, last of the House of Rurik (see RURIKIDAE), was married to a sister of

Boris Godunov (q.v.), and succeeded his father in 1584. He was of weak intellect and left the gov. of the country to Godunov. Important events of his reign were the law forbidding the movement of peasants from small to large estates and the estab. of the Moscow Patriarchy (1589).

Fëdor II (1589–1605), son of Boris Godunov, succeeded his father in 1605, but in a few weeks was deposed in favour of the usurper 'the false Dmitry' and murdered.

Fëdor III (1661–82), the last tsar of Muscovy, eldest son of Alexis Mikhaylovich, succeeded his father in 1676. An intelligent and advanced ruler, he endeavoured to modernise the gov. of the country and abolished the system of appointing high officials according to their birth and breeding.

Fëdorov, Ivan Fëdorovich (d. 1583), first Russian printer. In 1563 F. printed the first book in Moscow. He fled from Muscovy to Lithuania and Poland where he continued his work.

Fëdorov, Nikolay Fëdorovich (1828–1903), Russian thinker. He believed that the future ideal society, classless and universal, would be based on the conquest of the blind forces of nature and would concentrate all its energies on the supreme task of the resurrection of all the dead. Many of F.'s ideas have enjoyed great popularity in Soviet Russia and have influenced scientific research (see VERNADSKY), technical development (e.g. towards the utilisation of solar energy and inter-planetary travel), various organisations (Local Studies Movement), and even gov. policy (the estab. of labour armies in 1920). See N. Lossky, *The History of Russian Philosophy*, 1951; V. V. Zenkovsky, *A History of Russian Philosophy*, vol. ii, 1953.

Fedra, see INGHIRAMI, TOMMASO.

Fee, **Fee Simple** (from Lat. *feodum*), in Eng. law, is a freehold estate or interest in land. Theoretically all land is held of the sovereign—a concept inherited from the feudal systems of land tenure. Under that system tenants in F. held their land subject to certain feudal duties such as knight service and payment of aids. The types of F. or F. S. are as follows: (1) *Fee simple absolute in possession* means the absolute ownership of freehold land in perpetuity which enables the owner to dispose of it by will or deed and entitles him to everything in, on, or over the land. (2) *Determinable fee* is a F. S. which will determine on the occurrence of a specified but not inevitable event, e.g. the settlement of freeholds 'to A until she marries.' (3) *Conditional fee* is created by a condition attached to the grant of land, e.g. 'to B on his marriage.' (4) *Fee tail* is an estate in land limited to the issue of the person to whom it is granted (i.e. the tenant in tail). (5) *Base fee* is a particular type of determinable F. which is created where a tenant in tail, not yet in possession, bars the entail by deed without first obtaining the consent of the protector of the settlement. See also ENTAIL.

Fee Law, see FIEF.

Feeble-minded, see MENTAL DEFICIENCY ACTS.

Feeding, see FOOD AND DIET.

Feeling, see EMOTION.

Fehling's Solution, S. which is used for the detection and estimation of glucose and other 'reducing' sugars. It consists of a S. of cupric sulphate mixed with alkali and potassium-sodium tartrate. For use a small quantity of the S. is placed in a test tube and diluted with water. It is then boiled for a few seconds, after which the fluid to be tested is added drop by drop until its bulk is equal to that of the diluted fluid. If a reducing sugar (such as glucose but not sucrose, cane-sugar) is present a yellow precipitate of finely divided cuprous oxide is thrown down, which subsequently becomes ordinary red cuprous oxide.

Fehmarn, Ger. is. in the Baltic Sea, belonging to the *Land* of Schleswig-Holstein (q.v.). It is separated from Lolland (q.v.) by the F. Strait, and is mostly grazing land. Its chief tn is Burg. Area 72 sq. m.; pop. 10,000.

Fehmle Courts, tribunals, often, but not always, secret, which became widespread in Westphalia about the 14th cent., and afterwards spread throughout Germany. Important cases were tried in secret, capital crimes being punished by hanging, no culprit, however powerful, being secure. Implicit obedience was exacted from all members, who were known to each other by secret signs. The power of the F. C. declined after the 16th cent., but they were not officially abolished until 1811. The illegal Free Corps revived the F. C. in Germany in a bogus form after the First World War.

Fehrbellin, Ger. tn in the dist. of Potsdam, on the Rhin canal, 30 m. NNW. of Potsdam (q.v.). In 1675 the Prussians here defeated the Swedes under Wrangel (q.v.). Pop. 3800.

Fehrenbach, Konstantin (1852-1926), Ger. statesman, b. Wellendingen, Baden. He became a lawyer. From 1903 he was a member of the Reichstag and became its president in June 1918. He presided over the National Assembly at Weimar, Feb. 1919, and became chancellor at the head of a minority gov., 1920-1.

Feljo y Montenegro, Benito Jeronimo (1676-1764), Sp. scholar, became a Benedictine monk at the age of 12. He is regarded as the initiator of educational reform in Spain. He boldly attacked the dialectics and metaphysics then taught everywhere in his native country and maintained Bacon's system of induction in the physical sciences. He pub. *Teatro critico universal*, 1751-9, and *Cartas eruditas y curiosas*, 1753.

Fellding, Robert (1651-1712), rake, known as 'Beau Fellding,' was a member of the Denbigh family, and attached to the court of Charles II. He was noted for his numerous love-affairs, his extravagance, and his profligacy, and was satirised by Swift and Steele. He commanded a regiment in Ireland for James II.

Fellding, Rudolph Robert Basil Aloysius Augustine, see DENBIGH, 9th EARL OF.

Fellding, tn in North Is., New Zealand, 99 m. NE. from Wellington. It has dairy factories, freezing works, flour mills, and an agric. high school. Pop. 6780.

Fels (Fheis), term applied to festive gatherings organised locally all over Ireland for the preservation of Irish culture. Competitions are held in language, music, singing, dancing, drama, etc. The F. of Tara (q.v.), which originated 7 centuries BC, was mainly a national and political assembly, and was due to meet every 3rd year for the purpose of 'preserving the laws and rules,' but might be called at other times. After the proclamation of the laws the proceedings were festive in character. The last regular F. was held at Tara in AD 560.

Feisal (Faisal) (1883-1933), king of Iraq, b. Rahab, near Taif; son of Husain ibn Ali—afterwards grand shérif and emir of Mecca, and, later, king of the Hedjaz; descended from Hasan, eldest son of Mohammed's daughter Fatima. In 1913 he became deputy for Jiddah in the Turkish Parliament, and took part in the Arab national movement. He was at Mecca when the First World War broke out. With one of his brothers he raised the flag of revolt near Medina in 1915; and, having failed in an attack on that city, he became chief of his father's N. army. His forces, co-operating with Allenby, marched from Medina to the E. bank of the Jordan. He met Allenby 3 Oct. 1918, and the same day rode into Damascus in celebration of the overthrow of Turkish power in Syria. He attended the peace conference in Paris, Feb. 1919. In Mar. 1920 he was back in Damascus, where his appointment as king, and the independence of Syria, were proclaimed. But next month Syria was 'mandated' to France; and either F.'s appointment was unpopular, or opponents contrived to make it seem so (he had publicly expressed sympathy with Zionism), and Fr. troops entered Damascus, 25 July. F., deposed, left for Haifa, and began to turn his attention to Mesopotamia, otherwise Iraq, for the throne of which his brother Abdullah (now king of Transjordan) had hitherto been a somewhat passive candidate. A referendum of Iraq notables resulted in a huge majority for his election; he was enthroned king, 23 Aug. 1921. In 1927 he came to London to negotiate the admission of Iraq to membership of the League of Nations. The Brit. Gov., as mandatory, had by then substituted a treaty arrangement with Iraq in place of the mandatory regime, but full independence and membership of the League did not come until 1930, when a new treaty of alliance was concluded between Iraq and Great Britain. F. d. in Switzerland and was succeeded by his son Ghazi, who was killed in a motor accident in 1939. See Sir T. Comyn-Platt, 'King Feisal of Iraq,' in *Empire Review*, Nov. 1926; Mrs Stewart Erskine, *King Feisal of Iraq*, 1933; Sir H. Young, *The Independent Arab*, 1933. See also IRAQ.

Feith, Rhijawis (1753-1824), Dutch poet and writer, b. Zwolle. He was educ. at Harderwijk and at the univ. of Leyden, and became mayor of Zwolle in 1787. Influenced by Goethe, Klopstock, and Wieland, he wrote sentimental novels, which have been very much criticised for their morbid melancholy, as well as tragedies, didactic poems, and lyrics. Of his novels may be mentioned *Julia*, 1783, and *Ferdinand and Constantia*, 1785, both written in emulation of *Werther*, and his best tragedies are *Thirza*, 1784, *The Patriots*, 1784, *Lady Jane Grey*, 1791, and *Inez de Castro*, 1793. Among his poems are *Old Age*, 1802, *The Grave*, 1792, a didactic poem, and *Odes and Miscellaneous Poems*, 1796-1814.

praise of Voltaire. He also wrote descriptions of Versailles, La Trappe, and royal art collections.

Felidae, name given to an extensive family of carnivorous mammals. They are characterised by a lithe body, soft and often beautifully marked fur, feet provided with cushion-like pads and retractile claws, and short, strong jaws with formidable teeth. *Felis domesticus*, the domestic cat, and *Panthera leo*, the lion, are typical and widely contrasted species; others are *P. tigris*, the tiger; *F. pardus*, the leopard; *P. onca*, the jaguar; *P. concolor*, the puma; *F. silvestris*, the European wild-cat, and *F. ocreata*, the Egyptian cat, which is regarded as the parent of our own domestic species. *Lynx*, sometimes

FELIDAE: LION (*Panthera leo*)

Fejér County, see SZÉKESFEHÉRVÁR.

Felaniche, see FELANITX.

Felanitx, or **Felaniche**, Sp. tn in Majorca (q.v.), near the E. coast. It has an ancient pottery industry, and a trade in wine, fruit, and cattle. Pop. 13,000.

Feldkirch, Austrian tn in the prov. of Vorarlberg, on the Ill. Overlooking the tn is a 13th-cent. castle on a high rock, and there is a Gothic par. church. There are textile, timber, and paper industries. Pop. 15,300.

Félegyháza, see KISKUNFÉLEGYHÁZA.

Félibien, André (1619-95), Fr. architect and historiographer, b. Chartres. Went to Rome as secretary to the Fr. ambas. There he came in contact with writers and artists while translating Cardinal Barberini's life of Pius V. and thus turned to artistic subjects. With the patronage of Colbert and Fouquet, he was successively historiographer of buildings, secretary of the Académie d'Architecture, and keeper of antiquities; but he devoted most of his life to writing. His *Entretiens sur les vies et sur les ouvrages des plus excellents peintres anciens et modernes*, 1686, won the

termed *F. lynx*, is more frequently regarded as a distinct genus of *F.*, with *L. pardinus*, the pardine lynx, and *L. canadensis*, the Canadian lynx, as the most familiar species.

Felis (the cat genus), see CARNIVORA: CAT; FELIDAE; LEOPARD; and TIGER.

Felix, name of 5 popes or anti-popes: *St Felix I*, reigned from 269 to 274. He is said to have suffered martyrdom in the persecutions under Aurelian. *Felix II*, anti-pope, was raised to the papal chair in 355 on the banishment of Liberius, who refused to condemn Athanasius, but was expelled from Rome on his return in 357. He was regarded as a saint and martyr, and d. in 365. *St Felix III*, pope, ancestor of Gregory the Great, succeeded to the papal chair in 483 and d. in 492. He communicated the Patriarch of Constantinople, and so produced the first schism between the E. and the W. Church. *St Felix IV* (526-30) was elevated to the papal see by Theodoric, contrary to the wishes of the clergy and people. *Felix V* (1440-9) was the name assumed by the anti-pope Amadeus VIII, duke

of Savoy, when he was elected by the council of Basel in 1439. He submitted to the lawful pope, Nicholas V, in 1449. He was the last of the anti-popes. He d. at Geneva.

Felix, St (3rd cent.), patron of Zürich, whose feast is celebrated on 11 Sept. He and his sister Regula, who is commemorated with him, were martyred near Zürich.

Felix, Antonius, Rom. prefect of Samaria, and afterwards procurator of Judaea (AD 52-60). Immediately on assuming this last office he married Drusilla, sister of Agrippa II and wife to King Azizus of Emesa, whom he had persuaded to desert her husband. St Paul appeared before F. at Caesarea (Acts xxiv). For a summary of the procurator's evil character, see Tacitus, *Annales* XII, 54; *Historiae* V, 9.

Felixstowe, tn of Suffolk, England, which is usually considered as having derived its name from a priory dedicated to St Felix, bishop of Dunwich, is situated on a peninsula between the rvs. Orwell and Deben in the SE. of the co. It is a well-known seaside resort, much frequented on account of its cliff gardens, fine beach, and boating and bathing facilities, 12 m. from the co. tn of Ipswich. It adjoins Harwich harbour, which was an important centre of naval activity during the First and Second World Wars. It is the H.Q. of the F. Ferry Sailing Club, and there are 10 other yacht clubs within 20 m. Pop. approx. 15,210 (1954).

Fell, John (1625-86), clergyman, b. Longworth, Berkshire, son of the dean of Christ Church, Oxford. In 1636 he gained a studentship at Christ Church and took orders. During the Civil war he held a commission as ensign for the king, and at the Restoration was made dean of Christ Church and chaplain to the king. In 1676 he was consecrated bishop of Oxford, also holding the deanery of Christ Church. He was an extraordinary disciplinarian, encouraged learning, and proved himself a capable administrator, but refused all interference. It was written of him that 'He was the most zealous man of his time, for the Church of England,' also 'that he was very rude, and most pedantic and pedagogical, yet still aimed at the public good.' He is chiefly remembered for the verses beginning 'I do not love thee, Dr Fell,' which Thomas Brown (q.v.) composed for him extempore under the threat of expulsion. He spent large sums of his own money on the building of Christ Church (q.v.). He wrote many learned and religious works, and is noted, too, for his services to printing and publishing.

Fell Pony, see HORSE.

Fellah, plural **Fellahin** (Arabic for ploughman), name applied to the peasantry of Egypt (q.v.). They preserve to some extent the blood of the anct Egyptians; but the mixture of race due to long ages of inter-marrying with the various peoples who have occupied the country shows in the wide differences to be seen in their colouring, ranging from a deep bronze to almost white. Physically

the F. are a fine race; the men are powerfully built with well-shaped skulls, oval faces, and large, clearly-cut features; the women when young are often very graceful and beautiful. Most are Moslems by religion.

Fellenberg, Philip Emmanuel von (1771-1844), Swiss educationist, b. Bern. After distinguishing himself at the univ. of Tübingen he studied the life of the peasants and workmen of Switzerland, and was influenced by Pestalozzi (q.v.). In 1799 he bought the estate of Hofwyl, near Berne, and started an agric. college in conjunction with Pestalozzi, from whom he later separated. It was based on a new system of bringing all ranks of society close together by education, and in spite of the ridicule it first encountered proved a success.

Felling, urb. dist. in NE. Durham, England, on the S. bank of the R. Tyne, adjoining Gateshead. F. is in Jarrow parl. div. Industries include coal-mining, engineering, and the manuf. of paints. Pop. 26,000.

Fellow-feeling, see SYMPATHY.

Fellow Traveller, in Soviet Russia of 1920's, name given by Communists to those intellectuals (particularly writers) who accepted the Soviet regime but were not Communists. In current non-Communist parlance those who support or sympathise with Communists.

Fellowes, Edmund Horace (1870-1951), clergyman and musicologist, b. London. Attached to St George's Chapel, Windsor, since 1900. Hon. Mus.D. of Dublin (1917) and D.Mus. of Oxford (1938). He has written works on Byrd, and Orlando Gibbons, and ed. the complete series of Eng. madrigal and lute songs (88 vols.) and besides much Tudor church music.

Fellows, Sir Charles (1799-1860), archaeologist, b. Nottingham. In 1820 he became a member of the Brit. Association. In 1838 he went on the first of his 4 expeditions to Asia Minor. His second expedition resulted in the discovery of 13 anct cities in Lycia. The fourth expedition was the most famous and satisfactory: it resulted in 27 cases of marbles, chiefly from Xanthus, being presented to the Brit. Museum. This pioneer among archaeologists penetrated to dists. unknown by Europeans, entirely at his own expense. He wrote sev. books on his travels. In 1845 he was knighted, receiving no other public acknowledgment of the work he had accomplished. Wm James Muller (d. 1845), the Eng. painter, accompanied F. to Lycia, and made many beautiful and interesting sketches of the anct works of art.

Fellowship. At Oxford, Cambridge, and Trinity College, Dublin, Univs. the term is applied to a member of the foundation of an incorporated college, sharing in the gov. and receiving an income from the college revenues. F.s are conferred, generally through open examinations, on bachelors of art whose careers have been distinguished. There are prize F.s involving no collegiate duties, and official F.s which are attached

to the teaching and tutorial staff. Honorary F's are conferred on distinguished persons. The Dublin Univ. fellows hold their office for life. At first fellows were restricted to persons who took holy orders and were celibates; this was abolished in 1858. At Univ. College, London, and King's College, London, distinguished former students are elected as fellows of the college. A great many F.s are now awarded by other univs. and organisations as post-graduate research scholarships. They might be honorary or carry a money grant. The F.s often specify the area of research in which the recipient shall work. They frequently bear the name of the organisation or person founding the award.

Felitham, Owen, see FELTHAM.

Felo de Se (literally a felon on himself, i.e. a murderer of himself), the legal term for a suicide, hence used in verdicts where juries do not find evidence of temporary insanity. See SUICIDE.

Felon and Felony, in Eng. law, a legal term for a special but ill-defined group of criminal offences. Whether a particular crime is a felony, a misdemeanour, or a summary offence must be determined by reference to the common law and to various statutes. See CRIMINAL LAW.

Felsina, see BOLOGNA.

Felsite, term used by geologists for fine-grained igneous rocks of acid composition. They are composed chiefly of felspar and quartz in very minute particles. In colour the rocks are usually of a reddish-yellow, and are hard and sometimes nodular. They occasionally contain porphyritic crystals of clear quartz, and are then known as quartz-F.s. The variety of formation of these rocks has led to considerable discussion, and it cannot always be determined whether F. is an original substance, or the result of devitrification of primary glass. They are divided up into granite porphyries, orthophyres, felsitic rhyolites, etc. The term soda-F.s. is used of fine-grained rocks containing large quantities of soda-felspar.

Felspar (from Ger. *Feldspath*), important group of mineral silicates, forming prin. components of various plutonic and volcanic rocks. Lyell gives the minerals essential to granite (plutonic) in their order of importance as F., quartz, and mica, and the trachytic rocks (volcanic) are largely felspathic. The chief constituent of all F.s (sometimes over 60 per cent) is silica; alumina sometimes reaches 30 per cent, and there are varying proportions of lime and soda. F.s are classified according to their cleavage as monoclinic (including orthoclase, adularia, and sanidine) and triclinic (albite, anorthite, etc.). The sub-divs. are based on chemical composition and crystallography. F.s decompose when exposed to weather, forming various soils, among others china-clay. Kaolin, from which fine porcelain is made, consists of decomposed orthoclase. The F.s have a sp. gr. of from 2.55 to 2.75, and their hardness, 6 to 6.5, is less than that of quartz. Pure F. is colourless, but many varieties are finely tinted owing to the

presence of various minerals. Among these are: Amazon stone, a green F. found in Russia and U.S.A., this is often cut and polished; moonstone, a translucent variety known as adularia (hence its sheen is called adularescence), found in Ceylon; Labradorite, generally dull, but sometimes playing with brilliant blue, purple, and other tints, then very handsome when polished; sunstone, called aventurine from its golden spangled lustre, like that of aventurine glass, found in Queensland, Russia, and U.S.A. The colouring of red and grey granites is due to the F.s they contain.

Felsted, or Felstead, vil. of Essex, England, 4½ m. from Dunmow. The church, largely in the Transitional style, has a Norman tower. F. School (q.v.) was founded in 1564. Pop. 2010.

Felsted School, public school for boys, situated at F., Essex, founded in 1564 by Richard, 1st baron Riche, lord chancellor of England. In the 17th cent. it was well-known as a Puritan school, and 4 sons of Oliver Cromwell were educ. there.

Felstones, name given to volcanic rocks allied in composition to the granites. The name is also often used to describe and lavas allied to the Liparites or to Obsidians which have become devitrified. Certain Scottish rocks which were once classed as F.s are really devitrified trachytes.

Felt, fabric produced by the 'felting' or 'matting' together of fibrous materials, such as wools, furs, and some hairs. The hairs from wool are covered with serrations or minute hooks which can easily be forced together, so as to become 'matted.' Fibre F.s are interesting, as the art of felting preceded the art of weaving in the ant. civilisations of Asia. There are 2 classes of F., the woven F. and the fibre F. In the former selected wools are used, such as Saxony wool, and woven into a cloth that will endure the subsequent shrinking or felting; to obtain the heavier F.s, 2 or 3 woven cloths are stitched together before they are subjected to the process of shrinking. The material is passed between hollow steam-heated rollers which are kept moist and warm, and the fabric thus treated tends to shrink and thicken and become dense enough to resist water. Fibre F. is divided into the F. used for hats, impregnated F., and the ordinary F. For the manuf. of F. hats vegetable fibres, silk, hairs, furs, and wool are used; hair and wool being the most usual. The F. made for hats goes through the same process as other F.; for fur hat F.s, an air blast is used to carry fibres on to the required shape, and the F. is impregnated with stiffening agents. The prin. use for F. is for the linings of furniture, rubber shoes, slippers, as undercarpets, for steam engine packing, and covering steam hot-water pipes and all vessels which are to be insulated to prevent condensation, etc. The impregnated iron felt is a later development, used in the construction of bridges, etc., in the place of rubber. Asphalted F. is used for roofing, especially for wooden structures.

Feltham, or **Feltham**, Owen (c. 1602-1668), essayist, b. Mutford, Suffolk. He was noted for a vol. of essays entitled *Resolves, Divine, Moral and Political*, 1633. His writing was modelled on that of Bacon, and has a certain charm. Later eds. of *Resolves* include a collection of poems entitled *Lusoria, or Occasional Pieces*.

Feltham, large vil. and urb. dist. of Middx., England, about 4 m. E. of Staines, with nurseries and market gardens. The urb. dist. includes Hanworth, Bedfont, and Hatton. Pop. 44,830.

Felton, John (1595-1628), assassin, member of an old Suffolk family estab. at

Female Suffrage, see **WOMEN'S SUFFRAGE**.

Feme, O.F. word, the modern being *femme*, used in legal phraseology for 'woman'; *feme covert*, a married woman, i.e. protected by a husband, and *feme sole*, a divorcee.

Femern, see **FEHMARN**.

Feminism, belief in or advocacy of the influence of women in spheres conventionally reserved to men, or, more briefly, the movement for the equality of the sexes. The movement for extending the franchise to women in England had its intellectual genesis in the writings of John Stuart Mill. The great practical difficulty before

A FELUCCA ON THE NILE

Playford. He served as a lieutenant in the army, and the rejection of an application to the duke of Buckingham (q.v.) for promotion bred a deep hatred. He finally went to Portsmouth and stabbed Buckingham dead. F. was hanged at Tyburn; on his way to the gallows the crowd blessed him publicly for delivering them from the hated duke.

Feltre, It. tn. in Veneto (q.v.), 17 m. SW. of Belluno (q.v.). It is in an Alpine valley, is overlooked by an anct castle, and has a 16th-cent. church and fine frescoed houses. There is a trade in agric. produce, silk, and wine. Pop. 18,800.

Felucea, name of a particular kind of sailing boat used on the Mediterranean and in Egypt. It is a large boat built with a high bow and raking sternpost, and rigged with 2 or 3 masts, with lateen sails and a jib. It rides low on the water and moves very swiftly, being the fastest sailing boat on the Mediterranean.

emancipation lay in women's legal disabilities in the matter of acquiring their own separate property, a difficulty which was largely disposed of by the Married Women's Property Act, 1882. Legislation for giving the vote to women always passed the Commons from 1886 until 1911, being as regularly vetoed by the House of Lords. In 1918 a bill granting limited franchise was passed, and 10 years later full equality in this respect was attained. See also **WOMEN'S SUFFRAGE**.

Femunden, second biggest lake of Norway, situated 85 m. SE. of Trondheim. It is about 38 m. in length, and its greatest width is 5½ m.

Femur (thigh), see **LEG**.

Fences are made for various purposes, such as enclosing animals on pasture-ground, protecting crops from straying cattle, affording shelter from wind, and marking off boundaries. The ordinary hedge and ditch of an Eng. farm makes excellent fencing, but is expensive in the

matter of room and cost of maintenance. The hedge must be cut and trimmed regularly or it will run to top, and gaps must be stopped quickly. In many cases hedges have been grubbed out and replaced by F. made from wooden or concrete posts with stout wire (often barbed) strained between them. These are cheaper to maintain but afford less shelter or shade to stock and crops. Park F. are often constructed of posts and rails with feather-edge boards nailed on the latter, making a strong and neat enclosure. Sunk F., or 'ha-has,' are those made along the bottom of a hollow which are invisible until one reaches their edge. In parts where stone is plentiful dry-walls are often constructed, in Aberdeenshire of granite boulders, in some Eng. cos. of pieces of limestone, the top and bottom layers being sometimes fastened with mortar. On moorlands earthen banks topped with gorse make excellent F.

Fencibles, forces raised during the Amer. War of Independence and the Fr. revolutionary wars in both the U.K. and N. America. They were not liable for foreign service. In this they resembled the militia, though in organisation they were patterned on the regular army.

Fencing, the art of using a sword for attack or defence.

History.—F. has a centuries-old hist. and tradition. Swords were well estab. in the Bronze Age and all the anc. peoples, the Persians, Greeks, Romans, Egyptians for example, have left evidence of their concern with swordsmanship. There is a record of a F. match in a drawing in a tomb constructed at Luxor 2000 years B.C. In medieval times, so long a man continued to go to war encased in armour, the sword (q.v.) was heavy and clumsy. Early in the 15th cent., the discovery of gunpowder caused armour to be discarded and led to a sudden transformation of weapons to lighter forms better adapted to quick and neat fighting. Guilds of F. masters, the best known perhaps the famous Marxbruder of Frankfurt, sprang up all over Europe to study the now important art of F. The Italians are credited with being the first to recognise the superior efficiency of the point over the edge of the sword, and by the end of the 16th cent. they had developed lighter weapons and nimbler, cunning, and controlled methods which were soon universally adopted as rapier F. The rapier, a long, beautifully balanced sword excellent for attack or keeping the adversary at distance, was still too heavy to allow quick defensive movements and therefore had to be used in conjunction with a lighter sword or dagger in the left hand used primarily for defence or at close quarters. By the last half of the 16th cent. F. masters discontinued the teaching of wrestling tricks, the lunge was discovered, and swordsmanship pure and simple may be said to have originated. The Sp. school developed a scientific method early in the 17th cent. based on mathematical lines drawn on the floor within a circle, but this had little influence

on the development of swordsmanship elsewhere.

During the reign of Louis XIV. in the 17th cent., a change of fashion in dress led to a revolution in swordsmanship. Every gentleman had to carry a sword and be prepared to defend his honour 'at the drop of a hat,' but the long rapier was no longer suitable for the new elegance of knee breeches, silk stockings, and brocaded coats. Fashion decreed that the light, short, court sword should be worn. With the 'small sword' hits were made with the point only and all movements of attack and defence could be performed with one sword wielded with one hand. The dagger was no longer required for parrying, and the Fr. school of F. then evolved rapidly displaced rapier F. throughout Europe. All modern F. is based on the movements then estab.

Swordsmanship was studied in Britain for many centuries. In 1285 a statute of Edward I prohibited the estab. of F. schools or the holding of tournaments in the City of London. F. masters were regarded with disfavour as persons who encouraged duelling, brawling, and ruffianism until Henry VIII., a great lover of swordplay, founded a Corporation of Masters of Defence before 1540 to govern F. in his realms. It was because the first organisation of F. in Britain was estab. by a Tudor king that later Edward VII granted Brit. international fencers the right to wear a Tudor rose as their international badge. The sword and buckler, the long (2-handed) sword, and the backsword were the traditional Eng. weapons until the rapier was adopted in the reign of Elizabeth I. F. masters in London at that time included Vincenzo Saviolo, the first writer on the rapier here and said to have been Shakespeare's F. master; Signor Rocco, who had an academy in Warwick Lane near St Paul's; and George Silver, champion of the Corporation of Masters of Defence. From the 16th cent. prize fights were public displays of skill with swords. The fights were usually held on platforms in public gardens, and the fencer who defeated his opponents, often using a variety of weapons and often at 'sharps,' was said to 'hold the stage' to the last and collected the prize money. Towards the end of the 18th cent. James Figg, expert swordsman and the first Brit. boxing champion, introduced fisticuff fights into prize fights. This became so popular that F. was soon relegated to a prov. amusement where it degenerated to bouts with single sticks. F. was neglected in Britain during the early Victorian era, but popular interest was revived in the 1860's by its inclusion in the army physical training programme and the enthusiasm of Capt. Alfred Hutton and his friends. In 1902 the Amateur F. Association was founded to govern the sport in Britain, with Capt. Hutton as its first president, and has steadily increased in popularity both for ladies and men since that time.

F. with the small sword, even with blunted weapons, always involved danger

of injury to the eyes. Various conventions were therefore estab. to govern orthodox play. For example, hits were restricted to the breast and a fencer initiating an attack was allowed to complete his action, unless parried, before his opponent could commence his counter attack. The invention of the mask, about 1780, by the Fr. master La Boissière, allowed much freer play, including complicated movements such as remise, counter-riposte, redoublement, and so on. The traditional conventions became of increasing importance to prevent quick phrases made at close quarters with light weapons degenerating into a brawl of simultaneous movements. They have survived as the basis of the rules for foil F. Foil F., evolved directly from the light court sword, thus became a complex game, a 'conversation with the foils' but increasingly unlike the simpler swordplay in duels. Early in the 19th cent. the *épée de combat* with comprehensive target and absence of conventions, was adopted for training in schools for duelling. It is now fenced as a separate weapon. The heavy military sabre continued the tradition of backwording until the last quarter of the 19th cent., when the light lt. duelling sabre was introduced and very soon universally adopted as the recognised cut-and-thrust weapon.

Modern Fencing.—F. to-day is a very modern and athletic sport practised with 3 weapons, the foil, the *épée*, and the sabre.

The foil is the basic weapon with which the principles of swordsmanship should be learned. A light weapon with a small bell guard and square, tapering blade, the foil is a fascinating medium for the exercise of quickness of thought and movement and finesse. Hits are only valid if they are made with the point on the body. Hits which arrive on the head or limbs do not count and stop subsequent hits. Foil F. is governed by somewhat complicated conventions and rules. Besides the limited target, these rules are based on the convention that the fencer who originated an attack has the 'right of way' until his attack is parried (deflected clear of the target) when the 'right of way' passes to his opponent for the reply or riposte. If the riposte is parried the 'right of way' reverts to the original attacker for the 'counter-riposte' and so on through the sequence of F. movements which form the 'phrase.' Thus if one fencer attacks and his opponent, instead of parrying the attack, makes a simultaneous hit on the attacker only the hit made by the attacker is scored since he had the 'right of way.' An exception to the foregoing occurs when a complicated attack or one made with a bent arm is initiated, if the fencer who is attacked can seize the initiative and make a 'stop hit' well before the final movement of the attack arrives, this is given priority over the attack although no parry has been made. A simple attack (extending the sword-arm to hit the opponent's target) is easily parried, so that it is usual to precede

the real attack with false attacks, called feints, to induce the opponent to form a parry prematurely and thus leave some part of the target exposed for the final or real movement of the attack to score a hit. Foil F. is a game of skill, speed, and finesse. It is thus equally suitable for ladies as well as men, and both can derive much exercise and enjoyment from a bout together on much more even terms than at most other sports.

The *épée* is the duelling sword. Heavier than the foil, with a fluted triangular blade and a larger bell guard. Hits, with the point only, may be scored on any part of the opponent's body, head, or limbs. *Épée bouts* are fenced as near to the conditions of a duel as possible, none of the conventions of foil play apply but the object is to hit the opponent before he can hit you and, if possible, without his scoring a hit at all. The fencer who hits his opponent first in point of time scores the point. If both fencers are hit practically simultaneously a hit is scored against each because in a duel both would be wounded or dead. In order that hits can 'fix' on the wider target a *pointe d'arrêt* consisting of a number of small prongs is affixed to the point of the *épée*. Since *épée bouts* are judged entirely on time between the hits an electrical judging device is used in all competitions. *Épée F.* is a more open, simpler, and more athletic game than foil; tactics are of great importance and hits tend to be concentrated on the sword-arm and wrist as the nearest parts of the target.

The sabre is the light lt. duelling sword. It has a half-circular guard and a flexible flattened blade with which hits can be scored with the whole of the front edge or the last third of the back edge (cuts) as well as with the point. The valid target is the head, arms, and trunk down to the waist. Although it is a recognised duelling weapon, sabre F. in schools is governed by similar conventions and rules as the foil. Stop outs at the arm are much used and sabre fencing is a game of much movement and skill with point and edge.

Play.—A F. bout is fought for 5 effective hits (best of 9 hits) with a time limit of 10 min. of actual F. Ladies fence for 4 effective hits and 8 min. limit. Individual competitions are usually fenced on the 'pool' system. The competitors are divided into pools of 6 or 8 in which every member fences every other member, and those with the greater number of victories are promoted to subsequent rounds until the final pool is reached. Team matches are usually between teams of 4 fencers.

The jury judges bouts at foil and sabre. It consists of a president, or referee, and 4 judges who watch each fencer in pairs and decide when a valid hit is made. The president directs the bout and alone decides on the validity of hits according to the rules after the materiality of the hits has been estab. by the judges.

The electrical judging apparatus automatically records the arrival of hits and

eliminates errors of judgment on materiality. At *épée* the apparatus also registers the priority of hits scored, and when 2 hits are made within 1/25th of a sec. it registers a double hit. Hits on the guard of the weapon or on the metallic floor do not register. There is also an electrical judging apparatus at foil which registers hits on or off the target, but the president is still required to analyse the phrase and award the hit according to the rules and conventions of foil. See also DUEL AND DUELLING. See O-L de Beaumont, *Fencing*, 1951.

Fénelon, François de Salignac de la Mothe (1651-1715), Fr. archbishop and

FRANÇOIS FÉNELON

Engraving by J. Thomson from Vivien's picture in the Louvre

writer, b. of good family at the Château de Fénelon in the prov. of Périgord. He came to Paris in 1666, and after a term at the Plessis College he entered the famous theological college of St Sulpice, then recently founded. He took holy orders there in 1675, and in 1678 became director of the Nouvelles Catholiques, a Parisian institution for female converts from Protestantism. On the revocation of the Edict of Nantes in 1686, he accompanied a mission to the Protestants of Poitou and Saintonge. In 1689 Louis XIV appointed him preceptor to his grandson, the duke of Burgundy, a position which he held for the next 6 years. The varied character of F.'s works is a proof of the originality and flexibility of his mind. They include theological and controversial works, of which the chief are the *Traité de l'existence de Dieu*, 1712, and the *Maximes des Saints*, 1697; educational and moral works: the *Traité de l'éducation des filles* (written in 1681, pub. 1689) for the daughters of the duchess of Beauvillier; and the *Fables*,

the *Dialogue des morts*, 1699—the leading idea of which is that politics must be guided by moral principles—and the *Aventures de Télémaque*, 1699, all composed for his royal pupil; political writings, of which the most important are *Plans de gouvernement*, and the *Direction pour le conscience d'un roi*, 1711; critical works: the *Dialogues sur l'éloquence*, 1718, and the *Lettre à l'Académie*, 1716. The *Aventures de Télémaque* is a pedagogic romance, imparting moral teaching together with instruction in Grk mythology and antiquities. The politics of the book are more or less Utopian and its satire was aimed at the king—whence his anger when it was pub. clandestinely. The *Plans de Gouvernement* was also directed at the king: in it F. advocates a limited monarchy in which the king may demand of his subjects only what is necessary for the good of the State, and in which authority would be shared with a strong and Christian nobility mediating between monarch and people. F.'s services to the duke of Burgundy, however, led to his advancement, and he was presented to the abbey of St Valéry in 1694, and in 1695 became archbishop of Cambrai. About this time arose the controversy concerning the Quietism of Madame Guyon, who, accused of sharing the more extreme views of Molinos, was twice imprisoned. F. defended her so far as the attacks against her were personal, and this led to a long and acrimonious controversy with Bossuet, with whom he had previously been on the best of terms. Bossuet issued his *Instruction sur les États d'Oraison*, and F. took up the cudgels on behalf of Madame Guyon, and defended some of her teachings in his *Explication des Maximes des Saints sur la Vie Intérieure*, 1697. The latter was pub. first, in violation of an understanding between the 2 prelates, apparently without the knowledge of the author, and this led to their final estrangement. After some delay, during which the controversy grew more embittered, the pope, pressed by Louis XIV, condemned the *Maximes des Saints* in 1699, and F. honourably accepted the decision in accordance with his own declared views on papal authority. Pope Innocent summed up the matter in the words, 'F. erred by loving God too much, and Bossuet by loving his neighbour too little.' Ordered by the king to retire to Cambrai, F. spent his last years in doing good pastoral work within the confines of his diocese. He was buried in Cambrai Cathedral. The only controversy of his later years had reference to the Jansenists, whom he vigorously opposed. It is generally conceded that F. was in many ways a model archbishop, but for the rest his character has been the subject of much speculation and controversy. He was a born teacher, who combined the address of a *grand seigneur* with all the refinements of an accomplished ecclesiastic; gentle but also hard and inflexible when the case required it. He carried on a voluminous correspondence, and his many interests included politics, literature, and philosophy.

There are eds. of his works by J. B. Bossuet, 1831-4, Lebel and Lelièvre, 1820-30, Gosselin, 1851, and *Correspondances*, 1827. See J. B. Bossuet, *Histoire de Fénelon*, 1850; E. De Broglie, *Fénelon à Cambrai*, 1884; M. Maasson, *Fénelon and Madame Guyon*, 1907; H. Bremond, *Apologie pour Fénelon*, 1910; A. Déplangué, *La Pensée de Fénelon*, 1930; E. Carcassonne, *État présent des travaux sur Fénelon*, 1939.

Feng Meng-lung, see CHINESE LITERATURE.

Fenham, see NEWCASTLE UPON TYNE.

Fênho, largest riv. in Shanai, China. It flows in a SSW. direction, and is a trib. of the Yellow R. The lower course of the riv. is the only part navigable, and this only part of the year, as in winter it is frozen over.

Fenians, or **Fenian Society**, name of a 19th-cent. Irish-Amer. movement for the overthrow of Brit. rule in Ireland and the estab. of a rep. The name was derived from the anct *fann* or *féinne* (see FIANS), a legendary band of warriors in the heroic age of Ireland. The modern movement originated in America, where the Irish pop. had been greatly increased by emigrants after the famine of 1846-7, and it was there that the first Fenian organisation was founded by John O'Mahony in 1858. The F. were particularly active in the U. States, but the movement soon had many ramifications, and agents were sent to Ireland and to the centres of Irish pop. in England. The result in Ireland was the 'Phoenix Conspiracy,' which was put down with little difficulty by the gov. James Stephens, one of the 'rebels of 1848,' and other prominent leaders were arrested, and *The Irish People*, ed. by Jeremiah O'Donovan (O'Donovan Rossa), a prominent member of the Phoenix National and Literary Society, was suppressed. Many prisoners were convicted of treason and sentenced to penal servitude. Stephens escaped from prison, and renewed the agitation in America. A raid into Canada occurred in 1866, but it proved a complete failure. The collapse of the movement dates from 1867, when an attempt at insurrection in Ireland proved utterly abortive. The Catholic priesthood never countenanced the movement, and the peasantry were lukewarm. Sev. outrages took place in England. A raid was made on the castle and military stores at Chester, but the raiders were betrayed. In the same year (1867) a police van, containing suspected F., was attacked at Manchester, and an attempt was made to blow up the wall of Clerkenwell Prison in London. The energetic measures of the gov. and the subsequent Irish reforms, inaugurated by Gladstone, restored tranquillity in Ireland. Fenianism, however, continued to smoulder, particularly in the U.S.A., where another raid on Canada was frustrated by the U.S.A. Gov. The Clan-na-Gael and United Irish Brotherhood were then the 2 great F. S. and at the instigation of Michael Davitt (q.v.) they made the new departure which resulted in the Land

League (q.v.) and the National League. The Phoenix Park assassination (1882) was connected with the extreme party (see CAVENDISH, LORD F. C.). See SINN FEIN.

See J. Rutherford, *Secret History of the Fenian Conspiracy*, 1877; Justin McCarthy, *History of our own Times*, 1880; J. O'Leary, *Recollections of Fenians and Fenianism*, 1896; and W. O'Connor Morris, *Ireland from 1798 to 1898*, 1898.

See also HOME RULE; IRELAND, REPUBLIC OF.

Fenn, **George Manville** (1831-1909), novelist, b. Pimlico. Educ. at Battersea Training College, he was for a time a schoolmaster in Lincs. He wrote more than 170 books, the most successful being his adventure stories for boys; among the best known of these are *In Honour's Cause*, 1896, *Fire Bay'nets*, 1899, *Dick o' the Fens*, 1905, and *Shoulder Arms!*, 1905.

Fennec, Moorish name for *Vulpes zerda*, a species of fox native to N. Africa and ranging over the whole of the Sahara Desert. It has a coat of a pale fawn colour, which harmonises with its surroundings, black markings on the tip of the tail, and white round the eyes and on the forehead. The ears are huge compared with the size of the head, and give the animal a grotesque appearance. The body and head measure 15½ in. in length, and the tail 6½ in. The F. is a burrowing animal, and lines its habitation with feathers, hair, and other soft materials.

Fennel, usually perennial herbs of the Umbelliferae. *Foeniculum vulgare* grows in most temperate countries; its leaves are used for fish sauces, garnishings, and salads; and in Italy for soups or eating raw; seeds are used for flavouring, and for an infusion as a carminative; and an oil is distilled from them. *F. v.* variety *dulce*, the Florence F. or Fennocchio, is a cultivated, dwarfed form; and *F. v.* variety *piperithum* is the Carosella of S. Italy; both grown for salads and cooking, with a flavour like celery, but sweeter and more aromatic.

Fennell, **John Greville** (1807-85), artist and angler, b. at sea between England and Ireland. He studied art, then took to literature, joined the staff of the *Field* and wrote on fishing subjects for it and the *Fishing Gazette*. In 1870 he pub. *The Book of the Roach*, and he also contributed a paper on 'Curiosities of Angling Literature' to C. Pennell's *Fishing Gossip*. F. was a friend of Dickens and Thackeray.

Fenny Stratford, former mkt tn of Buckinghamshire, England, now incorporated in Bletchley (q.v.). St Martin's Day, 11 Nov., is celebrated by a service in the church of St Martin, built in 1730 on the site of an older one, and the firing of small cannon called the 'Fenny Poppers.'

Fens, low-lying dist. in the E. of England, situated W. and S. of the Wash, covering parts of the cos. of Lincs, Hunts, Cambs, Suffolk, and Norfolk. The region is about 70 m. from N. to S. and roughly

35 m. from E. to W.; it represents a bay of the North Sea (now silted up) of which the Wash (q.v.) is the last remnant. The prin. rivs. are the Great Ouse, Witham, Welland, and Nene, and many small watercourses intersect the area. Before the present system of drainage was developed, the whole dist. was waterlogged and consisted of marshy swamps, wide pools, and lagoons. The Romans made the first attempt to drain the F.; they dug the Caer or Car Dykes from Lincoln to Ramsey and constructed earthen embankments along the Welland and the seashore, some m. of which can still be seen. An unsuccessful attempt was made in the reign of Wm the Conqueror to drain Deeping Fen. After this the dist. was abandoned, although the forest portions were later preserved for the Plantagenet kings to hunt over. The isolated areas of higher ground above the surrounding levels were occupied by cells and monastic estates, as early as the 7th cent. The religious houses at Peterborough, Ely, Crowland, Ramsey, Thorney, and elsewhere disseminated a knowledge of cultivation and a certain amount of drainage was done in their immediate neighbourhood up to the dissolution of the monasteries. In the reign of Charles I another attempt was made to drain Deeping and Holland F. on Dutch methods by Cornelius Vermuyden (q.v.), and the initial efforts were made on the great scheme for the Nene and Ouse F., known as the Bedford Level (q.v.). The drainage of the other F. continued through the 18th and 19th cents. Frequent flooding has been caused in the F. by the coincidence of high spring tides and rivs. swollen with water drained off the land. The system of sluices (closed at high tide) keeps the sea water from entering the rivs. but likewise prevents the riv. water from escaping to the sea. Consequent piling up of fresh water may strain the banks and flooding follows.

The Great Ouse Riv. Board commenced a large-scale flood protection scheme in 1954 to prevent future flooding of the F. This scheme provides for the construction of a new intercepting channel round the edge of the F. from Barton Mills in Suffolk to Denver in Norfolk, for the widening and deepening of the existing riv. from Denver to the mouth of the Cam, and for a relief channel to carry the flood water direct to an outfall at King's Lynn. The scheme is expected to cost over £8 million.

The only part of the original wild, undrained Fenland is Wicken Fen, SE. of Ely, now vested in the National Trust as a unique natural preserve of wild plant and animal life. The soil of the F. is extraordinarily fertile and indeed forms some of the most productive agric. land in England; the area is noted for its bulb fields (especially around Spalding, q.v.) and for the growing of vegetables. There was opposition to the various drainage schemes, and the draining of enclosures always brought trouble with the Fenmen who were tenacious of their assets. In

earlier times life in the F. was primitive, being spent largely in fowling and fishing; both wild fowl and fish are still found in abundance in the rivs. and marshes. Wood is still grown in a few of the F. pars., a feature of the landscape are the little windmills, now mostly disused, dotted about the lonely flats. The region is associated with Boadicea, Hereward the Wake, and Cromwell, who was a native of the F. See H. C. Darby, *Draining The Fens*, 1940, *Medieval Fenland*, 1940, and *Domesday Geography of Eastern England*, 1952; A. Bloom, *The Fens*, 1953; and L. E. Harris, *Vermuyden and the Fens*, 1953.

Fenton, Elijah (1683-1730), poet, b. Shelton, near Newcastle under Lyme, Staffordshire. Educ. at Cambridge, he became private secretary to the earl of Orrery, with whom he went to Flanders, but later he came back to England and was appointed headmaster of the grammar school at Sevenoaks. He resigned in 1710, and became tutor to Lord Broghill, the son of his former employer. He worked with Pope at the trans. of the *Odyssey*, the 1st, 4th, 19th, and 20th books being trans. by him. He also ed. Milton and Waller, 1725 and 1729, and wrote a tragedy entitled *Mariamne*, 1723, and many poems. See W. W. Lloyd, *Elijah Fenton, his Poetry and Friends*, 1894.

Fenton, Sir Geoffrey (c. 1539-1608), Eng. translator, brother of Edward F., the navigator. While in Paris in 1567 he wrote *Certain Tragical Discourses written out of French and Latin*, consisting mainly of stories from Bandello, it has been styled 'a capital miscellany.' He also wrote *Monophylo, a Philosophical Discourse and Division of Love*, 1572, but his monumental work, pub. in 1579 and dedicated to Queen Elizabeth I, was his *History of the Wars of Italy*, trans. from Fr. versions of Guicciardini's *Storia d'Italia*. From 1580 till his death he was secretary to the lord deputy of Ireland.

Fenton, tn of Staffordshire, England, prior to 1910 an urb. dist., and since that date federated with the other pottery tns into the city and co. bor. of Stoke-on-Trent. Most of the people are employed in the manuf. of earthenware and china, other industries being coal-mining and engineering. Pop. 22,314 (1954).

Fenwick, Ethel Gordon (1857-1947), Brit. nurse, daughter of David Davidson Manson, of Spynie House, Morayshire. Educ. privately at Middlethorp Hall, York. She became a nurse in the Children's Hospital, Nottingham, in 1878, and was matron of St Bartholomew's, 1881-7. She married Dr Bedford F., gynaecologist, in 1887. From 1893, hon. editor of *Journal of Nursing*. Founder and first member of Brit. Nurses' Association. In her time, as the result of representations made by herself and the Royal College of Nursing, Parliament passed the Nurses' Registration Act, 1919. Founder and hon. president of the International Council of Nurses, 1900.

Fenwick, Sir John (1845-97), conspirator. He entered the army and became

a major-gen. in 1688. He was a strong supporter of James II. He was arrested in 1696 for a plot to assassinate William III, and was beheaded.

Feodor, see **FEDOR**.

Feodosiya (anct. Theodosia), then until 1804 **Kaffa**, Black Sea port in SE. Crimea. It has food industries. There are the remains of medieval walls, and an archaeological museum dating from 1811. Founded by the Greeks in the 6th cent. BC, it was a flourishing centre of the Genoese colonies on the Black Sea, 1260-1475, then Turkish. It became Russian in 1774. It was the scene of much fighting in 1941-2. Pop. (1956) 43,000, mostly Russians.

Feoffment, in feudal times, the usual way of conveying a freehold estate in England, and for a long period the only way. This method of conveying required to be accompanied by *livery of seisin*, either *in deed* or *in law*. In the case of *livery in deed* the feoffor handed a twig or clod of turf to the feoffee on the land to be conveyed; in *livery in law* the feoffor formally gave possession to the feoffee in sight of the land. A F. was usually evidenced by charter or deed, but writing was not necessary before the Statute of Frauds. The Real Property Act of 1845 rendered F. superfluous.

Ferae Naturae, term given in Rom. law to wild animals and birds, including game, such as rabbits and pheasants. In Eng. law, as was the case in Rom., they become the property of the first person who takes possession of them, subject, of course, to the game laws. A person keeping wild animals is responsible for any damage they may do.

Ferber, Edna (1887-), Amer. novelist, b. Kalamazoo, Michigan. Though she lived latterly in New York, her outlook is mid-W. After writing *Damn O'Hara*, 1911, and *The Girls*, 1921, she became a best-seller with *So Big*, 1925, which won the Pulitzer Prize. *Show Boat*, 1926, which was made into a musical play and a film, was followed by *Cimarron*, 1929, *Come and Get It*, 1935, *Saratoga Trunk*, 1941, and *Giant*, 1952. She also collaborated with George S. Kaufman in a number of plays, including *Dinner at Eight*, 1932, *Stage Door*, 1938, *The Land is Bright*, 1941. *A Peculiar Treasure*, 1939, is autobiographical.

Ferdausi, or **Ferdusi**, see **FIRDAVSI**.

Ferdinand I (c. 1000-65), king of Castile and Leon, second son of Sancho the Great of Navarre. He acquired possession of Castile in 1028, and was recognised as its first king in 1037. In the same year he claimed Leon by right of his wife, who was a sister of Bermudo III of Leon, and enforced his claim with the sword. He drove back the Moors, extended his frontiers from the Duero to the Mondego, and took the title of emperor of Spain in 1056. He left a reputation for piety.

Ferdinand II (1136-88), king of Leon, younger son of Alfonso of Castile and Leon, succeeded in 1157. He was constantly at war with the Moors, Castile, and Portugal. His repudiation of his

wife led to war with his father-in-law, Alfonso I of Portugal, whom he defeated and captured at Badajoz. The military order of Alcantara was founded by the pope during his reign.

Ferdinand III, Saint (c. 1200-52), king of Castile and Leon, son of Alfonso IX of Leon and Borengaria of Castile; became king of Castile in 1217, and succeeded his father as king of Leon in 1230. Thenceforward the kingdoms were never separated. F. fought with success against the Moors, capturing Ubeda (1234), Cordova (1236), Jaen (1246), and Seville (1248). He subdued Granada and made Seville his cap. He was responsible for the collection and codification of the *Las*, and Gothic laws known as the *Forum Judicum*. He was canonised in 1671 by Clement X.

Ferdinand I (c. 1373-1416), king of Aragon, surnamed 'The Just,' was the son of John I of Castile, but was elected king of Aragon in 1410. He proved a strong ruler, and carried on the war against the Moors. Though at first a supporter of the anti-pope, Benedict XIII, an Aragonese, he afterwards agreed to his deposition in order to end the Great Schism.

Ferdinand V (1452-1516), king of Spain (Ferdinand II of Aragon, and V of Castile), son of John II of Aragon and Sicily, b. Sos in Aragon. At 16 he married (1469) Isabella of Castile (q.v.), and on the death of her brother, Henry IV, in 1474, F. and Isabella were proclaimed joint sovereigns, though Isabella did not allow her husband much share in the gov. F. succeeded to Aragon in 1479 on the death of his father, and the union of these 2 kingdoms marked the beginnings of Sp. ascendancy in Europe. The power of the nobles was broken, and vigorous reforms were carried out, the king and queen being ably seconded in all their undertakings by Cardinal Ximenes. In 1492, Granada, the last kingdom of the Moors in Spain, was finally conquered after 10 years of strenuous conflict. In that year also Columbus, supported by the queen, set out on his great voyage of discovery, which made F. and Isabella sovereigns of a new world. A blacker episode of the period was the spoliation and expulsion of the Jews in 1492-2. The Moors, too, were treacherously treated, a promise of toleration by the 'Catholic kings' being violated. The Court of Inquisition had already been instituted at Seville (1480). In 1500 F. took part in the conquest of Naples, and, outwitting his allies, made himself master of it in 1503. By arranging politic marriages for his children, he gained for himself allies on all sides of France, and in 1512 he seized a favourable opportunity to add the S. part of the coveted kingdom of Navarre to his dominions, which thus stretched from the Pyrenees to Gibraltar. Isabella had d. in 1504 (though F. maintained his power in Castile until his death, acting as regent there, except for a brief interval) and F. married Germaine de Foix. He d. at Madrigalejo, and was succeeded by his grandson, the emperor Charles V, who was

already master of Burgundy, Flanders, Holland, and part of Italy. F. was a shrewd and clever diplomatist, though deceitful and despotic. The enthusiasm which governed Spain's religious policy during this period, and the vision which encouraged the foundation of a Sp. empire in America, were supplied by his wife, Isabella.

Ferdinand VI (1713-59), king of Spain, *b.* Madrid, the second son of Philip V, whom he succeeded in 1746. He helped to end the war of the Austrian Succession, and pursued a steady policy of neutrality in the Seven Years War, in spite of overtures from England and France. He did much to revive literature and the arts in Spain, and also attempted internal reforms. The death of his wife in 1758 resulted in his falling into a deep melancholia, from which he never recovered.

Ferdinand VII (1784-1833), king of Spain, eldest son of Charles IV. In 1808 Charles abdicated and F. became king. F. was almost immediately forced by Napoleon to abdicate in turn, and was enticed across the frontier and kept prisoner at Valençay. After the Peninsular war he was reinstated (1814), and promised to maintain the democratic constitution adopted by the gov. of National Defence at Cadiz in 1812. He twice broke a promise of this character, but by receiving Fr. support was able to maintain despotic gov. He was succeeded by his daughter, Isabella II, for whose sake he had repealed the Salic law, an act which subsequently led to the Carlist wars.

Ferdinand I, Holy Rom. emperor (1503-1564), *b.* Alcalá, Spain, younger son of Philip I and brother of Charles V. He married a sister of Louis, the king of Bohemia and Hungary, and he claimed the 2 kingdoms on the death of Louis, in battle, in 1526. His claim to Hungary was contested by John Zapolya, supported by the Turks, but, after buying off the Turks, F. gained the day. He succeeded Charles V as emperor in 1556. F. tried to conciliate Rom. Catholics and Protestants, and his reign was marked by generally wise and enlightened gov.

Ferdinand II (1578-1637), Holy Rom. emperor, *b.* Graz, a nephew of Maximilian II. His early training and his education by the Jesuits imbued him with a deep hatred against Protestantism, and he began early to try to put down Protestantism by force, first in his own duchy of Styria, and then in Bohemia (of which he was crowned king, 1617). When the Bohemians saw that F. intended to deprive them of the privileges they had gained under Rudolf, they declared that he had forfeited the throne and elected Frederick the Elector Palatine in his stead. This led to the outbreak of the Thirty Years War (q.v.) which had already begun when F. succeeded Matthias as emperor in 1619. F., supported by the Catholic League, was at first successful and gained a firm hold of the Bohemian throne. His gen., Tilly, defeated Christian IV of Denmark and the Protestant confederacy in 1626, but 2 years later,

after Wallenstein was checked before Stralsund, the Catholic cause began to decline. The success of the Protestant champion, Gustavus Adolphus, and the assassination of Wallenstein, at which F. connived, combined with other causes to bring his fortunes to a very low ebb at the time of his death in 1637.

Ferdinand III (1608-57), Holy Rom. emperor, *b.* Graz, the son of Ferdinand II. He took part in the Thirty Years War before his accession in 1637, and, though more inclined towards peace than his father, was compelled to continue the war for the first 11 years of his reign. A series of disasters in the summer of 1648 forced him to make peace, and the peace of Westphalia was concluded in Oct. of that year. In the Diet of 1653-4, the last over which an emperor presided in person, important changes were made in the administration of justice.

Ferdinand I (1751-1825), king of the Two Sicilies, *b.* Naples, the son of Charles III of Spain. He succeeded his father on the Neapolitan throne in 1759, ruling over Naples, 1759-1806 and 1815-1825, and over Sicily, 1759-1825. He consolidated his dominions as the Two Sicilies in 1816. From 1806 to 1815 Naples was under the domination of Napoleon. F. was a weak ruler, and the gov. was really controlled by his wife, Marie Caroline of Austria. His gov. was tyrannical and capricious, and although F. frequently promised reforms, at the request of the great powers, he always broke his word.

Ferdinand II, king of the Two Sicilies (1810-59), grandson of the preceding, *b.* Palermo. His reign opened in 1830 with promises of constitutional reforms, but they were unfulfilled, and his despotic and corrupt rule culminated in insurrection in Sicily (1848). His ferocious bombardment of the chief cities in 1849, which crushed the rising, earned for him the nickname of 'Bomba.' His vicious treatment of political suspects was the subject of 2 notable letters of Gladstone in 1851.

Ferdinand III (1769-1824), grand duke of Tuscany (1790-9 and 1814-24), younger son of the Emperor Leopold II, *b.* and *d.* Florence. He succeeded his father as grand duke, and continued his father's reforming policy. He was the first sovereign to acknowledge the Fr. rep., but nevertheless became involved in a quarrel with France, and Florence was occupied by the Fr. in Mar. 1799. He was restored later in the year, but in 1801, by the treaty of Lunéville, Tuscany was formed into the kingdom of Etruria. F. was finally restored in 1814 by the congress of Vienna, when his liberal rule contrasted with that of the majority of other restored monarchs. In the meantime he had been successively elector of Salzburg and grand duke of Würzburg.

Ferdinand I (1861-1948), 1st tsar of Bulgaria, *b.* Vienna, the youngest son of Prince Augustus of Saxe-Coburg and Princess Clementine of Bourbon-Orléans. He married: (1) 1893, Princess Marie Louise, daughter of the duke of Parma,

who d. in 1899; and (2) 1908, Princess Eleonore of Renss, who d. in 1916. On the deposition of Prince Alexander of Bulgaria, F. accepted the offer of the succession. He was elected by the Bulgarian Parliament, 1887, but his sovereignty was not recognised by Turkey until 1896. A nimble, cunning distinguished his reign, and with much astuteness he played the politicians and the military against each other. By 1896 his position, both nationally and internationally, had been rendered secure. In 1908 he declared the complete independence of Bulgaria and assumed the title of tsar, soon securing recognition from all the major Powers. F. set himself very successfully to the task of building up and consolidating his kingdom, and the fruits were seen on the outbreak of the Balkan war in 1912; the result of which was to enlarge the ter. of Bulgaria enormously. But his former allies, Greece and Serbia, dissatisfied with this result, turned against him, and, with the assistance of Rumania, in a war that began at the end of June 1913, greatly reduced Bulgaria's share of the conquests. This left F. bitter and revengeful against the other Balkan states. He remained neutral in the First World War until Oct. 1915, when he entered it on the side of the Central Powers. He was victorious in Macedonia, Thrace, and Rumania; but his army was defeated by Allied troops at Dobropele, Sept. 1918, and an armistice was signed. On 4 Oct. he abdicated in favour of his son Boris (q.v.), and retired to Coburg, where he d. 30 years later.

Ferdinand of Rumania (1865-1927), b. Sigmaringen, 2nd son of Prince Leopold of Hohenzollern-Sigmaringen, who was brother to Charles, 1st king of Rumania. Charles had no son and F. was adopted his heir in Mar. 1889. On 10 Jan. 1893 he married Marie, eldest daughter of the duke of Edinburgh. Troops of the central powers overran Rumania on the outbreak of war in 1914; F. and his family retired to Jassy. He succeeded to the throne on 11 Oct. 1914, and immediately sided with the Liberal gov. against the Central Powers. He was obliged to sign an armistice, 7 Dec. 1917, but refused to sign the treaty of Bucharest, 7 May 1918, and denied its validity. In Nov. F. proclaimed expulsion of enemy troops; he re-entered Bucharest, 1 Dec. In Aug. 1919 he sent into Hungary an expedition which led to the downfall of Bela Kun. F. and Marie were crowned king and queen of Greater Rumania, 15 Oct. 1922, at Alba Iulia. Under F. universal suffrage was introduced and large estates were expropriated (F. was himself the first to hand over his own estate to the peasants). In 1925 he caused his son Carol (q.v.) to be disinherited in favour of Carol's son Michael; and his last political act was to instal Carol's opponents in power. F. d. at Sinaia, 20 July, 1927.

Ferentino, It. tn. in Lazio (q.v.), 6 m. NW. of Frosinone (q.v.). It has a cathedral, and has remains of vast, ant. limestone walls. The tn. was much

damaged in the Second World War. There is a trade in agric. produce, wine, and oil. Pop. (tn) 7900; (com.) 16,000.

Fergana, or Ferghanah: 1. The name of an area which at the coming of the Russians in the middle of the 19th cent. formed the independent Khanate of Kokand. It was later annexed by the Russian Gov. and became part of the prov. of Turkestan. In the realignment of national ters. carried out by the Soviet Gov., F., or the F. valley as it is usually called, was divided among the reps. of Uzbekistan, Tajikistan, and Kirgizia. Nearly the whole of F. belongs to the fertile basin of the Syr-Darya, the outlying parts being mountainous. To the E. are the Tien Shan ranges; to the N. are the Ala-tau Mts, while the Trans-Ala-tau chain encloses the plain on the S. with the Tien Shan. The richest and most densely populated part of this whole region of Middle Asia is the F. valley. Sheltered from cold winds by some of the highest mts in the world, which practically encircle it, it consists of a flat valley floor covered by a thick network of irrigation channels, with poplars and willows growing along their banks. Cotton and sugar beet are the chief crops. The lower hillsides of the valley are treeless, with occasional patches of pistachio, almond trees, iron wood, and maple. The new F. canal is 170 m. long and provides water for over 12,000 ac. of grain as well as for potatoes, cucumbers, and tomatoes in the Uzbek, Tajik, and Kirgiz Reps. Minerals such as iron, coal, etc., are plentiful, and rice, maize, grapes, and melons are produced. But by far the most important crop is cotton, the F. valley being the main cotton-producing area in the U.S.S.R.

2. An oblast (prov.) of the Uzbek S.S.R. of the Soviet Union, consisting of the SW. portion of the F. valley. Pop. 720,000.

3. Tn and cap. of F. oblast, formerly called Novyy Margelan and Skobelev. It is an important cotton and silk centre and has a large power plant. Pop. 60,000.

Ferguson, Adam (1723-1816), philosopher, b. Logierait, Perthshire, was for a time chaplain to the Black Watch, and is said to have fought at Fontenoy. He succeeded Hume as keeper of the Advocates' Library, Edinburgh, in 1757; became prof. of natural philosophy in 1759, and of moral philosophy in 1764, at Edinburgh Univ., and afterwards travelled extensively. It was at his house that Scott, when a boy, had his memorable meeting with Burns. Chief works: *Essay on Civil Society*, 1767, *Institutes of Moral Philosophy*, 1769, and *History of the Progress and Termination of the Roman Republic*, 1783.

Ferguson, Robert (c. 1637-1714), pamphleteer and conspirator, known as 'The Plotter,' b. in Aberdeenshire. He spent most of his life in political intrigues. He became vicar of Godmersham, Kent, but was ousted in 1662 by the Act of Uniformity. He took a leading part in the conspiracies against Charles II and James II, accompanied Monmouth's futile

invasion, and supported the cause of William of Orange. Chagrined at the scant recognition he received from Wm, he finally transferred his services to the Jacobites.

Ferguson, Sir Samuel (1810-86), poet and antiquary, *b.* Belfast, was educ. at Trinity College, Dublin, and was called to the Bar in 1838. He gave up his legal practice in 1867, when he was appointed deputy-keeper of the Irish Records. He was conspicuously successful in that capacity, and was knighted for his services in 1878. His antiquarian works include the *Ogham Inscriptions in Ireland, Wales and Scotland*, pub. in 1887, and various papers contained in the *Transactions of the Royal Irish Academy*, 1834-84, of which he was a notable president. Much of his leisure was devoted to poetry, and the charm of his lyrics and ballads anticipates the modern Celtic Revival. *The Forging of the Anchor* is generally regarded as his masterpiece. His other pubs. in verse include *Lays of the Western Gael*, 1865, and *Congal*, an epic poem, 1872.

Fergusson, James (1808-86), 'the historian of architecture,' *b.* Ayr. His studies in Bengal resulted in the pub. of *Rock Temples of India*, 1843, *Ancient Buddhist Architecture of India*, 1848, and *Fire and Serpent Worship*, 1869. He also studied the archaeological remains of Palestine and surrounding countries. His monumental work is *A History of Architecture in all Countries from the Earliest Times to the Present Day*, 1865-7.

Fergusson, Robert (1750-74), poet, *b.* Edinburgh, his father being a clerk in the Brit. Linen Company. He obtained a good education at Dundee Grammar School and St Andrews Univ., but, declining to enter the Church or to study medicine, he spent his few brief years as a copying-clerk in the commissary clerk's office, Edinburgh. He contributed humorous descriptive poems to *Ruddiman's Weekly Magazine*, and the reputation of these drew him into a convivial society in which he ruined his health. A meeting with John Brown of Haddington influenced him for the better, but an injury to his head turned religious melancholy into insanity, and he *d.* in the city asylum. Robert Burns was greatly influenced by his poems, which were first pub. in 1773. Realist and humorist, in 'The Daft Days,' 'Hallow Fair,' and 'Leith Races,' F. depicts with vividness and gusto the rough hearty life of his native city, so that he has been termed 'the laureate of Auld Reekie.' See life by A. B. Grosart, 1898.

Fergusson, Sir William (1808-77), surgeon, *b.* Prestonpans, Scotland. Prof. of surgery at King's College, London, 1840-70. He was elected president of the Royal College of Surgeons in 1870, and was surgeon to Queen Victoria. *A System of Practical Surgery*, 1842, was his most important work. He was elected a Fellow of the Royal Society in 1843; created baronet 1866. See H. Smith, *Biographical Sketch*, 1894.

Ferise, holy days, or sacred festivals, in

ancient Rome. They were the *dies nefasti*, in contradistinction to the *dies fasti*, and correspond in some respects to the modern Sunday. Political and legal business was suspended, and slaves were given a respite from labour. There were 45 F. during the year, in addition to such festivals as the *feriae Latinae*, the dates of which were fixed annually, and special festivals at times of danger or victory. In addition to the *feriae publicae*, or public festivals, there were *feriae privatae*, observed by many single families in celebration of some particular event in their hist.

Feridoun, see FARIDUN.

Feringhi, or **Feringhee**, name for Europeans, common in the E., and dating from the Crusades, the word being a corruption of Frank. In India it is specially applied to the native-born Portuguese of Bengal. It has come to have a contemptuous implication, and was so used in the Indian Mutiny.

Ferishta, Mohammed Kasim (c. 1550-1612), Persian historian, *b.* Astrabad. As a young man he went to India and became captain in the bodyguard of the prince of Ahmednagar. In 1589 he removed to Bijapur, and was commissioned by Ibrahim Adil Shah (1585-1628) to write a hist. of the Muslim dynasties of India. He is one of the most trustworthy of Oriental historians, and his work still maintains a high place as an authority. It was trans. by J. Briggs under the title of *The History of the Rise of the Mohammedan Power in India*, 1829.

Ferlach, Austrian tn in the prov. of Carinthia, 7 m. S. of Klagenfurt. It is famous for its manuf. of sporting rifles, an industry started in 1553 by Belgian settlers. The craftsmen are organised in a kind of guild. Pop. 5200.

Fermanagh, co. of N. Ireland. The surface is hilly, the highest points being Cuilcagh (2188 ft) and Belmore, and the limestone hills of W. F. contain many remarkable cave systems, notably the Marble Arch and Noon's Hole. Lough Erne, with the R. Erne joining its lower and upper parts, bisects the co. throughout its entire length. The salmon fisheries of the Erne are important, and pike and trout are also caught in most of the loughs. There is an abundance of sandstone and limestone, and iron also occurs. Manufs. are few, the chief being pottery, tweeds, blankets, rugs, and cotton thread, for the people are chiefly engaged in agriculture. The only tn of importance is Enniskillen. F. is in the 2 dioceses of Clogher and Kilmore. By the Gov. of Ireland Act, 1920, F. returns 3 members to the N. Ireland Parliament. For administrative purposes F. is divided into the urb. dist. of Enniskillen and the rural dists. of Enniskillen, Irvinestown, and Lisnaskea; Belleek and Clones were merged in the foregoing rural dists. in 1921. Area 715 sq. m.; pop. 53,000.

Fermat, Pierre de (1601-65), Fr. mathematician, *b.* Beaumont-de-Lomagne, near Montauban. He made many discoveries in the properties of numbers, probabilities,

and geometry, and is said to have been the first to hit upon the principle of the differential calculus. He also collaborated with his friend Pascal in some of his mathematical researches. F.'s principle postulates that a light-ray traversing different media follows the path of least deviation. His writings, pub. after his death by his nephew, include: *Arithmetic of Diophantus; Method for the Quadrature of Parabolas*; treatises, *Maxima and Minima, on Tangents, and on Centres of Gravity; Geometric Loci, or Spherical Tangencies, and Rectification of Curves*. His collected works were pub. at Toulouse in 2 vols., 1670-9, and were re-ed. by Tannery and Henry, 1891-4. See A. Gentry, *L'Influence de Fermat sur son siècle*, 1784, and P. Bachmann, *Das Fermatsche Problem in seiner bisherigen Entwicklung*, 1919.

Fermentation, process by which a change is effected in the chemical constitution of many organic substances. It is well known that liquids formed from the juice of fruits gradually alter in character with the evolution of bubbles of gas, that milk cannot be preserved from becoming sour without special treatment, and that all dead organic matter putrefies or changes its chemical composition in course of time. These changes are brought about by the activity of various minute organisms, which contain substances known as enzymes (q.v.). The enzymes are the actual agents of the F. processes. In many cases they can be extracted from the organisms and work just as effectively, showing that the presence of a living cell or cells is not essential to F. Enzymes induce chemical changes in somewhat the same manner as catalysts hasten certain inorganic reactions. F. normally occurring in the presence of living organisms takes place when the temp. is suitable for their multiplication, where there is abundance of moisture and suitable food, and where there are no substances with a poisonous action on the organism. Perhaps the most important of fermentative processes is that by which the alcoholic liquors of commerce are prepared. (See ALCOHOL; BEER; BREWING; WHISKY; WINE.) This process is due to a member of the fungus group, yeast, which consists of rounded cells about 0.01 mm. in diameter, usually grouped in chain-like clusters. When introduced into solutions of sugars containing other organic substances which the yeast uses as food, the cells bud and multiply. The temp. must be maintained between 5° and 30° otherwise the cells are unable to multiply, and may eventually be killed. The yeast cells contain enzymes which produce characteristic chemical changes, and the action of each enzyme appears to be restricted to a few media. The chief enzymes present in yeast are *zymase*, which causes the breaking-up of glucose (grape-sugar) and fructose (fruit-sugar); *invertase*, which converts cane-sugar into invert-sugar, a mixture of glucose and fructose; and *maltase*, which converts maltose into glucose. In the manu. of beer (q.v.), the

action is begun by another enzyme, *diastase*, which is formed in the grains of barley during malting. The diastase converts the starch in the malt into dextrin and maltose. After the introduction of yeast into the wort, the maltose is converted into glucose by the enzyme maltase, and the enzyme *zymase* proceeds to set up alcoholic F. The effect of this F. is to break up the sugar into alcohol and carbon dioxide, thus: $C_6H_{12}O_6$ (glucose) = $2C_2H_5O$ (alcohol) + $2CO_2$. It is uncertain whether the chemical action accomplished is due *entirely* to the enzymes. The living cells produce a far greater effect than do the enzyme-containing juices obtained by breaking up and pressing the cells, indicating that a 'vital action' operates during F. But possibly harmful enzymes are isolated inside the cells.

Acetic fermentation is brought about by a living ferment, *Mycoderma aceti*, which finds its way into weak alcoholic solutions from the air, and, living upon the nitrogenous matter in the solution, causes the alcohol to combine with the oxygen of the air, thus: $C_2H_5O + O_2 = C_2H_3O_2$ (acetic acid) + H_2O . The formation of acetic acid in this way accounts for the souring of beer and light wines when exposed to the air, and is the basis of the manu. of vinegar.

Lactic fermentation is caused by a living organism, the lactic ferment, which has the power of causing milk-sugar or lactose to combine with water to form lactic acid, thus: $C_{12}H_{22}O_{11}$ (lactose) + $H_2O = 4C_3H_5O_3$ (lactic acid). This acid accounts for the sour taste of milk which has been exposed to the air.

Butyric fermentation is caused by a living organism, the butyric ferment, which is present in decomposing cheese. It often accompanies the lactic ferment, in which case the lactic acid is broken up with the production of the foul-smelling butyric acid, thus: $2C_3H_5O_3$ (lactic acid) = $C_4H_7O_2$ (butyric acid) + $2CO_2$ + $2H_2$.

Glycerin by fermentation. If normal sodium sulphite is added to a sugar solution which is then fermented, the main products are acetaldehyde (q.v.) and glycerin (q.v.), with little alcohol. Glycerin was manufactured in Germany during the First World War on this principle.

Fermentation in digestion.—The higher animals are also capable of producing enzymes. Thus the cells of the salivary glands produce *ptyalin*, which converts starch into sugar, and the gastric tubules produce *pepsin*, which transforms proteins into peptones. See DIGESTION.

Fermi, Enrico (1901-55), physicist, b. Rome. Studied at Pisa and at Göttingen and became prof. in Rome (1927). Awarded the Nobel Prize in 1938 for experiments on artificial radioactivity caused by neutron bombardment. Prof. at Columbia (1939), and took a leading part in the atomic bomb project in the U.S.A. Prof. at Chicago Institute of Nuclear Studies, 1945. He made many contributions to the theory of nuclear

and extranuclear processes, including beta-emission and hyperfine structure of spectral lines, and also to statistical mechanics.

Fermo (anc. **Ferrum Picenum**). It. tn. in the Marche (q.v.), 23 m. NE. of Ascoli Piceno (q.v.). It was founded as a Lat. colony in 284 BC after the conquest of the Picentes (see **PICENUM**). It has an archiepiscopal cathedral (partly 13th cent.), and an agric. college. There are bronze-founding and cotton-milling industries. Pop. (tn) 22,900; (com.) 27,700.

Fermoy, mkt tn in co. Cork, Rep. of Ireland, about 20 m. from Cork, on the R. Blackwater. The extensive military barracks on the N. bank of the riv. were destroyed in 1921; the grounds and remaining buildings have now been taken over for industry. Prominent buildings are the Rom. Catholic church and college (St Colman's). F. is the centre for salmon and trout fishing on the Blackwater, and has large flour mills at Clondulane (3 m.). Pop. 4212.

Ferrum Picenum, see **FERMO**.

Fernández, John, Portuguese navigator, reputed to be the first European to visit the interior of Africa. In 1446 he went with an expedition under Antonio Gonzalo to Africa, where, being anxious to glean information for his patron, Prince Henry, he remained in the country for 7 months after the departure of his companions. His account of his travels among the desert tribes and in W. Africa bears a remarkable resemblance to that of Mungo Park. The dates of his birth and death are not known.

Fernández, Juan, Sp. navigator, who in 1572, while sailing from Peru to Chile, came upon a small group of is. in the Pacific which now bear his name. In 1574 he left Chile, sailing in a south-westerly direction, and came upon an is. which so greatly attracted him and his companions that he formed the intention (apparently never carried out) of revisiting it with a larger expedition. It has been conjectured that this is. was New Zealand.

Fernández de Avellanada, Alonso, Sp. novelist, pseudonym of a writer who anticipated Cervantes in publishing *Segundo tomo del ingenioso hidalgo don Quijote de la Mancha* in 1614, as a sequel to *Don Quijote*. His real name is unknown. It is a work of some merit, but cannot compare with Cervantes's masterpiece. See E. Cotarelo y Mori, *Sobre el Quijote de Avellanada*, 1934.

Fernández de Moratín, Leandro (1760-1828), Sp. poet and dramatist, b. Madrid, son of the poet Nicolás F. de M. On the recommendation of Jovellanos he became secretary in 1787-9 to the Sp. embassy in Paris. He travelled extensively all over Europe. Of his 5 comedies the best are *La Comedia nueva*, 1792, a satire on the extravagant dramas of the day, *El Sí de las Niñas* (Little Girls' Consent), 1806, and the satire *La Mogigata* (The Female Hypocrite), 1804. His plays are full of subtlety and psychological insight. He also trans. Molière's *Ecole des Maris* and

Le médecin malgré lui. His complete works were ed. by Ruiz Morcende in *Códisos castellanos*, 1924.

Fernandina, city and port of entry of Florida, U.S.A., in Nassau co. It is situated on Amelia Is., at the mouth of St Marys R.; its harbour opens on the N. to Cumberland Sound, and may be entered at high tide by vessels drawing 20 ft of water. It is a fishing and pulp-milling centre, and exports phosphate, lumber, and naval stores. Pop. 4420.

Fernando de Noronha, is. (7½ sq. m.) in the S. Atlantic belonging to Brazil. It takes its name from its Portuguese discoverer (1503), the count of Noronha. It has a rugged surface and healthy climate (average temp. 78° F.), and is the seat of a Brazilian penal station. Pop. 1322, all males, consisting mainly of criminals and their guards.

Fernando Po, is. in the Bight of Biafra, W. Africa, which belongs to Spain and is considered to be one of the most fertile spots on the W. African coast. Its surface is mountainous, and a great portion of the is. is covered with dense forests of valuable timber. The climate is very hot, and a pestilential wind, the 'harmattan,' carrying minute particles of sand from the Sahara, is seasonal. The chief products are cocoa and palm oil. The cap. is Santa Isabel (pop. 8300). The is.'s affairs are administered by a governor-general and council subject to control of the colonial dept in Madrid. Much has been done to develop the resources of the is. and to improve the social services. Labour was, until recently, imported from Liberia under unsatisfactory conditions. This was the subject of an enquiry by the League of Nations.

Ferndale, city in Oakland co., SE. Michigan, U.S.A. It manufs. auto parts, synthetic paint and resins, and metal products. Pop. 29,700.

Fernel, Jean François (1497-1558), Fr. physician and mathematician, b. Montdidier, Somme. He attended the univ. of Paris where he graduated M.A. in 1519 and spent the next 5 years as a recluse reading classical texts and studying mathematics. He then began the study of medicine and obtained his M.D. in 1530. Meanwhile in 1527 he pub. *Monasphaerium*, a treatise mainly on the astrolabe, and in 1528 *Cosmotheoria*, a treatise on the shape and size of the earth, and *De Proportionibus*, a mathematical work. His first medical work, *De Naturali Parte Medicinæ*, 1542, was the first work devoted exclusively to physiology since the time of Galen. He next began to write a system of medicine but did not complete it; most of it appeared in his *Medicina*, 1554, part of which forms the first explicit treatise on pathology. Meanwhile he had pub. *De Abditis Rerum Causis*, 1548. His *De Luis Venerea Curatione*, pub. posthumously in 1559, was an important early work on syphilis. F. was physician to Henri II; for a time he served as prof. of medicine at Paris but resigned in 1550 because of the

demands of his phenomenally successful practice. He was a great humanist, with a burning desire to extend knowledge in the true spirit of the Renaissance. See *The Endeavour of Jean Fernel*, 1946, by Sir Charles Sherrington, which includes G. Plancy's life of F.; life by P. A. Capitaine, 1925.

Ferne (-Voltaire), Fr. tn in the dept of Ain, 4 m. NW. of Geneva. It is famous as the dwelling-place of Voltaire, the Sage of Ferney, who lived here 1758-78. Pop. 1300.

Fernguf, see FERRAGUS.

Ferne, city of Brit. Columbia, in the E. Kootenay dist., situated at the junction of Coal Creek with the Elk R. There are extensive coal-mines in the neighbourhood, and about 480 coke ovens, which supply fuel for the smelting works in S. Brit. Columbia. Almost destroyed by bush fire in 1903. Pop. 2757.

Ferne, tn in co. Wexford, Rep. of Ireland. It was once the seat of a bishop, and has given its name to the diocese of F. F. castle, 13th cent., is a perfect example of its kind. Pop. 1800.

Ferne (Filicinae) comprise over 10,000 species, widely distributed in all parts of the world. They attain their highest development in the tropics. The tree F., Cyatheaceae (q.v.), are the largest representatives. The majority of F. are herbaceous with a creeping underground stem or rhizome, terminating usually in a rosette of pinnate or deeply divided leaves. A peculiarity common to F. is the coiled position of the young leaves, giving them at the tip the appearance of a crozier, whence their vernation is said to be circinnate, and the leaves continue to grow at the apex until their full size is attained. Peculiar brownish scales, known as paleae or ramenta, often fringed, invest the stems, petioles, and sometimes also the leaves of most F. F. vary very much as regards their branching; in some, as in the bracken F. (*Pteridium aquilinum*), the stem forks at the apex; in a few, as in some filmy F., the branching is axillary, like that of flowering plants, while in others, as in some of the tree F., the stem does not branch at all. The roots which are found on a full-grown plant are all adventitious, for the original main root of the embryo dies away very early. The reproduction organs are spores which are produced in cases called sporangia. Each group of sporangia is known as a sorus which may or may not have a protective covering, the indusium. In most cases the sori are borne on the under surface of the leaves. When ripe the sporangia burst and liberate the spores, which on germination give rise to what is known as a prothallus. The prothallus is a flat, heart-shaped, green body, which leads quite an independent existence, and which produces sexual organs. The male organs (antheridia) and female organs (archegonia) are borne on the under surface of the prothalli. In the antheridia are produced the spermatozooids, which are free-swimming; male gametes, and one of these enters an

archegonium and fertilises the female gamete contained therein. This process cannot be observed by the naked eye. The fertilised ovum becomes the embryo of the F. plant. Thus the life hist. of a F. presents a true alternation of generations: the F. plant, or sporophyte generation, produces asexual spores, which grow into the gametophyte (prothallus) or sexual generation. This in its turn produces male and female gametes, which after fertilisation grow again into the sporophyte. Occasionally asexual reproduction is effected by budding, as in *Asplenium bulbiferum*.

MALE FERN
S. sori

The form and position of the sori and the presence or absence of an indusium are characters upon which are based the classification of F. Most of the Brit. F. belong to the family Polypodiaceae, which includes *Pteridium* (bracken), *Adiantum* (the maiden-hair), *Asplenium ruta mararia* (the wall rue), *Phyllitis scolopendrium* (the hart's-tongue), which has entire leaves, *Polystichum*, *Polypodium*, etc., etc. *Osmunda regalis*, the royal fern, belongs to another family; it is peculiar in that the upper pinnae of the leaves are fertile and develop little or no green, so that there is all the appearance of a flower. There are many species of fossil F., which proves them to have formed part of the flora of the geological ages; tree F. are met with in the Devonian period, and many forms were abundant in Carboniferous times.

F. are largely cultivated in gardens and greenhouses for decorative purposes on account of their graceful foliage. Bracken, when dried, can be used for stable purposes and thatching, and its root stock contains starch, which, however, is only used when there is a scarcity of food. The only medicinal fern products are the oil from the male fern and a syrup extracted from the rhizome of an Amer. maiden-hair.

F. are shade-loving plants, and like plenty of moisture and soil containing leaf mould. They should be transplanted in early spring or late autumn, and are divided by their rhizomes. This applies to the harder forms. The more tender F. require glass, with uniform temp. and moisture. The soil must be light and well drained, so that the abundance of water which they require will not rot them. They should be repotted before the roots become pot-bound.

Ferns, Filmy, see FILMY.

Ferns, Flowering, see OSMUNDA.

Ferns, Male, see MALE FERNS.

Ferns, Sweet, see COMPTONIA.

Ferozepore, see FIROZPUR.

Ferrabosco, Alfonso (1543-88), the Elder, lt. composer, son of the singer and composer Domenico F. (1513-74), appears to have settled in England before 1562, but afterwards returned to Italy. He was the most important of the lt. musicians who lived in England in the 16th cent., but he left in 1578 to enter the service of the duke of Savoy at Turin, leaving his children in Eng. He wrote madrigals, lute pieces, motets, etc.

Ferrabosco, Alfonso (c. 1575-1628), the Younger, Eng. composer of lt. descent, son of Alfonso F. the Elder (q.v.). He was left in England when his father returned to Italy. It is believed that Elizabeth I paid for his musical training; and he became a musician at the court of James I. His works include a number of masques, fantasies, and pavans for the viol, ayres with lute and bass viol, and contributions to Leighton's *Tears or Lamentations*. His 3 sons, *Alfonso* (c. 1620-before 1660), *Henry* (c. 1623-58), and *John* (c. 1626-82), were court musicians too, and Henry's daughter *Elizabeth* (1640-?) was a singer.

Ferragus, Ferracoute, Ferragut, Fernguf, or Veernagu, celebrated giant of medieval romance. In *Valentine and Orson* he is described as a giant of Portugal who took Belissant under his care after she had been divorced by Alexander, emperor of Constantinople, and as being in the possession of a brazen head which could answer any question put to it. In Turpin's *Chronicle of Charlemagne* he is a giant 36 ft high, with the strength of 40 men, and invulnerable as regards his skin; while in *Orlando Furioso* he is described as a Saracen, son of Lanfusa. Orlando slew him with a wound in the navel, his only vulnerable part.

Ferrandina, lt. tn, in Basilicata (q.v.), 15 m. SSW. of Matera (q.v.). Pop. 8000.

Ferrar, Nicholas (1592-1637), theologian, b. London, and educ. at Clare Hall, Cambridge. He was elected to parliament in 1624, but he retired to Little Gidding in Huntingdonshire in 1625, where he organised what was in effect a small religious community. He was visited by Charles I in 1633, but his 'Arminian nunnery' was broken up by the parliament in 1647.

Ferrara, Andrea, a name frequently found on the blades of broadswords of the 17th and 18th cents., especially Scottish

ones. It has been suggested that it refers to one Andrei dei Ferari of Belluno in N. Italy, who worked in F. at the end of the 16th cent., but this is unlikely. The name came to have a typological rather than a personal significance. Most blades bearing this name were probably made at Solingen in Germany and exported.

Ferrara: 1. Prov. of Italy, in NE. Emilia-Romagna (q.v.). It is a fertile plain, bordered on the N. by the Po (q.v.) and on the S. by the Reno. Its coastline in the W., on the Adriatic, contains sev. lagoons, of which the largest is that of Comacchio (q.v.). The prov. comprises the greater part of the anct duchy of F. (see ESTE, HOUSE OF). Area 1040 sq. m.: pop. 427,000.

W. F. Mansell

FERRARA CATHEDRAL

2. lt. city, cap. of the prov. of F., on the Po di Volano, 28 m. NNE. of Bologna (q.v.). It was ruled by the family of Este (q.v.) from 1208 until 1598, when it was annexed to the States of the Church (q.v.). Under the domination of the house of Este F. contributed greatly to the Renaissance (q.v.) in Italy; in the 16th cent. it was known for its school of painting (see ITALIAN ART), and in the 16th cent. it was a literary centre. The huge red brick Gothic castle of the Estes dominates the centre of the tn. There are numerous palaces and mansions, of which the most celebrated are the 14th-15th-cent. Schifanoia palace (now a museum), the Renaissance palace of Lodovico il Moro (also now a museum), the Diamond palace (now a picture gallery), and the beautiful 16th cent. house of Princess Maria. The archiepiscopal cathedral (1135) has a celebrated Romanesque-Gothic façade. The univ. (1391) has an important library (1753). Savonarola, Guarini, and Bentivoglio (qq.v.) were b. at F.; Tasso (q.v.) was confined in the hospital of St Anne during his period of insanity (1579-86), and the tn provided a refuge for Calvin and Marot (qq.v.). There is a large trade, in agric. produce, fruit, and wine, and there are distilling, engineering, pottery,

hosiers, sugar, rope-making, and furniture industries. Pop. 140,000.

Ferrari, Gaudenzio (c. 1484-1546), painter and sculptor of the Lombard school, b. Valuggia, near Novara. He was a pupil of Stefano Scotti at Milan, but made his greatest advance by a minute study of the pictures of Leonardo da Vinci. His works are remarkable for the elevation of their style as well as for the display of difficult and uncommon attitudes. His best are at Varallo, 'The Crucifixion,' a fresco which contains 26 life-size figures; 'Scenes in the Life of Christ,' consisting of 21 pictures; 'A Glory of Angels,' frescoes at Saronno, near Milan; 'The Martyrdom of St Catharine,' in the Brera Gallery, Milan; 'Pieta,' in the Royal Gallery, Turin. See B. Berenson, *The North Italian Painters of the Renaissance*, 1907.

Ferrari, Luigi (c. 1522-60), It. mathematician who at the age of 15 was employed as a servant in the household of Cardan (q.v.). F. was the first to solve a biquadratic equation, for which credit was given to him by Cardan. F. subsequently became prof. of mathematics at Bologna but d. young.

Ferrari, Paolo (1822-89), It. dramatist, b. Modena. He continues the tradition of Goldoni. His works are characterised by their vivacious dialogue and fresh and piquant style, though many are forced and confused in plot. His later plays are influenced by Augier and Dumas fils. His prin. works are: *Goldoni e le sue sedici commedie nuove*, 1851, *La salira e Parini*, 1854, *Opere Drammatiche*, 41 vols., 1877-1881.

Ferraria (in honour of J. B. Ferrari, an It. botanist), a genus of Iridaceae; dwarf bulbous plants of South Africa. They have glaucous leaves of a dull but sometimes beautiful colour and large greenish-brown flowers.

Ferrates, salts of the unknown ferric acid, H_2FeO_4 , discovered by Fremy in 1841. The sodium, potassium, calcium, and magnesium salts are dark red, crystalline, and soluble in water. The Barium salt is sparingly soluble.

Ferreira, Antonio (1528-69). One of the classic poets of Portugal, b. Lisbon. He was judge of the supreme court at Lisbon, composing in his leisure the poetry which earned for him the sobriquet of 'the Portuguese Horace,' and gave him a reputation equal to that of Camoens (q.v.). He wrote numerous striking sonnets, elegies, and odes, but his poetic fame rests mainly on his epistles. Also wrote dramas, *Inês de Castro*, in which he invested with the forms of Gk tragedy the most poignant and popular events of Portuguese chronicles; and 2 comedies, *Brieto* and *Cioso*. His collected works pub. in Lisbon, 1771, and Paris and Rio de Janeiro, 1865. He d. of the plague. See life by J. de Castilho, 1865.

Ferrel's Law is that everything moving in any direction on the earth's surface is subject to a deflecting force owing to the rotation of the earth—in the N. hemisphere the force deflects to the right, and

in the S. hemisphere to the left. This is especially applicable to the air when in motion—the winds of the N. hemisphere being deflected to the right and those of the S. to the left.

Farrer, Francisco (1859-1909), Sp. revolutionary, b. Alella, near Barcelona. After taking part in an insurrection in Spain, he earned a precarious living in Paris for a time as a teacher. In 1901 he opened a school, the Escuela Moderna, in Barcelona. This school was really a Socialist propagandist centre, though it did much for educational reform in Spain. After the attempt in 1906 on the lives of the king and queen of Spain, F. was arrested and the school closed. F. was, however, acquitted, only to be again arrested, in 1909, for taking part in anti-Catholic riots in Barcelona. Convicted on hearsay evidence, he was condemned to death by the Council of War and executed. See life by W. Archer, 1911.

Ferrers, Lawrence Shirley, 4th Earl (1720-60), was the last member of the peerage who was put to death as a criminal in England. In the year 1760, while in a fit of temper, he shot his steward, for which crime he was convicted of murder by his peers and hanged at Tyburn.

Ferret, animal belonging to the family Mustelidae, other species being the badger, weasel, otter, and polecat. The F. is the domesticated albino variety of the latter animal, both of them belonging to the genus *Putorius*. It is very similar to the wild polecat, but a little smaller, being about 14 in. long, has yellowish-white fur and pink eyes. Sometimes, however, F.s breed with polecats, and the result is a cross-breed having fur tinged with brown. The F. is not altogether tame, and occasionally it becomes quite ferocious, exhibiting no affection whatever. The female F. breeds twice during the year, producing from 6 to 9 young ones each time, and she has been known to devour them. This animal was known among the Romans, who employed it, and it is said that it was brought from Africa to the S. parts of Europe. It is used especially to hunt rabbits, and to kill rats. See N. Everett, *Ferrets*, 1897. W. D. Drury, *Ferrets and Ferreting*, 1927.

Ferric and Ferrous Salts, see IRON AND STEEL.

Ferricyanogen, Ferricyanides, Ferrocyanogen, and Ferrocyanides. *Ferricyanogen* and *Ferrocyanogen* are 2 isomeric compound radicles containing cyanogen and iron, whose exact chemical structure has only recently been elucidated. The ferrocyanogen compounds are either prepared from the potassium salt or from the cyanogen compounds obtained as by-products in the coal-gas manuf. or synthetically. *Potassium Ferrocyanide* is produced by heating crude potash in an iron pot closed by a lid having an aperture through which iron filings and certain animal matter, as feathers, horns, and leather, are introduced. The reaction is not well understood, but when the fused mass is lixiviated potassium ferrocyanide

($K_4Fe(CN)_6$) is contained in the solution. It forms quadratic pyramidal crystals of lemon-yellow colour soluble in warm water. It is used in calico-printing and in the preparation of Prussian blue, etc. The ferrocyanides of sodium, calcium, zinc, barium, strontium, and many other metals have also been prepared, and sev. insoluble ferrocyanides are made by double decomposition. Thus copper sulphate and potassium ferro-cyanide solutions mixed give soluble potassium sulphate and a brown coloured precipitate of cupric ferrocyanide ($Cu_2Fe(CN)_6$). This is used in the preparation of semi-permeable membranes (see Osmosis). Ferrocyanic acid is obtained by adding pure hydrochloric acid to an equal vol. of a saturated solution of potassium ferrocyanide, excluding air as far as possible. It is a white powder crystallising in small needles, is soluble in water and alcohol, and readily oxidises on exposure to air. Potassium ferrocyanide, or red prussiate of potash, $K_4Fe(CN)_6$, is formed when potassium ferrocyanide is oxidised, e.g. by bromine water. It crystallises in dark red prisms and is a powerful oxidising agent. Many insoluble ferrocyanides can be made from a soluble ferrocyanide and a soluble metallic salt. Hydroferricyanic acid or ferricyanic acid ($H_2Fe(CN)_6$), made by adding 3 vols. of very strong hydrochloric acid to 1 of strong potassium ferrocyanide, is a brown-green crystalline body. Hydrogen ferrous ferrocyanide is a white powder obtained by boiling an aqueous solution of ferrocyanic acid. The potassium salt, when heated with dilute nitric acid, forms Prussian blue, which exists in sev. varieties, e.g. soluble Prussian blue, insoluble Prussian blue, Williamson's blue, and Turnbull's blue. Prussian blue itself is hydrated ferric ferrocyanide; the soluble Prussian blues are hydrates of potassium ferric ferrocyanide, $KFe(Fe(CN)_6)_3 \cdot 4H_2O$. The iron atoms in Prussian blue are arranged, ferrous and ferric alternately, at the corners of a cubic lattice, and the CN groups lie in the edges of these cubes. The potassium atoms lie at the centres of alternate cubes. Prussian blue is used as a pigment.

Ferrier, Sir David (1843-1928), physician, b. Woodside, Aberdeen, and educ. at the univ. there and also at Heidelberg. He became F.R.S., 1876; and was appointed prof. of neuropathology in King's College, London, 1889. He made experimental researches on the localisation of function and diseases of the brain and wrote many medical works, including *Functions of the Brain*, 1876, and *Localisation of Cerebral Diseases*, 1878-80. He was a founder, and for a time editor, of *Brain: a Journal of Neurology*. President of the Medical Society of London, 1913; knighted 1911.

Ferrier, James Frederick (1806-64), metaphysician, b. Edinburgh, and the nephew of Susan F. and of John Wilson ("Christopher North"). Educ. at Edinburgh High School and Univ. and at Magdalen College, Oxford; he was called to the Scottish Bar 1832, and appointed

prof. of civil hist. at Edinburgh, 1842, and prof. of moral philosophy and political economy at St Andrews, 1845. After having contributed various metaphysical essays to *Blackwood's Magazine*, he pub. *The Crisis of Modern Speculation*, 1841, *Berkeley and Idealism*, 1842, and *The Institute of Metaphysics*, 1854. His *Lectures on Greek Philosophy* were ed. in 1866 by Sir A. Grant, who also wrote a life. See also life by E. S. Haldane, 1899.

Ferrier, Kathleen (1912-53), contralto singer. She was b. in Lancs, where she took a diploma for the pianoforte and had begun work as a telephonist before she began to take singing-lessons after winning a prize at a musical festival. She sang in factories and for the forces during the Second World War, and soon afterwards made a great impression as a concert singer and in opera, where she first appeared in Britten's *Rape of Lucretia* in 1946. Very successful tours in Europe and America followed. To a voice of exquisite quality she added sensitive understanding and musicianship, which were enthusiastically recognised everywhere, but her career was unhappily cut short by cancer, from which she already suffered cruelly when she appeared for the last time, in Gluck's *Orpheus* at Covent Garden in Feb. 1953.

Ferrier, Paul (1843-1920), Fr. playwright, b. Montpellier. His plays include *La Revanche d'Iris*, 1868, *Chez l'Avocat* and *Les Incendies de Moussolard*, 1873, *Les Mousquetaires au Couvent*, 1880, *Babolin*, 1884, *Joséphine vendue par ses Sœurs*, a famous opéra-bouffe with music by Victor Roger, 1886, *Le Fétiche*, 1890, *Le Carillon*, 1896. He also wrote libretti for operas by F. Offenbach, A. Messager, and Gabriel Pierné.

Ferrier, Susan Edmonstone (1782-1854), novelist, b. Edinburgh, the daughter of James F., a clerk of the court of session with Sir Walter Scott. Her first work, *Marriage*, appeared in 1818, and was followed by *The Inheritance*, 1824, and *Destiny, or the Chief's Daughter*, 1831. These novels are very lively presentations of Scottish society, and show a rare gift of observation. They were all pub. anonymously, and many conjectures were made as to their authorship; some people attributed them to Scott, who greatly admired her writings and of whom she wrote in her *Recollections of Visits to Ashfield and Abbotsford*, pub. with a memoir in Bentley's ed. of her works (6 vols.), 1882. The latest ed. is by Lady Margaret Sackville, 4 vols., 1928.

Ferring, seaside vil. near Worthing, Sussex, England. It is situated between the S. Downs and the sea immediately W. of Worthing. There is a prehistoric camp and the site of a Saxon cemetery, which were purchased for the National Trust in 1938 by the W. Sussex Co. Council, the Worthing Corporation, and the Worthing Rural Dist. Council.

Ferro, see HIERRO.
Ferro-concrete, see REINFORCED CONCRETE.

Ferro-magnetic, see INDUCTION, MAGNETIC.

Ferro-manganese, commercial alloy consisting of: iron, 4 to 6 per cent; manganese, 50 to 80 per cent; carbon, 5 to 6 per cent; and silicon in small and varying amounts. It is used commercially in the manu. of other alloys, and chemically as a reducing agent.

Ferro-silicon, alloy consisting of: silicon, 10 to 95 per cent; manganese, 2 to 3 per cent; carbon, 1 per cent; and iron the remainder. It is used in the formation of other alloys of iron or silicon, and also as a reducing agent.

Ferrol (Del Caudillo), El, Sp. port in the prov. of La Coruña. It is in a strongly fortified fiord, opening off the bay of Coruña, and is the prin. naval dockyard of Spain. It is also an important mercantile port, and has arsenals, fisheries, and linen manu. It fell to the insurgents early in the Civil war of 1936-9. Pop. 70,050.

Ferrottype, **Tintype**, or **Energiatype** is a photographic process of the wet collodion type, in which a direct positive image is produced on a thin black enamelled iron plate. The discovery is credited to Robert Hunt in 1844.

Ferry, Jules François Camille (1832-93), Fr. statesman, b. Saint Dié, Vosges. He studied for the Bar, but soon devoted himself entirely to politics. Elected Republican deputy for Paris in 1869, he strongly urged that peaceful relations should be maintained between France and Germany, but without effect. Created prefect of the Seine in 1870, he had the full responsibility of the siege of Paris, and was forced to resign his prefectship in 1871. He became a member of the Republican ministry formed in 1879, and eventually became minister of education and then minister of Foreign Affairs. He was twice premier, and it was during his administrations that 2 important measures were carried out, the organisation of public education free from clerical influence and the colonial expansion of the Fr. empire. A Fr. protectorate was formed in Tunis (1881), and the conquest of Indo-China, and exploration of the Congo and Niger dists. were planned. But his spirited colonial policy involved France in war in Madagascar, and brought about his own downfall in 1885. He was assassinated by a madman. See lives by A. N. Rambaud, 1903, and A. Billot, 1904, and A. Israel, *L'École de la République; le grand œuvre de Jules Ferry*, 1931.

Ferry, 'a place where boats ply regularly across a riv., or arm of the sea, for the convenience of goods and persons' (Ferries Committee report). F. is also the name given to the boat which holds the passengers. Examples may be seen at South Haven Point, at the head of Studland Bay, in Dorset, where the F. plies across an arm of the sea to the sandbank, and at Twickenham, near London, where the F. crosses the R. Thames. The right to F. is a franchise or royal grant, and has the same legal significance as the right to hold a fair or market. It has

nothing to do with the ownership of land or water. The possessor of the F. is not entitled to ownership of the stretch of water across which his passengers are ferried. He merely has the right to exact reasonable toll for the service he has rendered in supplying boats for the landing of passengers and goods on the other side. He is, moreover, responsible for the condition of his boats and for the ferryman he employs. No one is allowed to set up an opposition F. or establish a new F. unless authorised by Act of Parliament. Train-F.s are vessels used for trains and have railway lines placed across their decks. Vehicular F.s enable cars, etc., to run on and off the vessels on their own wheels. There are many varieties of F. boats, such as rafts and flat-bottomed barges with inclined planes for horses. The flying-bridge is worked by means of a long rope or chain attached to a fixed buoy in the middle of the riv., and is useful in military operations. Proposals for improving 32 F.s and starting new F.s were made by the Ferries Committee's report to the minister of transport, June 1948 (*Ferries in Great Britain*, H.M.S.O., 1948). Other recommendations ranged from the provision of additional or larger vessels to the use of radar or other navigational devices on services liable to interruption by fog. The report also recommended that highway authorities should be empowered to take over F.s linking trunk or classified roads and that these should be treated as part of the highways and freed from tolls, expenditure being met in part by gov. grants. In Britain 45 vehicular F.s are normally in use, 7 of them free from tolls.

Ferry-Port-on-Craig, see TAYPORT.

Ferryhill, tn in co. Durham, England, 6 m. S. of Durham. Coal-mining is the prin. industry. Pop. 11,000.

Fersen, Hans Axel, Count (1755-1810), Swedish marshal, b. Stockholm, son of Fredrik A., Count F., of Scottish descent, from McPhersons. Colonel in Royal Swedish regiment of Louis XVI of France, served in Amer. War of Independence. In the flight of Louis and Marie Antoinette to Varennes, June 1791, F. made the preparations and accompanied them. F. was almost certainly infatuated with Marie Antoinette, and some sources have suggested that he was actually her lover. Later he returned to Sweden, where he was murdered by the mob in Stockholm tn hall on account of a false rumour that he had poisoned the crown prince Charles Augustus.

Ferté-sous-Jouarre, La, Fr. tn in the dept. of Seine-et-Marne, on the Marne. The 7th-cent. crypt of a former Benedictine abbey remains. Agric. machinery is manufactured. Pop. 3900.

Fertilisation, fusion of sexual elements in the reproductive processes of animals and plants. The essential fact of F. is that a gamete or sexual cell from the reproductive 'tissues' of one parent becomes so intimately associated with a gamete from the reproductive tissues of the other parent as to form one cell called

a zygote, which becomes the starting point of a new living individual. Where there is no F. in the process of reproduction, the development of the new organism is called *parthenogenesis*. In some of the lower plants and animals the fusing gametes are indistinguishable in form, size, and other characteristics. Such sexual processes are called isogamous, and the term conjugation is to be preferred to F. The term F. now becomes restricted to that process by which a cell derived from the specialised tissues of a parent known as male is united to a cell derived from corresponding specialised tissues in the female parent. It is therefore a process characteristic of the higher animals and plants where sexual organs are differentiated into male and female. In animals the organs from which the gametes are derived are the testes in the male and the ovaries in the female. The male gamete is the spermatozoon, a small cell of elongated form. The nucleus is situated in the 'head' or thickened part, and the remainder consists of a vibratile tail by which the cell moves freely in a liquid medium. The female gamete is the ovum, a cell usually much larger than the spermatozoon. It is quiescent or non-motile, containing a large nucleus and a large amount of nutritive material enclosed in a protecting membrane. Ova are produced in small quantities, while spermatozoa are relatively far more numerous. The ovum and spermatozoon come into conjunction for the admixture of the seminal fluid in the sexual act. The actual fact of F. consists of the penetration of the envelope of the ovum by the spermatozoon. This is probably brought about by *chemotaxis*, or attraction of a chemical nature exerted mutually by the male and female elements. What happens is that the nucleus of the spermatozoon enters the ovum and sometimes the centrosome does so. With the formation of the zygote by this fusion of cells, the embryonic hist. of the new organism begins. In plants there are many modes of the sexual process. In certain algae similar gametes, furnished with cilia, move about in the water and eventually fuse; this process is isogamous. In other plants the male cell is a spermatozoid which visits the female cell. In the mosses, for example, the spermatozoids are developed in large numbers in the *antheridium*, and are set free to move in the water by means of 2 vibratile cilia. The *archegonium* contains the ovum at the bottom of its flask-shaped structure. When the ovum is ready for F., a passage is opened through the archegonium, through which the spermatozoid reaches the ovum. In the phanerogams, or flowering plants, the male element is contained in the pollen of the stamen, which has to be conveyed in some manner to the female element, the ovule of the stigma. F. in flowers is therefore necessarily preceded by pollination, and the special structure of the flower is adapted to that end. Wind is often an active agent in pollination; in this case the pollen is produced in enormous quantity and the

stigmas are often feathery so as to catch the pollen. Insects are, however, the great carriers of pollen, and the colour and scent of the flower serve to guide the appropriate insects to their favourite flowers. When the pollination is effected, the male cell passes from the pollen-tube into the female cell, and a zygote is the result of the fusion. It has been shown that cross F. is the rule even when male and female organs are found on the same individual. In many cases this is ensured by the male and female elements in the same plant ripening at different times. The chemical attraction which effects the fusion is only operative between cells of a certain degree of affinity, that is, it generally means that F. can only take place between cells of individuals of the same species. In that one phenomenon the potential characteristics of both parents are fused, and may reappear in the new organism when developed (see MENDELISM). See Wilson, *The Cell in Development and Inheritance*, 1902; D. M. Mottier, *Fecundation in Plants*; F. H. A. Marshall, *The Physiology of Reproduction*, 1932; R. Kuczynski, *Fertility and Reproduction*, 1933; N. M. V. Rothschild, *Fertilisation*, 1956.

Fertilisers, see MANURES.

Fertility of Soil, see SOIL.

Fertő Tó, see NEUSIEDLERSEE.

Ferula, family Umbelliferae, a genus of tall, herbaceous perennials, of the Mediterranean region and Central and W. Asia, with much divided leaves and thick roots, sometimes known as giant fennels, grown in gardens for foliage beauty. *F. sambul*, the Sambul plant, has a milky, musky sap, used as a musk substitute in Russia, and as a remedy in cholera; *F. asafoetida* and *F. narthex* give gum asafoetida; *F. communis v. brevifolia*, gum ammoniac, and *F. galbaniflua*, gum galbanum; all reputed to have medicinal value. *F. communis* and varieties, and *F. tingitana* are esteemed for gardens.

Fescennine Verses (*Versus Fescennini*), early form of popular poetry in Italy. They took the form of a dialogue, usually in the Saturaian metre, and were composed extempore at weddings and other private festivals. They became so licentious that the practice had to be suppressed by law. See Horace, *Epistles*, li. 1, 145.

Fescue Grass, name given to *Festuca*, a genus of perennial grasses (q.v.): *F. pratensis*, the meadow F., *F. arundinacea*, tall F., *F. ovina*, sheep's F., *F. gigantea*, tall brome, and *F. rubra*, the red F., are common species in Britain.

Fess, or **Fesse**, see HERALDRY, *Ornament* (2).

Festa, Comastanzo (1490-1545), It. composer of madrigals and motets. In 1517 he was appointed singer in the Vatican. F. is chiefly remembered for his very popular madrigal *Down in a Flowery Vale*, which was trans. by Thomas Oliphant.

Festival, see FEAST.

Festoon, in architecture, sculptural wreath or garland, formed of conventional flowers, fruit, and leaves, suspended by

ribbons. It was used by the Greeks and Romans probably in imitation of the garlands of flowers that were hung about a sacrificial victim or altar; and may be found as a decorative feature in many Renaissance buildings. Also called a 'swag.'

Festubert, Battle of (N. France, 20 m. SW. Lille). On 9 May 1915 Sir Douglas Haig opened an attack on the Germans just N. of Fromelles and also between Neuve Chapelle and Givenchy, F. being in the latter sector. This attack was undertaken in pursuance of a promise made by Sir J. French to Marshal Joffre to keep the enemy occupied on his front as long as possible. Some ground was gained about Fromelles, but the Ger. machine-gunners on the Aubers Ridge held up the advance in that area, and bad weather then held up progress. On 15 May the attack was resumed between Richebourg-L'Avoué and F., in which the Canadian Div. distinguished itself. On 16 May the 7th Div. made good progress immediately due E. of F., having for its objective the line Rue l'Ouvert-Canteleux.

By the capture of the orchard at F. on 20 May the Canadians (16th Canadian Scottish) again distinguished themselves. This position had been strongly fortified by the Germans. The result of the battle of F. was to deprive the Germans of a highly entrenched and fortified area on a 4-m. front. Their losses in personnel and material also were heavy.

Festus, Porcius, Rom. procurator of Judaea, in which office he succeeded Antonius Felix (q.v.) in AD 60. He bore testimony to St Paul's innocence when the apostle was arraigned before him. See Acts xxiv., xxv.

Festus, Sextus Pompeius (fl. late 3rd cent. AD), Rom. lexicographer. His epitome of Flaccus's *De Significatu Verborum* is extant in a single imperfect MS. as well as in a further epitome by Paul the Deacon (8th cent.). See W. M. Lindsay, *Glossaria Latina*, LV, 1930.

Fet (real name Shenshin), Afanasiy Afanas'yevich (1820-92), Russian poet, an outstanding representative of the 'art for art's sake' school, an impressionist, lyricist, and mystic (*Evening Lights*, 4 vols., 1883-91). He made excellent trans. of classical Lat. poets and of Shakespeare, Goethe, and Schopenhauer.

Fethard, anct mkt tn of co. Tipperary, Rep. of Ireland, 8 m. N. of Clonmel. Pop. 1000.

Fétiiales, see FÉCIALES.

Fétiis, François Joseph (1784-1871), Belgian musical critic and composer, b. Mons, and trained by his father and at Paris. He was appointed organist and prof. of music at Douai, 1813; prof. at the Conservatoire, Paris, 1821; director of the Conservatoire, Brussels, and chapel-master to Leopold I, 1833. In 1827 he founded the *Revue Musicale*, and he wrote a *Biographie universelle des musiciens*, 1835-44, *Histoire générale de la musique*, 1869-76, and, in collaboration with Moscheles, *Méthode des Méthodes de Piano*,

1837. He also composed sev. operas and oratorios.

Fetichism, or **Fetichism** (Portuguese *fetico*, a charm), the worship of inanimate objects which are believed to be possessed with spirits; the word is also used to indicate the use of charms which, though not the habitation of spirits, are supposed to have a magical influence, derived from spirits, in warding off danger and bad luck. This cult is found especially among

A NIGER FETISH

W. African tribes. The term was first used in its present sense by 15th-cent. Portuguese explorers for the stones, wooden figures, beads, etc., worshipped by negroes. See also AMULET. The term F. is also used in psychology to describe types of obsessional mental or nervous disorder.

Fettes College, Edinburgh, public school for boys, founded by Sir Wm F. (d. 1836), who left a large endowment for the purpose of educating orphans and children in unfortunate circumstances. The Trust funds were allowed to accumulate till 1864, when the buildings were begun. The college was opened in 1870, and the administration is similar to that of an ordinary Public School.

Feu and Feu-duty. In Scots law, F. is a mode of land tenure which gives the feuar the right of holding in perpetuity certain property, in return for which he makes an ann. payment in money, called feu-duty. The land is held from the crown, but the crown vassals may give out their land in F. to their vassals, who in turn may F. the land. This process of subinfeudation was prohibited in England by the statute of Quia Emptores in 1290. See Rankine's *Law of Landownership in Scotland*.

Feu de joie, discharge of musketry given as a salute on occasions of public rejoicings. The guns are let off one after another at quick but regular intervals, thus producing a running fire.

Feuchterleben, Ernst, Freiherr von (1806-49), Austrian poet and physician, b. Vienna. He was secretary to the Society of Physicians, and from 1844 delivered lectures on the training of psychic physicians. His philosophical and psychological studies had a wide influence. His works include: *Die Lehre von den Heilanzeigen* (in Lat.), 1833, *Gedichte* (containing 'Es ist bestimmt in Gottes Rat,' set to music by Mendelssohn, 1836), *Zur Dittetik der Seele*, 1838, *Beiträge zur Litteratur-, Kunst- und Lebenstheorie*, 1837-41, and *Lehrbuch der ärztlichen Seelenkunde*, 1845.

Feuchtwanger, Lion (1884-), Ger. author, b. Munich, of a Jewish family. He studied philosophy in Berlin and Munich. In 1907 he pub. a widely-noticed dissertation on Heine's fragment *Der Rabbi von Bacherach*; also a play, *Der Felsch*. In 1910 appeared his first novel, *Der Iönerne Gott*. In 1916 came a tragedy, *Julia Farnese*; also a refurbishing of the old Ger. play *Vasantasena*. He adapted *The Persae* of Aeschylus in 1917; and the *Acharnians* and *Peace* of Aristophanes in the burlesque *Friede*, 1918. Of his dramas, *Warren Hastings* appeared in 1916, and *Jud Süß* and *König und Tänzerin* in 1917. He pub. the novel *Die hässliche Herzogin* in 1923, and the famous one *Jud Süß* in 1925 (trans. into Eng. as *Jew Süß* in 1926). It is a story of Germany in the 18th cent., a wonderful combination of Teutonic thoroughness, of workmanship, and Heb. imagination. Later plays: *Die Petroleuminsel* and *Wird Hill amnestiert?* 1927. His *Erfolg*, 1930, bears a close resemblance to A. Zweig's famous novel, *The Case of Sergeant Grischka*, being founded on the theme of the unavailing attempts of a determined woman to secure the freedom of a man wrongly condemned to prison. Like *Jew Süß* it is sketched on a great canvas, comprising scores of characters and all of them intensely vital. His trilogy *Josephus*, based on the life of the Jewish historian, was pub. in Eng. in 1933. Other works include: *Die Geschwister Oppermann*, 1933, *Der falsche Nero*, 1937, and his autobiography *Unholdes Frankreich*, 1941. Since 1941 F. has lived in California.

Feud (M.E. *fede*, through the Fr., from Old High Ger. *fehida*. Cf. D.E. *fäh*, foe),

a lasting quarrel, often resulting in warfare, between 2 families, clans, or tribes. See BLOOD VENGEANCE; VENDETTA.

Feudalism (late Lat. *feodum*, or *feudum*, a fee or fief), one of the most influential of medieval institutions, gave rise to legal principles and social ideas not yet extinct. The origin of F. is not generally agreed. Institutions have existed in Japan, Africa, and many other places, to which the term 'feudal' might be applied. But the system of medieval W. Europe is always meant. F. came into existence in the 8th and 9th cents., owing to the inability of the central gov. to cope with the disorders of the period. The 2 main features of F. are of Rom. origin: one related to land and the tenure by which it is held, and the other to the personal relationship of individuals. The latter was known in the time of the Rom. empire as 'patrocinium'; a poor and landless freeman goes to the rich landowner who can afford him protection, states his need, and offers such services as a freeman may perform in exchange for shelter and support. The other institution was the 'precarium'; under this form the owner granted the use of a piece of land to another. The object of this practice was not to obtain income, but to serve a friend, to reward a dependent, or to secure a debt, etc. Its chief characteristic from a legal point of view was that the lessee had no right of any kind against the grantor, as the land was revocable at the will of the owner with no penalty. When a small landowner was in trouble, he made over his land as a gift to a rich landowner near, and received it back as a precarium; this process was known as 'patrocinium fundorum.' When the Franks entered Gaul and found these customs prevalent, together with many other Rom. institutions, they legalised them. In this they were in all probability influenced by the pre-existence of the institution of the 'comitatus', which had much in common with the patrocinium. The latter had held no stigma for either of the parties entering into it, but in the case of the comitatus, not only was there no disgrace, but the transaction was considered to confer honour on both the chief and the dependent. All these ideas and customs, such as special ceremonies and oaths of allegiance, passed from the comitatus into the feudal system. The idea of the precarium also would not be totally opposed to Frankish ideas, though the practice was mostly carried on by the great landowners until the beginning of the Carolingian period. The Church was the chief agent in carrying over the precarium from the Rom. to the Ger. state; frequently grants of land were made by the Church on this system. The Merovingian period was not distinguished by any great change in the character of feudal institutions; the legalisation of the Rom. practices was the great achievement of that age. The most necessary steps to the formation of the historical feudal system were taken in the Carolingian period; those are the steps by which the 2 institutions of the patro-

odium and precarium became 2 sides of a single system. Military service had not previously been connected with the Rom. or Merovingian institutions, and the Carolingian age is remarkable as the period during which military service was estab. as a necessary corollary of F. Charles Martel made use of very extensive Church lands to be given to his followers in order that being thus relieved of some expense, they might be able to furnish cavalry to repulse the Arabian attack on Gaul; the method used was called 'precariae verbo regis.' This was the first step towards the unification of the 2 institutions; about this time the word 'benefice' displaced precarium and 'commendation' was used instead of patrocinium. The judicial functions of the state also passed into private hands during this period. As a result of the extension of the principle of military service, the duty of defending the state changed from a public obligation to a private agreement. So full sovereignty was exercised by the great lords over all residing within their 'fief,' as the benefice was called at this later period. In the majority of cases such power was usurped by the landowner. In the ideal feudal system the vassal always receives a fief, and a fief is held by none other than a vassal. Estates of allodial land, that is land which the original owner had held in fee-simple, not as a benefice, frequently formed little states of their own; if the pretensions of the owner were made good, they were distinctly recognised by the general gov. as independent states. F. was prevalent over W. Europe from the 10th to the 13th cents.; even where allodial lands were numerous, the real gov. was completely local. At the same time the theory of the state, with an almost absolute king at its head, was never allowed to lapse. The kings themselves never allowed the barons' claim to independence. Such a regular organisation as outlined in the legal theory nowhere existed in practice. A rough system of organisation obtained in most places. The national feudal system of the different countries of Europe presented many constitutional points of difference, and no exercised a different influence on the hist. of each country. See LAW and ENGLISH HISTORY, FRANCE, GERMANY, SCOTLAND, etc., for details of these systems. See also ENCAGE; FIEF; GRAND SERJEANTY; KNIGHT-SERVICE; VILLEINAGE.

Feuerbach, Anselm (1829-80), Ger. painter, b. Speyer, trained in Düsseldorf and Munich; was the pupil of Couture in Paris. After a visit to Italy, his subjects were drawn largely from ant. hist. and mythology, and before long he was recognised as the leading painter of the Ger. classic school. His chief works are: 'Iphigenia in Tauris,' 'Orpheus and Eurydice,' 'Pieta,' and 'Dante at Ravenna.' See lives by Allgeyer-Neumann, 2nd ed., 1904; O. Fischer, 1922; and L. Zahn, 1940.

Feuerbach, Karl Wilhelm (1800-34), Ger. prof. of mathematics at Erlangen. F.'s Theorem states that, In any triangle

the centre of the circumscribed circle, the common point of the altitudes, and the centre of the circle through the feet of the altitudes lie on one and the same straight line, whose mid-point is the last named point.

Feuerbach, Ludwig Andreas (1804-72), Ger. philosopher, 4th son of Paul J. A. F., b. Landshut, Bavaria, and educ. at Heidelberg, Berlin, and Erlangen. His first work, *Gedanken über Tod und Unsterblichkeit*, 1830, an attack on the doctrine of personal immortality, was followed by *Abdard und Heloise*, 1834. In 1837 he married a woman of some means, and was thus enabled to devote his time to study and reading, which resulted in the pub. of *Das Wesen des Christentums*, 1841, trans. into Eng. by George Eliot under the title of *The Essence of Religion*, 1853. This work is an attempt to prove that God, or the Absolute, is an outward projection of man's inner self, only existing in the human consciousness of the infinite. F. thus denies the existence of God apart from man, and maintains that the highest good is created in man's consciousness as an expression of his human needs. His complete works appeared in 10 vols., 1846-66, new ed. 1903-11. See A. Lévy, *La Philosophie de Feuerbach*, 1904; K. Barth, *Geschichte der protestantischen Theologie, seit Schleiermacher*, 1943.

Feuerbach, Paul Johann Anselm Ritter von (1775-1833), Ger. writer on criminal law, b. Frankfurt-on-Main, and educ. at the univ. of Jena. His *Kritik des natürlichen Rechts*, 1796, followed by *Anti-Hobbes*, 1798, attracted much attention, and in 1801 he was appointed prof. at Jena, and in 1802 accepted a similar position at Kiel. He became second president of the court of appeal at Bamberg (1814), and first president of the court of appeal at Anspach (1817). His works include *Merkwürdige Kriminalrechtsfälle*, 1808-11, *Beurteilungen über das Geschworenengericht*, 1811, and *Kaspar Hauser*, 1832. A collection of his *Kleine Schriften* was pub. in 1833. The *Leben und Wirken* were ed. by his son Ludwig (2 vols.), 1852. See M. Grünhut, *Anselm von Feuerbach und das Problem der strafrechtlichen Zurechnung*, 1922.

Feuerbach, Ger. tn in the *Land of Baden-Württemberg* (q.v.), a NW. suburb of Stuttgart (q.v.).

Feuillants, religious order in France, a reformed branch of the Cistercians, founded in 1577 by Jean de la Barrière, the abbot of a Cistercian monastery at Feuillant near Toulouse. The stricter rules laid down by de la Barrière were ultimately confirmed by Pope Sixtus V, and a convent for the new congregation was founded in the Rue St Honoré, Paris, by Henry III. During the Fr. Revolution the name of F. was given to some moderate Jacobins, including Lafayette, Sieyès, Barnave, Charles de Lameth, and Barrère, who met in the building in Paris formerly occupied by the religious order. The object of the club (founded 1791) was to unite the old monarchy with the new

constitution. The old Jacobins became absolutely republican and contemptuously called the F. the 'Club Monarchique.' The club was dissolved in 1792.

Feuillet, Octave (1821-90), Fr. novelist and playwright, b. Saint-Lô in La Manche. He was intended for a diplomatic career, and was for a while cut off by his father on declaring his resolution of adopting a literary career. He contributed to the *Revue Nouvelle* and *Revue des Deux Mondes*, but made his first definite success with his novel *Bellah*, 1852, reprinted from the latter paper. This was followed by *La Petite Comtesse Dalila*, 1857, and *Le Roman d'un jeune homme pauvre*, 1858. He also wrote many comedies, which had long runs, but have not retained their popularity. His best work in fiction was done during his later years, and include *Sibylle*, 1862, his masterpiece; *Monsieur de Camors*, 1867, *Julia de Trécoeur*, 1872, *La Mort*, 1886. He was elected to the Academy in 1862. See H. Bordeaux, *La Jeunesse de Feuillet*, 1922.

Feuilleton (a diminutive of Fr. *feuille*, leaf of a book), supplement of a political newspaper devoted to literary and art criticism, gossip about the fashions, epigrams, and *bons mots*. It was not usually printed on separate paper, but divided from the political part of the newspaper by a line or by smaller print. It was first adopted in the *Journal des Débats* under the editorship of Bertin, and was so popular as treated by the Abbé Geoffroy that it became a permanent feature in Fr. journalism. Later, the F. was adopted by other continental newspapers. The same kind of *causerie* may be found in Eng. papers, but the name F. is used in England exclusively to denote an instalment of a serial story.

Fever (Lat. *febris*, from *fervere*, to burn), condition of the body characterised by a temp. above the normal, and accompanied by disturbances of normal functions. The feverish condition is symptomatic of a large number of diseases, but the term is particularly applied to those morbid conditions where high temp. is the predominating symptom; that is, where the rise of temp. is practically a measure of the severity of the disease. The normal temp. of the body is between 98° and 99° F. (about 37° C.); when the temp. is above 103° F. the febrile condition (*pyrexia*) is estab.; at 106° the condition is known as *hyperpyrexia*; if the temp. rises above 107°, a fatal termination to the disease may be expected. The cause of rise of temp. may be increase of heat-production owing to stimulated oxidation or a decrease in heat-elimination owing to disturbance of the functional activity of the heat-eliminating organs, notably the skin. The greater factor is probably the latter, as in cases of F. due to the action of micro-organisms it has been found that the increase of combustion due to the struggle between the white corpuscles and the bacteria does not produce much rise of temp. On the other hand, the destructive action of the bacteria and the consequent disintegration of protoplasm are accom-

panied by a proportionate disability of the cutaneous vessels to effect adequate elimination of heat. The febrile condition is usually ushered in by shivering and alternate phases of cold and heat. Although during the cold fits the skin is clammy and the patient complains of lack of heat, the internal temp. is usually as high as in the hot fits, the sensations felt by the patient being due to nervous disturbance. The pulse is generally rapid and weak. The treatment of F. consists in the treatment of the cause. Patients with high F. should be nursed in blankets and should be given plenty of fluids. Tepid sponging, taking care to expose a small part of the body only at a time, encourages the skin to act and in this way lowers F.

Fever, Breakbone, or Dandy, see DENGUE.

Feydeau, Ernest Aimé (1821-73), Fr. author, b. Paris. His first pub. was a vol. of poetry, *Les Nationales*, 1844, but he was far more successful in writing fiction, for which he showed a genuine talent. In *Fanny*, 1858, *Sylvie*, 1861, and *Le Roman d'une jeune Mariée*, 1857, he depicts the corrupt manners of an immoral age. His other works include: *Du Luxe des Femmes*, *des Maieurs*, *de la Littérature et de la Vertu*, 1866, *Histoire générale des usages funéraires et des sépultures des peuples anciens*, 1857-61, and *L'Allemagne en 1871*, 1872, a caricature of contemporary Ger. life.

Fez, or **Faz**, sacred city of Morocco, about 85 m. S. of the Mediterranean Sea, and 100 m. E. of the Atlantic Ocean; it is picturesquely situated in the valley of the Sebu, a stream which flows through the centre of the city and falls into the Atlantic 100 m. to the W.; the valley is shaped like a pear, and surrounded by orange groves, olive plantations, and fruit orchards. The mosque of Karueen is said to be the largest in Africa and is used as a kind of univ. by over a thousand students. The mosque of Muley Edris, built nearly 1100 years ago by the reputed founder of F., is held to be so sacred that any approach by Christian or Jew is forbidden. The interior of the city is not so pleasing. The walls are decayed, and ruined buildings are to be seen on every hand. The streets are narrow and scarcely ever penetrated by the sun. Commercially, F. is one of the busiest centres of NW. Africa. The exports are olives, olive oil, citrus fruit, hides and dressed leather, and made-up silk. There is a regular caravan trade with the interior cities of Africa. The native industries are morocco leather goods, pottery, and ornamental brassware. F. was founded in 808 by Muley Edris, and it became the cap. of the W. African Muslim states. In the 10th cent. pilgrimages were made to F. instead of to Mecca. It was incorporated with Morocco in 1548. In 1911 the city was besieged by hostile tribesmen, but relieved by the Fr. gen. Lyantey. Pop. (1952) 180,000 (Europeans 15,000), but since 1952 there has been a large exodus of Europeans.

Fez, crimson skull-cap, which used to form the national head-dress of the Turks.

It was so called because the place of its sole manuf. was formerly F. in Morocco, France, Germany, and Switzerland also make F.s now. They are brimless and are ornamented with a tassel on the centre of the crown. The dye used for them is obtained from small berries which grow in profusion in the neighbourhood of F. In the 1st quarter of the 20th cent. Kemal Atatürk prohibited the wearing of the F. in Turkey as part of a campaign to modernise the country by abolishing many anct traditions which separated it from more progressive communities.

Fezzan (anct **Phazania**), Libya, country situated S. of Tripoli, N. Africa, and transferred to Italy with the rest of Tripolitania under the treaty of Ouchy (Oct.

He took the oasis of Kufra in 1941 and, in 1942, made frequent raids into the F. from Fort Lamy in Chad. Having thus acquired a familiarity with all the conditions of terrain and climate, he concentrated at Fort Lamy and Faya forces and supplies considerably greater than those he had used in the raids throughout 1942. By 22 Dec. (1942) his troops had penetrated the F. and routed a motorised It. detachment SE. of Gatroun. Oum-el-Araneb was attacked on the 30th and fell on 4 Jan. (1943). Gatroun was taken on 6 Jan. and with the capture of Mourzuk on the 12th the whole of the F. was conquered and Le Clerc's forces went on to take Misda, entered Tripoli (25 Jan.), and on the next

Paul Popper

FEZ: THE GREAT MOSQUE OF KARUEEN

1912). It extends 390 m. from N. to S., and 420 m. from E. to W., and has an area of 156,000 sq. m. It consists of a desert enclosing numerous oases and bordered by low ranges of hills. The Jebel-es-Soda or Black Mts and the Haruj-el-Aswad cross the country on the N. The climate is even and healthy on the whole, as it does not lie within the tropical rain zone; rain is not frequent. Water, however, is found plentifully near the surface of the ground. There are 5 grain harvests annually; wheat, barley, melons, turnips, and cotton are cultivated, while figs, dates, olives, almonds, henna, alfa, oranges, and grapes form the chief wealth of the country. Homs (or Khoms) has for ages been the depôt for the produce of the F. The prin. tns are Murzuk, the cap. (pop. 10,000), and Sokna, Germa, Gatroun, Tejerri, etc. In the Second World War the F. was the theatre of a successful campaign organised by Gen. Le Clerc, on the orders of Gen. de Gaulle, in 1941-2 and carried out in 1943.

day took Gadamés. This remarkable campaign involved a march of 2500 km. across formidable deserts, without re-victualling, and the scaling of the Tibesti Mts, some 3000 metres in height. A Franco-Libyan Treaty of Friendship was signed on 10 Aug. 1955, under which France was to retain aircraft landing rights in F. at Ghatt, Ghadames, and Sebha. Pop. 32,000. See Capt. Paul Moynet, *Les Campagnes du Fezzan*, 1943.

Ffestiniog (place of hastening), par. and tn of Merioneth, Wales, situated about 20 m. NW. of Bala, and 8 m. from Portmadoc. It is the centre of a slate-quarrying dist. Pop. 6891.

F.F.L., abbreviation for Forces Françaises de l'Intérieur, Fr. resistance army in the Second World War. See **FRANCE—History; and WESTERN FRONT IN SECOND WORLD WAR.**

Fheis, see **FEIS.**

Fiacre, or **Fèvre** (Celtic **Fiaohra**), St (d. AD 670), Irish anchorite, who was allowed by the bishop of Meaux (in

France) to build a little monastery at Breuil. During life he was famed for his miracles, and his shrine in Meaux Cathedral, where his relics were transferred in 1568, is still a place of pilgrimage. The Hôtel St Flacore of Paris, which was named after him, gave its name to a kind of cab (*fiacre*).

Fianna Fáil (Soldiers of Destiny), Irish political party. It was estab. in 1926 under the leadership of Eamon de Valera (q.v.), and formed at first the opposition in the Dail to the gov. party led by Wm T. Cosgrave (q.v.), which accepted the Anglo-Irish treaty of Dec. 1921. The objectives of the party included, *inter alia*, the securing of the unity and independence of Ireland as a rep., the restoration of the Irish language as the spoken language of the people, and the creation, so far as possible, of an economically self-contained and self-sufficing country. The elections of Feb. 1932 placed the F. F. party in power, and it remained in power until 1948. During this period the objectives of the party were vigorously pursued. The so-called 'Economic War' with England (caused by the refusal of the Dublin gov. to continue the payment of land annuities to the Brit. Gov.) was terminated by the London Agreement of 1938. In 1937 a new constitution was promulgated, under which the country became in all practical essentials a sovereign, independent state—the link with the Crown being retained only for certain matters within the field of external affairs. Throughout the Second World War the F. F. gov. steadfastly maintained the neutrality of the country, and repressive measures were taken against political extremists. The party was again returned to power in the general election of 1951, but was succeeded by an inter-party gov. (in which it did not take part) in 1954. In the elections of 6 Mar. 1957 the F. F. party was returned to office with a clear majority of 9 seats in the Dail. See IRELAND, REPUBLIC OF; FINE GAEL.

Fians, anglicised form of *Fiann*, or *Féinne*, of which the Eng. 'Fenians' is a variation. It is rather uncertain exactly what the F. were; what is certain is that the name is derived from Finn MacCool, or Finn MacCumail, who is the central figure of the later heroic or Ossianic cycle of Irish legend. In Scotland Finn MacCool is called Fingal. Finn was a posthumous child, and was at first called Demni. He was the leader of the F., concerning whom the general opinion is that they were a kind of militia or standing army, which was drawn from all quarters of Ireland to assist in the repulsion of enemies, particularly those from over the sea. The H.Q. of the F. was at Almu (Allen) in co. Kildare, where Finn himself usually resided with sev. contingents of his followers; the rest were posted at various places throughout the country. The adventures of the F. in war, love, and hunting are the subject of many tales and legends. The admission to this band of warriors was only gained after peculiar

and trying ceremonies of initiation. Dr Skene considers the F. to have been a distinct race, which preceded the Irish and Scottish Gaels and the Germanic people of 'Lochlan' (Scandinavia). The chief figures of the F. were Ossian, the son of Finn MacCumail, Oscar, the grandson, and Diarmait O'Duibne; the latter eloped with the destined bride of Finn, Granme, the daughter of Cormac MacArt (q.v.); the story of this is a well-known legend. The process whereby Finn became associated with the reign of Cormac MacArt is by no means clear; by the year 1000 he was so associated and has been a popular hero for more than 900 years; primarily he is regarded as one with magical powers, and as a great poet. Finn can be shown to have been originally a figure in the traditions of Leinster and Munster previous to the Viking age; it is impossible that such a band as the F. existed in the 2nd and 3rd cents., as a number of sages of much earlier date than those which state so have no mention of them. See W. F. Skene, *The Dean of Lismore's Book*, 1862, with introduction; J. F. Campbell, *Leathar na Féinne*, 1872; J. G. Campbell, *The Fians*, 1891; D. MacRitchie, *Fians, Fairies and Picts*, 1893; A. Nutt, *Ossian and the Ossianic Literature*, 1899.

Fiasco (It. word meaning 'bottle') has long been used in connection with the It. stage to draw attention to faults in either singing or acting. Perhaps the modern sense of failure is a metaphorical transference from the bursting of a bottle. The word was early borrowed by other nations of Europe, and in this country it is used indifferently of any event which comes utterly to grief.

Fiat, decree, order, or warrant of a judge, or the attorney-general, or a secretary of state, ending with *fiat ut petatur*, i.e. let it be done as is asked. For example, appeals may only lie to the House of Lords from the Court of Criminal Appeal on the F. of the attorney-general, who will only grant them if he considers a point of exceptional public importance is involved.

Fiber Zibethicus, see MUSK-RAT.

Fibich, Zdeněk (1850–1900), Czech composer, b. Schofove, studied at the Leipzig and Paris Conservatories (1865–7 and 1868–9). In 1874–8 was conductor at the National Theatre in Prague. His music is personal rather than national, and was considerably advanced and daring for its time. He wrote 7 operas and a trilogy of melodramas (spoken text accompanied by music) entitled *Hippodamia*, the most ambitious work of the kind ever produced; also some choral works, 3 symphonies and other orchestral music, melodramas with orchestra and with piano, chamber and piano music, and songs.

Fibre and **Fibrous Substances** (from Lat. *fibra*), slender filaments which compose other bodies, which may be either animal, vegetable, or mineral, and are utilised in manufs. Those used in the arts are either of animal or vegetable origin, with the

Fibrin

exception of asbestos, which is mineral. An animal F. of great importance is that of the camel, which is made into excellent cloth, while the hair of the cow makes an inferior woollen cloth. A F. of a silky quality is derived from the byssus of a large shell-fish found in the Mediterranean, and which is used for the making of shawls and gloves. The dicotyledonous plants yield the most important textile F. of vegetable origin, of which flax, hemp, reed, and jute are good examples. The most valuable is the cotton plant, consisting of hairs all round its seeds. Coir F. is obtained from the husk of the nut of the coconut palm. See also PLASTICS and MAN-MADE FIBRES.

Fibrin, protein derived from blood. F. is only a constituent of blood after it has left the arteries, being formed during the process of coagulation or clotting. F. is formed from fibrinogen by the action of the enzyme thrombin (q.v.). (See also under ENZYMES.) It reacts like other proteins, is insoluble in water, highly elastic, tough, and jelly-like.

Fibrolaine, a textile fibre made from casein, derived from waste milk, and used in the manuf. of dress fabrics, carpets, leathercloth, etc. See MAN-MADE FIBRES.

Fibula: 1. The splint-bone of the leg, being situated slightly behind and on the outer side of the tibia, or shin-bone, and extending from the knee to the ankle. It is composed of a slender 4-sided shaft and 2 larger extremities. Ligaments fastened to a roughened surface bind this bone to the tibia. The outer projection of the ankle, known as the 'external malleolus,' is a downward projection of the lower end of the F. This extremity articulates with the astragalus, and the upper or head with the upper portion of the tibia. In severe sprains of the ankle the tip of the external malleolus is sometimes fractured by the pull of the external ligaments. See also under LEG.

2. (Lat., from *figere*, to fasten), an antique clasp, buckle, or brooch. Fibulae

ANGLO-SAXON FIBULA
Silver set with garnets

or safety-pin brooches were known in the Mycenaean age, which is pre-Homeric. They are among the most common relics of prehistoric and early historic antiquity, and the study of their form and decoration is of great importance to the archaeologist. For the development of the brooch from medieval times until the present day, reference should be made to any standard work on costume and jewellery. See BROOCH.

Fichte, Immanuel Hermann von (1797-

Fichte

—, b. Jena; lectured at the Univ. of Bonn from 1818, and afterwards was ap- to a chair in Tübingen. In his *der Ethik*, 1850-3, and his *Pay-* 1864-73, etc., he tries to reconcile Herbert and Hegel. Disliking the pan- theism of the latter, he was drawn rather towards the theism of Kant.

See also Baumgarten Hermann, *Die Philosophie Immanuel Hermann von Fichtes*, 1928.

Fichte, Johann Gottlieb (1762-1814), Ger. philosopher of Swedish descent, b. Rammenau, Upper Lusatia. His early precocity aroused the interest of a local dignitary, Baron von Miltitz, who gave him an excellent education; and after passing through Pforta, where he read Lessing and Goethe, he entered Jena Univ. to study theology. He was now self-dependent, and the next few years found him occupied in private teaching and writing. In 1788 he became a tutor at Zurich, but this relief was short-lived, and settling at Leipzig he was compelled to turn again to literary hackwork for a livelihood. About this time he first studied Kant—an important event in his mental development, which thoroughly reversed the fatalistic tendencies shown in his early *Aphorisms on Religion*, 1790, the result of reading Wolff and Spinoza at Jena. He even commenced a 'popular version' of Kant's *Critique*, but this was left unfinished. Shortly after this, he made Kant's personal acquaintance and submitted a treatise, *A Critique of Revelation*, which Kant approved so highly that he secured its pub. in 1792; and F. was at once acclaimed as a significant philosophical force. This success enabled him, in 1793, to marry Johanna Maria Rahm, to whom he had become engaged at Zurich 3 or 4 years before; and for the next few months he remained in Switzerland, studying and developing Kantian ideas and principles. In 1794 he secured the chair of philosophy at Jena, and won immediate recognition and renown for his brilliant lectures. These early lectures formed the nucleus of the Fichtean system, and in the same year he pub. 3 vols. on the *Theory of Knowledge*. His practical philosophy was given in the *Founda- tion of the Laws of Nature*, 1796, and the *System of Moral Philosophy*, 1798, his most important work. Meanwhile, from 1795 to 1798 he had been joint editor of the *Philosophical Journal*, and had incidentally become the friend of Goethe, Schiller, Schelling, the Schlegels, Tieck, and Novalis. But in 1798 trouble arose through a paper pub. in that jour., and the following year F. had to resign from Jena, charged with atheism and disowned by Kant. The rest of his life was mostly passed in Berlin with the Schlegels and Schleiermacher: the chief literary results being the *Vocation of Man*, 1800, the *Exclusive Commercial State* (a socialist thesis), 1800, and *The Way to a Blessed Life*, 1806. In 1810 he was appointed rector at the new Berlin Univ.

With the exception of his lectures on transcendental logic, 1812, none of his subsequent work covers any important fresh ground; but during the struggle for national independence he earned some distinction as a patriotic lecturer, 1813. F.'s philosophy, known as subjective idealism, aimed at a complete exposition of the fundamental laws and principles which govern cognition. He contends that subject and object are absolutely identical and that the individual ego, the human mind, is non-existent apart from the absolute ego, the divine and infinite spirit of all things, God. 'Knowledge is not merely knowledge of itself, but of being, and of the One Being, God, that really is.' All realities, animate, and inanimate, are but sensuous phenomena, material expressions of their essential divine idea, and they have no separate existence, but are the product of the human soul, divinely inspired. The majority of men live in relation to the superficial appearances of things, ignorant of their divine essence; it is for the philosopher and the man of letters to discover and interpret the fundamental spiritual ideas, of which the appearance is merely a vesture. F.'s influence on philosophy and literature has been enormous; Hegelian idealism and Emersonian transcendentalism are considerably indebted to him, both for idea and for idiom of expression, whilst Schopenhauer's writings are almost wholly evolved from F.'s later works. Besides his more esoteric philosophical works, he wrote sev. of a popular cast, including *The Nature of the Scholar* and *The Characteristics of the Present Age*. He died during the War of Independence, having caught a fever which his wife had contracted while nursing the wounded. His collected works were pub. by his son I. H. F., 1845-6. See M. Weber, *Fichtes Sozialismus und sein Verhältnis zur Marx'schen Doktrin*, 1900; G. H. Turnbull, *The Educational Theory of Fichte*, 1926; and life by E. Bergmann, 1928. See HEGEL; IDEALISM.

Fichtelgebirge (pine mts), a nat system of Bavaria (q.v.), on the Czechoslovak border; it forms the nucleus of 3 mt ranges, the Erzgebirge, Frankenwald, and Forest of Bohemia (q.v.). The highest summits are the Schneeberg, 3461 ft, and the Ochenkopf, 3334 ft. The mts were once covered with pines. The geological formation is chiefly granite, slate, gneiss, and basalt; the minerals obtained are iron, sulphur, lead, and copper. Marble and stone are quarried, charcoal is burnt, and there are forges and blast furnaces. There are extensive tracts of forest land.

Ficksburg, tn of South Africa, in the Orange Free State, on the Caledon R. (q.v.), an agric. centre (wheat, oats, rye, potatoes, malt, fruit). F. is the centre of the 'Conquered Territory'; there are many Bushman paintings in the neighbourhood. Pop.: Whites, 3138; Bantu, 3826; Coloureds, 164.

Fiction, see NOVEL.

Fiction, Legal, some fact, state of things, or proposition assumed to be true by the

law & avowedly for the purposes of justice or convenience. F.s in law, though often ridiculous enough, have generally had their origin in some defect in the existing laws or course of procedure, and have in a measure exemplified the desire of judges or other interpreters of law to make the law, in particular cases where some change was necessary, conform to the general and progressive opinion of society. Many F.s, far from being injurious, have been highly beneficial, and have paved the way to legislative remedy. Social necessities, says Maine (*Ancient Law*), and social opinion are always in advance of law. Law is static, most societies progressive, and Maine thinks that legal F.s were historically the first agency by which law was brought into harmony with society. But in this sense of the relation of F. to the evolution of law, Maine uses the term to signify any 'assumption which conceals or affects to conceal the fact that a rule of law has undergone alteration, its letter remaining unchanged, its operation being modified.' In this wider signification the term embraces not only F.s in Eng. law and Rom. law, but the whole of Eng. case-law (Bentham's 'judge-made law'), and the Rom. *responsa prudentum* (answers or opinions of jurists of repute), as resting on a fictitious basis. It is a jurisprudential commonplace that the law is constantly and more or less imperceptibly changed by judicial decisions, although all decisions profess to do no more than apply settled principles to new facts; and similarly with the authoritative answers of the ant. Rom. jurists. A good instance of the utility of a legal F. in Rom. laws was that of adoption, which overcame the narrow caste nature of a legal *familia* by permitting the family tie to be artificially created by adoption or arrogation. Some instances of F.s in Eng. law are: the proposition that husband and wife are one; the assumptions in ancient writs for such purposes as those of *quo minus* by which the Exchequer Court (q.v.) obtained its common law jurisdiction, and *vi et armis* by which the King's Bench court usurped much of its jurisdiction (see QUEEN'S BENCH DIVISION); the suppositions involved in *fines and recoveries* (q.v.); and the assumption of the existence of the 2 legendary and much ridiculed litigants 'John Doe' and 'Richard Roe,' with the object of applying the readier process of an action of ejectment to the trial of questions relating to title to land.

Ficus, genus of Moraceae, chiefly indigenous to tropical forests, and containing species with widely diverse characteristics. *F. carica*, the fig-tree of commerce, a native of Asia Minor and Syria, is now found in a wild state in the countries bordering on the Mediterranean. The fruit of the wild variety has not the succulence of the cultivated kinds. *F. elastica* is the indiarubber tree, and is frequently cultivated in small pots; *F. religiosa*, the peplu, or sacred tree of the Brahmans and Buddhists, yields a gum resembling caoutchouc; *F. bengalensis* is the banyan, and yields an inferior rubber, the bark and

roots also furnishing a coarse rope-fibre. *F. pumila* is the climbing fig of China.

Fidei-commissum, in civil law (q.v.), denotes a trust. Scots legal writers generally refer the origin of their law of trusts and trustees to the Rom. conception of a F. In Rom. law a F. was an informal bequest or devise made to the heir or legatee (who in such a case was called the *fiduciarius*), with a request attached to it that the *fiduciarius* or trustee should deliver the property to some named person who was incapable of taking directly under the will (the *fidei-commissarius* or beneficiary). At first the rights of the beneficiary were unenforceable and could only be made good by entreaty. The Emperor Augustus, supported by the propaganda of literature and inspired by a revival of religion which led to the supplanting of secret foreign rites, estab. a system which made F.-commissa obligatory on the trustee, and appointed a special magistrate, the praetor F.-commissarius, to compel the trustee to carry out his obligations. For the most part F.-commissa were created by means of codicils (q.v.). Eng. legal historians, generally, are of the opinion that the lord chancellors (q.v.) borrowed the doctrine of the Eng. use (see USES) from the Rom. law of trusts.

Fidei Defensor (Lat. 'Defender of the Faith'), title conferred on Henry VIII by Pope Leo X to mark the Church's appreciation of a pamphlet which Henry had written defending the papacy against Luther's attacks on it. It was granted in 1521, and was subsequently confirmed by parliament and accorded to every Eng. sovereign since. It still appears on the coins of the realm.

Fidelity Guarantee, a form of insurance for the benefit of employers by which they are indemnified against loss through the fraud or dishonesty of their employees. The rate of premium for individual guarantees varies from 5s. per cent to as high as 40s. per cent, according to the duties of the employee concerned and the amount for which he is guaranteed. Often all the employees of a firm are guaranteed under one floating policy, in which case the names of the individual employees are not required. There is no fixed rate of premium for floating policies, as each is rated on its merits. The prin. F. G. companies are the Guarantee Society Ltd., who originated this form of insurance in 1840, Ocean Accident, Guardian, etc. See also INSURANCE.

Fidenae, anct. tn of Latium, 5 m. N. of Rome in ter. disputed in early times by the Romans and Veientes. It was destroyed by the former in 438 BC, but rebuilt on account of its strategic position. In classical times F. was merely a post-station.

Fidenza (Rom. *Fidentia*; later *Borgo San Donnino*), It. tn. in Emilia-Romagna (q.v.), on the Stiro, 14 m. WNW. of Parma (q.v.). It suffered severely during the Second World War, and among the buildings damaged was the beautiful cathedral (partly 12th-13th cent.). Glass

is manuf., and silk and hemp are spun. Pop. (tn) 12,200; (com.) 17,800.

Fides, goddess of fidelity. Numa Pompilius was said to have instituted her festival and built a temple to her on the Capitol. She was represented as a matron wearing a wreath of olive or laurel leaves, and carrying a basket of fruit.

Fiduciary Issue. In banking language, a F. I. is that part of an issue of bank notes that is not backed by gold actually held by the bank. As the word F. implies, it is an I. made on the 'faith' of people in the reputation of the bank. In this sense all bills of exchange, cheques, and promissory notes are 'fiduciary' in so far as the assets behind them are undisclosed. From the time the Bank of England lent its original capital to the nation, thus commencing the national debt, the extent of its F. I. has been regulated by the gov. The Bank Charter Act of 1844 fixed the F. I. at £14 million. During much of the 19th cent., while Britain was on the gold standard, the F. I. was only a very small part of the total I. of banknotes. In 1914 it had risen to only £18 million. In 1939, 8 years after Britain left the gold standard, the F. I. had risen to some £300 million, but this was still only about a third of the total I. of banknotes. The war and post-war financial measures revolutionised the position, and in 1956 all but £500,000 of the total note I. of over £1900 million was F. See PAPER MONEY.

Fief, or **Fee Law**, first meant an estate held in trust, on condition that the person holding it rendered personal or other service to the lord who granted it. There were 3 varieties of tenure, free, base, and religious. The first consisted in following the lord of the land to battle; the second was held in virtue of those services which more menial vassals did for their immediate superiors; and the last was held by virtue of masses said by the priests to whom the land was granted. See ENTAIL and FEUDALISM.

Field, Cyrus West (1819-92), b. Stockbridge, Massachusetts. At 15 he was a clerk in a store, and in 1840 started a paper business for himself at Westfield, in which he was so successful that he was able to retire in 1853. He became interested in a trans-Atlantic telegraph cable, and, having enlisted the sympathy of Peter Cooper and other Amer. capitalists, organised the New York, Newfoundland, and London Telegraph Company in 1854, and the Atlantic Cable Company in 1856. The cable was completed by 1858 and was hailed with delight, but it was not in proper working order until 1866. He also interested himself in the New York elevated railroad.

Field, David Dudley (1805-94), Amer. lawyer, b. Haddam, Connecticut. He took his degree at Williams College in 1825, and was admitted to the Bar in 1828. After a special study of England's legal system he worked throughout his life for the codification of the common law and procedure of America. His pamphlet on the reorganisation of the judiciary led to

his appointment as chairman of a state commission for the revision of practice and procedure, and the resultant civil code (1857) was adopted in 24 states and the criminal in 18; while the civil code of procedure was adopted in England—though not until 1873. He became head of a state commission in 1857 for the ambitious plan of reducing the whole *corpus juris* of the state into a written systematic code; but the codification was only adopted in small part, though it has often served as a model for Amer. codes. His pub. were *The Reorganisation of the Judiciary*, 1846, and *Draft Outlines of an International Code*, 1872.

Field, Eugene (1850-95), Amer. journalist and poet, b. St Louis, Missouri. He studied at Williams and Knox Colleges, and the univ. of Missouri. He wrote for various papers, but made his reputation when he became connected with the *Chicago News* in 1883. He is, however, chiefly known by his poems of childhood, among which 'Little Boy Blue' and 'Wynken, Blynken, and Nod' are favourites. His prin. works are: *A Little Book of Western Verse*, 1889; *With Trumpet and Drum*, 1892; and *Love Songs of Childhood*, 1894. See study by C. H. Dennis, 1924.

Field, Frederick (1801-85), divine, b. London, a direct descendant of Oliver Cromwell, of which fact he was very proud. He was educ. at Christ's Hospital and Trinity College, Cambridge, and became a fellow of his college in 1824. In 1839 he ed. Chrysostom's *Homilies on St Matthew*, and in 1842 he was presented by his college to the rectory of Reepham, in Norfolk. It was here he ed. Chrysostom's *Homilies on St Paul's Epistles* between 1849 and 1862. In 1863 he resigned his living and devoted his time to an ed. of the fragments of Origen's *Hexapla*, which was pub. in 1874.

Field, Sir Frederick Laurence (1871-1946), adm., b. He was in charge of the torpedo and signal schools of Portsmouth. Flag-captain of H.M.S. *King George V* and Director of Torpedoes during the First World War. Commodore and chief of staff to Adm. Madden. Third Sea Lord, 1920-3. He was deputy chief of the naval staff, 1925-7, and First Sea Lord and chief of the naval staff in succession to Adm. Madden.

Field, John (1782-1837), Irish pianist and composer, b. Dublin, was forcibly taught by his father and grandfather, and appeared at a public concert at the age of 10. After the family's removal to London he first played there in 1794 and was apprenticed to Clementi, who, while teaching him, employed him at his piano warehouse to show off the instruments. In 1802 Clementi took him on a tour to Paris, Germany, and Russia, and in 1803 F. settled in St Petersburg as piano teacher and began to be very successful there and in Moscow as performer and composer. In 1832 he reappeared in London and the next year made an extensive continental tour. But he gave way to drink and sank into poverty.

After a miserable 9 months in hospital at Naples he was rescued by a Russian family, only to die in Moscow soon afterwards. He wrote 7 piano concertos, a little chamber music, 4 sonatas, and sev. pieces for piano in an individual style somewhere between Hummel and Chopin, both lyrical and brilliant; but his most important contribution are the 18 *Nocturnes*, both the manner and the title of which he originated, and which were the direct model for those of Chopin.

Field, Michael, joint pseudonym of Katharine Harris Bradley (1848-1914), b. Birmingham, and Edith Emma Cooper (1862-1913), b. Kenilworth, Warwickshire. Katharine B. was educ. at Newnham College, Cambridge, Paris, and Univ. College, Bristol. She educ. Edith C., her niece, who lived with her from the age of 4, and subsequently they worked together in such close affinity that their productions can only be regarded as if they were by a single author. Imbued with a keen sense of beauty and a fine writing touch they pub. many poetic tragedies and 8 vols. of verse. The

works include, 1890, *Eclogues of Adoration*, 1912, and *Mystic Trees*, 1913. *Works and Days*, 1933, contains extracts from their jour. In 1907 they both became Rom. Catholics. See M. Sturgeon, *Michael Field*, 1922.

Field, Nathan (1587-1633), actor and dramatist, b. London. One of the comedians of the Children of the Queen's Revels, he acted in plays by Ben Jonson and Chapman. He himself was the author of 2 plays, *A Woman's a Weathercock*, 1612, and *Amenitis for Ladies*, 1618, which retracts the charge. He is thought to have collaborated with Massinger in *The Fatal Dowry*, 1632, and also in some of Beaumont and Fletcher's plays. His plays were ed. by W. Perry, 1950.

Field, William Ventrils, 1st Baron Field of Bakenham (1813-1907), judge. From 1830 to 1840 he was a member of a firm of solicitors, then entered the Inner Temple. Called to the Bar, 1850, appointed judge of the Queen's Bench, 1875. On supreme court rules coming into force in 1883, F. was appointed by the lord chancellor to sit in chambers continuously for nearly a year, to estab. a uniform practice. F. decided some very important cases—notably *Sharp v. Wakefield*, which laid down the principle of unfettered magisterial discretion in renewal of drink-licences.

Field, term in heraldry for the tintured ground on which armorial bearings are displayed. See HERALDRY.

'Field, The,' originated by Robert Smith Surtees and first pub. by Bradbury and Evans as a sporting weekly on 1 Jan. 1853, with Mark Lemon as editor. Leech and Hablot Browne were among early sporting artists. It took a leading part in starting dog shows and field trials, and in the development of the shot gun, and sponsored the research for a preventive for dog distemper. To-day it is an

illustrated country newspaper and authority on hunting, shooting, game preservation, fishing, racing, equestrian, polo, farming, gardening, natural hist., dogs, games, and country pursuits. Owned by the Harmsworth Press Ltd., and ed. by Wilson Stephens.

Field Artillery, see ARTILLERY.

Field-glass, instrument used for viewing objects at a distance, composed of 2 telescopes, which are identical in construction, placed parallel to one another. It is easy to use and does not strain the eyes like some telescopes, indeed it has the advantage over the telescope in that it allows the use of both eyes. It is of great value to travellers, soldiers, and sailors, and is almost universally employed by the navy in place of the long telescope used in Nelson's time. There are 2 kinds of F.s, the Galilean type and the prismatic. The Galilean, which is the ordinary F., consists of 2 lenses, an object-lens and an eye-lens; the object-lens is convex, and the eye-lens concave. It was Porro, an It. engineer, who discovered that the usual reversing lenses in a telescope could be replaced by a combination of prisms, but these could not be used until a suitable medium was found, owing to the great absorption of light. The prismatic F. was introduced in 1898, and is now in general use. Of this there are sev. varieties: the special one used by the field naturalists has extending arms which place the object glasses above the head, thus enabling the person using them to keep out of sight; the object-lenses, too, can be placed at any angle. The modern glass is made of magnalium with mountings of horn for the eye-pieces, and each eye-piece can be adjusted to suit each eye, and there must be 2 prisms in each tube. It is made in 3 different powers, magnifying 3, 6, or 12 diameters. The first is used for objects at a short distance, while the last, which does not cover such an area of view, is of great service to soldiers and naturalists.

Field-Marshal, the highest rank in the Brit. Army, was introduced by George II in 1736. Between 1736 and 1956 123 Brit. F.-M.s were created. Of these, 16 were either sovereigns or other members of the royal family, 8 were foreign sovereigns, and 1 (Marshal Foch) was a Fr. citizen.

The appointment of F.-M. rests with the sovereign and the rank may be conferred without reference to seniority. F.-M.s are presented with a baton as a symbol of office, and they remain on the active list until death. See W. C. Rundle, *The Baton*, 1950.

Field-mouse, name given to sev. species of rodents, which are allied to the ordinary mouse, the vole (q.v.), etc. *Apodemus sylvaticus*, the wood-mouse, is a great pest in fields and gardens, and hoards large quantities of grain.

Field of the Cloth of Gold, name given to the place between Guines and Ardres, France, where Henry VIII met Francis I in June 1520. Henry meant to make a great impression in Europe, and spared no pains to make the scene as magnificent as

possible. A treaty signed between the 2 kings was of little real significance.

Field-officers, in the Brit. Army, are those which rank above a captain, but below a general, viz. majors, lieutenant-colonels, and colonels. The captains, lieutenants, and sub-lieutenants are called company officers. See OFFICERS.

Field Research, see ARCHAEOLOGY.

Field Spaniel, see SPANIEL.

Fielden, John (1784-1849), politician, b. Todmorden, Lancs. As a boy he worked in his father's factory, and became M.P. for Oldham in 1833. He was a keen supporter of the Ten Hours Bill which became law in 1847. He also took an active part in the agitation for parl. reform, and was, like Cobbett (q.v.), very much against paper money.

Fieldfare, or *Turdus pilaris*, belonging to Turdidae, the thrush family, a familiar winter visitor to the Brit. Isles and central Europe. It is gregarious in habit, and finds its summer homes in the birch forests of Norway, Sweden, and Russia. The nest of the F. is of long fine grass with an intervening layer of mud; it may be built in birch or fir trees at an elevation of 15 ft, and has occasionally been seen quite near to the ground. This bird feeds on berries in hard weather, but also travels in flocks over the fields in search of slugs and other animal food. The plumage varies from ashy-grey to chestnut-brown, the underparts being a rich ochre, spotted with black.

Fielding, Anthony Vandyke Copley (1787-1855), water-colour landscape painter, was the pupil of John Varley. In 1810 he became an associate of the Water-Colour Society and contributed largely to its exhibitions. In 1813 he was a full member, and was made president in 1831. His works are clever but slight, his best pictures being sea-pieces and aerial effects. There is a collection of his drawings in the Victoria and Albert Museum, South Kensington, London.

Fielding, Henry (1707-54), novelist, b. Sharpsham Park in Somerset, son of Gen. Edmund F.; he was a second cousin of Lady Mary Wortley Montagu. Educ. at Eton, where he was contemporary with Pitt and Fox, he studied law for a short time at Leyden. He returned to London in 1728 and for some years led a dissipated life and began a long dramatic career by the pub. of *Love in Several Masques*, which was played at Drury Lane. Sev. comedies and farces followed, and his burlesque, *Tom Thumb*, 1730, is said to have evoked a laugh from Swift, who only laughed twice in his life. In 1735 F. married Charlotte Bradock and bought the little Fr. theatre in the Haymarket, where he produced *Pasquin*, 1736, and *The Historical Register*, 1737, but the Licensing Act of 1737 put an end to his career as a dramatist. After a brief experience as a theatre lessee, he studied law at the Middle Temple and was called to the Bar in 1740. Literature, however, was his main preoccupation, and in 1742 he came to the front with *The History of the Adventures of Joseph Andrews and of his*

friend Mr Abraham Adams. This was begun as a burlesque of Richardson's *Pamela*, but soon outgrew its original conception as the story developed. The chief character in the book is Parson Adams, who is a 'noble example of primitive goodness and childlike Christian altruism.' In 1743 appeared 3 vols. of F.'s *Miscellanies*, the 3rd of which contained his strange *History of the Life of the late Mr Jonathan Wild the Great*, a satirical work which places F. second to Swift in ironic power. After his wife's death he turned again to the law, but in 1745 he was once more engaged in literature as editor of the *True Patriot* and

HENRY FIELDING

afterwards of *The Jacobite's Journal*. In 1747 he defied convention by marrying Mary Daniel, who had been his first wife's maid and the nurse of his children, and who proved a faithful helpmeet to him. He was made a justice of the peace in the following year, and was an upright and efficient magistrate. His *Inquiry into the Increase of Robbers*, 1751, with suggested remedies, led to beneficial results. In 1749 his greatest novel, *The History of Tom Jones*, appeared; this was popular from the very first, and was praised by Hazlitt and Coleridge, and by Byron, who calls its author 'our prose Homer.' In 1752 *Amelia* was pub.; the plot of this is inferior to that of *Tom Jones*, but the descriptions and characters are very fine. He founded, conducted, and was the chief contributor to the *Covent-Garden Journal*, 1752. Journalism and his duties as a justice of the peace occupied much of his time from 1750 to 1754, when ill-health forced him to go abroad to Lisbon, where he d. and was buried. After his death his *Journal of a Voyage to Lisbon* was pub., 1755.

Scott styles him 'the father of the English novel.' In both *Joseph Andrews* and *Tom Jones* F. outlined his ideas on the proper constitution of the novel, pruned of mere didacticism, but informed with a critical spirit and built on a philosophy of life. He conceives the novel as a type of epic, which, like drama, may be either tragic or comic. In associating his comic novel, *Joseph Andrews*, with the epic, it is evident that he was thinking more of the narrative form than the content of epic. There is a less remote analogy between his most typical novel, *Tom Jones*, and drama, not only in structure but in the new prominence given to dialogue—a prominence which was destined to have a most marked influence on the development of the Eng. novel. The aim of F.'s realism, unlike that of Defoe, who employs it to give readers the illusion of recorded facts, is to convey a general impression of life. Unlike the novels of Richardson, F.'s contain no emotional crises. Yet in the hist. of the evolution of the modern novel the names of F. and Richardson are inseparable. Both his and Richardson's novels differ not only from those of Defoe (who shares with both the title of 'father of the English novel') but from those of all their predecessors in one essential feature, which is best expressed in F.'s own words: 'It hath been thought a vast commendation of a painter to say his figures seem to breathe; but surely it is a much greater and nobler applause, that they appear to think.' If to Richardson we owe the note of sentiment, F. may claim to have introduced the note of humour. In analytical force and subtlety F. may be inferior to his contemporary, but his was the fresher and more vigorous mind. He attempted to paint a picture of human life as he saw it, and in reproducing the broad features of town and country life in the mid-18th cent., he is unsurpassed. There are eds. of F.'s collected works by L. Stephen, 1882; G. Saintsbury, 1893; E. Gosse, 1898-9; and W. E. Henley, 1903. See Sir W. Scott, *Lives of the Novelists*, 1825; A. Dobson, *Fielding*, 1883; G. M. Godden, *Henry Fielding: a Memoir*, 1910; H. K. Banerji, *Henry Fielding, Playwright, Journalist, and Master of the Art of Fiction*, 1930; B. M. Jones, *Henry Fielding: Novelist and Magistrate*, 1933; M. P. Willcocks, *A True-Born Englishman*, 1948; E. Jenkins, *Fielding*, 1948; and F. H. Dudden, *Henry Fielding, his Life Works, and Times*, 1952.

Fielding, William Stevens (1848-1929), Canadian statesman, originally a journalist, b. Halifax, Nova Scotia. He was for 20 years connected with the *Halifax Morning Chronicle*. Entering politics, he became premier of Nova Scotia in 1884, and in 1896 was minister of finance in Laurier's gov. In this capacity he was charged with the readjustment of the Canadian tariff. He was a member of the Brit. royal commission on trade between Canada and the W. Indies, 1909-10, a governor of Dalhousie Univ., and Canadian delegate to the League of Nations Assembly, 1923; privy councillor, 1923.

Fields, Grace (1898--), variety actress, b. Rochdale, Lancs. Real name Grace Stansfield. She joined a troupe when only 7 years of age, went into a cotton mill, and began as a vocalist in a Rochdale cinema, 1906. Her first London appearance was in 1915 at the old Middlesex Music Hall in a revue *Yes, I Think So*, brought from Manchester. A revue, *It's a Bargain*, with Archie Pitt (whom she married in 1923), ran for nearly 3 years. Their next revue, *Mr Tower of London*, ran for 7 years (1918-25). Appeared with Sir Gerald du Maurier in *SOS*. In 1940 she married Monty Banks (d. 1950), and in 1952 Boris Alperovici. She has entertained at 7 royal command performances, and has won great popularity, both through her burlesques and her private generosity.

Fields, William Claude (real name Dukinfield) (1879-1946), actor and comedian, b. Philadelphia, son of a London cockney whose family had emigrated to America in the late 1870's. Before coming to the cinema, F. had a long career in vaudeville and music hall. He collaborated on the scripts of a number of his films under the name of Charles Rogie. His main films were *If I Had a Million*, *It's a Gift*, *David Copperfield* (in which he played Mr Micawber), *Mississippi*, and *My Little Chickadee*.

Fieri Facias, see EXECUTION.

Fiery Cross, anct summons to arms which was used in Scotland and sent by messengers from place to place. The token was made of wood, generally in the form of a cross, which was first set on fire and then dipped in the blood of a goat. It was employed by the Highland chiefs on special occasions, especially in time of war, to summon the clan as quickly as possible. Roderick Dhu, in Scott's *Lady of the Lake*, used the F. C. to summon his clan to battle.

Fiescho, Sinnibaldo, see INNOCENT (ponces). *Innocent IV*.

Fiesole, Giovannida, see ANGELICO, FRA.

Fiesole (anct *Faesolae*), lt. tn, in Tuscany (q.v.), finely situated on a hill 3 m. NE. of Florence (q.v.). It was an important city in Etruscan (see ETRURIA) and Rom. times; from 63 to 62 BC it was the H.Q. of Catilina (q.v.). In the Middle Ages it was eclipsed by the rise of Florence. It has immense walls, a well-preserved Rom. theatre, and other antiquities include Rom. baths and Etruscan and Rom. tombs and sculptures. The cathedral is partly 11th cent. Straw goods are manuf. Pop. (tn) 5400; (com.) 12,200.

Fife, Alexander William George Duff, Duke of (1849-1913), son-in-law of King Edward VII. From 1874 to 1879 he represented Elgin and Nairnshire in parliament. He succeeded his father as 6th earl of F. in 1879, and was created duke of F. in 1889 on his marriage to the princess royal, Princess Louise Victoria Alexandra Dagmar, eldest daughter of the future Edward VII, by whom he had 2 daughters.

Fife, a maritime co. of Scotland,

forming a peninsula on its E. coast, between the Firths of Tay and Forth. It was originally Pictish ter., and has long been known as the 'Kingdom of Fife'. The R. Eden flows through the length of the co. into St Andrew's Bay, and waters the large and fertile valley of Stratheden and the Howe of F. immediately E. of the Lomond Hills, while the R. Leven flows from Loch Leven through the industrial area of the co. to the Forth near Levenburgh. F.'s highest hills are E. Lomond, 1417 ft, and W. Lomond, 1713 ft. Agriculture is extensively carried on, and there are valuable coal-mines; limestone, sandstone, ironstone, and shale are also worked. The prin. manuf. is linen, which is carried on at Kirkcaldy and Dunfermline, and Kirkcaldy is also famous for its oilcloth and linoleum. Brewing, tanning, ironfounding, engineering, and shipbuilding are important, and most of the coast tns take part in fishing. The chief tns are Cupar (the co. tn), Dunfermline, St Andrews (with a univ. founded in 1411), and Kirkcaldy. The burghs of Dunfermline and Kirkcaldy, and the 2 co. divs., E. F. and W. F., each send 1 member to parliament. Area 504 sq. m.; pop. 306,855.

Fife, musical instrument similar to flute, but which generally has only 1 key. It

FIFE

has a compass of about 2 octaves, and is usually pitched in Bb or C. Only simple melodies can be executed on it, and it is generally played with the drum. The army drum and F. bands were very popular. See FLAGEOLET; PICCOLO; FLUTE.

Fifth Column, term that had its origin in the Sp. Civil war, being credited to the Nationalist gen., Mola, who said, when he was beleaguering Madrid: 'I have four columns operating against Madrid and a fifth inside composed of my sympathisers.' The Germans, in the invasion of Poland, Norway, the Low Countries, and France (1939-40), had elaborated the use of F. C. activity into an essential part of the technique of invasion. By long and insidious efforts they had weaned elements of these countries to the Nazi political faith, and Nazis of Ger. descent had obtained various apparently orthodox posts in the ters. of their intended victims, so that, when the actual invasion was launched, the campaign was already half-won. Thus it is evident that the term may connote, as in the case of the Sp. Civil war, a mere supporter of one particular faction of his own fellow-countrymen, whereas, in the evolution of the Ger. technique, it meant nothing less than a traitor or spy. One of the most infamous traitors in the Second World War was Quisling (q.v.), the Norwegian betrayer of Oslo, whose name rapidly became a synonym for a F. columnist in its

worst connotation. During the invasion of the Low Countries in May 1940, the Dutch were betrayed at The Hague by Ger. civilians resident in Holland, while over a hundred Ger. and Dutch Nazis took possession of strategic points in the centre of the city. In Rotterdam the Germans succeeded, with the help of the F. C., in occupying the stock exchange in the heart of the city and the marine barracks, well in advance of the actual invasion of the city. In Belgium, the Rexist leader, Degrelle, lent the support of his party to the Germans. F. C. activities played some part in the rapid collapse of Fr. morale in June-July 1940, though the truth was that a large section of the bourgeoisie had been undermined for many years previously by quasi-Fascist tendencies, not so much through any real sympathy with their hereditary enemies, as out of a fear of the predatory intentions of the Communist elements in France. At the time of the Second World War, there seems little doubt that fear exaggerated the importance of the F. C. Most authorities have since agreed that its value was less great to the Germans than was thought at the time.

Fifth Monarchy Men, religious sect in England in the time of Cromwell, with adherents among many soldiers in the parl. army, who believed in the imminence of the millennium, or 'fifth monarchy,' during which Christ should reign on earth. They advocated a code of law based on that of Moses, and when they saw their hopes not likely to be fulfilled turned against Cromwell. Their leaders were arrested, but after the Restoration the sect again gave trouble; the insurrection of 1661 was suppressed, and Venner and 10 others were executed for high treason. Thomas Harrison (q.v.) was the most prominent of the F. M. M.

Fig (Lat. *ficus*), name given to the members of a genus of shrubs and trees of the family Moraceae. F.s are characterised by their pear-shaped receptacles which, by curving inward, form an almost perfect cavity, on the surface of which grow numerous flowers, the sterile and fertile being intermingled. They abound in tropical and sub-tropical regions, occur in about 600 species, and range in size from small trailing shrubs to huge trees, like the gigantic bo (*Ficus religiosa*) described by Emerson Tennent as growing near Anarajapoor, in Ceylon, and traditionally said to be one of the oldest trees in the world. The *F. rumphii* and the *F. religiosa* are deemed sacred by both Buddhists and Brahmins. The latter, called also the 'pepul' or 'bo,' is a large tree with heart-shaped leaves, and is cultivated in S. Asia. (See also BOTANY.) Casutobono is obtained in large quantities from the *F. elastica*, or India-rubber tree of the E. Indies—a tree remarkable for its pink buds and its great, shiny, oblong leaves, but, above all, for its gigantic roots, which group themselves snake-wise round the base. All over India the *F. benghalensis*, popularly

known as the banyan, flourishes and covers yearly an ever-increasing area with its vast canopy of foliage and branches. For each branch sends down its own root, which, growing to the surface, becomes in its turn the parent to new growths, and so both roots and branches multiply apace. The dessert fruit of commerce is grown from the *F. carica*, so called because, according to legend, the famous F. trees of Attica were originally imported from Caria in Asia Minor. In this species the leaves are deeply lobed in the cultivated tree; though often almost entire in the wild they grow alternate and are rough and deciduous. Single receptacles spring from the axils of the leaves, the numerous single-seeded pericarps being packed close

FIG

together inside. In colour the fruit varies from pale yellow to purple and bluish-black. 'Caprifiguration' was long since introduced as an artificial aid to fertilisation. Probably the F. is indigenous only in Asia Minor and Syria, spreading thence all along the Mediterranean. Cardinal Pole introduced it into England, where on S. walls it can be cultivated with success; and in the U.S.A. it is grown profitably as far N. as Pennsylvania. The S. of France, the Sp. peninsula, and Asia Minor supply most of the F.s for Great Britain, the best kinds being shipped from Smyrna. In the warmer climates there are 2 crops, one from the buds of last summer and the other and more plentiful crop from the spring shoots, which ripen in the autumn. In S. Europe and W. Asia F.s form an important article of food, being eaten fresh and also in the form of a mashed cake, whilst medicinally they are used for chronic constipation and also for gum-bolla. F. wine is also brewed. Before being shipped abroad the F.s are usually dried in the sun, or in ovens, being pulled and extended by hand during the process, after which they are compressed in wooden cases.

Fig Marigold, see MESEMBRYANTHEMUM.

Figaro, famous character of dramatic fiction, who made his first appearance in *Le Barbier de Séville*, 1785, and *Le Mariage de Figaro* of Beaumarchais. The word 'figaro' seems to have meant 'wig-maker' and to have been common to Spanish and Italian. Since Beaumarchais's time F. has become the type of ingenious roguery, intrigue, and cunning, who displays the utmost sang-froid in all his daring deceptions. He appears conspicuously in Mozart's opera, *Marriage of Figaro*, and Rossini's *Barber of Seville*, 1816, and is sometimes represented as a barber, sometimes as a valet de chambre.

'**Figaro, Le.**' Fr. daily newspaper, started about 1840 by Henry de Villemessant and his colleagues. It was not until 1866 that the paper appeared daily. The first jour. with this name, which was borrowed from Mozart's well-known opera, was pub. in 1826, and was in circulation till 1833. During its short life it counted Balzac, George Sand, Paul Leconte, and Jules Janin among its contributors. After the death (1879) of Villemessant, who had given L. F. a distinctly monarchical bias, the management passed into the hands of François Magnard, Périvier, and de Rodays. Its quieter tone, compared with the earlier issues, was largely due to the good offices of Magnard, who d. in 1894. Its present manager is Pierre Brisson. The paper increased its circulation to over 500,000 in 1957. Politically it is moderate right. Associated papers are *Le Figaro Littéraire*, *Le Figaro Agricole*, and *Le Figaro Sélection*.

Figeac, Aimé Louis and Jean Jacques Champollion-, see CHAMPOLLION-FIGEAC.

Figeac, Fr. tn, cap. of an arron., in the dept of Lot, on the Célé, in a deep valley surrounded by vine-clad hills. It has many ant. buildings. Aeroplane propellers are manuf., and there is an agric. market. Pop. 6900.

Fighig, or **Figig**, walled oasis, 6 sq. m., in the Sahara, 165 m. ESE. of Fèz, near the frontier of Algeria in SE. Morocco, occupied by Fr. in 1893. It is an entrepôt for the Timbuktu and Mecca caravans. Pop. 15,000.

Fighter, name given to aeroplanes whose specific purpose is, strictly, the antithesis of that of the bomber (q.v.), though there are fighter-bombers, and bombers are armed to defend themselves when attacked. Primarily the function of F. planes is to stop hostile bombers, reconnaissance and photographic aircraft from flying over one's own ter.; to fly over hostile ter. as escorts, protecting home-based bombers and photographic or reconnaissance aircraft operating over enemy ter.; to attack enemy aerodromes or carry out, single-handed, specialised raids on selected targets; while, in the Second World War, another important task was that of 'tank-busting,' using rocket missiles as well as guns and bombs. Historically, guns were first fitted to aeroplanes as early as 1910, when an armed Voisin biplane was displayed at the Paris Aero Show; but

there were no true F. aircraft in service at the outbreak of the First World War. Military aircraft were expected to be useful only for reconnaissance and their pilots were armed only with a revolver for personal defence.

The first aeroplane designed for air fighting was the 2-seat Vickers Gunbus of 1914 which had a 'pusher' engine behind its wings and a gun position in its nose, as no way was then known of firing a gun between the blades of a 'tractor' propeller. Then the Fr. pilot, Roland Garros, fixed a machine-gun in front of the cockpit of his single-seat Morane Scout, with metal plates on the propeller blades to deflect bullets that would otherwise have damaged them. This idea was also adopted on the Brit. Sopwith Tabloid Scout and these aircraft are regarded as the first true single-seat F.s.

Garros's idea was improved upon by Anthony Fokker, whose 'interruptor' gear timed the bullets to pass between the rapidly-turning blades. Fitted to his E. II monoplane, it gave the Germans temporary air superiority in France in 1915, until the Allied air forces introduced new types such as the Sopwith Camel, D.H.2, and S.E.5.

In the 1930's Brit. aircraft builders produced the famous Hawker series of biplanes constructed with steel tubing covered with fabric. Among these were the Fury and the 2-seater Demon. The F.s of this period were officially styled 'interceptors' from the assumption that their main duty was to take to the air and intercept hostile aircraft as soon as the latter were signalled from the coast. This purely defensive function was, however, too limited, and it was not long before a strongly offensive technique was worked out, largely through the initiative of Lord Trenchard. The first Hurricane came in 1935, and almost at the same time the first Spitfire. Revolutionary changes were introduced in these famous aircraft. They marked the return to favour of monoplane designs, and the interruptor and synchronising gear were abolished, with all their weight, complexity, and liability to accident and error. The guns—8 fitted in the wings—fired clear of the airscrew. In 1918 the Lewis and Vickers guns fired at the rate of 600 rounds a min. Spitfires and Hurricanes, at the opening of the Second World War, flew at 330–365 m.p.h. and fired their 8 guns at the rate of 1200 rounds per gun per min., or 160 rounds a sec. The supreme triumph of these Brit. F.s in the Battle of Britain (q.v.) is an epic in the hist. of the nation, and was perhaps the first occasion on which the course of hist. had been changed so drastically by air power. The armament of F. aircraft was increased first by replacing machine-guns with 20 millimetre (later 30 millimetre) cannon and then by adding air-to-air rockets, air-to-ground rockets, bombs, and napalm jellied-petroleum fire-bombs. To-day there are many different classes of F. aircraft, all of them propelled by jet and/or rocket engines. They

include high-speed single-seat F.s for day interception, 2-seat twin-engined all-weather interceptors, ground-attack F.s, long-range night intruder F.s for attacking targets of opportunity in enemy-held ter., reconnaissance F.s, and other specialised categories. The fastest F. in service in 1957 is the Amer. Lockheed F-104 Starfighter, capable of fighting at about 1400 m.p.h. It is armed with a Vulcan 20-millimetre gun which fires at the rate of 6000 r.p.m. and, like most modern F.s, has radar gun-sighting and aiming equipment.

Some of the all-weather types are flown automatically by 'homing' radar after the

'English Electric' photograph

A P.1 FIGHTER

This is powered by two Rolls Royce Avon jet engines.

pilot has brought them within a pre-determined distance of their target, by linking the radar with an automatic-pilot installation. Their guns or rocket missiles are fired automatically by the radar when within correct range. The next step, to a fully-automatic pilotless interceptor, may be only a short one. See also AEROPLANE. See C. G. Grey, *British Fighter Planes*. 1941.

Figueira da Foz, fishing port and seaside resort of Portugal, in Coimbra dist., on the Atlantic, 20 m. W. of Coimbra (q.v.). It stands at the mouth of the Mondego R., and has fish-curing, cement, and glass industries. Pop. 10,000.

Figueras, Sp. tn in the prov. of Gerona, in the fertile plain of El Ampurdán. It has an old citadel, and was damaged in the Civil war of 1936-9. Pop. 16,200.

Figueras, Francisce de (c. 1540-1620), Sp. poet, b. Alcalá de Henares. His comedies and pastorals reveal It. influence, and he was the first to use blank verse in Sp. poetry, modelled on the Ital-

ian. It was for his pastorals especially that his contemporary admirers gave him the ambitious title of 'Divine poet.'

Figurate Numbers, succession of series derived from any arithmetical series. The series derived from the natural numbers is obtained as in the following table:

	1, 2, 3, 4, 5, 6, etc.
1st order	1, 3, 6, 10, 15, 21
2nd order	1, 4, 10, 20, 35, 56

Here it is seen that the first order is obtained by adding 1, 2, 3, etc., terms of the natural numbers, the second order is obtained by adding 1, 2, 3, etc., terms of the first order, and so on. The numbers of the first order in the above case are called triangular, as equilateral triangles are formed with such numbers of points placed equal distances apart,

thus: . . .

etc. Square F. N. are the first order obtained from the series 1, 3, 5, 7, 9 . . . The first order is 1, 4, 9, 16 . . . and

may be represented by . . .

and so on. From the series 1, 4, 7, 10 . . . are obtained pentagonal numbers, 1, 5, 12, 22 . . .

These numbers owe their name to the fact that they may be represented by geometric figures.

Figure: 1. In geometry, a diagram drawn to illustrate a plane or solid shape.

2. In music, short phrase, especially one which assumes a distinctive character in the course of a composition by repetition or thematic use.

Figure of Speech, or **Figure of Rhetoric**, is a deviation from the ordinary use of words in order to obtain some special effect. See separate entries under ALLITERATION; ANACOLUTHON; ANADIPLOSIS; ANAPHORA; ANTICLIMAX; ANTITHESIS; ANTONOMASIA; APOSIOPESIS; APOSTROPHE; ASSONANCE; ASYNDETON; CHIASMUS; CLIMAX; EPIGRAM; EUPHEMISM; HENDIADYS; HOMOEOTELEUTON; HYPALLAGE; HYPERBATON; HYPERBOLE; HYSTERON PROTERON; INNUENDO; IRONY; LITOTES; MEIOSIS; METAPHOR; METONYMY; ONOMATOPOEIA; OXYMORON; PARADOX; PARALEIPSIS; PARAPROSODKIAN; PARONOMASIA; PATHETIC FALLACY; PERIPHRAISIS; PERSONIFICATION; PLEONASM; PROLEPSIS; PUN; REPETITION; RHETORICAL QUESTION; SARCASM; SIMILE; SYLLEPSIS; SYNECDOCHE; TAUTOLOGY; TMESIS; ZEUGMA.

Figured Bass, see THOROUGH-BASS.

Figurehead, figure, statue, bust, or other device attached to a ship's prow immediately under the bowsprit. Merchant vessels used to have timber volutes or scrolls in place of figures, but the fashion of F.s had largely gone out before the introduction of steamers, whose bows, therefore, were usually plain. The huge F. of the 'fighting Téméraire' and many belonging to other ancient battleships may still be seen at Millwall.

Figwort, name given to some species of *Scrophularia*, natives of Britain. *S.*

nodosa is the *F. S. scorodonia*, balm-leaved *F.*, and *S. vernalis*, yellow *F.*, all perennial herbs at one time used medicinally to alleviate the 'fig' or piles.

Fiji, Brit. Crown Colony, consisting of 322 is. between 16° and 19° S. on the 180th meridian. The cap. Suva, lies 1960 m. NE. of Sydney (Australia) and 1317 m. N. of Auckland (New Zealand). 106 of the is. are inhabited. The total land area of the colony is 7083 sq. m., the main is. being Viti Levu (4010 sq. m.), Vanua Levu (2137 sq. m.), Taveuni (167 sq. m.), and Kadavu (157 sq. m.). Temps. are seldom below 60° or above 90°. Average rainfall varies from 120 in. per year on the windward side of the is. to 60 in. on the leeward, with the result that there is marked variation from dense forest in wet zones to grass and scrub in 'dry' zones. Rain falls all the year round, but is generally heavier between Nov. and April.

Although Sp. navigators may have visited *F.* earlier, the usual date for the W. discovery of the group is put at 1643, when Abel Tasman (q.v.) happened upon some of the N. is. Capt. James Cook (q.v.) discovered some of the small S. is. in 1774; Capt. Bligh (q.v.) in the launch of the *Bounty* passed through the main group in 1789; Capt. Wilson of the missionary ship *Duff* visited the N. is. in 1797. A Russian commander, Fabian von Billingshanser, discovered the Ono-I-Lau archipelago in 1820. In 1827 and 1838 D'Urville (q.v.) made the first comprehensive chart of the group, but it was inaccurate. Two years after D'Urville's second visit, Commander Wilkes of the United States Exploring Expedition made the first reliable chart.

In the meantime traders, attracted by sandalwood and *bêche-de-mer*, had started to come to the group from Australia. A few Europeans settled and won the favour of the chiefs, mainly by virtue of their possession of firearms and their ability to use them. The 2 best-known characters of this period were a Swede named Charlie Savage, who gained importance in Bau, and an Irishman, Paddy Connell, who was in favour in Rewa. *F.* was divided into a number of chiefly domains of varying strength and status, with most of the lesser chiefs owing allegiance to one or the other of the 2 leading chiefs—Cakobau, whose H.Q. were on the small is. of Bau, not far from Suva, and Maafu, a Tongan chief, whose H.Q. were at Lomaloma in the Lau group. Cakobau held sway over most of Viti Levu and Maafu over Lau, Taveuni, and much of Vanua Levu. The hist. of the period is one of intrigue and petty wars between tribal groups, with Cakobau and Maafu each trying to maintain his area of influence rather than either coming into direct conflict with the other.

European traders began to settle in Lau—at Lomaloma and Lakeba—in the 1830's. The first Christian missionaries, Tahitians of the London Missionary Society, settled in Lakeba from Tonga in 1830 and were already at Onesta when

the Rev. David Cargill and the Rev. Wm Cross, of the Brit. Wesleyan Society, arrived in 1835. European settlement of Levuka, on the is. of Ovalau, also began in the early 1830's, and by 1861 there were 166 adult Europeans in *F.* Interest was growing in the group as a cotton-producing country.

In 1858 Cakobau offered the group to Britain in return for meeting a claim lodged against him by the U.S.A. for £9000. Britain, beset by the Maori wars in New Zealand, declined the offer. A subsequent offer to the U.S.A. drew no reply as America was in the midst of a civil war. Nor was Germany interested when asked to accord protection in 1872.

In the meantime, after 10 years of failure, Cakobau had succeeded in establishing a Fijian parliament in 1871. Most of the power was in the hands of a few Europeans. With Fijians disunited and Cakobau far from estab. as undisputed 'king' of the group, with the Europeans divided into conflicting groups, and with the general lack of administrative experience and ability, it is not surprising that the parl. system broke down. Finally, after some years of agitation both in Australia and in England, Britain accepted sovereignty of the is. in 1874. Levuka became the cap. of the new colony and remained so until 1882 when the seat of gov. was transferred to Suva.

The pop. of *F.* at the census of 1956 was 345,737, of whom 169,403 were Indians, 148,134 Fijians, 7810 part-Europeans, 6402 Europeans, 4422 Rotumans, and 4155 Chinese, most of the remainder being other Pacific islanders. Indian immigration began as indentured labour for the sugar industry. When indenture ended, many Indians remained as independent small farmers. To-day, Indians are also active in industry, commerce, public service, and the professions. Fijians mainly engage in agriculture on communal lands, but are increasingly taking gov. and private employment.

Chief exports are sugar (£8,264,000 in 1955); copra products (£2,971,000); gold and silver (£1,031,000); bananas (£376,690). The total value of exports in 1955 was £12,761,000. A new industry is manganese mining, exports of which in 1956 were expected to total £250,000. Imports totalled £14,373,000 during the year 1955. Prin. imports are food (£2,827,000 in 1955); manufactured goods, including textiles (£3,945,000); transport equipment (£2,591,000); fuel oil and lubricants (£1,346,000). Trade is mainly with the U.K. (37 per cent), Australia (17 per cent), New Zealand (12 per cent), and Canada (9 per cent). Trade with other parts of the Commonwealth totals 10 per cent. The tourist industry is estimated to earn £500,000 a year. (All the above figures are in *F.* currency: £F111 = £100 sterling.)

F. is administered by a Governor appointed by the Crown, assisted by an Executive Council and a Legislative Council. The Legislative Council consists of the Governor, a Speaker, the

Colonial Secretary, the Attorney-General, the Financial Secretary, 13 official members, and 15 unofficial members. Of the unofficial members 3 Europeans are elected and 2 nominated, 3 Indians are elected and 2 nominated, and 5 Fijians are selected by the Governor from a panel submitted by the Council of Chiefs. The Executive Council consists of the Governor as chairman, 3 *ex-officio* members—the Colonial Secretary, the Attorney-General, and the Financial Secretary—and other members appointed by the Queen or by the Governor on the instruc-

Tonga, Cook Is., Niue Is., Gilbert Is. (q.q.v.). From Suva flying-boats provide fortnightly connections with Samoa, Cook Is., and Tahiti (q.v.), and regular but less frequent flights to Nadi is linked by road and aeroplane with the international airport at Nadi (NW. Viti Levu). Nadi is on the regular air route between N. America and New Zealand and Australia. A coastal road runs 317 m. around the main is. of Viti Levu, and there are a further 350 m. of all-weather roads in the colony. Communications between the is. of F. are by small ship or by

Public Relations Office, Suva: Fiji official photograph

SUVA, FIJI

tion of the Queen acting on the advice of the Secretary of State for the Colonies.

In July 1948 it was announced that before deciding whom he would recommend to the Crown to fill 3 of the seats on the Executive Council, the Governor would ask the official European, Indian, and Fijian groups of the Legislative Council each to nominate one of their own number as a suitable candidate to be considered for appointment to the Executive Council. It was emphasised that this procedure did not confer an absolute right of choice on the unofficial members of the Legislature. The discretion vested in the Governor to submit to the Secretary of State the names of persons he considered fit for appointment to the Executive Council remained unimpaired.

The seat of gov., chief port, and commercial and light industrial centre is Suva (q.v.). There is good communication with the U.S.A., Canada, Australia, and New Zealand, and there are shipping links with other S. Pacific is.—Samoa,

Fiji Airways, which links Suva with Nadi, with Labassa and Savusavu on Vanua Levu, and with Taveuni.

There are 1 daily newspaper (Eng. language) and 5 weekly newspapers (in Eng., Fijian, or Hindustani). Broadcasting was carried on in the colony by the Fiji Broadcasting Company Ltd., a subsidiary of Amalgamated Wireless (Australasia) Ltd., from 1935 until July 1954, when the F. Broadcasting Commission took over the service. The F. Broadcasting Commission is a statutory body appointed by the Governor. The chairman and the majority of members are not gov. officials. F. was the first colony to give control of broadcasting to an independent commission of this type. The commission is financed from a gov. grant and from advertising revenue. It operates from 4 stations and broadcasts in 3 languages—Eng., Hindustani, and Fijian.

Education is not compulsory, except that Fijian children from 6 to 14 years

must attend school if there is one within a distance of 3 m. In 1955 there were 510 schools, of which 37 were gov., 246 Fijian dist. schools, 125 Indian committee schools, and the remainder mainly mission schools. In 1955, 60,223 children were attending primary schools and 2462 secondary schools. Four craft centres are maintained by the gov., which also runs a teachers' training college. The Central Medical School, which is the responsibility of the Medical Dept, provides a 5-year course for assistant medical practitioners and a 4-year course for assistant dental practitioners. Students are taken from Pacific is. as far away as New Guinea (q.v.), as well as from F. The Agriculture Dept has maintained a farm institute since 1954. A 2-year agric. course is provided.

There is no univ. in F.—students seeking further education attend Australian and New Zealand univs., while a smaller number go to England, India, or the U.S.A.

See R. A. Derrick, *The History of Fiji*, vol. 1, 1946; G. K. Roth, *Fijian Way of Life*, 1954; and *Colonial Reports: Fiji* (H.M.S.O., annually).

Filadelfia, It. tn. in Calabria (q.v.), 18 m. SW. of Catanzaro (q.v.). Pop. 6000.

Filament, in botany, is the stalk of the stamen, at the apex of which is borne the anther or pollen case. F. is also used to describe a combination of cells which are connected only by their contiguous ends, as in many algae, hairs, etc.

Filangieri, Gaetano (1752–88), Neapolitan jurist and writer, a barrister of note and a leader of the Liberal cause. For 1 year before his death he acted as financial minister to Ferdinand IV, but his *Science of Legislation*, 1780–5, is his title to fame. In this work he discusses the principles of justice both in theory and practice in such a way as to prove himself an historian of learning and true philosophical insight. The influence of the *Contrat Social* is traceable throughout.

Filaria, diseased condition due to the presence of the parasite *Filaria sanguinis hominis*, or allied forms. The adult *Filaria* was discovered by Bancroft of Brisbane, and its embryo was discovered in the blood by Dr Timothy Lewis. The embryo is known as *microfilaria sanguinis hominis nocturna*; it inhabits the lymphatic vessels and makes its appearance in great numbers in the blood at night-time. They are about .35 mm. long. Other species are *microfilaria perstans*, which is found in the blood both day and night, and *microfilaria diurna*, which is found in the peripheral circulation only in the day-time. The larvae inhabit certain species of mosquitoes (q.v.). The larvae are sucked from the blood by the mosquito and enter the stomach. They afterwards make their way to the base of the piercing apparatus, so that they can once more enter the body of a man when the mosquito bites. It has been observed that the blood of men may contain swarms of these parasites without any symptoms of disease being apparent.

Under certain circumstances, however, they lead to inflammation and blocking of the lymphatics and a general disturbance of their function. The characteristic symptom of F. is the appearance of chyle in the urine, and at a later stage of the disease there is a gross enlargement of the legs, and sometimes arms too, as a result of obstruction of the lymph flow. This condition is known as elephantiasis. The anti-malarial drugs are to a certain extent effective against the *filaria*. Chyle is the product of the digestion of fat; it is a liquid of milky appearance owing to the presence of small globules of fat, and under ordinary circumstances makes its way to the thoracic duct, ultimately appearing in the blood stream, where it undergoes combustion or is stored up as adipose tissue. When the lymphatics are obstructed by masses of *filaria*, the chyle is diverted from its normal course, and appears in great quantity in the urine.

Filberts are the fruit of the cultivated *Corylus maxima*; they are oval, elongated nuts that have a mild, oily taste, which makes them pleasant food. In England they are extensively grown in Kent. See COB-NUTS.

Fildes, Sir Luke (1844–1927), painter, b. Liverpool, son of Jas. F. of Chester. Studied art at the S. Kensington and Royal Academy schools. He began his artistic life as an illustrator, became a popular contributor to the *Cornhill* and *Graphic*, and illustrated Dickens's last novel, *Edwin Drood*. He was noted for the 'social realism' of his 'Casual Ward', 1874, and for 'The Doctor' (Tate Gallery) 1891, but later painted summer pictures of Venetian life. In 1902 he painted a portrait of King Edward VII, and in 1912 of King George V. He became R.A. in 1887, and was knighted in 1906; K.C.V.O., 1918.

File: 1. (from Lat. *filum*, a thread, through Fr. *fil*). Used in the military sense as the opposite of a 'rank', that is to say, it refers to an alignment from front to rear, one man being behind another, whilst 'rank' is an alignment abreast or from right to left. Three men now form a F., the F.s being 'doubled' or 'trebled' if a denser formation is required: the number has been gradually reduced from 16, as it was in 1600. The 'rank and F.' of a regiment properly includes non-commissioned officers and men.

2. Steel implement, with teeth or serratures on its surface, much used for abrading and shaping metals and other hard surfaces. The art of filing is known to most savage tribes, hard stone- or fishes' teeth being generally employed. Single-cut F.s, which are suitable for soft metals, have only 1 set of parallel ridges, whilst double-cut F.s have 2 courses or series of chisel cuts, the second, which is usually finer, being at an angle with the first. In shape they are various: 'flat' F.s have a rectangle for their section; ratchet F.s, a circle frequently tapered; 3-square F.s, an equilateral triangle. Most are 'bellied,' that is thicker in the

centre, and in length they vary from $\frac{1}{2}$ in. (a watchmaker's) to over 3 ft (engineer's). Blanks are forged from bars of the best crucible steel and after being annealed and straightened are cut either by hand or by machine. The teeth are incised by a small stout chisel inclined at an angle of about 13 degrees from the perpendicular, the chisel being hit sharply for each cut by a hammer. A skilled craftsman can strike as many as 80 blows an hr. The hardening and tempering of a F. is a delicate operation, as excess of heat renders the steel brittle, and too little causes the teeth to wear down very rapidly, whilst hasty cooling often warps the metal and so spoils the tool. The chief difficulty in the way of making thoroughly reliable machinery for F.-cutting is that of adjusting the force of the blow to the hardness of the steel. Single-cut and double-cut F.s are graded according to the number of cuts per in., varying from 14 to 100 or more. The grades, from rough to fine, are known as rough (always single-cut), coarse, bastard, second-cut, smooth, and dead-smooth (always double-cut). The tang or tapered end provided for fitting into a handle is not included in describing the length of a F.

File-fish, *see* BALISTES.

Filicfo, Francesco (1398-1481), It. humanist, b. Tolentino, and educ. at Padua. He taught Lat. and Greek at Bologna from 1427, from 1440 at Milan—where duke Filippo Visconti became his patron. To the honour of whose successor, Francesco Sforza, F. dedicated an epic, the *Sforziad*. He went to Rome in 1475, and became prof. of Greek at Florence, 1481.

Filley, fishing tn and fashionable summer resort of E. Riding, Yorks, situated 8 m. SE. of Scarborough. There are cliff gardens, and clean golden sands. F. contains the remains of a Rom. harbour, which proves it to have been a Rom. station of some importance. There is a 12th-cent. Norman church. Pop. 4764.

Filibusters (probably a Sp. form of our word 'freebooter,' derived from Dutch *vrijbutler*) are pirates and, in general, adventurers who practise illegal warfare for their ends. Thus the Amer. adventurers who took part in the revolutions of Sp. S. America, with the purpose of increasing the anarchy to their own profit, were popularly called F.s, and in the U.S.A. the expression is frequently used of politicians whose one purpose is obstruction. Again, the expeditions sent into Spain against the Republicans by Mussolini and Hitler during the Civil war were frequently and accurately described as filibustering expeditions. In England the word F. is also applied to a small fast-sailing ship. *See also* BUCCANNERS.

Filicini, Vincenzo da (1642-1707), It. lyrical poet, who came of a noble Florentine family. He became famous on account of a series of odes written in commemoration of the victories of Sobieski. He is also noteworthy for the few very beautiful sonnets he wrote, the most famous of which was *Italia, Italia, O tu*

cui feo la sorte. There is a trans. by Borrow in his *Wild Wales*. In 1864 a new ed. of his *Poesie e Lettere* was pub. *See* G. Caponi, *Vincenzo da Filicini e le sue opere*, 1901.

Filiudi, *see* LIPARI ISLANDS.

Filigree (from Lat. *filum*, a thread, and *granum*, a grain), delicate jewel and ornamental work made of twisted gold or silver wire. The metal threads are finely interlaced, solder being used to strengthen the points of union, and are wrought into intricate volutes and spirals. In the 'Tara' brooch (*see* BROOCH) and other Irish work of the 10th and 11th cents., however, the design is skilfully contrived by a single long thread. To-day the best F. work comes from the United and Central Provs. of India, where the art has been practised from time immemorial, from Malta and from Scandinavia, where the daintiest silver buttons and brooches are fashioned, with a further decoration of tiny chains and pendants. F. patterns were often built on to a solid metal ground; in the Middle Ages the Moors of Spain used in this way to embellish croziers and reliquaries. Up to the 12th cent. Byzantine goldsmiths lavished a great deal of artistic skill on F. work, and a few illustrations of their handiwork show that the art was well-known both to the Etruscans and the Celts. The Victoria and Albert Museum has a variety of examples of F.

Filioque Controversy, controversy on whether the Holy Spirit proceeded from the Father and the Son (*filioque*), or from the Father only, but through the Son. The addition of the words to the Nicene Creed in Lat. was a major cause of the Great Schism between E. and W. in 1024, the W. Church maintaining the former and the E. the latter point of view.

Filipepi, Alessandro di Mariano dei, *see* BOTTICELLI, SANDRO.

Filipino, a native of the Philippine Is., and, more particularly, a member of the Christianised races of Malay stock, generally with an admixture of Sp. blood.

Filippi, Cav. Filippode, *see* DE FILIPPI.

Fillan, St, name of 2 distinct holy men of Scotland, whose feasts are celebrated on 20 June and 9 Jan. The 'June' St F. is the older of the two. He was called 'an Iobar,' the leper, and a church was dedicated to him at Loch Earn in Perthshire. The other was of Irish origin, being the son of Feredach of Munster and St Kentigerna. He d. at Strathfillan in 777, and here as early as 800 an Augustinian priory was built in his honour. Within its grounds was the 'pool of Fillan,' whose waters accomplished miracles of healing. Two relics of this saint, the Quirich and a bell, are preserved in the Antiquarian Museum of Edinburgh.

Fillet (from Lat. *filum*, a thread), architectural term, applied to the narrow ribbon-like bands, so common both in Classical and Gothic architecture, separating mouldings one from the other; also between the flutings of Classical columns. A F. may also be any narrow strip of wood.

Fillmore, Millard (1800-74), 13th president of the U.S.A., rose, like many others who have held that office, by the sheer force of his own high abilities and sterling moral character, and might with justice have said that he was handicapped rather than assisted by the accident of birth. In 1820 he broke away from his apprenticeship to a dyer, and having studied in Buffalo was called to the Bar in 1823, and prospered in his law practice. Having served in the state legislature of New York (1829-31) he next sat in Congress for 8 years between 1833 and 1843. From 1850 to 1853 he held the chief magistracy, succeeding President Zachary Taylor upon the latter's death, the office coming to him as the elected vice-president. In policy he allied himself with the Whigs, supported measures framed to mitigate the evils of slavery, advocated protective tariffs, and in 1851 tried to prevent the invasion of Cuba, which the 'filibusters' urged. His active support of the Fugitive Slave Law endangered his popularity.

Film Institute, British. Founded in 1933 and reconstituted in 1948 with an ann. grant from the Treasury, the B. F. I. is a semi-official body charged with 'the development of the art of the film, the promotion of its use as a record of contemporary life and manners, and the fostering of public appreciation and study of it from these points of view.' In effect, therefore, the I. acts for the film in the same way as the Arts Council of Great Britain (q.v.) does for music, drama, and painting. The I.'s main achievements so far have been the foundation of the National Film Archives in which millions of ft of film of priceless historical value are being preserved for posterity; the creation of the first National Film Theatre in the world; the estab. of an information service on the cinema which is second to none; and the encouragement of the film society movement for the study of film at home and throughout the Commonwealth. The I. also issues a number of periodicals dealing with various aspects of the film, and has sponsored the pub. of the first authoritative hist. of the Brit. cinema.

Film-setting, or Photo-composing, is a method preparatory to making printing plates without using type. The general scheme is to place transparent letters on an opaque substance, mount them on a carrier, and automatically bring the desired letter into line with a light beam, which transfers the image to a sensitised film or paper. The first proposal was that of G. P. Drummond of Ontario, who was granted a U.S.A. patent in 1877. Since that date over 50 schemes have been proposed, most of them failing to mature. Among the few in recent years which gave promise of success were the August-Hunter and the Uher-type; lack of capital in the former case and war conditions in the latter stopped development. The Uher-type was the first of its kind to be installed in Great Britain—at Waterlow's Durable works in 1937. There are 7 machines on the market.

Rutherford (Sun Chemical Corporation, New York) is used mainly for the credit lines of cinema films; it does not compete with ordinary printing methods. **Photo-setter** (Intertype Corporation, Brooklyn, New York) is based on the Intertype mechanical composing machine (see TYPE-CASTING AND TYPE-SETTING MACHINES). Letters are inserted in the matrices and after assembly are moved one at a time in front of a camera, which takes the place of the casting apparatus. Justification is by ordinary space-bands or, alternatively, by letter-spacing the whole line. Sev. machines have been installed in Great Britain, the first in Glasgow in 1956, and a comparatively large number in the U.S.A. **Linofilm** (Mergenthaler Linotype Company, Brooklyn, New York) is a 2-unit machine: a perforator and a photographic unit. The keyboard unit, comprising an electric typewriter, a computer, and a tape perforator, produces a typed page for proof-reading and a punched tape to be fed into the photographic unit. This tape bears in code the original copy, all type-face specifications, and instructions for justification. Justification is automatic, space distribution being between words. Means are available, however, not only to letter-space but also to subtract from the normal white space between such letters as capitals AW, giving a better fit. The making up of galleys into 'originals' for plate-making is performed by an optical device which employs a working surface the same size as a full newspaper page. This device can enlarge or reduce photo-set matter in the range of 4 to 108 points and can place single lines or blocks of lines on sensitised film or paper exactly as specified in a layout of up to 96 picas wide and of any depth. **Hudego** (Dr H. J. A. de Goel, Haarlem, Netherlands) sets the matrices by hand, placing them in a 'stick' which slides into the machine. The movement of levers automatically switches on the light and photographs the line on to film by surface reflection. Type sizes can be varied from 4 to 115 points, using 2 sizes of matrix. The machine is used mainly for display work, a number of them being in commercial use. **Monophoto** (Monotype Corporation Ltd., London) has the Monotype casting machine (see TYPE-CASTING AND TYPE-SETTING MACHINES) as its basis. The copy is set on an ordinary Monotype keyboard, the perforated paper being placed on the paper tower of the photographic unit, which is an adaptation of the composition caster. The alphabet frame is a replica of the die-case, its movement causing each letter to be photographed on to sensitised film. The machine is in an advanced stage. **Rotafoto** (George Westover, London) is also based on the Monotype machine. In addition to the keyboard it has line-projector and make-up units, the projector being an adaptation of the caster. Lines are produced on film in the line projector and enlarged, when corrections can be indicated, after being printed on sensitised paper. A paste-up key proof

is made and the final negative produced on the make-up unit. This latter machine is characterised by 5 spools, carrying the main film, with corrections, insertions, folios, etc., from the line projector, each piece of film being brought into operation as required. A few machines are in use commercially. *Photon* (Photon Incorporated, Cambridge, Massachusetts), formerly known as Lumitype, Lithomat, and the H-M machine, is a single-unit proposal. Operation of a keyboard causes the thickness and size of the letter to be coded and passed to a 'memory box.' On completion of a line, depression of a special key causes this information to be decoded and passed through the photographic unit while the next line is composed. There are sev. machines in commercial use in the U.S.A., more or less experimentally.

Most of these machines have their own correction units, and, except for the Fotosetter and the Hadege, they use the standard typewriter lay-out. When the film is completed it is developed and ready for the preparation of plates, usually for gravure or photolitho, but with Dowe-etched magnesium alloy plates the way seems open for using the film for letterpress work.

Filmer, Sir Robert (c. 1589-1653), writer on politics, matriculated at Trinity College, Cambridge, was knighted by Charles I. and, being an ardent Royalist, had his house pillaged by the Roundheads. In his *Patriarcha*, 1680, and other pamphlets he developed to a ludicrous extent the theory of the divine right of kings. Yet the fact that Locke (q.v.) took the trouble to expose his fallacies *seriatim* in the *Treatise on Government* shows that at the time at least his theories made a grave impression.

Films, see CENSORSHIP, FILM; CINEMATOGRAPH.

Filmy (or Transparent) Ferns are chiefly native in moist woods of the tropics, but many species are cultivated in Britain. In many forms the fronds are filamentous, and some have the appearance of Liverworts. They like much moisture, which is best given by growing them in closed cases; a cool greenhouse is sufficient, but they must be kept well guarded from the sun. They should be planted in sphagnum, peat, or fibre; ordinary soil is unsuitable. *Hymenophyllum tunbrigense*, Tunbridge F. F., and *H. wilsoni*, Wilson's F. F., are native in England; as is *Trichomanes speciosum*. *H. fuciforme* of Chile and *H. pulcherrimum* of New Zealand are beautiful greenhouse F.s, and *Septopteris superba* is also grown.

Filter. Solid matter which is suspended, but not dissolved, in a liquid may be separated again by a variety of methods. The commonest is the use of F.s, by means of which the liquid is made to flow through one or more porous substances, which will not allow the suspended matter to pass. The simplest form of F. is that used in chemical laboratories, where a circular piece of blotting paper is folded into a quadrant and

opened into a hollow conical shape. Placed in a glass funnel this fits closely to the sides, and as the liquid is poured through the precipitate collects on the paper, and can easily be removed. When liquids are dealt with which attack paper, glass wool or asbestos fibres may be used instead of paper. One simple method of accelerating filtration is to use a funnel with a long stem. Another more effective method is to employ a Buchner funnel, i.e. a porcelain funnel with a perforated base on which a filter paper is placed, and apply a vacuum to the stem. The funnel fits into a bottle with a side tube connected to a F. pump. Difficulties sometimes

Paterson Engineering Co. Ltd.
STELLAR FILTER

arise when crystallisation from the liquids takes place in the funnel stem. To avoid this double-walled funnels are used, the space between the 2 surfaces being filled with hot water. Some suspensions are of such a fine nature that the solid particles are not efficiently retained by ordinary F. paper, in which case the remedy is to use special paper with smaller pores. Even this will not suffice to F. colloidal solutions. For the ordinary purpose of filtering water for domestic use, a large number of F.s have been devised. They mainly differ in the manner of drawing the dirty water through them. It is usual to use, as the filtering substances, sand and charcoal in some form. A home-made F. is often constructed of 2 flower-pots placed one inside the other. In the lower one is placed a sponge to plug the hole, then a layer of pebbles, upon which is a layer of sand with powdered charcoal resting upon it,

and this in its turn held down by another layer of pebbles. In the upper pot is only a sponge to prevent the water flowing too fast into the F. By this means quite a pure water may be obtained. The F.s which are manufactured for use on ship-board, and by soldiers, etc., work on this principle, but are constructed so that the sediment may be removed. To enable this to be done, devices are used so that the water may be filtered as it ascends. Thus, if a F. has 4 compartments, and the water is stored in the top one, and passed by a pipe to the bottom one, then it will ascend through the middle chambers. This is the principle adopted in Leloge's F. When the stored water reaches the lowest chamber, it ascends through a porous filtering stone to the filtering chamber, from whence it still ascends through a second stone to the chamber from whence it is drawn off. The sediment can be removed from the lowest chamber by withdrawing a plug.

Another form of F. consists of a cylindrical pot containing the filtering media and with a long tube attached to it. This pot is lowered into the water, and by using the tube as a syphon (q.v.) the water is drawn up through the pot and filtered on its way. This method has been utilised for travellers and others who may have to drink from turbid sources. A porous cylindrical stone, consisting of compressed carbon, is fitted on to one end of a flexible tube, to the other end of which is attached a mouthpiece. Then the traveller, lowering the filtering end into the pond, may drink clean water direct from the turbid source. Not only does filtration remove solid matter, but it is well known that charcoal acts upon any soluble organic matter which may be present, so purifying the water. This is of great importance, as very clear water may be highly dangerous to drink on account of the presence of organic matter. The length of time that the charcoal is efficient is, therefore, of the greatest importance. For this same reason charcoal is often placed at the openings from which issue deleterious gases, and so the air is filtered, rendering it inodorous and often innocuous.

For filtering water on a large scale the methods of slow sand filtration and rapid filtration are used, particularly the latter. In slow sand filtration, the F. beds are contained in water-tight tanks with drainage channels leading from gratings in the floor. To prevent clogging, these gratings are covered with heaps of gravel and fine sand laid level over all. Water is run in slowly and percolates through, the organic matter forming a slime on the surface. The sand, which is as a rule 2 ft deep, is simply a mechanical support and collecting area for the impurities. As the bed becomes clogged another bed is brought into use, the bed cleansed by back-washing, and the surface cleared of organic matter. Filtering is allowed to proceed as slowly as possible, but the rate is contingent on the area available and the demand for water. The reduction in

organism in the case of filtering of Thames waters amounts to 97.7 per cent on the average, depending on the thickness of the sand layer and slowness of the process. In rapid filtration, mechanical pressure F.s are used.

See WATER SUPPLY; and for other processes of clarification (q.v.) see BEER; OIL; SUGAR; SYRUP; WINE, etc. See J. Don and J. Chisholm, *Modern Methods of Water Purification*, 1911; J. A. Pickard, *Filtration and Filters*, 1929.

In photography, a F. is generally used as a control device to accentuate or to limit the transmission of one or more colours of the spectrum to which the material is sensitive. Such F.s, of tinted gelatine or glass, may be placed on, near, or in the lens. As an example, a pale yellow F. will retard the transmission of blue rays and may be used to accentuate the difference between white clouds and a blue sky in distant views, outdoor portraits, or architectural studies. See also PHOTOGRAPHY.

Flurina, see FLORINA.

Fimbria, Gaius Flavius, Rom. soldier, an enthusiastic supporter of Marius and Cinna. In 86 BC he was sent to Asia as legate of Valerius Flaccus, whom he induced the troops to murder. He carried on war with Mithridates, but in 85 was attacked by Sulla and committed suicide.

Fin, see FINS.

Fin-backs, see FIN-WHALES.

Fin-whales, or Rorquals, also called Fin-backs or Razor-backs, constitute the *Balaenoptera*, a genus of Cetacea. They are characterised by their elongated shape, short and recurved backfin, and a number of longitudinal folds in the skin of the throat. The F. are the most widely distributed of all whales, being known in all but the extreme Arctic and Antarctic seas. The blue whale, *B. musculus*, is the largest of all living animals, sometimes attaining a length of 80 or even 100 ft. *B. physalus*, the common F., grows to a length of about 60 ft, while the lesser F., *B. acutirostris*, attains 30 ft. These and the other whalebone whales feed on small, shrimp-like crustaceans of the plankton, these being strained from the sea by the plates of baleen hanging from the roof of the mouth.

Finale (lt. word meaning 'end'), musical term, describing the concluding piece of a composition in sev. movements, such as a sonata, quartet, or symphony, also of an operatic act with a built-up final piece. It is variously handled by different musicians, usually either in sonata or rondo form, but variations or freely shaped movements also occur. The choral F. of Beethoven's 9th symphony is exceptional though no longer unique.

Finance, National, see BUDGET; TREASURY; PUBLIC DEBT.

Finance Acts, in Brit. administration, are formal A. of Parliament which, after the Budget (q.v.) has been introduced by the Chancellor of the Exchequer, are necessary in order to give effect to its

provisions. The first and more important of these is the F. Act, which embodies the chief alterations in methods of raising revenue. This is occasionally a very long and involved document, as the utmost precision is necessary when such methods as those relating to income tax are revised; but where the changes are few and no fundamental system is affected the F. Act may be one of the simplest and briefest for the year. The Appropriation Act, which follows, is a formal measure for voting the necessary funds to the various spending depts, and is usually supplemented at the end of the financial year by a similar measure which legalises any additional expenditure that may have become necessary. These A., as they deal chiefly with F., do not require the approval of the House of Lords. When they have been passed by the Commons they are sent to the upper chamber with the Speaker's certificate attached declaring them to be Money Bills.

'Financial News,' London morning daily paper, founded 1884, now incorporated with the *Financial Times* (q.v.).

'Financial Times,' London morning daily paper, which first appeared in 1888. With it are incorporated the *Financier* and *Bullionist* and the *Financial News*. It provides detailed news of markets, stocks and shares, and articles and news on every industrial happening and development of interest to the business man.

'Financier and Bullionist,' London morning daily paper, estab. 1866, now incorporated with the *Financial Times* (q.v.).

Finch, Heneage, 1st earl of Nottingham (1621-82), jurist, was educ. at Westminster School and Christ Church, Oxford, and later joined the Inner Temple. In 1660 he became solicitor-general, and in 1661 he entered parliament. When Shaftesbury was dismissed he was made lord keeper of the seals (1673), and next year was promoted to lord chancellor. F. was a zealous churchman; he declared in the House that gov. by bishops was inalterable, was vehemently opposed to Charles's Declaration of Indulgence (1663), and eagerly supported the Five Mile Act (1665). Burnet testifies to his forensic powers, and says that he was 'well versed in the law' but mentions also that he was ill-bred and vain. He framed for the Commons their congratulatory address to Charles on his coming to England.

Finch, name given to members of the Fringillidae, a family of hard-billed singing birds which inhabit the N. hemisphere. They are almost unknown in Australia. The Fringillidae are divided into sev. sub-families, according to the formation of the skull and beak. The *Coccothraustinae*, or grosbeaks, inhabit the Old and New Worlds, and extend as far S. as India. Their bills are fairly stout and acute, and they have bright-coloured plumage, green and yellow predominating. The species *Chloris chloris*, or common greenfinch, is often heard in gardens and small plantations. It feeds on the seed of the wild

mustard and other weeds, and has plumage of olive yellow, shading to grey. Other members of this group are *Coccothraustes coccothraustes*, or European hawfinch, and *Hedymeles virginianus*, or rose-breasted grosbeak, a handsome and sweet-voiced bird. The sub-family *Fringillinae* are distinguished by their softer bills and by their cranial differences. *Fringillae caelebs*, or common chaffinch, is a general favourite in the Brit. Isles, and may be seen nesting under the eaves of dwelling-houses. The plumage of the male is chestnut-brown, the crown and forehead black or slaty-blue, and the chin and breast pale red. The female is ashy-brown, shading to olive-yellow, the wings being pied with white. To this group also belong *Chrysomitris tristis*, or yellow-bird, a lively, graceful bird common to the U.S.A. and to Canada; also its European sister, *C. spinus*. *Carduelis cannabina*, or common linnet, is also a member of the F. tribe, and inhabits most parts of Europe, ranging eastward as far as Central Asia. *Montifringillia nivalis*, or snow-finch, and *Erythropsiza githaginae*, or desert F., are rarer and even more beautiful varieties. *Petronia domestica*, or house sparrow and its allies, are true F.s; so are *Serinus hortulanus*, or serin F., and *S. canarius*, or familiar yellow canary. The *Pyrrhula rubicilla*, or bullfinch, is another inhab. of the Brit. Isles. A further sub-order of the F. family is the *Emberizinae*, or buntings, which inhabit the N. parts of the Old World, and some parts of India.

Finchley, municipal bor. of Middx, England, lying N. of Hampstead, a healthy and popular residential suburb of London. The manor of F. belonged to the bishops of London from very early times. At the beginning of the 19th cent. the par. contained only 1500 inhab., but it developed rapidly from the mid-19th cent. F. Common, now built over, was notorious in the 18th cent. as a resort of highwaymen, including Dick Turpin and Jack Sheppard. Hampstead Garden Suburb (q.v.) is partly in the bor. F. returns 1 member to parliament. Pop. 70,000.

Finden, William (1787-1852), engraver, who worked mainly in collaboration with his younger brother and fellow-pupil, Edward Francis F. (1791-1857). Earlier worked on book illustrations, engraving e.g. Smirke's drawings for *Don Quixote*. The F.s soon estab. a school of pupils, who worked under their direction, and indeed actually executed most of the engravings which bear their name. The elaborate finish and precision were, however, the work of the F.s. After engraving the Elgin Marbles for the Brit. Museum, and illustrating Murray's *The Arctic Voyages* and Campbell's *Poetical Works*, the F.s pub. at their own private cost in 1833 the illustrations to Moore's *Life and Works of Byron*, a work which made so great a stir that it was followed by other works of a popular nature: *Landseer's Illustrations of the Bible*, after Turner, Calcott and others; *Landscape Illustrations to the Life and Poetical*

Works of George Crabbe, 1834. But the profits they had derived from these works were squandered in a well-planned and beautifully executed but luckless venture, *The Royal Gallery of British Art*, 1838, etc. F.'s last engraving on a large scale was that of Hilton's 'Crucifixion.'

Findhorn, riv. of Inverness-shire, Scotland, flowing through Nairn and Moray to the Moray Firth.

Findlay, John Ritchie (1824-98), newspaper proprietor, b. Arbroath. He began his career in the office of the *Scotsman*, afterwards becoming owner of most of the property. He gave the Scottish National Portrait Gallery to the nation at a cost of £70,000.

Findlay, city of Ohio, U.S.A., 40 m. S. of Toledo. It manufs. machinery, rubber products, and pottery, and is the seat of F. College. Pop. 23,800.

Findon: 1. Fishing vil. of Kincardineshire, Scotland, from which F. or Finnan haddocks (Finnon Haddies) take their name. Pop. 80.

2. Vil. in the S. downs, Sussex, England. It is picturesquely situated in a vale and is not far from Cissbury Ring (q.v.).

Fine. F.s can be imposed by the courts for practically any offence other than murder or treason, though it is only since the passing of the Criminal Justice Act, 1948, that the higher courts have been able to impose F.s for felonies.

With rare exceptions only the maximum F. is fixed by law, the courts being free to impose any lesser sum. In 1955 over 93 per cent of all persons guilty of non-indictable offences were fined, and 33 per cent of those guilty of indictable offences. This latter figure is much higher than the corresponding pre-war figure. In 1933 only 18 per cent of persons guilty of indictable offences were fined. The extension of the power to F. to the higher courts is only a minor element accounting for this change, since assizes and quarter sessions were responsible for only 1700 out of a total of almost 34,700 F.s imposed. The explanation is chiefly that there has been a swing from probation to F.s largely owing to the shortage of probation staff (see PROBATION).

Before the First World War the number of persons imprisoned in default of payment of F.s averaged over 83,000 annually. A requirement that 7 days should normally be allowed for payment effected a considerable reduction, but it was not until the Money Payments (Justices Procedure) Act, 1935, was passed that the means of the offender were seriously considered in settling the amount of the F. Previously the summary courts fixed the alternative prison sentence at the same time as the F. (e.g. 20s. or a month) and in the case of non-payment committal to prison was generally automatic. Under the Act, the court can in the first instance fix only the amount of the F. If this is not paid the offender must appear again before the court and the reasons for non-payment must be investigated. Only if the circumstances, including the offender's

financial position, justify it can the court then pass a sentence of imprisonment. Time to pay, whether in a lump sum or instalments, must be allowed unless the court for any special reason direct otherwise. These requirements do not apply to the higher courts.

As a result of the Act, imprisonment in default fell from an ann. average of over 11,000 to just under 3000 in 1947. Since then there has been an upward movement and in 1953 the corresponding figure was 5100. See CRIMINAL LAW; FINES AND RECOVERIES.

Fine Arts are traditionally divided into 2 groups—the greater arts, which are sculpture, painting, architecture, poetry, and music; and a group of lesser arts, among them acting and dancing. The name F. A., with its Fr. equivalent *beaux arts*, and its It. *belle arti*, is given to these arts by reason of their fostering the love of the beautiful, although they may at the same time be useful; thus there are other minor arts which may be classed as fine if they fulfil the former condition. Among these is the work of the goldsmith, the potter, and the weaver, all of whom produce decorative as well as useful wares. Though in its widest sense the term 'Fine Arts' embraces poetry, music, dancing, and the drama, in its more usual and restricted sense it comprises only the 3 sister-arts of painting, sculpture, and architecture. 'The work of art,' according to Hegel, is 'a product of human activity and is made for man.' Its primary appeal is to his aesthetic sense; this is, indeed, its actual *raison d'être*, and the fact that it may add to his comfort or convenience, as in the case of an architectural work of art, in no way adds to its artistic importance. While philosophers do not attempt to decry the beauties of nature, they look upon them as being of a lower order than those which are classed under the heading of F. A.: for as Hegel puts it, 'the beauty of art is the beauty that is born of the mind; and by as much as the mind and its products are higher than nature and its appearances, by so much the beauty of art is higher than the beauty of nature.' Nevertheless, for various reasons, the phrase F. A. is nowadays less in use than it was, art as an expression or as a function being conceived in fundamental terms making the adjective 'fine' superfluous or inappropriate. The term has a legal aspect inasmuch as it may imply certain privileges. Thus in the court of appeal, 1955, it was adjudged that the Eng. Folk Dance Society could not claim exemption from rating, on the ground that folk dancing was not a F. A. It was remarked, however, that ballet might have had a stronger claim to that title. See AESTHETICS; ART; ARCHITECTURE; PAINTING; SCULPTURE. See also G. Baldwin Brown, *The Fine Arts*, 1916; H. Read, *The Meaning of Art*, 1951.

Fine Gael (United Ireland party), Irish political party. It was formed in Sept. 1933 by the amalgamation of Cumann na nGaedheal (the 'Cosgrave Party'), the

Centre party under the leadership of Frank McDermott and James Dillon, and the National Guard (formerly the Army Comrades' Association) under the leadership of Eoin O'Duffy (q.v.). Cumann na nGaedheal had been composed principally of the majority of the old Sinn Féin (q.v.) party which had accepted the Anglo-Irish treaty of Dec. 1921, and which had inherited the political and economic principles of Arthur Griffith and Michael Collins (qq.v.). With Wm T. Cosgrave (q.v.) as leader it carried on the gov. of the Irish Free State from 1922 until the general election of 1932, which put the Fianna Fáil party of Eamon de Valera (qq.v.) into power.

F. G. led by ex-President Cosgrave until his retirement in 1943, when he was succeeded by Gen. Richard Mulcahy was the official opposition party in the Dáil from its foundation until the general election of 1948, when it was returned with 31 seats. It then united with the other parties returned to the Dáil, excepting Fianna Fáil, to form an inter-party gov. under John A. Costello (q.v.). At the general election of 1951, F. G. increased its membership in the Dáil by one-third, but the inter-party gov. failed to retain office. In the 1954 general election F. G. was returned with 50 members, and became again the largest element in an inter-party gov. The inter-party gov. was, however, defeated at the general election of Mar. 1957, and F. G., with 40 seats, once more took over the rôle of main opposition party in the Dáil.

Finedon, vil. in Northants, England, 3½ m. from Wellingborough, in which it is now incorporated. It has boot and shoe factories, and iron-stone quarries. Pop. 4000.

Fines and Recoveries. These were fictitious or collusive actions at law, which were mainly instrumental in conveying land in spite of certain legal restrictions. Both were notoriously in use as a means of barring the entail (q.v.) of estates, thereby enabling the tenant in tail to sell the lands so as to defeat the rights of his own issue and of the remaindermen and reversioners (see *DE DONIS*; *ENTAIL*), while the common recovery was as ostensibly invoked to elude the Statutes of Mortmain (see *CHARITABLE USES*). A fine (*Lat. finis*, end) was formerly a common mode of transferring any freehold. Originally founded on an actual suit, it became later nothing more or less than an amicable compromise of an action, real or fictitious, whereby the lands which formed the subject of the action were acknowledged to be the right of one of the parties. It was so called because it put an end (*finis*) not only to the suit but also to all other suits concerning the same matter. The end of it was to bar issue, but not remainder or reversion, and instead of fee simple it created a 'base fee' lasting only as long as there was issue of tenant in tail, but allowing a remainderman or reversioner to come in upon the extinction of such issue. The effect of the fine was that the right of all strangers to

the suit was barred, unless claim was made within 5 years. The common recovery was an invention of the ecclesiastics designed to enable them to hold land, notwithstanding the prohibition of conveyance to a corporation. It was an action actual or (generally) fictitious, in which the lands were recovered against the tenant of the freehold, the judgment so obtained binding all persons and vesting an absolute fee simple (q.v.) in the plaintiff. In regard to estates tail the common recovery was first employed in Taltarum's historic case, and its effect was to defeat the rights not only of the issue of the tenant in tail, but of remaindermen and reversioners (q.v.) as well. Both F. and R. were abolished by the Fines and Recoveries Act, 1833. See *ENTAIL*.

Fingal, see FIANS.

Fingal's Cave, see STAFFA.

Finger-prints are reproductions of the patterns formed by the papillary ridges located on the palm side of the distal joints of the fingers and thumbs.

History.—The estab. facts of science show that the chance against one finger producing a print identical with that of another finger, whether on the same hand or on the hand of another person, is so astronomical in number that for all practical human purposes it is reasonable to conclude that such a chance will never materialise. It has been computed that theoretically 2 identical prints would be found only once during a period longer than that which astronomers estimate is needed for the sun to grow cold.

There has been much theorising on the antiquity of finger-print identification but there exists little real evidence that the science as it is known and practised to-day is other than of comparative recent origin. Some of the prints found on ancient documents and pottery are more likely to have been either a form of signature or part of a ritual; many others are merely chance impressions. Examination of a number of them show that they are simply daubs and could not be identified at any time. Three great Englishmen—Sir Wm Herschel (1833-1917), Sir Francis Galton (1822-1911), and Sir Edward Henry (1859-1931) (qq.v.)—were outstanding in their contributions to the science of finger-print identification. It was Herschel who proved that the groupings of the papillary ridges (they are formed in the first few months of foetal life) remain constant from birth to death. This he did by taking test prints at intervals, ranging over a long period, of his own fingers and those of other people. The result of these tests estab. the reliability of F. as a means of human identification. Galton did much pioneer research work, chiefly from data supplied by Herschel, but it was Henry who produced a workable system. In 1901 his system was officially adopted and the same year saw the inception of the Finger-print Bureau at Scotland Yard. Henry's system displaced Bertillon's (q.v.) anthropometric method of identification by means of bodily measurements, and its superiority soon

became manifest. The new system of the registration of habitual criminals was implemented by directions to the governors of prisons to take and forward to Scotland Yard the F. of prisoners convicted at quarter sessions and assizes and sentenced to 1 month imprisonment or more. Later the scope of registration was extended to include persons sentenced to imprisonment at lower courts for scheduled offences.

How finger-prints are taken.—For official use F. are recorded on a special form with spaces for impressions of all the digits. The spaces are numbered from 1 to 10. The prints taken in these spaces are called *rolled impressions* because they are obtained by rolling each finger from side to side on an inked plate and then repeating the same process with the inked finger during the taking of the impressions on the form. The reason for the rolling action is to obtain the largest picture possible of the area of the skin ridges which lies between the edges of the nail and the flexure of the first or distal joint of the finger, thus ensuring the inclusion of all data necessary for classification purposes. Below the rolled impressions are taken what are known as *plain impressions*. These are obtained by inking the fingers of each hand simultaneously and pressing them with the fingers held together in the spaces provided on the form. The thumbs held side by side are treated in a similar manner. The purpose of taking the plain impressions is to ensure that the rolled impressions have been taken in the correct order. A misplaced impression could result in an incorrect classification formula. After all the impressions have been taken the prisoner signs the form and immediately after the signature a print of one of his fingers is taken as a check that the prints are his.

Finger-print patterns.—F. are divided into 4 main groups of patterns, viz., arches, loops, whorls, and compounds. There are variations of each pattern.

The *arch* (Fig. 1): as the name implies, the ridges are arranged in an archlike fashion; a variation of this type is the *tented arch* (Fig. 2). The *loop* (Fig. 3) is the most common type of print. The point indicated by the arrow is called the *delta*. The ridges lying between the delta which cut a direct line to the core are counted. As the number varies in different prints it provides useful data for classification. In (Fig. 3) there are 10. The delta appears on the left side of the print. Other loops have the delta on the right side.

Whorls (Fig. 4) have a circular arrangement of the ridges. There are 2 deltas (arrowed) in all whorls—1 only in loops. Whorls are sub-divided by tracing to the right the course of the lower limb of the left-hand delta and noting whether it passes inside the right-hand delta, meets it, or drops below it (Fig. 6). The cores of some whorls are more or less elongated. *Compounds* (Fig. 5) possess features of other patterns. There are 2 deltas, and

sometimes more. They are classified in the same manner as whorls. Extra deltas lying between the 2 outer deltas are ignored.

Ridge characteristics.—When 2 prints are of the same pattern it does not follow that they originated from the same finger. Identity or non-identity is determined by comparing the order in which the ridge characteristics appear in each print. Characteristics comprise ending ridges, forking ridges, ridges forming lakes and is., etc. When the expert finds a number of these appearing in the same order in each print he knows that both prints were made by the same finger and that the remaining characteristics will coincide. Ridge characteristic data remain constant unless disturbed by a deep-seated injury that leaves a permanent scar. Superficial damage to the epidermis is more or less transient and subsequently leaves little or no trace of such injury.

Classification.—The 4 main types of pattern form a basis for the primary classification of F. For this purpose the patterns are placed in 2 categories. Whorls and compounds are given a numerical value according to the number of the digit on which they occur. Arches and loops have no value numerically. By this arrangement 1024 primary groups are arrived at. Further subdivisions are obtained by using the delta ridge tracing of whorls and compounds and by counting the ridge lines in loops (see above, *Finger-print patterns*). Many permutations result from the inter-combination of the ridge tracing and ridge counting formulas. The presence of arches and radial loops provide additional data in some sub-groups.

Filing and searching.—The place a set of prints will occupy in a collection depends firstly on the primary classification number. This may be any one of the 1024 groups referred to. Reference is then made to the secondary classification derived from the methods used for subdividing patterns. If a tertiary classification appears in the formula it must be consulted next, and finally the set of prints is arranged according to the number of ridges in loops, if they are present, on the little fingers and thumbs. If a person has been previously convicted, and providing he has given his correct name when he is again finger-printed, the location of his prints in the collection is a matter of a few min. Should he give an alias the searcher must have recourse to data existing in the prints for identification and disregard names. Selection of the appropriate file in which to search is made by following the sequence shown for filing prints.

Finger-prints left at scenes of crime.—This is the aspect of finger-print identification that appeals most to the public imagination, but it is more difficult to deal with than the phase which has been outlined. Scenes-of-crime prints are often fragmentary and lack the data and clarity of prints deliberately taken by a skilled operator. Surfaces of reasonable

FINGER-PRINT TYPES (ENLARGED)

1, arch; 2, tented arch; 3, loop; 4, whorl; 5, compound; 6, detail of ridge tracing of 4

smoothness are suitable mediums for retaining sweat prints. Some of these marks can be recorded by means of photography alone; others have to be intensified by the application of powders, and in some cases chemical agency is employed. Development of marks on cloth is limited to closely woven materials of very fine texture. Coarse cloth will not yield identifiable prints. As it would be a gigantic task to search among the vast number of prints filed in the main finger-print collection an ancillary one of single prints is maintained to expedite the identification of chance impressions. The *Single Finger-print Collection* is in effect 10 separate collections, each containing the prints of 1 digit only. Experts can often decide which finger has made a mark and this greatly reduces the number of prints to be compared. The prints for inclusion in the *single* collection are selected from those in the main collection and include those of convicted burglars, house-breakers, etc. The methods of classifying single prints are more complicated than those used for a complete set of 10 prints and require special apparatus.

General.—Regulations made under section 8 of the Penal Servitude Act, 1891, and sections 39 and 40 of the Criminal Justice Act, 1948, confer upon prison governors and police power to obtain the F. of both convicted and unconvicted persons in custody. Finger-printing for civil purposes is practised little in this country. During the late war the prints of merchant seamen were taken on their identity cards, otherwise the scope of the system is and has been very limited. On the other hand the whole of the armed forces of the U.S.A. are finger-printed, and the Federal Bureau at Washington has a huge collection of the prints of persons who, in their own interests, have volunteered them. Many other countries make extensive use of F. for civilian registration and the taking of prints of immigrants is often a condition of entry. See Sir E. Henry, *Classification and Uses of Finger-Prints*; F. R. Cherrill, *The Finger-Print System at Scotland Yard*, 1954; and *The Journal of Criminal Science*, vol. II.

F. impressions are required in the passports issued by a number of countries, but not by the U.K.

Fingers, Deformities of, see HAND.

Fingo, name given to the remnants of the Nguni (q.v.) tribes of the Cape, South Africa, after the numerous inter-tribal and border wars of the 19th cent. To-day they are settled in many small locations of the Ciskei. Many have traces of European blood.

Finial, a vertical ornamental feature, usually of stone, standing at the base or on the apex of a gable or pinnacle; much used in Gothic and Elizabethan architecture.

Finiguerra Maso, or *Tomaso* (c. 1410–1475), It. sculptor and goldsmith, b. Florence, supposed to have been taught by Lorenzo Ghiberti. He was specially skilful as an engraver on metal. His

'Coronation of the Virgin,' now in Paris, has great beauty.

Fining, see BREWING—Top Fermentation.

Finistère (from Lat. *Finis terrae*, end of the land), most W. dept of France, with an area of 2729 sq. m. It is bounded by the Eng. Channel, Atlantic Ocean, and the depts of Côtes-du-Nor and Morbihan. The coast is bold and rocky, with lofty cliffs of granite; the Pointe de Raz is the most dangerous headland. The interior has 2 chains of hills, stretching parallel from E. to W.—the Mt Arrez, and the Noires; these are clothed with forest trees and heathland, while rich meadows and fertile valleys lie between. The climate is temperate with W., NW., and SW. winds. Over a million ac. are under cultivation, and the crops are wheat, rye, barley, oats, potatoes, flax, mangold wurzel, etc.; fruit and vegetables are exported. The grass lands are very extensive, horse and cattle breeding being an important industry. The mineral wealth is not great; coal and iron, lead, bismuth, and zinc are obtained, and granite, marble, and slate are quarried. The arrons. of Brest, Châteaulin, Morlaix, and Quimper are contained in the dept. Quimper is the cap., and Brest, the largest tn, is a port and military station. The manufs. are woollens and linens, sailcloth, rope, paper, shipbuilding, etc. Pop. 760,000.

Finisterre, Cape, Atlantic cape on the NW. coast of Spain (lat. $42^{\circ} 52' 45''$ N.; long. $9^{\circ} 15' 32''$ W.). It is in the prov. of La Coruña, is the most westerly point in Spain, and is the projection of a mt height rising to about 2000 ft above sea-level. Its lighthouse is visible from vessels 50 m. out. In a naval engagement off E. in 1747, Anson (q.v.) captured 12 Fr. men-of-war and 6 other vessels. In the same year Rear-adm. Hawke (q.v.) took 6 Fr. men-of-war, and here again, in 1805, Calderan Strahan defeated the Fr. and Spaniards.

Finite: 1. In mathematics, when in the expression $(1+x)^n$ the index n is a positive integer the series is called a *finite series*. When n is negative or fractional the number of terms is unlimited and the series is called *infinite* (q.v.).

2. In grammar, a *finite verb* is limited by person and tense and states what someone or something does, did, or will do, or what is, was, or will be done.

Finite Differences, in mathematics mean the excess of one quantity over another. This fundamental meaning of the term is almost lost in the higher parts of mathematics from the association of it with a methodised theory, the calculus of F. D., derived from the consideration of the D. presented by successive quantities which follow a regular law. By the operation of taking D. in this sense, we may find the rational integral function of the number of terms in a series or the general term of a series, when a certain number of the terms of the series are given. That is to say, the regular law of the series not being known by inspection,

we proceed to take the first order of D., viz., by subtracting each term from the term which immediately follows it and so forming a new series called the series of the first order of D.; then by repeating the process we get the series of the second order of D. and so on until a series of regular or known form is arrived at, e.g. take the series $-1, -3, 3, 23, 63, 129 \dots$ and let a^n denote the general term of the series, and n the number of terms in the series. The successive orders of D. are:

$$\begin{array}{ccccccc} -2 & 6 & 20 & 40 & 66 & & \\ & 8 & 14 & 20 & 26 & & \\ & & 6 & 6 & 6 & & \end{array}$$

That is, the third order of D. gives equal terms, and a^n , the rational integral function of n , may be assumed $= v + x^n + y^{n^2} + z^n$. Putting 1, 2, 3, 4, for n in succession, we find $v = 3, x = -3, y = -2, z = 1$, and that the general term of the series is $3 - 3n - 2n^2 + n^3$.

A practical application of the method is shown by the following example. Find the value of the co-ordinate x of the sun on Feb. 14d. 12h., 1955, from the following data taken from the *Nautical Almanac*.

Feb.	x	Δ	Δ^2	Δ^3	Δ^4
14	+0.8040992				
		+101488			
15	0.8142480		-2490		
		+98998		-35	
16	0.8241478		-2525		+4
		+96473		-31	
17	0.8337951		-2556		
		+93917			
18	0.8431868				

The values of x are deducted from the succeeding values in each row and the results are tabulated under Δ , denoting the first difference. Each value of Δ is then deducted from the succeeding value and the results are tabulated under Δ^2 , the second F. difference. The process is continued as far as the fourth difference tabulated under Δ^4 . It will be seen that the D. decrease in each column and would ultimately disappear or become so small that they would not appreciably affect the figures to the degree of accuracy that is necessary.—in the present case to 7 decimal places. The next step is to adopt one of sev. formulæ which are in common use by computers, and the Gregory-Newton formula will be selected in this case. In this formula y denotes the value of x on Feb. 14d. 12h. (or 14.5) and x is the interval of time from the preceding day to the instant at which the computations are to be made—in the present case 0.5 day: $y = f(a) + x\Delta + \frac{x(x-1)\Delta^2}{2!} + \frac{x(x-1)(x-2)\Delta^3}{3!} + \dots$ Taking $x = 0.5$, the values of the coefficients of $\Delta^2, \Delta^3, \Delta^4$, are $-1/8, +1/16, -5/128$, and hence $y = 0.8040992 + \frac{1}{2} \times 0.0101488 - \frac{1}{8} \times 0.002490 + \frac{1}{16} \times 0.000035 - \frac{5}{128} \times 0.000004 = 0.8040992 + 0.0050744 + 0.0000311 - 0.0000002 - 0.0000001 = 0.8092045$.

1924; G. Boole, *The Calculus of Finite Differences*, 1946.

Finland (Finnish *Suomi*, or *Suomen maa*, 'the land of fens and lakes'), rep. of N. Europe, situated between the Gulfs of Bothnia and F., and bounded on the W. by Sweden, on the N. by Norway, and on the E. by Russia. Its land area in Jan. 1945 was 117,975 sq. m. (excluding inland water area of 12,190 sq. m.). The Ahvenanmaa or Åland Archipelago (q.v.) at the entrance to the Gulf of Bothnia (area 560 sq. m.; pop. 29,000) forms part of the Finnish Rep. The coast-line of the

country is flat, the highest mt being Hallatunturi (4126 ft), in Lapland. In the S. the highest is Thirismaa (754 ft). Three-fourths of the land surface is covered with forests which yield valuable timber and raw materials for wood-working and paper industries.

MINERALS in F. are very limited. No coal is found, but some 22,000 tons of copper, 100,000 tons of pig iron, 175,000 tons of steel ingots, and a total of 180,000 tons of rolled products are obtained annually. Some gold is found on the Ivalojoiki, in Lapland, and very fine

FISHING IN WINTER, FINLAND

Finnish Embassy

country is deeply indented, like that of Sweden, and there are clusters of numerous small is. Inland there is a labyrinth of large lakes and rocky basins which are divided by low, flat hills and artificially joined by canals. The chief lakes, prior to the war with Russia, were Lake Salmaa, drained by the Vuoksen over the famous Imatra Falls into Lake Ladoga; Inari, Näsijärvi, Pyhäjärvi, Oulujärvi, and Päijänne; but after the war, F. lost her portion, the N. half, of Lake Ladoga, and further losses were sustained by the terms of the armistice of 1944. The prin. rivs. are Tornio, Kemi, Oulu, Teno, and Kymi. S. F. is watered by a number of short rapids, which are of use for working mills, and to some extent for internal navigation. Lake Salmaa is connected with the Gulf of F. by a sluiced canal 36 m. in length. The surface of the

granite is quarried from the Vehmaa mines. The surface of the country consists of such primitive rocks as gneiss, gabbro, and diorite. Cambrian, Silurian, and Carboniferous deposits are found along the coasts of the Gulf of F.

INDUSTRIES AND COMMUNICATIONS.—Agriculture is the chief industry of most of the pop., though only about 8 per cent of the land is cultivated. Wheat is the chief crop, but rye, barley, oats, hay, and potatoes are also grown. Butter and all kinds of dairy produce are exported in large quantities. The State encourages scientific training and provides instructors for the agric. and horticult. schools. Currants, strawberries, and raspberries are grown with great success, and the apple, pear, and cherry tree are cultivated in the S. Fishing is a prosperous industry; salmon, trout, perch, etc.

abound in the lakes and rivs., and a kind of herring is caught off the SW. coast. The manufacturing industries include paper, engineering, wood-working, textiles, chemicals, tobacco, cellulose, leather, etc. The exports are mainly the output of the paper mills, saw mills, and wood-pulp factories: sawn and planed timber, boxboards, and wood for paper-making, also hides, pitch, and dairy produce. The many lakes, connected by canals, form an important system of internal communication. The canals and waterways are navigable at a length of

The ann. rainfall at Helsinki is 20 in. and along the S. coast 25½ in. Helsinki, Turku, and Hanko are the only ports open during the winter.

EDUCATION AND GOVERNMENT.—Education in F. is very advanced. There is a univ. at Helsinki (founded in 1640 at Turku), which has over 10,000 students, 4000 being women, and 2 univs. at Turku. Helsinki has also 1 technical and 4 commercial institutes, which are accorded univ. status. There are a number of polytechnic, commercial, nautical, and agric. schools. The country is governed

Finnish Embassy

TURKU, THE ANCIENT CAPITAL AND SECOND CITY OF THE COUNTRY

about 2700 m. and floatable at a length of over 26,000 m. There are only 3000 m. of railway, all but 150 m. belonging to the State. There are 20,000 m. of high roads and 17,000 m. of other public roads. There are over 32,000 m. of State-owned telegraph wires and over 270,000 m. of telephone wires.

CLIMATE.—The climate of F. is very severe during the winter, even along the S. coast, where it varies in Jan. between 20° and 30° F. Owing to the SW. and W. winds, and to the proximity of the sea, the climate is less rigorous than it is farther E. in N. Russia. The winter lasts many months, and frosts have been known to destroy the crops as late as June. The ground is usually covered with snow from the middle of Nov. till late in April. In June, July, and Aug. the days are very long and the weather dry and sultry.

by a president, elected for 6 years, a Council of State, chosen by him, and a House of Representatives consisting of 1 chamber of 200 members. Women have been enfranchised since 1907 and are eligible for the House of Representatives. F. was thus the first country to concede women suffrage. Military service is compulsory.

POPULATION.—The pop. is 4,215,000. The bulk of the inhab. are Finns, a people of Finno-Ugric stock. The rest of the pop. is made up of Swedes, Lapps in the N., Russians, and Germans. The vast majority of the pop. is Lutheran, but there is complete religious toleration. Helsinki (formerly Helsingfors), with a pop. of 404,000 is the cap.; other important tns are Tampere (Tammerfors), 110,000; Turku (Åbo), 110,000; Pori (Björneborg), 44,000; Lahti, 44,000;

Kuopio, 37,000; Jyväskylä, 33,000; and Kotka, 28,000.

THE ARTS.—Finnish is a Finno-Ugrian tongue; and from 1883 it was placed on an equal footing with Swedish as an official language of the country; but subsequent to the creation of the Finnish Rep. after the First World War the use of Swedish declined except in the Åland Is. In literature, too, until the end of the 18th cent., Swedish was dominant, but there was a Finnish revival in the first decades of last cent., while the formation of an association for the promotion of Finnish literature in 1831 gave a new impetus to the study of the national language and to the collection and pub. of popular songs and lyrics. Many of the modern Finnish novelists and poets, writers for the most part of the naturalistic school, enjoy a European reputation. Eemil Sillanpää was awarded the Nobel Prize for Literature in 1939. In music F. can claim Jean Julius Christian Sibelius (q.v.), who was b. at Hämeenlinna, 1865.

HISTORY.—The Finns are said to have settled in F. during the 8th cent., having been expelled from the banks of the Volga. Until the 12th cent. they were pagans, when they were conquered by Swedes and adopted Christianity. They remained a dependency of Sweden for 500 years, but enjoyed autonomous gov. Russia repeatedly tried to seize the country from Sweden, and in 1721 by the treaty of Unskaupunkti (Nystrad), Peter the Great won that part of F. which forms the prov. of Viborg. In 1743, by the peace of Turku, Elizabeth extended the Russian frontier to the Kymmene. In 1809 Sweden ceded the rest of the country with the Åland Is. to Alexander I in the peace of Hamina. F. preserved its ancient constitution until 1897, when its autonomy was attacked by the Russian Gov. In 1899 Russia declared her right to legislate on Finnish affairs, regardless of the consent of the Finnish Diet, and between 1900 and 1902 the national Finnish forces were incorporated into the Russian Army, and Russian was made the official language of the senate and of the more important public depts. There was great discontent in the country, and in 1904 Bobrikov, the governor-general, was assassinated. In 1905, the Constitutionals and the Social Democrats formed a coalition and, taking advantage of trouble in St Petersburg, succeeded in winning certain concessions from the governor-general, Prince Obolenski. The popular demands included the freedom of the Press, the deposition of Russian officials, and the reorganisation of the Diet on a basis of universal suffrage. These requests were granted and a single chamber of 200 members was substituted for the old Diet of 4 chambers. Trouble was renewed in 1908 when the Russian Gov. again attempted to curtail the powers of the Finnish Diet, and in 1910 the 'Imperial Legislation Law' was passed depriving the Parliament of its right to legislate on such questions as the imposition of taxes, police direction, school management, and

the control of the Press, which, it declared, affected 'imperial interests.' In 1911 the Russian Duma passed a Bill 'placing Russians on civil equality with the Finnish citizens in the grand duchy.'

In 1917, when the Russian Empire broke down, F. declared itself independent, but Bolshevik aggression led for some time to civil strife. Order was restored and matters finally settled between F. and Russia by the treaty of Dorpat, 1920.

Finnish-Russian War, 1939-40.—In the autumn of 1939 F. was one of the small nations suddenly destined to be a pawn on the international chess-board. The extension of Soviet influence in the Baltic, following the estab. earlier in the same year of military, naval, and air bases in the 3 Baltic reps. of Estonia, Lithuania, and Latvia, offered an obvious threat to F. There were negotiations in Moscow on political and economic questions, but it was clear that Molotov, the Soviet Minister of Foreign Affairs, was presenting demands incompatible with Finnish independence. Stalin's real policy was to secure a hold on F. by way of offsetting Ger. penetration in Scandinavia, and in his attack on F. he undoubtedly showed considerable acumen in forestalling Germany's coming invasion of Norway of the following year. Soon after the Moscow negotiations had broken down, the Soviet Gov. denounced the non-aggression pact of 1932 and diplomatic relations were broken off. On 30 Nov. Soviet bombers began hostilities by attacking Helsinki and a number of other Finnish towns, including Viipuri (Viborg) and Enso. The fortress of Hanko was bombarded by Soviet warships and Petsamo seized. At the same time a so-called Finnish People's Gov. was set up at Terijoki by Kuusinen, a former secretary of the Komintern, the avowed object of this puppet gov. of the Soviet being to help the Finnish 'Democratic Republic' of revolutionary peasants and workers. This 'Winter War' was branded as an act of Soviet aggression in Dec. 1939. Although outnumbered, the Finnish forces at once offered a most determined resistance to the Russian invasion. Heavy casualties were inflicted on the Russians both in the Karelian Isthmus and to the N. of Lake Ladoga (1 Dec.). The soul of the Finnish defence was Field-Marshal Mannerheim, the 'liberator of Finland' from the Bolsheviks in 1918. The Finnish Gov., however, through the Swedish Gov., notified the Soviet of their desire to enter into fresh negotiations, but the offer was rejected. There is no doubt that, despite the bravery of the Finnish troops, the morale of the people suffered from the bombing of the towns, especially as the Finns had but few planes with which to resist or retaliate. Large numbers of Russian tanks were destroyed and heavy casualties inflicted on their infantry in the course of the gradual withdrawal of the Finns to the Mannerheim Line. The Russians then proclaimed the blockade of the Finnish coast of the Gulf of Bothnia down to

Hanko and 20 m. out to sea. Very fierce fighting occurred from 10 to 16 Dec., especially on the Karelian Isthmus and N. of Lake Ladoga and all along the E. frontier, but the Mannerheim Line held firm. The Finnish Gov. then appealed to the world for help and issued a statement setting forth the circumstances leading to the conflict. It was obvious that if the Finnish account of the Moscow negotiations were accurate, she could never have acceded to the Soviet demands, which actually included a 30-year lease of Hanko, the cession of numerous is., a port on the Karelian Isthmus, and mutual demolition of fortifications on the isthmus.

In the week 16-23 Dec., the Russians made desperate attempts by massed troop attacks to break the Mannerheim Line on the Karelian Isthmus, but were repulsed with very great losses. Heavy damage was done on 18-21 Dec. to Helsinki in numerous air raids, as many as 200 planes taking part in successive attacking waves. Once more President Kallio appealed to the world for assistance. Preparations were made in England to send a token force, but the effort was frustrated by the assurance that both Norway and Sweden would resist their passage to F. However the Finns continued to offer a staunch resistance, defeating the Russians at Aglajärvi, Salla, and elsewhere, and even crossing the Soviet frontier N. of Lake Ladoga; while in the far N. the Russians were also hurled back in retreat. Victories were also won at Lake Kianta and at Suomussalmi. The Soviet command retaliated with more bombing raids on the main Finnish towns, and these repeated raids undoubtedly told with cumulative effect on Finnish morale, although some 170 planes had been shot down. Yet a third appeal to the world was made by President Kallio, but, while there was some talk of foreign aid, only a few aeroplanes reached F., these being sent by Britain. In the penultimate week of Jan. many Soviet attacks were launched N.E. of Lake Ladoga in a new effort to outflank the Mannerheim Line, but the Finns still held firm. Early in Feb., further attacks were made on the Mannerheim Line and near Lake Ladoga. The attacks making some impression at Summa, but only at great loss to the Russians. The Soviet command now brought up some of their best shock troops in a determined effort to break the stubborn resistance of their adversaries. Massed attacks were made ceaselessly, with especial violence at Summa, Muolaa, and on the Taipale R., and at length the Finns were forced to withdraw from their advanced positions (11-17 Feb.); but they inflicted some 30,000 casualties on their attackers. F. appealed in vain to the Swedish Gov. for military assistance, and by 25 Feb. the Russian offensive on the Karelian Isthmus had brought their forces close to Viipuri and compelled the Finns to evacuate the important fortress of Kovisto.

The massive Russian attacks were at last wearing down the gallant resistance of the Finns, who had now abandoned the

W. part of the Mannerheim Line, and hostilities concluded early in Mar., the peace treaty being signed in Moscow a day or two later. Under it F. ceded the Rybachi Peninsula in the N., some ter. in the N. centre, the Karelian Isthmus, and the Gulf of F. is. in the S.—including Viipuri, Viipuri Bay, and shores of Lake Ladoga and a 30 years' lease of the port of Hanko and neighbouring mainland. The total land and lake area ceded under the treaty being 16,170 sq. m. These terms were far more onerous than those presented by Russia in the Moscow negotiations of Oct.-Nov. 1939, especially as the ceded ter. included the whole Mannerheim Line defences: nor were any concessions made to F. such as had been previously proposed by the Soviet. But at least F. retained her independence. F. was able to hold out against its powerful enemy for as long as it did owing to the discipline of the people and the absence of any 'Fifth-Column' in the country. This absence was due to the virtual elimination of social injustice in F. and the consequent acceptance by all sections of the pop. of the position that the war was their war and not merely the war of one economic group or other in the country.

When Hitler invaded Russia in 1941 F. at once became involved in hostilities with Soviet Russia, reoccupying most of the ter. ceded under the treaty of 1940. In 1944 the Russians, who had been counter-attacking throughout 1943-4, made a determined effort to eliminate F. from the war. Finnish resistance was overcome, Viipuri falling on 20 June. In accordance with Russian conditions, the Finnish Gov. called upon the Ger. Gov. to withdraw Ger. forces from Finnish Lapland by 15 Sept. Four days after that date the 'cease fire' was sounded in F. and a peace delegation went to Moscow. On 19 Sept. an armistice was signed by Russia, Great Britain, and F. Territorial concessions were severe. Finnish troops were to be withdrawn behind the frontiers fixed by the treaty of 12 Mar. 1940, between the U.S.S.R. and F.; F. agreed to cede the Petsamo area, its only outlet on the Arctic Ocean, and to lease for 50 years the Porkkala headland, with a considerable stretch of sea and land, for use as a military base. The leased ter. was handed back to F. in 1955 without compensations. F. also undertook to pay 300 million dollars in reparations within 6 years. Of the 3 major problems which faced F. in the post-war period, the foremost was to build up relations with the Soviet Union on a basis of peaceful neighbourly dealings between 2 sovereign states of widely different size and power. On economic lines the reconstruction and resettlement of the pop. from the ceded ters. was an undertaking of major importance and the payment of the very heavy war-reparations to Russia another remarkable achievement. All those problems would seem to have been successfully solved in less than 10 years although they have left the nation economically exhausted though (1957) showing promising

signs of rapid recovery. See E. Young, *The Land of the Thousand Lakes*, 1912; A. M. Scott, *Suomi, The Land of The Finns*, 1926; W. E. Hiley, *The Forest Industry of Finland*, 1928; J. W. See further under EASTERN FRONT OR RUSSO-GERMAN CAMPAIGNS IN SECOND WORLD WAR.

Finland, Gulf of, E. arm of the Baltic Sea, having F. on its N. shores, and Russia and Estonia to the E. and S. It is 260 m. long, and 25 to 90 m. broad. Into it flow the Kymi and various lesser riva. from F.; from the E. the Neva, draining the great lakes, Omega and Ladoga, and from the S. the Narva, draining Lake Peipus. It is connected with the Saimaa Lake by the Saimaa Canal. The Finnish coast of the G. is very dangerous, owing to its shoals and is. The water is slightly salt and not very deep, being covered with ice for about 20 weeks in the year in the E. end, while the W. end remains ice-free.

Finlay, George (1799-1875), historian, b. Faversham, Kent, and educ. at Glasgow and Göttingen. Most of his time was spent in writing the hist. of Greece (where he lived from 1854), the first part of which, *Greece under the Romans*, was pub. in 1844. He wrote also *History of the Byzantine and Greek Empires from 716-1453*, 1854, and *History of the Greek Revolution*, 1861.

Finns, see FIANS.

Finnmark, prov. (or fylke) of Norway, in the extreme N., with a rocky, indented coast and a barren mountainous interior. Fishing is the main industry. Pop. (including 18,000 Lapps) 65,000. Chief towns are fishing ports of Hammerfest, Vardø and Vadsø, and mining tm of Kirkenes (not far from the Russian border). Wholesale destruction of F. was carried out by the Germans in 1944, and 45,000 people were deported.

Finns, group of peoples in N. and E. Europe speaking languages of the Finnish family. They are divided into 4 sub-groups: (1) the Baltic, comprising the F. proper of Finland, the Karelians, the Estonians, and a number of small peoples; (2) the Lapps; (3) the Volga F.—the Mordva and the Mari; and (4) the Permian F.—the Udmurts and the Komi. They have lived in their present areas since ant times, being exposed to the pressure of stronger neighbours—Scandinavians, Germans, and Russians—and for the most part under their rule. The Russians have assimilated a number of Finnish tribes which inhabited what is now the centre and N. of European

Russia, and the Great Russians are largely the product of this process. Christianised by their neighbours, the F. fell under their cultural influence; the use of Finnish languages for writing started comparatively late—Komi in the 14th cent. (see ST STEPHEN OF PERM), Finnish and Estonian in the 16th, others in the 19th-20th cents. The Finnish languages are related to the Ugrian and are often treated together with them as a single Finno-Ugrian family. Racially the F. belong to 3 sub-races of the White or Europeoid race—the Nordic, the Baltic, and the Ural—which is transitional to the Mongoloid race.

Fins, flattened extensions from the bodies of aquatic animals, which help to balance and propel these organisms through the water. In the case of fish they may be paired F. or median F., the former including pectoral and ventral F., and the latter caudal and dorsal F., these F. being supported by a series of cartilaginous or bony rays. The F. in cetaceans are simple extensions of the soft tissue and have no bony rays. The term may also be applied to other aquatic animals, as in the case of the tadpole's tail. Among the invertebrates any expanded part of the body which helps in swimming is termed a fin.

Finsbury, metropolitan bor. (the 2nd smallest) of London, lying to the N.W. of the city of London. The name means 'Finn's manor.' It has many historical associations, and in late Tudor and Stuart times was a fashionable dist. Moorfields, on the E. side, was a recreation ground from medieval times. Among interesting evidences of the past are the Charterhouse and Bunhill Fields (qq.v.). Near the latter many victims of the Great Plague were buried. S. of Bunhill Fields is the Artillery Ground, which since 1683 has belonged to the Honourable Artillery Company, with barracks and armoury. The prin. industry is watch-making, and working of precious metals; there are also large printing works. The S. part of the bor. is generally called Clerkenwell (q.v.). Together with Shoreditch, F. returns 1 member to parliament. Area 587 ac.; pop. 35,500.

Finsbury Park, dist. in the bor. of Hornsey, Middx, England. It takes its name from the park (121 ac.) formerly known as Hornsey Wood, but renamed after the London bor. in 1857. It is a well-planted park with good views.

Finsen, Niels Ryberg (1860-1904), Dan. physician, b. Thorshavn, Faeroe Is. He took his degree in medicine at Copenhagen, where he lectured on anatomy. It was here that he discovered the therapeutic effect of light upon certain diseases. He advocated the exclusion of the chemical rays from people suffering from small-pox, maintaining that this prevented the pustules from suppurating, and used ultra-violet rays for curing certain diseases of the skin, for example lupus. For this process he invented a lamp which collects the light by means of a quartz lens and also provides for cooling it.

In 1903 he was awarded the Nobel prize. He wrote *Chemical Rays and Variola*, 1894, and *Phototherapy* (trans. from the German by J. H. Sequeira, 1901).

Finsteraarhorn, highest peak of the Bernese Alps, Switzerland, about 40 m. SE. of Bern: height 14,025 ft. It was first climbed in 1829.

Finsterwalde, Ger. tn in the dist. of Kottbus, 28 m. WSW. of Kottbus (q.v.). In 1835 it came into the possession of Saxony, and in 1815 of Prussia. There is a 16th-cent. church, and a 17th-cent. castle. Lignite is mined in the area, and there are textile, paper, and metal industries. Pop. 20,000.

Finzi, Gerald (1901-56), composer, b. London, studied under Bairstow and

Most F.s are the result of glacial erosion. Old riv. valleys are widened, and their floors excavated below sea-level by the action of glaciers. F.s are found in Norway, Iceland, Greenland, on parts of the Amer. coast and in New Zealand. Those of Norway are among the most notable; Sogne F., one of the largest, being 100 m. in length, and Hardanger F. considerably more than half that length. Christiania (Oslo), Aurlands, and Trondhjem are also well known, the last being the scene of much naval and air activity in the Second World War in 1939-40, between the Brit. and Ger. forces. D. McLeish

THE AURLANDS FJORD, ONE OF THE GRANDEST IN NORWAY

R. O. Morris. After a short period (1930-3) as prof. of composition at the Royal Academy of Music he withdrew to the country and devoted himself entirely to creative work. His instrumental works include an *Introit* for violin and orchestra, a clarinet concerto, and a *Fantasia and Toccata* for piano and orchestra, also a little orchestral and chamber music. His vocal works show in particular a sensitive choice and treatment of fine poetry: Crashaw, Wordsworth, and Blunden for chorus and orchestra, Drummond and Bridges for unaccompanied chorus, Christina Rossetti for part-songs with piano, Traherne, Peele, and Milton for voice and orchestra, and Shakespeare and Hardy for songs.

Fjord, or **Fjörd**, narrow inlet of the sea, having high coasts on either side, and cutting far into the land. These F.s, which are found on mountainous coasts, are exceedingly deep, the deepest part being the farthest inland, while the bottom shelves up to the coast and the mt sides are often lined with waterfalls.

Fir, strictly speaking, is the popular name for *Abies*, a genus of coniferae, but the genus *Picea* and others are often included. The leaves are needle-shaped and in *Abies* have a rounded base; those of *Picea* are decurrent. *Abies* cones are erect, and when ripe the scales fall off leaving the upright axis standing alone; the cones of *Picea* are pendent. *A. pectinata* is the European silver F., *A. nobilis* is the Noble silver F. of America, *A. Nordmannica*, the Crimean silver F., *A. amabilis*, the red silver F. of U.S.A., *A. venusta*, the Monteroy silver F., and *A. religiosa*, the Mexican silver F., *F. excelsa*, is the Norway spruce. All these trees are commonly cultivated, but the Norway spruce flourishes in severe exposed situations, and is widely distributed over N. Europe. The timber of this tree constitutes deal, and the trunks are used for masts, etc. There are many valuable products from other members of the order, e.g. gums, resins, pitch, etc., and *A. balsamea* yields Canada balsam. See FORESTRY; TIMBER; TREE.

Fir-bolg, in Irish tradition, a race of early inhab. of Ireland. See IRELAND, *History*.

Firando, see HIRADO.

Firdausi, **Firdausi**, **Ferdousi** (c. AD 935–c. 1020), Persian poet, author of the Persian epic, the *Shahnama* (Book of Kings), a long poem of c. 60,000 couplets, incorporating some 1000 couplets by the earlier poet, Daqiqi (q.v.). The *Shahnama*, which enjoys an unrivalled popularity in Persia, relates the legendary hist. of Persia from the beginning to the Arab conquest in the 7th cent. AD. It was dedicated in its final form to Sultan Mahmud of Ghazna in 1010. The latter is related to have offered F. an inadequate reward for his labours. F. fled from Ghazna and satirised Mahmud. He finally returned to his native Tus where he d. He also wrote the romance *Yusuf and Zuleykha*. The chief eds. of the *Shahnama* are: Turner Macan, 1829; Julius von Mohl, pub. with a trans. into Fr., 1876–8; J. A. Vullers, and S. Landaner, 1877–83; A. G. and E. Warner, 1905. See T. Nöldeke, *Das Iranische National epos*, 1896; H. Massé, *Les Épopées Persanes*, 1935.

Fire. Although the statement has been not infrequently made that tribes totally ignorant of F. have been discovered, the evidence on this point is very weak, and it is questionable whether such a race is in existence at the present time. There are considerable variations of detail in the primitive methods of producing F., but they are all based on the principle of either concussion or friction. The simplest form of the latter, rubbing a stick along a groove in another stick, is practised in Tahiti, Samoa, the Sandwich Is., and other places. The stick is twirled round in a hole in the other piece of wood in Australia, Kamchatka, Ceylon, South Africa, the West Indies, North and Central America, and as far S. as the Straits of Magellan. Concussion has also been known as a means of producing F. from very early times, and such methods as striking 2 stones together, striking a stone on a piece of wood, or striking 2 bamboos together are in use. The employment of a burning-glass is also of great antiquity; Aristophanes mentions one in *The Clouds*. There are many different legends as to the origin of F. In Gk mythology, Prometheus brings down the torch he has lighted at the sun; Ukko, the Estonian god, strikes his stone with his steel and sends forth F. in the shape of lightning; in North Amer. legend F. is struck from the hoofs of the great buffalo as he gallops over the prairie, and thunder in the Hindu mythology is the clatter of the hoofs of the sun's horses on the sky. Primitive man found it convenient to have a F. always burning in a public building, hence the prytaneum gradually became a religious institution, round which centred also all civil and political interests. The principle of an ever-burning F. was practised by the Romans, Egyptians, Greeks, Persians, Aztecs, Peruvians, etc. If the F. of Vesta at

Rome, for instance, went out, all business was suspended until it had been rekindled with appropriate ceremonies. As the sun appears to lose its power to provide heat at certain times, the longest day of summer was in many religions an occasion for ceremonious rites connected with F. It was the belief of many ant. philosophers, e.g. the Stoics, that the world would perish by F.; the Scandinavian mythology and the Apocrypha (2 Esdras xvi. 15) also mention this belief. For further details as to folk-lore, etc., see ORDEAL; PARSEES; and ZOROASTRIANISM; for the physics and chem. of F. see COMBUSTION; FLAME; and FUELS. See also C. F. Dupuis, *Origine de tous les cultes*, 1794; E. B. Tylor, *Researches in the Early History of Mankind*, 1865; Sir J. G. Frazer, *The Golden Bough*, 1890; J. A. G. Pauschmann, *Das Feuer und die Menschheit*, 1908; W. Hough, *Fire as an Agent in Human Culture*, 1926.

Fire Alarms, see FIRE BRIGADES.

Fire Brigades and Fire Fighting. F. B. are bodies of trained men and their equipment for fighting fires, and for saving life and property from loss and damage from fire or any other causes. Under this heading will be treated the personnel and F. appliances throughout the Brit. Isles, but similar precautions for dealing with uncontrolled fire are taken in every tn of size and importance throughout the world. The first reference to a F. B. relates to China, c. 4000 BC. In 2000 BC Egypt had an organisation for fighting fires, and the Romans started to form their B.s under a *praefectum vigillum*, or prefect of the watch, about 150 BC, and by about 40 BC theirs was a highly trained and efficient B. In England there is no record of very early F. B.s, although legislation in 1189 encouraged the use of building materials of a more fire-resisting nature than hitherto. In 1212 also, it was decreed that new houses were not to be roofed with reeds, rushes, straw or stubble, and that water should be kept for F. purposes.

The first fire insurance office was founded in London in 1680—The Phoenix (not to be confused with the Phoenix which was founded a century later), and the first body of F. fighters was then organised. These men were drawn from the Thames watermen, and each insurance company dressed their men in distinctive livery. It is not known how they were equipped. In 1825 some of the rival companies realised the desirability of united effort, and later all the more memorable insurance offices merged their F. fighters in the formation of the London Fire Engine Estab. in 1833, later to become, by act of parliament in 1865, the Metropolitan Fire Brigade. Money was raised for the maintenance of this B. by (i) a halfpenny rate on the rateable property of London; (ii) a contribution from the insurance companies of £35 for every million pounds gross insured; and (iii) a £10,000 grant from the gov. In 1904 the title was changed to the 'London Fire Brigade' which, by 1938, had reached

a strength of 1 chief officer, 6 senior officers, and 2241 other officers and men. There were 59 land fire stations and 3 R. Thames stations. In other important cities and towns throughout the country, most local authorities maintained B.s. staffed by professionals or volunteers.

Organisation.—The first F. B. act for over 40 years was passed by parliament in 1938. It required, among other things, that certain local authorities should make provision for the extinction of fires and the protection of life and property by providing F. B.s, making efficient arrangements for them to be called, and arrangements for mutual assistance between fire authorities. This act had not come into operation, however, before the first Air Raid Precautions Act, 1937, which required air raid precautions and fire

changeable, and it was this body which successfully met the varying forms of air attack from 1941 until the end of the war. A National Fire Service College was established where officers and prospective officers were given extensive training in all aspects of F. F. and fire prevention. One of the important developments within the National Fire Service was the selection of certain suitable officers for specialised training over a long period in the subjects of fire prevention and fire protection, and these officers were available to give free advice to local authorities, schools, hospitals, factory managers, and private householders.

As the result of a promise made by the home secretary that, after the war, local authorities might again control their own F. B.s, the Fire Services Act was passed in 1947 making co. councils and co. bor. councils the 'fire authorities' from 1 April 1948. The 1947 act provides that, among other things, fire authorities shall secure:

1. Such a fire brigade and such equipment as may be necessary to meet efficiently all normal requirements;
2. The efficient training of members of the fire brigade;
3. Arrangements for dealing with calls;
4. Information, by inspection and otherwise, required for fire-fighting purposes, with respect to the character of buildings and other property;
5. Arrangements for mitigating damage to property resulting from measures taken in dealing with fires (i.e. salvage);
6. Arrangements for giving advice on fire prevention, fire protection and means of escape in case of fire.

Mutual assistance schemes must be made between adjoining fire authorities' areas, so there is no question whatever of there being any boundaries from a fire point of view. The only boundaries are administrative ones. The secretary of state is the controlling authority, and a staff of H.M. inspectors is responsible for ensuring that effective and efficient F. B.s are maintained. Regulations made under the 1947 Act establish standardised ranks, rank markings, rates of pay, conditions of service, etc., throughout the country. The ranks in the F. B.s are now: chief officer, assistant chief officer, divisional officer, assistant divisional officer, station officer, sub-officer, leading fireman, and fireman. Training establishments are organised by the larger F. B. where members of those F. B. having no training centres may also receive initial and supplementary training. The Fire Service College gives advanced and specialised training to officers. Financially, the fire authorities bear 75 per cent of the cost of F. B., the remaining 25 per cent coming from the Treasury. By the Civil Defence Act, 1948, an auxiliary organisation, including women members, was again set up (see FIRE SERVICE, AUXILIARY).

The account for fire damage (Britain and Rep. of Ireland) in recent years is given in the following table:

YEAR	Loss
1954 . . .	£26,184,000
1955 . . .	£27,645,000
1956 . . .	£27,512,000

schemes to be prepared, such schemes to include an emergency F. B. service and the recruiting and training of auxiliary firemen. These schemes brought into being the Auxiliary Fire Service which consisted of volunteers from all walks of life who trained in their spare time as auxiliary firemen. At the outbreak of the Second World War many thousands of part-time firemen had completed their initial training, and many of them entered their F. B.s on a full-time basis, while others continued with evening and night duties. The auxiliary firemen and their 'Regular' colleagues met and fought the great air raid attacks of 1940 and 1941. Owing to the widespread nature and severity of the Ger. air attack, however, the need for greater mobility and uniformity of practice and equipment was realised, and in Aug. 1941 all local authority F. B.s, 'regular' and 'auxiliary,' were united to form the National Fire Service. The organisation within the National Fire Service enabled vast numbers of appliances and men to be mobilised at a moment's notice to any part of the country requiring assistance, with the advantage, *inter alia*, that all equipment, appliances, etc., were uniform and inter-

These figures relate to material loss only, and take no account of consequential loss. Lives lost in accidents caused by burning, combustion, etc., in England, Wales, and Scotland numbered 783 in 1953, 753 in 1954, and 815 in 1955. The growth of the inflammability of certain building materials, and the use in industry of highly inflammable and complex chemicals, together with the increased importance of conserving food-stuffs and timber in co. dists., have rendered adequate fire protection essential. This has been made possible during recent years by the great advances made in the science of F. F., in the specialised knowledge of fire engineers, and in the increase in efficiency of mechanically propelled vehicles.

The earliest record of fire appliances is of a pump invented by Ctesibios, a Greek

its high output for small weight, and very high efficiency—important factors in fire appliances.

Present-day practice is the combination, as one unit, of the internal-combustion engine and the centrifugal pump which, instead of working on the principle of displacement by pistons or plungers, makes use of the natural law known as centrifugal force, and consists of a revolving impellor which receives water at its centre and which discharges it from the outer edge of the blades. The water is converted into the pressure energy required by the general construction of the pump casing. Pumping cannot be commenced until water is within the pump casing, and this is either obtained by introducing water into the pump under pressure (e.g. from a street main supply) or by 'lifting' water from an open supply

Merryweather

TURNTABLE LADDER

living in Egypt, about 150 bc. There is no direct record of it, but Hero of Alexandria described it in the same century. Later buckets, simple pumps, and squirts were used, although inventiveness in this direction seems to have been ignored, for at the time of the Great Fire of London in 1666, there were still only squirts and simple pumps available.

Pumps.—The first known appliance for delivering a continuous stream of water was described in 1675, when an air-chamber was coupled to a manual piston-type pump. During the latter part of the 19th cent., the manual type of fire engine was gradually replaced by a combination of horses and steam engines. The horses, specially trained, pulled to the scene of the fire a trolley upon which was a steam engine for pumping purposes. These engines were kept with fires banked down or ready for quick ignition, and were quickly brought to life so that a good head of steam was available by the time the engine had arrived at the fire. At the commencement of the 20th cent. the internal-combustion engine began to replace the steam-pump and the horses, and the design of the pumps themselves started to change from the reciprocating-piston type to the centrifugal pump with

by 'priming,' i.e. by reducing pressure within the pump and suction hose to below atmospheric pressure (14.7 lb. per sq. in.), thereby causing the atmospheric pressure on the surface of the open water supply to drive the water up the suction hose and into the pump to fill the vacuum created. Under absolute vacuum conditions a maximum 'lift' of 34 ft. is theoretically possible, but under the most favourable working conditions the maximum possible 'lift' is 28-30 ft. See also PUMPS.

Fire 'Escapes' (Ladders).—In residential or factory areas the 'first attendance' to a fire usually includes an escape carrying appliance and the ladders, known as escapes, are designed to be used rapidly for rescue purposes up to a height of about 50 ft. Designs vary, but escapes consist generally of an extending ladder in 3 sections which are extended by means of steel cables from drums and winch handles, mounted on a sliding carriage enabling the elevation of the ladders to be varied as required. Very rapid and effective use is often made of this piece of equipment. With the increase in height of modern buildings came the need for firemen to get still higher with their apparatus and the escape was developed

into the turntable ladder which, although similar in principle to the escape, is constructed normally of steel, power driven, and, as the name implies, is mounted on a turntable on the main vehicle, by which it can be rotated through a complete circle. By the simple operation of levers, the ladders may be manoeuvred into any position required within its range (up to 150 ft). The turntable ladder is not only used for rescue purposes, but as a water tower from the top of which large quantities of water can be pumped on to a high, burning building.

Various other ladders for use in varying circumstances are carried on fire appliances, together with numerous items of 'small gear,' each piece having its own particular use.

Hose.—The original hose used in F. F. was made of leather, riveted throughout its length. The excessive weight and its inflexibility confined the lengths to short pieces only. The first flexible hose was made in 1872 by J. van de Hyde, snr., and J. van de Hyde, jnr., by sewing together the edges of strips of leather. This was a great step forward. Modern hose is made of vegetable fibres woven in such a way as to withstand considerable internal pressures and rough abrasions externally. The main fibres used are flax, jute, ramie, cotton, and hemp, although synthetic fibres (rayon, nylon, and terylene) are being increasingly used. Hose is mainly of 2 types—'unlined,' which is the ordinary woven fibre, and 'lined,' which contains a very fine layer of rubber or latex covering the whole of the inside of the hose. The latter is the heavier to handle, but the smooth surface of the rubber greatly minimises the friction on the water, and also reduces the amount of water damage within buildings, for this type of hose does not leak as the 'unlined' type does. 'Unlined' hose is usually in 75-ft or 100-ft lengths, and 'lined' in 50-ft lengths, each length being capable of being coupled to any other by (usually) light alloy or brass instantaneous couplings. The diameter of hose varies according to the use to which it will most likely be put, but the most common size for all normal F. F. purposes is 2½ in. diameter. Fire appliances each carry 1900–2000 ft of hose according to locality and need.

Fire Alarms (Street).—Most large built-up areas are equipped with an electric fire-alarm system, with fire-alarm posts situated at convenient positions in the streets and roads, which connect direct to the fire station. The fire alarm is usually operated by breaking a glass panel and pulling a knob. This immediately makes electrical connection with the fire station where bells are automatically actuated, and the code number of the fire alarm which has been operated is punched out on a tape machine, together with the exact time. There are 2 main types of fire alarm—'open circuit,' where the actuation of a fire alarm box closes the electrical circuit, and the 'closed circuit' where actuation of a box breaks the electrical

circuit, in each case causing the alarms to be given at the station. One disadvantage of most street fire-alarm systems is that the person giving the alarm must wait at the post until the arrival of the B., and then direct them to the actual address of the fire. Modern development is overcoming this feature by enclosing a telephone in the alarm post so that the caller may speak to the fire station and give necessary details of the address. It is questionable whether, in highly built-up areas, street fire-alarm systems are now so essential as they were, for, with telephones so often readily available, and with emergency facilities, this latter method of calling the B. is almost as quick as the street fire-alarm system, with the advantage also that the full address of the fire can be given.

Fire Alarms (Automatic).—Automatic fire alarms within buildings are devices which automatically respond to any sudden rise in temp. or any gradual rise above a predetermined temp. within a room or compartment, and give an alarm of fire by ringing a bell either outside the building protected to call attention to passers-by, or in a fire station, or both. These automatic alarms work on one of the following principles: by (a) thermostatic control, where a rise in temp. will expand a piece of metal situated in small containers fitted at intervals to the ceiling; (b) the expansion of a volatile liquid in a small diameter copper tube running round the walls at ceiling level; (c) the expansion of lengths of wire situated at intervals on the walls causing a weight to drop; or (d) using the resistance differential between an insulated wire and a bare when exposed to heat. In each case the action causes an electric circuit to be completed for the operation of the alarm bell. See also SMOKE DETECTORS.

Automatic Sprinklers.—A sprinkler system within a building consists of a range of pipes fitted at ceiling level and connected to a pressure supply of water (e.g. in mains, overhead tank, pump from riv., etc.). On the range of pipes are situated at regular intervals sprinkler heads or outlets, having 1-in. diameter, which are sealed in such a manner that they are automatically opened at a predetermined temp. These sprinkler heads are fitted normally 1 for each 100 sq. ft (i.e. at 10-ft intervals) and the seal consists of a seating held in position by a special solder which melts, or by a small quartz bulb containing a volatile spirit which when expanding on being heated, shatters the bulb, thereby releasing the valve seating. The operating temp. may be varied, and is normally at 155° F. The water issuing from the pipe impinges on a deflector which causes it to 'sprinkle' in umbrella shape over a floor area of approximately 100 sq. ft. In buildings which may become very cold in winter, e.g. riverside warehouses, with the possibility of water in a sprinkler system freezing, a special 'alternate' system may be installed whereby the pipes are charged in winter time with air under pressure

but with an automatic device for rapidly expelling the air and admitting the water in the event of fire. The value of the automatic sprinkler installation lies in its ability not only to detect a fire but also to confine it or extinguish it, and also to give warning by an alarm bell that it is in operation.

Adaptations of the sprinkler system have been made for use on oil fires where water at ordinary pressures would not be suitable for extinguishing burning oil. This adaptation causes water to be ejected on to the surface of the burning oil at high pressure, thereby creating a water-oil emulsion which will not burn readily. Further variations of the sprinkler system may be found outside of buildings which are separated from others only by a short distance. This variation, known as a 'drencher system,' is to create a water curtain down windows and other openings to prevent fire spreading from the nearby buildings. A similar device may be found in many theatres, where the purpose is to provide a cascade of water down the safety curtain to keep it from buckling and falling in the event of a fire on the stage. A system, not unlike the automatic sprinkler system in principle, is the automatic carbon dioxide (CO_2) installation which is used to extinguish fires involving oils, spirits, or electrical equipment. On the automatic opening of a valve at a predetermined temp., the room or chamber protected is flooded with carbon dioxide gas. One advantage of this system is that no water damage is caused to delicate electrical apparatus, and on the dispersal of the gas no damage has been caused to any unburned oil or spirits.

Fire Extinguishing Media.—To produce the phenomena of fire 3 factors are essential to combustion. They are: 1, the presence of a combustible material, or fuel; 2, the presence of air or oxygen to support the combustion; and 3, the attainment and maintenance of a minimum temp., according to the nature involved. If any one of these 3 essentials is removed then combustion will cease, and fire extinction consists of this action either by 1, removing the burning material (starvation of the fire of fuel); 2, reducing the available air or oxygen (smothering); or 3, reducing the burning material to a temp. below which it will not continue to ignite or re-ignite (cooling). Some methods of extinguishment involve more than one of the above.

Water is the most common extinguishing agent. In the first place, it is the cheapest and most readily available agent, but, secondly, and particularly, it is a substance which will absorb most heat from a burning material and thereby reduce it below its ignition temp. This is due to the fact that water absorbs 85 calories per gram (153 B.Th.U. per lb.) on being heated from normal temp. to boiling point, but to convert boiling water to steam will absorb 540 calories per gram (973 B.Th.U. per lb.). It will be seen, therefore, that if water is to be used to best advantage it should be converted into steam by the

burning material in order that the maximum possible heat is thereby absorbed, for it takes about 6 times as much heat to convert water to steam as it does to raise it to its boiling point. These figures, compared with those relating to other extinguishing media, show that water has a very much greater capacity of absorbing heat and consequent reduction of the temp. of the burning material to below its ignition temp. *Foam* is a chemically produced solution not unlike thick soap suds in appearance. It is used for the smothering (or excluding oxygen from) burning oils, spirits, fats, etc. Water on this type of fire would have the effect of spreading the burning material. *Carbon dioxide*, *methyl bromide*, *carbon tetrachloride*, and *chlorobromomethane* are inert gases, heavier than air, all of which are used for their smothering effect on burning materials. They have also some cooling properties, but limited compared with water. These extinguishing agents are particularly suitable for use on electrical apparatus, for they are non-conducting and non-damaging. However, the dangers of inhaling the vapours of these substances should not be overlooked. Certain *dry powders* have been used for F. F. purposes. Generally these powders contain a large percentage of sodium bicarbonate, together with chalk, whiting, sand, etc., and for ordinary fires are no more effective than a bucket of water. Various methods are used to eject forcibly the powder on to the fire. Certain classes of fires, however, cannot be extinguished by water or liquid extinguishers, and dry powders of one kind or another only are possible, e.g. for fires involving magnesium, sodium, etc.

Fire Prevention.—In recent years considerable emphasis has been placed on the specialised knowledge of fire prevention, and the protection of life and property against fire, as opposed to fire extinction, and there is in every F. B. at least 1 specially trained officer who is available to give advice on these subjects. In principle, the aim of these specialists is to reduce the work of the F. fighter by, if possible, preventing fires, or if that is not possible, the danger of loss of life, to lessen and to minimise the spread of fire and thereby reduce the damage. These aims are carried into effect by the inspection of all types of property and the giving of free advice to the occupiers, on matters relating to building construction, means of escape in case of fire, fire prevention, water supplies, access for fire appliances, etc. (See also FIRE-RESISTING BUILDINGS AND MATERIALS.) The following is a summary of fire prevention legislation concerning chiefly means of escape and public safety:

- 1, Public Health Act, 1936 (sections 59 and 60);
- 2, Factories Act, 1937 (sections 34, 36, and 37);
- 3, Miscellaneous Factory Orders and Regulations;
- 4, Celluloid and Cinematograph Film Act;

- 5, Cinematograph Acts, 1909 and 1952, and Regulations;
- 6, London Building Acts;
- 7, Regulations made under Education Act, 1944;
- 8, Children and Young Persons Acts, 1933 and 1952;
- 9, Theatres Act, 1843;
- 10, Children's Act, 1948, and Regulations;
- 11, Local Acts, Orders, Regulations, and Byelaws;
- 12, Petroleum (Consolidation) Act, 1928, and Regulations;
- 13, Explosives Acts;
- 14, Heating Appliances (Fireguards) Act, 1952, and Regulations.

See R. Northwood, *Fire Extinguishment and Fire Alarm Systems*, 1928; A. N. Cameron, *Chemistry in Relation to Fire Risk and Fire Extinction*, 1933; *Chemical Fires* (revised), 1934; J. J. Williamson, *General Fire Hazards and Fire Protection*, 1935; J. H. Blood, *Technology of Fire Insurance*, 1935; J. Bowman, *Hydraulics for Fire Engineers*, 1936; *Manual of Firemanship: A survey of the Science of Fire-fighting* (H.M.S.O.), 1943 ff.; Building Research Committee and Department of Scientific and Industrial Research, *Fire Grading of Buildings* (H.M.S.O.), 1946; H. S. Hodges, *Electricity and Fire Risk* 1947; J. W. Kenyon, *The Fourth Arm*, 1948; Sir A. Firebrace, *Fire Service Memories*, 1949.

Fire Engines, Escapes, etc., see FIRE BRIGADES.

Fire-extinguishing Compounds, see FIRE BRIGADES—*Fire Extinguishing Media*.

Fire Insurance, see INSURANCE.

Fire of London, see GREAT FIRE.

Fire-raising, term used in Scots law for what is known in Eng. law as arson. It applies to the setting fire wilfully to someone else's property, for example ships, buildings, growing wood, corn, coal or articles of that sort. The law with regard to this also forbids setting fire to one's own or other people's property with the intention of defrauding the insurance company, and these offences are punished in Scotland with imprisonment.

Fire Resisting Buildings and Materials. The purpose of erecting F. R. B. is to give greater safety to life and property by providing safe exit for occupants, reducing outbreaks of F. and minimising F. spread. This is achieved largely by the use of B. M. which are not only incombustible but which will not readily transmit heat. They must also withstand rapid cooling during F. fighting. Those B. M. which offer the most resistance to F. are solid clay bricks, stone, concrete. Steel is incombustible but if exposed to heat will (a) expand and cause damage to the structure, and (b) lose much of its structural strength at temps. reached in moderate F.s. Cast iron will 'resist' F. but may collapse suddenly on being cooled. These latter 2 M. should be well clad with concrete or other non-heat conducting and incombustible M.

Considerable progress has been made in

recent years in the classification of B. M. and elements of structure into various grades of F. resistance following subjection to comprehensive standard tests. This work is carried out jointly by the Dept of Scientific and Industrial Research and the F. Offices' Committee. As a result, architects, builders, and others, having determined the degree of resistance required for their particular purpose, may select M. and forms of construction falling within certain specified grades ranging from $\frac{1}{4}$ hr to 6 hrs resistance to F. spread. Wall boards or B. boards used for internal work are also graded according to combustibility, but some of these M., although in themselves comparatively incombustible, have the character of spreading flame rapidly across their surface. Large B. sub-divided by internal F. R. walls must have door and window openings protected to be effective. The F. Offices' Committee issues rules relating to the construction and fitting of F. R. doors, etc. These, to be completely effective, should be self closing and held open only by a fusible link which will melt at a predetermined temp.—thus allowing the door to close.

Timber of the hardwood type (e.g. oak, teak) 2 in. thick gives a good degree of F. resistance for doors. Other timber with a large cross-sectional area may withstand F. for a considerable time before failing, and may be more reliable than unprotected steelwork. Woodwork may be given treatment by impregnation with certain ammonium salts or painted with a mixture of sodium silicate and china clay. This produces a 'flame retardant' effect rather than make the timber F. R. Fabrics, draperies, etc., used on the stage in theatres are usually required by the licensing authorities to be dipped or sprayed with various solutions for the same purpose. These solutions often contain boric acid, borax, and sodium phosphate.

The London Co. Council make stringent regulations relating to F. protection in certain classes of B.

Fire Service, Auxiliary. Under regulations made under section 2, Civil Defence Act, 1948, F. authorities are required to organise their F. brigades for the purpose of civil defence (q.v.). As part of this general function, they are required to 'enrol auxiliary firemen as members of fire brigades for service therein.' For convenience of reference, the A. organisation, which includes women members, is known as the A. F. S. but the personnel are members of the individual brigades in which they enrol and not of any national organisation. The activities of the A. F. S., except in a war emergency, are restricted to such duties as are desirable for training; this training is, as a rule, based on existing F. stations, instruction being given by regular members of F. brigades. The training is designed to give the A. a thorough knowledge of the basic principles of firemanship, the improvisation of water supplies, rescue from F., and civil defence. At a suitable stage of their

training, opportunities are provided by many F. authorities for A.s to stand-by at F. stations for attendance at F.s.

The training of A. firewomen covers duties in relation to F. S. organisation and administration, control and mobilising of appliances, and the use of radio. They may also be taught to drive and serve as members of the crews of mobile control vans, wireless vans, canteen vans, and mobile kitchens. Some are trained as despatch riders. A number of appliances have been specially developed for emergency F. fighting, these include a self-propelled pump and special vehicles such as control units, communications units, hose layers, and transportable water units; new equipment includes lightweight plaster, piping, and tanks as well as large-diameter hose for large-scale water relays.

Fire-ships, vessels filled with combustible materials for the purpose of bringing destruction on the enemy. The 'fire-chamber' was built between the decks from bulkhead to forecabin and filled with various combustible materials, among them gun-powder. The F. were then set on fire and sent among the enemy, the men escaping in boats. They were employed to defend Antwerp in the siege of 1585, and in 1588 to destroy some of the ships of the Armada. In more modern times Lord Dundonald used them against the Fr. in 1809, but after that they were very little used. Certain kinds of floating fire were, however, used much earlier than any of these, some being mentioned by Livy as being used in the 2nd cent. BC.

Fire Tactics have undergone considerable modifications since the first introduction of firearms in warfare; the increased range and efficiency of the arms of infantry and artillery (q.v.) have naturally made many changes. The method of delivering fire originally used by the Spaniards for infantry was for each man in succession to fire, and then to fall to the rear of the line to reload. This required a great degree of coolness and individual skill to be successfully carried out. As the handiness of the musket was improved rifle firing became more and more irregular, and by the middle of the 17th cent. it was the usual custom for the musketeers to F. 1 or 2 'voleros' or 'salves' and then charge. The 'linear' system consisted of 3 long lines of battalions, giving the utmost scope for F. T., as it was considered that the maximum weight of controlled fire at short range was a decisive factor. The Prussian system of F. discipline was originated by Leopold of Dessau and Frederick Wm I, and put into operation by Frederick the Great. Under this system a battalion consisted of 8 companies, which fired company volleys as follows. As the company on the extreme right began to fire, the 2nd company was at the ready, and so on; the same process was gone through on the left flank, so that by the time the centre companies had fired the end companies were again ready. Since that time rifles have become

efficacious at over 1000 yds, and the finding of the range has become a matter of importance. The F. T. of an infantry company are controlled by the non-commissioned officers and officers, who name the target and give the range. Firing by volleys is the usual method; save at short ranges independent F. and magazine F. are rarely adopted. The most important modification of rifle F. has been the adoption of rapid F. in 'bursts' as the normal method for infantry instead of slow continuous F. Five rounds a min. was the rate of normal F. and 15 rounds for rapid aimed rifle F. With the new FN rifle a rate of 650 rounds a min. is attainable, and with the machine carbine or sub-machine-gun, 500. Machine-gun F. T. are still somewhat indefinite, but one or two principles of action stand out clearly. It is important that whether they are used in numbers or as auxiliaries they should be free to move without being under the necessity of maintaining a relative position to some other unit. Machine-guns must also co-operate with other troops as closely as possible, and must be able to be concealed and evade the enemy's shrapnel. As the result of experience in the First World War, machine-gun companies are now attached to regular infantry battalions. The most favourable range for machine-gun F. is from 600 to 1400 yds. The same principle of firing in bursts is observed. As regards guns which come in the category of artillery, 4 methods of firing are used. When each gun is fired separately at a signal from the commander of the battery, this independent F. is used to find the range, etc. When guns F. at stated intervals all along the line of the battery, this is known as battery F. If the guns of each section are fired at the will of the commander thereof with no reference to the rest of the battery, this is known as section F. Firing by salvos is when all the guns F. simultaneously; this is only employed very rarely, as sometimes for salutes, etc. These principles, however, have but little relation to massed attacks by tanks—preceded by very mobile troops on motor cycles and parachutists operating well behind the opposing lines and armed with sub-machine-guns—co-operating with dive-bombing planes and other low-flying planes armed with machine-guns. These F. T. were employed by the Germans with overwhelming success against the armies and towns of Holland, Belgium, and France in May-June 1940, and very speedily resulted in the complete defeat of all 3 countries. In the later years of the war the Allies developed these F. T. with armoured formations and aircraft with devastating results against the Wehrmacht. See ARTILLERY; GUN; RIFLE.

Fire-watching, see CIVIL DEFENCE.

Firearms are dependent on the powder or propellant used in them. It is not known for certain where gunpowder was invented; but modern opinion traces its discovery to the E., and maintains that it was used originally as an incendiary rather than as a propellant. All that can

be said with certainty is that by 1250 Roger Bacon (q.v.) had in his possession a perfectly good receipt for 'black gunpowder,' the evolution of which was due to the discovery of the effect of using refined saltpetre and coarsely ground sulphur in place of the usual flowers of sulphur, or sublimed sulphur. These, combined with willow charcoal in the proportion 75 per cent saltpetre, 15 per cent charcoal, and 10 per cent sulphur, represent modern B.P. Earlier types had a lower percentage of saltpetre and were weaker propellants.

Primitive Firearms.—Early cannon and hand F. were made from wrought-iron bars forged very roughly and secured with a series of forged rings. Gaps between the bars were filled with molten copper or brass, and the weapons were but roughly shaped. Crude cannon were in use on the Continent by 1300, and were used by Edward III of England in his war against the Scots (1327). The first hand-guns appear at Perugia, Italy, in 1364, and were common by 1380 at Augsburg and probably at other large iron-manufacturing centres. These guns were simply tubes of wrought iron fixed upon wooden stocks. They were probably held in the left hand and fired by means of a match held in the right. Sometimes 2 men were employed, one to hold the gun, the other to apply the match.

Matchlocks.—By 1425 a mechanical lock for applying the match had been evolved, and the first matchlocks were in being, thus enabling one man to control one weapon. It now became possible for some precision to be achieved with the primitive F. of that period, and competitions for shooting were held at Augsburg and other continental centres. Two types of gun appear to have been in use, one the wrought-iron and banded conical gun, the other the plain cylindrical bored gun for firing leaden bullets only (see BULLET). The conical gun had the advantage of being able to fire not only bullets, but also a modification of cross-bow quarrels, incendiary and armour-piercing arrows, and pebbles of varying weight. Though not an accurate weapon, it was effective at close range. Guns of the latter type were used by mercenaries from Hainault in the 2nd battle of St Albans (1461), the first occasion on which hand-guns of any sort were used on Eng. soil. There is no further record of the use of F. in this country until 1486, when Henry VII ordered that half the royal guard should be armed with arquebuses. The arquebus (q.v.) was a simple matchlock gun carrying a solid bullet in a cylindrical barrel, and was fairly accurate up to about a range of 50 yds. With slight changes in lock action, calibre, and length of barrel, this simple form of matchlock arquebus or musket endured in the Brit. service until at least 1680. It was the standard military infantry weapon for practically all W. powers.

Wheel-locks.—Despite its simplicity, there were many objections to the match-

lock. The smoke of the matches would frequently disclose an ambush, night attacks were entirely out of the question, and in wet weather the efficiency of the weapon was more than doubtful. A self-igniting mechanism, the Ger. wheel-lock, had been invented, some say, as early as 1520. (Very few wheel-locks, however, date from much before 1575, and it is doubtful if the earlier date is correct.) It consisted of a serrated wheel revolving in a pan which had a sliding cover and was filled with the priming powder. A fragment of iron pyrites was held in the jaws of the cock. When this was lowered into the uncovered pan, and the trigger pressed, the serrated wheel revolved, the pyrites gave a stream of sparks from its contact wheel, and the powder was thus fired. But the wheel-lock was expensive, clumsy, and required a powerful spring. This spring, if left cocked, tended to 'set down' and thereby render the weapon useless; for the art of making good spring steel had yet to be discovered. The wheel-lock (or rose-lock as it was sometimes called, probably from Fr. *roue*) was never common in England, and there is no trace of its ever having been manufactured here. Parallel in development to the wheel-lock is the *snaphanslock* (Sp., or Dutch, lock). It is similar in appearance to the conventional flintlock which later superseded it; the essential difference is that in a snaphance the pan has a sliding cover similar to the wheel-lock, while the frizzen or steel on which the flint or pyrites strikes in the jaws of the cock is separate from the pan cover. The *dog-lock* is a modified form of the snaphance. It is similar in appearance to the conventional flint-lock, but has at the back of the hammer a large hook which engages it and acts as a half-cock. There were other locks based on very similar principles, some rather closer to the flint-lock, and some designed for countries where flint was rare and which required the use of a small flake of flint or pyrites in place of the usual heavy firestone.

By 1600 the private possession of F. was very common, and pistols and birding pieces and similar forms of light weapons were within the provenance of the ordinary citizen and middle-class person. But very few arms were made in England, because Eng. iron was at that time not sufficiently pure. Both iron and steel for gun-making had to be imported from the Continent, and weapons were generally imported in the partly-finished state and completed over here. The Low Countries were the main source of supply; but the better-class material came from Italy, and it is probable that we must look to Italy for most of the technical improvements which occurred in the manu. of F. at this period. When the outbreak of civil war in England became certain there were practically no serviceable F. in the country. Those which had been used by the levies at the time of the Armada were now hanging in the churches and had not been put into condition since. Supplies were hastily sought by both sides, and

Holland and the N. provs. supplied the E. coos. with a large number of dog-locks.

Flintlocks.—All the above arms suffered from the same disability, in that they had no half-cock on the hammer. Further, the trigger mechanism consisted of a pin which came through the lock plate and secured the spur upon the face of the cock, or in a similar manner engaged laterally in an internal tumbler. This horizontal sear is a manifest source of weakness, although it endured in Sp. and Moorish arms up to the 19th cent.; but it was superseded entirely by the evolution of the normal flintlock, which dates from about 1640 and is probably of It. origin. In the true flintlock the sear simply engages in notches upon the tumbler of the hammer or cock, and it acts vertically and securely, so that 2 notches (1 for half-cock and 1 for full-cock) are all that is essential for a simple, reliable, and firm mechanism. By 1650 it can be said that, with the exception of a few Mediterranean arms of other design, the normal flintlock had completely superseded every other form of lock. It endured, with only detail variations and improvements, until superseded by the percussion lock about 1825. While the true flintlock was in use on cavalry pistols and carbines during and after the Civil war, rearmament, so far as the regular army was concerned, did not actually take place until the 1680's, when the old matchlocks and doglocks of the Cromwellian era were superseded by the traditional Brown Bess flintlock (see BROWN BESS). There does not appear to have been a rapid changeover, for during the Williamite wars in Ireland the older types were always referred to as 'King's Arms' and the new Brown Bess as 'The Queen's Arms.'

The craft of gun-making developed just before and during the Restoration and became a very successful trade. The improvement in Birmingham irons led to the invasion of the London market by Birmingham-made guns which were, although not of good quality, suitable for export trade to the Guineas, Africa, and to America. From 1660 to 1690 the quality of really high-class arms supplied by the Brit. makers was as good as anything which could be found in Europe. The rigid system of proof then in force was a very decided protection to the trade and to the purchaser. The sporting guns of the period were usually single-barrelled, rather long, and, to our minds, heavy and ill-balanced; but very little was done in the way of shooting game on the wing (see SHOOTING). Double-barrelled pistols and guns were fairly common but never very popular, because the double-barrel, side-by-side flintlock is wide at the breech and clumsy to handle. The under-and-over type, which had been the earliest double-barrel to become popular, had an unfortunate habit of shaking loose upon its central pivot, and disappeared completely about 1655. From 1690 to 1780 there was practically no change in F. The steel ramrod was substituted for the wooden one, and there were small changes of

fashion in decoration, but no material alteration in design or mechanism. About 1780 an increase of interest in shooting and the desire for more accuracy in pistols (see PISTOL) than was capable with conventional horse-pistols of the period led to decided improvements. Attention begins to be paid to matters of quick lock-action and good balance in the hand, both for sporting weapons and pistols. The evolution of the duelling pistol is now beginning. By 1800 the private weapon had become as near perfection as it was possible to achieve in the flintlock period. Such masters as Egg and Manton had reduced the cumbersome weapons of the past to a close-fitting, well-balanced weapon hardly inferior to the best designs of to-day. But the flintlock was never reliable in wet or windy weather, and it was quite possible to miss 2 shots out of 3 if the weather was inclement.

The Detonating System.—In 1810 the Reverend Forsyth took out his patent for the detonating lock. This substituted the use of a detonating compound that exploded by a blow for the old system of ignition by spark from flint or pyrites. Though fulminates and chlorates had long been known and had been used as priming powders, Forsyth was the first to confine the ignition and produce a controlled detonation. By 1820 various forms of detonators had been tried and design had steadied down to the conventional percussion cap (see PERCUSSION CAPS), which was a simple capsule fitted upon a nipple. Its invention was claimed by Col. Hawker and sev. others; but there is no certainty as to the true inventor, and it may have evolved from the ideas of sev. contemporaries. The superiority of the detonating system was manifest. It was almost waterproof; it did away with the necessity of priming; and it reduced the amount of powder necessary, because none of the powder gases escaped through the touch-hole. It took some time for the public and the gunmakers of the period to realise that a smaller charge was effective in the detonating gun. It was, however, very simple to convert existing flintlocks to the new percussion system, and by 1835 the flintlock was becoming a rarity in the private field, although it was still the official weapon of the army. The first percussion rifle (see RIFLE) issued to the Brit. Army was the Enfield of 1842. Nevertheless, the issue was very slow, and during the Crimean War many of our troops still used the old Brown Bess flintlock in addition to, or in support of, the limited number of Enfield and Minié rifles (see MINIE) in use.

Breech- and Magazine-Loading Rifles.—Both the principles of breech-loading and of magazine or repeating F. are as old as practicable F. themselves. They were tried out in matchlock and in flintlock days, but they were never effective because there was no means of controlling the explosive gas from the powder. Breech actions could not be made sufficiently close-fitting to stop the escape

of the gases, and experimental weapons were very soon rendered useless. Development of the practical breech-loader only became possible after the invention of the percussion cap. Many people tried to combine the percussion cap, or some similar form of ignition, with a reliable form of cartridge (q.v.). Until the cartridge was achieved no breech-loaders were successful. The Prussian needle gun was the first of practical military breech-loaders. This was adopted in 1848 and was used in successful wars waged by Prussia against the Danes in 1864 and the Austrians in 1866. Crude as the original needle gun was, its military efficiency was so remarkably demonstrated that all observers pressed their govts. for the immediate adoption of some form of breech-loading weapon. Most nations were content to convert a large proportion of their existing arms to some form of breech-loading. In Britain the Snider mechanism was adopted, by which a simple form of block breech was adapted to the muzzle-loading Enfield. This was not entirely a success with paper cartridges, similar to those used in shotguns to-day, but proved perfectly effective when a rolled metal cartridge was devised by Col. Boxer in 1867. This, however, was a temporary measure and complete rearmament was necessary. In 1871 the Martini-Henry single-loading rifle (see MARTINI, FREDERIC) was adopted, and the calibre of the projectile reduced from the old standard bore of .577 in. to a cylindrical bullet of .45 in. This was the last of the black powder rifles, for within the last 2 decades of the 19th cent. the development of reliable smokeless powder took place. Smokeless powder had been in use for shotgun cartridges for a considerable time before it was adapted successfully to military F. There is a very considerable difference between the powder suitable for a shotgun and that suitable for a rifle cartridge. Successful and popular smokeless powders for shotguns had been evolved by the late 70's, and it is doubtful if by 1900 black powder was widely used.

While the actual shot velocities given by smokeless powders to-day are not in any way better than those which can be achieved with black powder, smokeless is infinitely preferable, for there is less recoil and a great deal more cleanliness. Reduction of recoil is due to the fact that when firing black powder the weight of the discharge of smoke and unburnt material is added to that of the projectile. It amounts to a substantial proportion, and with smokeless powder, with practically no unburnt residue, the recoil is very much lighter. Any power armed with a magazine rifle of modern design using smokeless powder was in a military position of great strength against any nation not so armed. Continental powers adopted various models of the Mauser and Mannlicher (qq.v.) rifles, and in England the Lee-Metford was designed. It was issued in 1889 and was later modified in 1899 to the Lee-Enfield. Thus the turn

of the century shows all the great powers armed with magazine rifles of relatively small bore, about .30, and with a range of double any of the old black-powder rifles and a rapidity of action which had not before been thought possible. With the small bore and 'all metallic' cartridge case for military rifles, machine-guns, which had hitherto been unreliable, now became practicable, and the Maxim gun and other automatic principles were adopted to a more or less standard degree by various powers. The Boer War was the first in which the new rifles were practically tested, and results showed that the new small calibre was in effect as good as the old heavy, black-powder projectile. It was equally effective as a killer; but it rendered wounds less dangerous, thereby conforming with the requirements of the Geneva Convention.

Automatic Pistols.—It was also at the turn of the 19th cent. that the first automatic pistols were introduced. The Mauser and Borchardt Luger were used to a limited extent during the Boer War, and the Ger. official pistol, known as the Luger or Parabellum, has the official date of 1908. With minor changes in the type of propellant used, and in some details of the projectile, this cartridge is that known as the 'nine millimetre' in the Brit. Army and is the standard for Sten, sub-machine-gun, and a wide range of other automatic and semi-automatic weapons. The term 'automatic' is strictly applicable to weapons that continue firing so long as the trigger is kept depressed; in weapons where the trigger has to be pressed for each consecutive shot, as is common with most, the term 'self-loader' is preferable. But the word 'automatic' has been used of both kinds for 50 years. The self-loading pistol was not a practicable weapon until the evolution of cartridges, which were miniature versions of the military cartridges of the period, containing smokeless powder and a nickel- or steel-covered projectile. Black powder, with its fouling and its relatively large bulk, was unsuitable as a propellant for the automatic arm. The soft lead projectile of a revolver cartridge is of no use in an automatic pistol cartridge, which requires a hard, metallic-cased bullet which can be held in the case with firmness and rigidity.

Sporting Guns, 1860-1900.—During this period the shotgun had undergone a great deal of development. It had changed from the ordinary muzzle-loading, double-barrelled, hammer gun to a hammerless, self-ejecting, and, in some cases, single-triggered weapon. After an early and complicated experimental period, design steadied down until it was practically the same in essentials as to-day. The only important modification was one of ballistics (q.v.): the principle of choke-boring became understood and was no longer purely a matter of chance. Steel barrels replaced the old figured Damascus and iron barrels, but it is doubtful if they had any effect upon the shooting. On the other hand, they were easier to work, and

many of the cheaper varieties were more reliable than their equivalent predecessors. Black-powder sporting rifles were not so easily adapted to smokeless powder, nor was the Brit. military propellant, cordite, more suitable. The early cordite deteriorated rapidly under hot and tropical conditions, and gave extremely variable pressures which involved great differences in shooting. Sporting versions of the normal military bolt-action rifles, such as the Mauser or the Mannlicher, became popular for medium game, and it was soon found that they could be fitted with heavier barrels for larger calibre cartridges suitable for dangerous game. These magazine rifles, although slightly slower for a second shot than a good double-barrel, weighed only half as much and cost about a quarter of the price of a double-barrelled rifle. They soon superseded the old double expresses.

Firearms Development, 1900-1918.—The Boer War had demonstrated 2 things: (1) the futility and inaccuracy of the cavalry carbine; and (2) that the clip-loading system, as shown by the Ger. Mausers used by the Boers, was far more efficient than the method of pushing cartridges one by one into the magazine of the Lee-Enfield. It was therefore decided to have 1 model rifle, the standard for both infantry, cavalry, and all branches of the service. To this end, the barrel was shortened and fully encased in wood. Charger or clip-loading was adapted, 2 clips being used to fill the magazine; but unfortunately the old rimmed cartridge, as distinct from the nearly universal rimless cartridge, was retained. This rifle was the S.M.L.E. (short model Lee-Enfield); and with various minor modifications, this was the weapon with which Great Britain entered the war in 1914 and again in 1939. The First World War witnessed the development of light machine-guns, e.g. the Lewis. Hand grenades, which had not been used since the early 18th cent., were introduced for trench warfare, as were many rifle grenades propelled from a cup screwed to the end of the rifle barrel. In 1918, the Germans introduced a few of the Bergmann Karbines. This is a short, self-loading carbine which fired a magazine containing some 30 rounds of Ger. automatic pistol ammunition. It is the forerunner of all sub-machine-guns, and

Prior to 1915 it was the duty of every officer to equip himself with a revolver which was his own personal possession and could be of any type or make so long as it took the standard .455 ammunition of the service issue. From 1915 onwards, when the new armies were taking the field, revolvers were manufactured at, and issued to them by, Enfield, and the Webley revolver ceased to be the usual Brit. officer's weapon which it had been since the 1880's; but the Webley .455 self-loading pistol, which is a special issue to the Navy, was retained in service.

Inter-war Developments.—During the inter-war period, about 1923, great atten-

tion was paid to streamlining of bullets, and the pointed bullet, or Mark VII, was introduced. This was followed later by a boat-tailed version, intended for long-range machine-gun fire and known as the Mark VIII. It was not a particularly stable bullet, and was not manufactured after the first years of the Second World War. Another remarkable change of the inter-war period was the substitution of .380 Enfield revolver for the older .455, in order to reduce weight. The cartridge for this revolver was an almost exact replica of what is known as the .38 Smith and Wesson, which dates back to about 1870, and was a favourite cartridge for medium-sized pocket pistols but quite unsuitable for warfare. Between the First and Second World Wars many developments took place in armour, and particularly in the provision of light armoured vehicles for troops. While few detailed changes had been made in the infantryman's rifle, many, and in some cases extremely useful, supplementary weapons had been devised. The Brit. had added to their list the .55 Boys rifle, nominally an anti-tank weapon but really quite useless. It was a heavy, single-shot, bolt-action affair, very much like the early Mauser rifles of relatively similar calibre which were produced by the Germans during the First World War as anti-tank weapons. Of greater interest was the Polish and Ger. system, in which tungsten carbide was used as the internal core of a small-calibre bullet of about .30. This was, however, backed by a 13 mm. cartridge which was necked down to take the minute bullet, and it was capable of piercing a large number of the lightly armoured tanks of the early period of the war.

The Second World War.—Whereas between 1914 and 1918 there were relatively few changes in ordinary small arms or even in machine-guns, the Second World War gave rise to a bewildering number of different weapons. Practically every nation concerned had already provided itself with some form of light automatic rifle or possibly a light machine-gun—the distinction between them is sometimes rather difficult to decide. During the course of the war about 44 different types of machine carbine or sub-machine-gun were evolved. Of these, 25 fired the old Luger Parabellum 9 mm. cartridge, which are used in the Sten. Ten, including those preferred by the Russians, fired the old Mauser 7.63 cartridge of practically equivalent date. Seven, all American, used the .45 in. cartridge popularised by the Colt automatic pistol of similar calibre, and 2 were the peculiar 8 mm. cartridge used only by the Japanese. The pre-war rifles, sub-machine-guns, and other novelties were all what may be called properly engineered and machined weapons, made as rifles always had been, i.e. under machining systems which were rigidly controlled by inspection and were first-class engineering work. This class of material cannot, of course, be turned out in

quantity in time of war, when material is restricted and when supplies of all sorts of essential small parts are restricted or unobtainable. So very early in the war we find a complete change in arms manuf. It can be detected in the early models of the Sten gun, which were hurriedly put together at Enfield after the retreat from Dunkirk. It was a rough job of spot-welding, very poor machining and stampings, and suggestive of a cheap toy. Nevertheless it would fire, however unreliably in its early stages. Under the same tremendous urgency of need for weapons, Britain produced the No. 4 rifle, which was simply a modified Lee-Enfield in which a large number of awkward parts (special screw threads of no great importance) had been modified so that the ordinary manufacturer could turn out components without the rifle having to be completely made and finished at Enfield. In Germany some remarkable devices appeared. The Ger. Army used something like half a dozen automatic rifles of various types, and special ranges of light machine-guns, some for the Luftwaffe, some for the ground troops. Full use was also made of such techniques as spot-welding, rough stampings for those portions of the rifle which were not subjected to extreme stress, and die-castings of light metal for parachutists' weapons. Left-handed bolts, too, were preferred by the Germans. They found it no more difficult to train men to work a left-handed than a right-handed bolt, provided the weapon was automatic in action. In the last stages of the war the Germans attempted to arm the Volkswehr with almost any form of rifle which could be hastily manufactured. They succeeded in turning out an amazing number of extremely crude rifles, which were, however, both practical and accurate. Their potential value, on the other hand, was negatived by lack of ammunition, thanks to the effectiveness of Allied air operations.

If we consider the advances in F. made from the time of the Boer War to that of the Second World War, we find that the huge mechanised armies of to-day tend to rely upon vol. of fire rather than upon the old-fashioned skilled and accurately aimed musketry. The poorest shot can spray bullets from an automatic weapon with some prospect of either hitting his adversary or at least of forcing him to keep his head down. The advantage, however, is achieved at the cost of an enormous supply of ammunition, and of all that its production and transport involves.

Modern British Gun Trade.—The Brit. gun trade has dwindled considerably since the closing years of the 19th cent. Many old-estab. firms are amalgamating or going out of business. To some extent this may be due to the restrictive effect of the various F. acts, but above all to economic changes which have rendered hand-work so expensive. So far as shot-guns are concerned, no mechanically made weapon, however good, can compete in

balance, feel, and general smoothness of action with a good hand-made and hand-finished piece. It is not easy to obtain craftsmen able to carry out the old-fashioned and highly skilled operations necessary for the production of a perfect gun. It is also to be regretted that during the last 50 years many overseas markets have been lost to Brit. manufacturers, who can no longer compete with the cheap machine-made produce of Germany, Belgium, and North America. Few firms have been able to instal machinery which would enable them to keep pace with continental makers; and the few which have been able to afford the necessary equipment have been ultra-conservative in their design. Another factor has been the disappearance of the small private firms of cartridge makers. Shortly after the First World War they were amalgamated or absorbed into a single combine under the aegis of Nobels Explosives, which in turn has become a dept of Imperial Chemical Industries, so that there is practically no competition in Britain. Moreover, in the U.S.A., and in most European countries, all primers and the '22' rim-fire ammunition are charged with anti-corrosive priming composition. These have now been in use for some 25 years and are practically standard, but were only belatedly adopted in Britain.

Firearms of To-day and To-morrow.—The military rifle of the present and the immediate future is the light semi-automatic weapon. Some of these were largely used in the Second World War. The Americans carried the 'Garrand,' a weapon which was by no means wholly successful; and to a certain extent they replaced the traditional 'Colt' pistol, carried as a sidearm, by the issue of the new automatic carbine of .30 calibre. In the course of the war the Germans introduced a remarkable innovation by cutting down the length of their rifle cartridge to about half. They retained the same calibre of bullet, but it was a shorter and lighter projectile. In the same way, the propellant load was reduced to about half. This new cartridge was, for all practical purposes, just as good at any normal battle range as its much larger predecessor. It had the further advantage that it saved an enormous amount of unnecessary waste of metal and packaging. Many designs were submitted for the new rifle which was to be used by Americans, Brit., and all W. nations alike. Our almost traditional .303 has been abated to .30, and the design produced by the F.N. Company of Liège adopted as standard for troops. Similarly, the 9-mm. Sten gun has been replaced by a new and totally redesigned model based upon the Australian Patchett type; and the adoption of the new .30 rimless cartridge greatly simplifies matters of light machine-guns and self-loading weapons of all kinds. Though the revolver is still in service, it is inevitably obsolescent and has, so far as the Canadian Army is concerned, been replaced by a 9 mm. type of 'Browning' pistol (*see* BROWNING, JOHN MOSES),

which is manufactured in Canada. It is probable that this, or something very similar, will in time become the official pistol for the Brit. Forces. On the other hand, the pistol may completely disappear as a military weapon, yielding place to the new types of automatic carbine. While this enormous development of self-loading and automatic weapons means that a vast vol. of fire can be deployed by a relatively small body of men, at the same time it introduces special problems of its own. The question of barrel wear is one which is always important in machine-guns, and it is doubtful if there is any particular advantage or likelihood of the present cyclic rate of fire being exceeded. Electric ignition slightly improves the rate of fire of most machine-guns; it was used for the 13 mm. and even larger sizes of aeroplane-mounted machine-guns by the Germans during the Second World War. It is not, however, a system which can be usefully applied to operational machine-guns in the field. As regards sporting rifles, modern ballistic science has greatly extended the initial velocities of many well-known cartridges, as well as introducing other specialised cartridges for small and medium game. These latter cartridges are greatly favoured in America, where it is held that a small bullet travelling at an extremely high velocity has the killing power of a large bullet at a much lower velocity. This opinion is far less widely held in Africa where the game is not only heavier but a great deal more dangerous. There the tendency is to retain the old-fashioned larger calibres which are known to be thoroughly effective. The practical advantage of these very high velocities is that no adjustment of sights is necessary for any normal sporting range, but there is a disadvantage in that a very light bullet travelling at extreme velocity is likely to break up on contact with the animal and to develop its energy without penetrating far. The result is sometimes an unpleasantly wounded animal and a failure to kill where the use of a heavier and slower projectile would certainly have been fatal. Muzzle velocities in the neighbourhood of 4000 ft per sec. as against that of the medium game rifle (about 2000 ft per sec.) are claimed for some of the newer Amer. cartridges, but little is yet really known about their game-killing power in practical use. In the same way, some of the newer Amer. pistols are made to take a cartridge called the .357 magnum. This has a muzzle velocity in the neighbourhood of 1400 ft per sec., nearly double that of the normal pocket revolver of equivalent calibre. The result is greatly increased striking power, but this is only achieved at the expense of a punishing recoil and extremely expensive ammunition. In many Amer. pistols the weight of the frame has been reduced by about $\frac{1}{4}$ by the use of special light alloys; but this lightening of weapons makes the recoil far more severe. In general, the modern tendency is rather

towards simplification of machining processes, much closer precision gauging than was usual in the past, and improved methods of manuf. Modern advances in metallurgy have greatly simplified a number of processes which used to be relatively expensive and dependent upon hand work; and while it remains uncertain whether the ordinary user of F. will benefit much from the use of light alloys and die-castings, these will doubtless be of some use to specialised troops such as paratroopers, with whom considerations of weight are of greater importance. It is unlikely that the ordinary standard patterns of weapons as we know them to-day will be altered until some revolutionary change occurs in the field of propellants. Just as black powder, which had held the field for centuries, was superseded by the nitro-cellulose propellants, so these in their turn will yield to new discoveries; but so far nothing is known which is likely to take their place at an economic price. See H. H. C. Pollard, *History of Firearms*, 1926; H. C. Logan, *Hand Cannon to Automatic*, 1944. See also ARTILLERY; EXPLOSIVES; GUN; HOWITZER; REVOLVER; RIFLE.

Fireball, name of one or two kinds of firework, formerly used in war for illuminating or incendiary purposes. Of these the ground F. consisted of a sack filled with some brightly burning composition, and pierced with holes. A parachute F. was constructed in a similar manner, but was timed with a fuse and supported by a parachute. Both were fired from a mortar. They are now superseded by rockets (q.v.). The name F. is also applied to a certain class of comet, and also to a variety of globe lightning. See A. St H. Brock, *A History of Fireworks*, 1949.

Firebote, term in law used to denote a tenant's right to cut wood for fuel from the land on which he is living. See ESTOVERS.

Firebrick, see FIRECLAYS.

Fireclays are clays which will withstand a high degree of heat without excessive shrinking or warping. The varieties of F. differ in their degrees of fusibility owing to the variations in the proportions of free and combined silicon; they are essentially hydrated aluminous silicates with lime and magnesia in the form of carbonates, iron pyrites, free silica, potash, and soda, with a percentage of water. No fixed standard of refractoriness can be given, but in all good F. the fusion point is over 1600° C. Such materials as ganister, sand, sawdust, etc., are mixed up with F. before burning to ensure the 'body' of the brick being sufficiently open in character. Ordinary F. are used for making bricks, crucibles, chimney-pipes, etc., but when special properties are required in the bricks such materials as lime, bauxite, etc., are added. Fireclay is found in conjunction with coal at Stourbridge, Glasgow, Newcastle-on-Tyne, and many other places in the Brit. Isles. It is also found in Germany, France, Belgium, the U.S.A., etc.; the beds do not as a rule exceed 2 ft

in thickness. The Stourbridge F. are world-famous, and widely exported.

Firedamp, the name applied by miners to methane (CH_4) (q.v.). It comes from the crevices in the mines, being formed in the coal, and when mixed with the air in a certain proportion is highly explosive, causing many accidents. See **COAL-MINING**.

Firefighting, see **FIRE BRIGADES AND FIREFIGHTING**.

Fireflash, air-to-air guided weapon, carried as part of the armament of a piloted aircraft and propelled to supersonic speed by solid-fuel rockets. The warhead is proximity fused and designed to explode as soon as the weapon is within lethal range. F. was the first guided weapon to be delivered to the R.A.F.

Firefly, name given to the luminous beetles belonging to the Lampyridae and the Elateridae. The former family include the true glow-worm (q.v.), the Eng. species being *Lampyrus noctiluca*. Little is known as to the light given by the Lampyridae, but most entomologists agree that it has a sexual significance; in the *Luciola*, F. of S. Europe, this brilliance is almost entirely confined to the male. To the Elateridae belong the genus *Pyrophorus*, tropical Amer. beetles, some of whom possess remarkable luminosity; *P. noctilucus* has a yellowish eye-like lamp on each side of the thorax, and another on the ventral surface of the abdomen. These beetles are used by the natives as lanterns, and the women ornament their hair with them.

Firelock, see **FIREARMS**.

Firenze, see **FLORENCE**.

Firenzuola, **Agnolo** (1493-c. 1545), It. author, b. Florence. He at first entered the legal profession, and practised in Rome, where he was the friend of Aretino. It is said that he joined the order of monks at Vallombrosa, and after the death of Pope Clement VII he became abbot of Prato. Among his works are: *Discorsi degli animali*, a satire on court life, 1541, 2 comedies, *I Lucidi* and *La Trinzuzia*, 1549, and a trans. of the *Golden Ass* of Apuleius. His works were first collected and pub. by P. L. Fantini in 1802. See life by M. Olivieri, 1935.

Fireweed, see **EPILIBIUM**.

Fireworks, see **PYROTECHNICS**.

Firmament, name applied to the vault of Heaven, the Vulgate trans. *Firmamentum* being the rendering of the Septuagint *stereoma*, the idea in Hebrew being that of something stretched out. The F. was originally looked upon as a solid sphere, which revolved and carried with it the stars which were fixed to it—also forming the div. between the 'waters above the firmament' and those below it.

Firmân, or **Firmaun**, term applied to a decree issued by the sultans of Turkey. Any minister could sign such a decree, but a special one had to make it effective by placing on it the name of the sultan in a monogram.

Firmium Julium, see **MOTRIL**.

Firmont, **De**, see **EDGEWORTH, HENRY**.

Firn, see **NÉVÉ**.

Firozshahr, vil. in the dist. of Firozpur, W. Punjab, Pakistan. It is now very close to the boundary between India and Pakistan. It was the scene of a battle which took place in 1845, when the Brit. under Sir Hugh Gough and Sir Henry Hardinge defeated the Sikhs.

First Aid, term used for assistance given immediately in cases of accident or sudden illness before medical advice can be obtained. A knowledge of a few simple rules about stopping bleeding, etc., is often the means of saving life. Lessons in F. A. methods and principles are given to both men and women by the St John Ambulance Association (St John's Gate, Clerkenwell, London, E.C.1), the Brit. Red Cross Society (14 Grosvenor Crescent, London, S.W.), the St. Andrew's Ambulance Association (a Scottish organisation), and boy scout and girl guide organisations. See **ANTIDOTES**; **BANDAGES**; **BLEEDING**; **BRUISES**; **BURNS AND SCALDS**; **CHOKING**; **CONCUSSION OF THE BRAIN**; **CONVULSIONS**; **DISLOCATION**; **DROWNING**; **EPILEPSY**; **EYE**; **FAINTING**; **KIT**; **FRACTURE**; **HYSTERIA**; **POISON**; **SHOCK**; **SPRAIN**; **SUN-STROKE**.

First Empire, that of Napoleon I, who was created emperor of the Fr. by a decree of the Senate on 18 May 1804. The E. lasted until the restoration of the Bourbons in 1814.

First-fruits, first profits of any office, property, etc., as e.g. in feudal tenure, the year's profit of the land after the death of the tenant, which was payable to the king; and, in eccles. law, the first year's income of a benefice. When the papal power was dominant, each new incumbent had to remit to the papal treasury the first year's revenues (*primiciae*) of his benefice. Valuations of annates were made in England in the 13th cent. and probably originated about that time. By the Annates Acts of 1532 and 1534 payment of F. to the pope was forbidden, and they were appropriated to the crown. Their valuation was recorded in the *Valor Ecclesiasticus* in 1535 and became the basis of the valuation of the Eng. clergy thereafter. In Queen Anne's reign these annates were given up to a fund for augmenting poor livings, known as Queen Anne's Bounty.

First of June, Battle of the. The name given to the naval victory of Lord Howe over the Fr. which was fought off Ushant and terminated on 1 June 1794. This was the first occasion on which the Fr. naval strength in the Channel had been encountered in the Napoleonic Wars, and the victory was important in its results both in destroying Fr. naval activity in the Channel and in depriving them of a large quantity of grain which was under convoy from America. The number of ships on either side was about equal, and the fight was hotly contested; but though it is always referred to as the 'glorious' First of June, no remarkable evidence of naval skill was given. The result, however, was fairly decisive, for the Fr. adm. lost 7 ships, and 3000 men, and was compelled to seek refuge in Brest.

First Offenders. In order to mitigate the harshness of the criminal law the First Offenders Act, 1887, gave courts the power in certain cases to place F. O. on probation instead of committing them to prison. The probation system was extended by the Probation of Offenders Act, 1907 (repealed by the Criminal Justice Act, 1948). The Criminal Justice Act, 1925, provided for the appointment of probation officers. The present law relating to the probation of O. is contained in the Criminal Justice Act, 1948. See CRIMINAL LAW.

First Republic, proclaimed in France on 21 Sept. 1792 by the National Convention (q.v.), following the downfall of the Bourbons in the Fr. Revolution. The Convention was succeeded by the Directory (q.v.) in 1795 and by the Consulate in 1799. The R. ended with the estab. of the First Empire (q.v.).

Firth, Sir Charles Harding (1857-1936), historian, b. Sheffield, and educ. at Clifton and Balliol College, Oxford. F. was lecturer at Pembroke College, 1887-93; Ford lecturer in Eng. hist. in the Univ. of Oxford, 1900; fellow of All Souls', 1901, of the Brit. Academy, 1903, of Oriel, 1904. In 1904 he was appointed regius prof. of modern hist. at Oxford. F. followed in the tradition of S. R. Gardiner, like him, devoting his prin. studies to the Civil war period. His works include: *Scotland and the Commonwealth*, 1895, *Journal of Joachim Hane*, 1896, *Scotland and the Protectorate*, 1899, *Oliver Cromwell*, 1900, *Cromwell's Army*, . . . 1901, *The House of Lords during the Civil War*, 1910, eds. of lives of Col. Hutchinson, 1885, and the duke of Newcastle, 1886, Ludlow's *Memoirs*, 1894, and *The Clarke Papers*, 1891-1901. He also contributed to the *Dictionary of National Biography*. He was knighted in 1922.

Firth, Mark (1819-80), philanthropist and steel manufacturer, was a native of Sheffield. In 1843 he estab. in Sheffield his own steelworks, which grew rapidly in size and importance, and where eventually most of the steel ordnance came to be manufactured. As a philanthropist he figures as the donor of a park (opened in 1875), Firth College (founded in 1879), and almshouses, all of which gifts were bestowed on Sheffield.

Firth (Icelandic *fjörð*, Eng. *frith*), Scottish name applied to a narrow arm of the sea, e.g. Firth Bay, a shallow inlet 6 m. from Kirkwall, etc. It is frequently a riv. estuary, as the F. of Forth and the F. of Clyde.

Fisc, see FISCUS.

Fiscal, see PROCURATOR FISCAL.

Fischart Johann, known as *Mentzer* (Mainzer) (c. 1546-c. 1590), Ger. satirist, b. Strasburg. He took the degree of doctor of the Univ. of Basel about 1572, and after travelling in France and England went to Strasburg about 1576, and in 1581 became advocate to the imperial court at Speyer. After his marriage he became magistrate or bailiff at Forbach, near Saarbrücken, 1583. His works, the greater number of which were written between 1575 and 1581, are many of them

clever satires directed against the pope, the Jesuits, the aristocracy, and all sorts of folly. They are mainly based on the model of Rabelais, but at the same time are characterised by a true originality. In addition to these satires there are many works which are purely humorous, and which assure to him one of the highest places among Ger. humorists. He was a master of his own language, which fact is exemplified very clearly in his prin. work, *Geschichtsklitterung, or Affentourliche Geschichtsschrift von . . . Gargantua und Pantagruel*, 1575, a free adaptation of Rabelais's *Gargantua*, full of the most masterly play on words. Other satires include: *Aller Praktik Grossmutter*, 1572, *Podagrammisch Trostbüchlein*, 1577, and *Bienenkorb des heiligen römischen Immenschwarms*, 1579, while *Klühhatz*, 1573, and *Weiber Tratz*, 1573, are among his humorous work. He also wrote *Das glücklichste Schiff von Zürich*, 1576. See lives by C. H. W. Wacknerhagl, 1870, and A. Hauffen, 1921-2.

Fischer, Emil Hermann (1852-1919), Ger. organic chemist, b. Euskirchen. Studied at Bonn and Strasburg and, after some years as assistant to von Bayer in Munich, became prof. of chem., first at Erlangen and then at Würzburg. Later he succeeded von Hoffmann as prof. of chem. at Berlin, and during his tenure the school fl. so that students came to it from all parts of the world. He became famous for the preparation in conjunction with Julius Tüfel of synthetic sugars and from these of the ferments and enzymes. His work on proteins was, however, his prin. achievement. His other researches included the analysis of the constitution of the rosaniline dyestuffs, investigation of uric acid, and the preparation of purin and its derivatives. The value of his work in organic chem. was recognised in most countries; in 1890 he was awarded the Davy Medal of the Royal Society; and in 1902 the Nobel prize for chem.

Fischer, Ernest Kuno Berthold (1824-1907), Ger. philosopher, b. Sandewalde, Sillesia; educ. at Leipzig and Halle Univs. He became a lecturer at Heidelberg, and in 1856 prof. of philosophy at Jena until 1872, when he succeeded Zeller at Heidelberg. His chief work is *Geschichte der neuern Philosophie*, 1854-1910. See studies by E. Traumann, 1907, and E. Hoffmann, 1924.

Fischer, Hans (1881-1945), Ger. chemist, b. Höchst. He was educ. at Lausanne, Marburg, and München, and later held various professional appointments in Vienna, Innsbruck, and Munich. In 1930 he received the Nobel prize in chem. for his work on the red colouring matter in blood.

Fischer, Johann Georg von (1816-97), Ger. poet and dramatist, b. Gross-Süssen, Württemberg. He studied literature and botany at Tübingen, in 1846 being appointed prof. at the Stuttgart Oberrealschule. His first vol. of poems, *Gedichte*, was pub. in 1854, and his last, *Mit Achtzig Jahren*, in 1896. He also wrote some dramas, among the best known being

Saul, 1862, and Kaiser Maximilian von Mexico, 1868.

Fischer-Tropsch Process, system of synthesising hydrocarbon waxes and oils from hydrogen and carbon-monoxide. It was invented in Germany by Franz Fischer and Hans Tropsch in 1925 and under the pressure of war preparation was developed intensively to produce liquid fuels. During the Second World War 9 plants produced a total ann. output of 500,000 tons of synthetic oil. In this process coal is converted into a gas mixture by high-temp. treatment. After purification it is subjected to a catalytic treatment in which 80 per cent of the gases is converted to the required products, generally olefine hydrocarbons and straight-chain paraffin. The compressed gas may be used as a raw material for chemical production or as a portable fuel. The motor spirit, provided it is reformed or combined with high-grade fuel, is suitable for petrol engines. Diesel oil of very high quality is another product; the wax is suitable for polishes, etc.; by further treatment of the primary products detergents, soap, fats, and lubricating oils may be produced. See FUELS.

Fischer Verlag, S., name of a leading publishing house in Germany, founded by Samuel F. (1859-1934) in Berlin, 1886. The firm was a great sponsor of literary naturalism, and pub. works by Gerhart Hauptmann, Thomas Mann, Hugo von Hofmannsthal, and Hermann Hesse. In 1890 the literary and political periodical *Die Neue Rundschau* was issued, which has successfully appeared ever since. A pocket-book series of classics and contemporary literature, as well as of general knowledge, was introduced in 1952, and in 1957 F. started publishing pocket encyclopaedias, which will eventually comprise 34 vols.

Fiscus, or **Fisc** (Lat. *fiscus*, a basket or money-bag), word used to denote the Rom. emperor's privy-purse as distinct from the *aerarium* or state treasury.

Fish, aquatic vertebrate breathing by means of gills and having fins supported by skeletal rods called fin-rays. F.s have a definite brain and sense organs, including inner ears, each with 1, 2, or 3 semicircular canals. Thus defined, F.s comprise the jawless *Cyclostomata* (and the fossil jawless F.s) and the jawed F.s, these being divisible into the cartilaginous F.s (see ELASMOBRANCHII) and the bony-F.s, Osteichthyes (see BONY-FISHES). See also TELEOSTEI.

Fish, Royal. In Eng. law, certain fish (whales, sturgeons, porpoises, etc.), when taken in territorial waters, belong to the crown or its grantee, though caught by another person.

Fish Curing, term used to describe methods of preserving F. intended for distant markets or for consumption at a later date. This is usually done by salting, drying, or smoking. Of recent years the improved facilities of carriage and the use of refrigeration have made it unnecessary for F. to be cured for marketing in many cases where it was once

essential; but against this, the enterprise of merchants in various parts of the world has built up a demand in remote areas where previously little trade was done. The 2 chief varieties of F. thus treated are herrings and cod. Haddock is also cured, and Findon, near Aberdeen, has given its name to the well-known Finnan haddock. The last-named fish are usually dried, either split or treated whole. The F. curers of Iceland are especially well known for their skill in preserving cod, which enables it to be sent to very remote areas. Herring-C. is usually done by salting, the pickle being little more than the natural salt of the sea brine. A large demand exists for smoked herrings, and great care is taken in selecting the right kind of wood to be used for this purpose, as the flavour is very easily affected by the nature of the smoking. Around the Brit. seaboard many endeavours have been made to deal with the problems arising from the occasional unexpected glut of herrings. Where there is suitable warehouse accommodation, and a local pop. which is prepared to join in 'rush jobs,' as in some places on the Northumberland coast, large quantities of herrings are frequently cured with remarkable speed.

Fish-hawk, see OSPREY.

Fish-hooks. These, in very early times, were made of stone, bronze, copper, and sometimes shell, as has been revealed by relics belonging to a prehistoric era. In spite of their antiquity, however, some of them resemble very closely those of modern times, though some seem to have been quite original, such as those made of the spine of a cactus and used by Indians. The place in England where F. are principally made to-day is Redditch. They are usually composed of soft steel wire, afterwards hardened and polished, and may be manufactured either by hand or machinery. Their shapes differ, and the number of designs which are executed is considerable. The one most generally in use has the point parallel to the shaft, although some anglers prefer it bent in another direction. The ends also may be ringed, flattened, or simply plain.

Fish-lies, name generally applied to any of the copepod crustaceans which are parasitic on fishes; there are many genera and species, which are ectoparasitic, as *Caligus*, or epizolic.

Fish-oils are esters of glycerol with highly unsaturated fatty acids usually containing 20 or more carbon atoms. Many of them, e.g. cod-liver oil, sardine oil, seal oil, and whale oil, are of medicinal, nutritional, or industrial importance; thus whale oil is used in the manuf. of margarine and soap, for tempering steel, lubricating, and as a leather dressing.

Fish River, see GREAT FISH RIVER.

Fisher, Andrew (1862-1928), Australian statesman, b. Kilmarnock, Ayrshire, Scotland, son of Robert F. Worked in a coal-mine, and went to Queensland in 1885. Elected to Queensland legislature in 1893; minister of railways in Dawson administration. In 1901 he entered Commonwealth Parliament as Labour member

for Wide Bay. Joined Watson Labour Cabinet, 1904, as minister of trade and customs. Leader of party from 1907. In 1908 he was prime minister for 6 months and in 1910 was back in power. Privy councillor, 1911. The gov. fell, 1913; but he returned to power Aug. 1914. Resigned 1915 and became high commissioner in London, where he retired in 1921.

Fisher, Geoffrey Francis (1887-), churchman and schoolmaster, son of the Rev. H. F., rector of Higham-on-Hill, Nuneaton. Educ. Marlborough College, and Exeter College, Oxford; Liddon studentship, 1910; at Wells Theological College, 1911; assistant master, Marlborough College, 1911-14; headmaster of Repton School, 1914-32; bishop of Chester, 1932-1939; of London, 1939-45; dean of the Chapels Royal, 1939-45. Elected archbishop of Canterbury in succession to Wm Temple on 22 Jan. 1945, and enthroned 19 April.

Fisher, Herbert Albert Laurens (1865-1940), politician and historian, b. London, and educ. at Winchester, New College, Oxford, Paris, and Göttingen. He became a tutor and lecturer in modern hist. at Oxford; and was vice-chancellor of Sheffield Univ., 1912-16. After being elected Liberal M.P. for the Hallamshire Div. of Sheffield, 1916, he was appointed president of the board of education, and in that capacity he served until the fall of Lloyd George's 2nd coalition gov. in 1922. From 1918 to 1926 he sat in the Commons as National Liberal member for the Eng. Univs. As president of the board of education he was responsible for the far-reaching Education Act of 1918, which was framed 'with a view to the establishment of a national system of public education available for all persons capable of profiting thereby.' He left a lasting memorial in his masterly *History of Europe* (3 vols.), 1926, a work which gives him a place among the greatest European historians. Of his other works the more important are: *The Mediæval Empire*, 1898, *Studies in Napoleonic Statesmanship*, 1903, significant for its account of the emperor's reorganisation of Germany, *The Political History of England, 1485-1547*, 1906, and *Bonapartism*, 1908.

Fisher, John, St (c. 1459-1535), Eng. saint and bishop, b. Boverley, Yorks, and educ. at Cambridge, becoming master of Michaelhouse in 1497. The countess of Richmond, mother of Henry VII, made him her confessor. In 1503 he became first Lady Margaret prof. of divinity at Cambridge, and was appointed chancellor of the univ. and bishop of Rochester the following year. F. was a prominent humanist, and was responsible for inviting Erasmus to Cambridge, though in the question of Church reforms he was rather more conservative than fellow-humanists such as Colet, More, and Erasmus himself. He opposed Henry VIII's divorce from Catherine of Aragon, and in 1534 was sent to the Tower for refusing to swear to the Act of Succession. In 1535 he was beheaded on Tower Hill for refusing to

take the Oath of Supremacy. F. had been made a cardinal a month earlier; 400 years after his death he was canonised. See life by N. M. Wilby, 1929.

Fisher, Sir (Norman Fenwick) Warren (1879-1948), Brit. civil servant and public administrator, educ. at Winchester and Hertford College, Oxford. Entered the civil service by open competition 1903. On the retirement of Sir John (later Lord) Bradbury, he was appointed to the important office of permanent secretary to the Treasury, being singled out by Lloyd George as the right man to introduce progressive methods in the organisation of the civil service. F. at once recast the Treasury estab. by placing the 3 chief branches, finance, supplies, and estab., under separate controllers ranking as heads of first-class gov. depts, with direct access to the Chancellor of the Exchequer. The permanent secretary, thus freed from much departmental routine, was formally recognised as 'head of the civil service'—a style that did not pass without a strong challenge in the Commons and outside the House. But as such he was entrusted with the duty of advising the prime minister on matters of common interest to the service, including especially the appointment of permanent heads of depts—a reform which secured an approach to a unified service in the higher ranks.

Fisher, Marten, see L'EKAN.

Fisher of Kilverstone, Sir John Arbuthnot Fisher, 1st Baron (1841-1920), adm., b. on the Wavenden estate, Ceylon. Entered the navy in 1854, and served in the Crimean war of 1855, and the China war of 1859-60; took part in capture of Canton and Pei-ho forts. In 1882, as commander of the *Inflexible*, he was present at the bombardment of Alexandria. He became director of naval ordnance, 1886, and served as such until 1891. Thereafter he received steady promotion, holding a number of commands, and was first sea lord of the Admiralty from 1904 until 1910. He was ennobled in 1909. During his term as first sea lord he introduced many reforms, including that of the nucleus crew, which rendered a peacetime navy rapidly available for war; the elimination of obsolete ships; and the substitution of the Dreadnought type. He is remembered as the man who, in 1910, predicted the date of the war with Germany and shaped his policy accordingly. Under many gov. he worked and planned with extraordinary success to provide an adequate fleet, and when the First World War broke out the Grand Fleet was in readiness to sail to the right location and thwart the enemy, which it did by going, at the psychological moment and without delay, to its war station at Scapa Flow. He retired from the Admiralty in Jan. 1910, and from the navy in 1911. In 1912 he was president of the royal commission on oil fuel and engines, and it was through the researches of this body that in 1913 the Admiralty launched the first oil-fired battleships of the *Queen Elizabeth* class and that the first light Brit. cruisers (*Arethusa* class) to burn

oil fuel were on the point of being commissioned when the war commenced. The *Arethusa* class certainly proved its value in the war, notably in the action off the bight of Heligoland. When the war commenced F. had been in retirement since the age of 70, though after that age he continued to exercise a very real influence on naval policy, and in particular his advice was sought by the gov. and followed in the handling of the Agadir incident (q.v.). When, in 1914, through prejudice and popular clamour, Prince Louis of Battenburg, later the 1st marquess of Milford Haven (q.v.) was driven to resign office, F. succeeded him as first sea lord, and at once ordered some 600 vessels of all classes, and in many cases of new design, to be completed by the early part of 1915. His ambitious plans, however, for the use of these ships, were frustrated by the Dardanelles expedition, which was diametrically opposed to his naval policy of striking at the heart of Germany by a landing force, covered by the navy, on the coast of Pomerania. When he saw that ships were being gradually withdrawn from the North Sea forces to supply the needs of the Mediterranean forces, so that (in his opinion) Brit. control of the sea was in jeopardy, he tendered his resignation, and retired immediately after the coalition gov. came into office. But this did not mark the actual end of his services; his work in organising the Board of Invention and Research, a purely advisory body, which work he rendered on recall in 1915, was highly effective. He appears to have spoken in the House of Lords on 2 occasions only, and then only on matters arising out of the Dardanelles expedition. Laconic in the extreme, the first speech, following the resignation of Churchill from the cabinet in Nov. 1915, was by way of retort to Churchill's accusation that the first sea lord had not given clear guidance or firm support over the Dardanelles question. The second speech was in Mar. 1917, and was to much the same effect. Whatever his faults of impulsiveness and sailor-like bluntness—as exemplified by his famous phrase 'Sack the lot'—he was essentially the great organiser and administrator who created the modern Brit. Fleet and whose uncanny strategic prevision secured its efficiency and readiness for war. In 1919 he pub. 2 very characteristic books—*Records*, and *Memories*. From these the reader gets the impression that Cutcliffe Hyne's Capt. Kettle was drawn, in part at least, from F. He was buried in Westminster Abbey. His brother, Sir Frederic Wm F. (1851–1943) was also a naval officer. Served in the Mediterranean, 1887–91; in Australian service from 1894 to 1898. Promoted adm. 1907. President of the Royal Naval College, Greenwich, 1911–14.

Fisheries. (1) *River and Lake Fisheries*, are regarded in England as centres of sport and recreation. They are generally the right of the owner of the soil over which the water flows, and in the hands of private owners. It is divided into sev.

and common fishery. A sev. fishery is the exclusive property of the owner of the soil and can only be transferred by deed; should the right be unclaimed the public acquire no title by right of custom. If the course of a riv. is diverted, the late owner has no claim to the new channel. The owner of the soil has the right to all the fish he can take, and is not restricted in the use of machinery if that machinery does not disturb the navigation. He cannot put up an obstruction to fish, above or below the part under his control, neither may he use dynamite or any other explosive, nor pollute the riv. in any way. Common fishery is fishery which all persons may enjoy. The Crown has no right of fishery in non-tidal waters on a subject's property. The control of fresh-water F. is in the hands of dist. boards appointed by co. councils which regulate the by-laws and licences and fix the close time for the protection of fishing. There are special laws for salmon and fresh-water fishing. The prin. fresh-water fish are carp, barbel, tench, roach, bream, trout, salmon, and chub (qq.v.). The largest and most important lake fishery in the world is the Great Lakes fishery in the U.S.A., from which great quantities of food fish are obtained, including white-fish, trout, pike, and perch. Huge quantities of fish are obtained from the Mississippi R. The rivs. of Russia are well stocked with food fish, and carp, bream, lampreys, and sturgeon are extensively caught in the Ural and Volga rivs.

(2) *Sea Fisheries.*—The capture of fish as a food for man seems to have been carried on from very early times. Cave remains in W. Europe afford evidence of the use of many different kinds of implements for fishing and of the capture of a considerable variety of species, even including the whale. Dried and salted fish was an important article of commerce among ant. peoples, and many great maritime cities, both ant. and modern, had their origin in fishing vils. A herring fishery is known to have been estab. off the Eng. coast by the 8th cent., and a little later the Brit. fishing industry had extended all over the North Sea up to the Arctic regions. The industry was greatly assisted by the growth of Christianity, since the demand for fish for abstinence imposed by the Church, was considerable. In this country the Reformation dealt a severe blow to the F., and the Brit. supremacy in this direction was not regained till after the Napoleonic wars, having been held in the meantime by the Dutch. During the latter part of the 19th cent. the fishing industry throughout the civilised world received a great impetus from the introduction of steam. This first showed itself in the increased market for fish rendered possible by railway transit, and later spread to the methods of fishing themselves. Steam drifters and trawlers are now largely used, and by these means, and the introduction of ice as a preservative, fresh fish is sold at great distances inland. The regulation of the fishing industry has also been found

necessary, as many of the best grounds were becoming worked out owing to indiscriminate methods.

Methods of Fishing.—The numerous modes in which fish are captured all fall under 3 main heads: fishing by lines, nets, or traps. Fishing with a hooked line is of 3 varieties, known as the hand line, the small line, and the long line. Fishing by hand line is carried on off the E. and S. coasts of England for cod and whiting. It is only possible in shallow water near land, and the lines are single and bear 1 or more hooks. As each fish is caught the line is drawn up and the hooks rebaited.

Small-line fishing is the prin. method

Odham's Press

OTTER TRAWL-NET

Fish enter through the wide mouth, and are trapped once they pass through the narrow funnel into the bag.

employed in the Scottish haddock industry. It is carried on by small boats, known as yawls, within 2 or 3 m. of land. The lines range about 2000 fathoms, and are usually baited on land by the wives and children of the fishermen. Mussels form the usual bait, but limpets, scallops, cockles, lugworms, and crabs are also used. The hooks are attached to smoods about 4 ft apart, and the line, when ready, is coiled into a creel, the baited hooks all lying in the centre, and fresh grass scattered over them to keep the bait fresh. When the fishing ground is reached the lines, all fastened together, end to end, are run out over a metal cylinder. The ends are kept down by large stones, to which are also attached lines reaching to the surface, and there fastened to a buoyed flagstaff, weighted so as to float upright and mark the position. The line is shot across the tide, and is left at the bottom for from half an hr to an hr. Plaice, codlings, whittings, dabs, flounders, and gurnets are also caught by this method, though haddocks form the chief haul.

Long- or great-line fishing, also known as boulder or trot-fishing, follows the same principle as small-line fishing, but employs longer and stronger lines and larger hooks. It is largely used in the North Sea, by both Eng. and Scottish fishermen, at a considerable distance from land for the capture of large fish, such as cod, ling, coalfish, halibut, skate, rays, turbot, conger, and hake. Off the Scottish coast this mode of fishing is generally carried on by the herring boats, and herrings are used as bait. Off the Eng. coast large vessels with a sea-water well are used, in which the fish are kept alive. The Eng. long line is often about 8 m. long when shot, and carries over 4000 hooks; squid, whelks, herrings, and lampreys are used as bait. Steam vessels are now employed in long-line fishing, and are usually provided with an ice-chamber for storage. The Scottish North Sea long-line fishing is carried on mainly from Mar. to July, and extends as far N. as Iceland. It requires deep water of over 200 fathoms. It is also worked during the winter over the Dogger Bank and Cromer Knoll. Boulder ('spiller' in Devonshire and Cornwall) is the term usually applied to the long line used off the S. coast of England, which is not so long as the North Sea type, and is worked from smaller open boats.

Fishing by line has sev. advantages over the use of nets. The fish secured by a line are less bruised and injured, and thus preserve their freshness better. Also, long lines can be shot over rough rocky ground and in mid-water, where trawling, etc., is impossible. Many species of fish may be secured by either method, but some, such as congers, seem to be only caught by lines, and others, such as soles, only by nets.

Fishing by nets is of many different varieties. Of these the most important is trawling, by which most of the fish for the Brit. market is secured. Trawling is an industry which has been altogether developed during the last century. First used in the SW. of England, it was introduced at Ramsgate in 1815, Harwich in 1828, Hull in 1844, and Grimsby in 1858. Steam trawlers made their appearance in 1879, and have largely increased in number, being faster and more seaworthy, and having a much larger fishing capacity than the sailing vessels. The modern steam trawlers are about 180 ft long. The North Sea, off the E. coast of England, is a trawling ground, and large numbers of boats are based on Hull, Grimsby, Yarmouth, Lowestoft, and Ramsgate. But the most profitable trawling grounds are those in the N., such as round Iceland, Bear Is., Greenland, and in the White Sea. The SW. coast trawlers work independently from Brixham and Plymouth, and fish near those ports in winter and S. of Wolf Rock, or off the N. coast of Cornwall, in summer. Some trawling is done by steam tugs from Falmouth and Cardiff. Another trawling ground lies off the NW. coast of England, and is worked by boats from Tenby, Whitehaven, Fleetwood, Blackpool,

Southport, and Liverpool. The Scottish trawlers are almost all steamboats, and work outside the Firth of Forth, off the coast of Aberdeenshire, and in the Moray Firth, the vessels coming from Granton, Leith, and Aberdeen. A large fleet of Irish trawlers, with Dublin as their H.Q., fishes between the Irish coast and the Isle of Man. Trawls are of 2 kinds, the beam and the otter, the latter being the newer and better. The beam trawl is a large conical bag-shaped net, with a wide mouth kept open by a beam of wood, which has iron runners at its ends. The lower edge of the net is weighted, and the whole apparatus is dragged by the boat over the sea bottom, thus enclosing the low-swimming fishes in a kind of bag formed by the hind end of the net. The net is often 80 ft long and the beam measures from 18 to 50 ft. The net is kept extended by a stout foot-rope, and a ground rope stirs up the fishes. The net is brought on board by means of a warp of strong steel wire attached to the bridle-ropes, and the haul is emptied at the cod end, i.e. that farthest from the beam. In the case of the otter trawl, the single heavy beam is replaced by 2 boards which automatically come apart when the trawl is let down and come together when it is hauled in, thus rendering the latter operation much easier. The boards are often weighted with iron plates, and only 1 edge rests on the ground, while a direct pull on the trawl is obtained by the use of from 6 to 12 ft of chain between them and the bridle. A simpler form of the otter trawl is used by lt. and Sp. fishermen. The labour involved in trawling is very considerable, since the hauling of a heavy trawl on board takes at least an hr, and the expense caused by damage done to the nets by obstacles on the sea-floor is often heavy. Almost every kind of fish is caught in greater or smaller numbers by the trawl, though ground-feeding species predominate. Flat fish always form a large proportion of the haul, which includes sole, plaice, ray, conger, red mullet, dory, mackerel, bass, turbot, brill, halibut, cod, haddock, hake, gurnard, and ling (q.v.).

The drift-net forms one of the most scientific methods of fishing, depending as it does on knowledge of the habits of certain kinds of fish and observation of their whereabouts at certain times. The net is set up in the water, being kept in a vertical position by weighting the lower end and buoying the upper with cork, wood, or glass floats, and is allowed to drift with the tide or current in such a way that it is at right angles to the direction which is being taken by a school or shoal of fish. The fish are caught by the gills, which become entangled in the netting. The nets, which are long and straight, may be used at the surface, as is most commonly the case, or at different depths, by means of weights and buoys. Fishing by drift-net is carried on off Cornwall for pilchard, with nets 40 fathoms by 4, having 40 meshes to the yd; for mackerel, with nets 20 fathoms by 16, with 28

meshes to the yd; and for herrings, with nets 40 fathoms by 4, with 36 meshes to the yd; off the E. coast and the Scottish shores for herring, with nets 30 fathoms by 9; and at the E. end of the Channel for mackerel. Ground fish, such as cod and turbot, are also caught by sunk drift-nets. The fishing is carried on in Cornwall from about 5 in the afternoon till 8 or 9 in the evening, this being the time when shoals of pilchard and such fish spread out, all the fish heading away from the land. Each boat shoots a fleet of nets, numbering from 16 to 20 for pilchard and herring,

DRIFT-NET

Herring, mackerel, and fish that swim nearer the surface are caught by drifters, which drag a series of nets between them. The net is kept close to the surface by floats; the fish are caught by their gills.

and 80 for mackerel, to windward of itself, and boat and net drift together, the former being kept head to wind by a small mizzen sail. A large number of boats can fish on the same ground, drifting parallel, without the nets becoming entangled. When the nets are hauled in, the fish are torn from the meshes and thrown on deck. Trawling and drift-net fishing have been seriously hampered on some parts of the Brit. coast, notably the coast of Devon and Cornwall, by sunken wreckage, resulting from the submarine destruction of shipping during the First World War. Great damage is suffered by the nets, which are frequently torn by projections and wrecks which have spoilt some of the best trawling beds on the S. coast.

Another method of fishing with nets is by the use of seines or seans. These are long nets, weighted below and buoyed above, which are dragged around a shoal, the fish being then brought in them either to the shore or the boat. In its simplest form seining is carried on from shore. One end of the net is fixed on the beach, the rest of the net is taken on board a boat and dropped over the stern as the boat makes a semi-circle. When the

vessel again reaches shore the net is brought in by means of the 2 ends being drawn together either by man-, horse-, or steam-power. A level bottom is necessary for this operation, which is largely performed on sand-banks, in riv. estuaries, as in the sand-eel fishery at Teignmouth. A more complicated type of seining is that carried on at St Ives for pilchards during the late summer and autumn. This involves the use of a seine-boat, 32 ft long, and manned by 6 rowers, and 2 men to work the net, 2 boats with the stop net, and a 4th boat, known as the lurker, from which directions are issued. The seine measures 160 fathoms by 6 or 8 ft, and the stop-net is 70 or 80 fathoms long. The pilchard fishery is protected by very stringent regulations, and has some interesting customs in connection with it, such as the employment of hucers, who signal the approach of shoals from look-out stations. A variation of the seine is the purse-seine, used in deep water for mackerel, which has a rope run through the bottom, so that it can be drawn up into a large bag, which encloses the fish. Purse-seines are 900 to 1500 ft long, and 160 to 180 ft deep, and are set by large rowing boats accompanying the seine-boat.

The trammel is an ingenious arrangement consisting of 3 walls of netting, set alongside each other, of which the middle one has a much smaller mesh and is set much more loosely and slackly than the 2 outer ones. The nets are set up and down the tide, and a fish, striking through the large mesh of one of the outer nets into the small-meshed centre one, carries this with it through the large mesh of the 3rd net, and is thus imprisoned in a bag of the small meshed and slack middle net. A trammel is usually 40 to 50 fathoms long and 1 to 1½ fathoms deep, with the 2 outer nets of a 12-in. mesh, and the inner one of a 2½-in. mesh. Red mullet, bass, and lobsters are largely caught by this means, particularly off the Cornish coast.

There are numerous minor varieties of nets. The fyke net is a long cylindrical bag kept open by hoops, which terminates in a pocket entered by a funnel-shaped opening, through which the fish will not return. Long straight nets, termed leaders, extend from the mouth to direct the fish towards it. The fyke net is set in fairly deep water, at the bottom. The pound net has a long straight leader, running out from shore to a bag-like net from which the fish cannot escape. Fish swimming along the shore come against the leader, and in attempting to swim round it, follow it down to the enclosure at the end. Pound nets are set in rather shallow water and are supported by stakes. Another type is the Lancs stake net, a long straight net 900 ft long and 3 ft wide, which is stretched across the tide on stakes. The fish, mostly plaice, are entangled in its meshes, and taken out when the tide goes down. Plaice are also caught in the hedge-baulk, which is a net set between long wicker walls. The stow, or bag net, is used in the Thames estuary,

the Solent, the Lynn estuary, Boston Deep, and the Firth of Forth. It is a kind of moored beam-trawl, being a large funnel-shaped bag 60 yds long, and having an opening 20 to 30 ft square. The fishing is from an anchored boat, and the flowing or ebbing tide carries the fish into the mouth, which is kept open by wooden spars. Sprats, herrings, and other small fish are caught in this way. The ground or set net works on the same principles as the drift net, but is anchored upright on the sea bottom. Herring, cod, turbot, and skate are captured by this means. Oysters are caught by a dredge resembling a beam-trawl, with the netting made of iron rings and the beam of iron also.

Traps are only used for crabs and lobsters. In the most common pattern a framework of wicker or wood is covered with netting. A bait is placed inside, and the opening is so arranged as to prevent the escape of the crab, etc., when once inside.

In recent years experiments have been carried out with a ring-net, in conjunction with an echo-sounder. Originally an aid to navigation, the echo-sounder sends sound impulses from the ship to the ocean-bed. The time taken for the echo to return to the ship is measured, and the depth of water or configuration of the ocean-bed can be recorded as a picture. It was observed that the instrument would record any comparatively solid body between the bottom and the surface, such as a dense grouping of fish. Having located the shoal the boat steams in a circle, paying out the ring-net as it goes. The haul is brought aboard after the fish have been completely ringed. The element of uncertainty which always exists in fishing is thereby likely to be dispelled, as the fisherman will cast his nets where the fish are virtually seen. Another recent contribution of science to fishing has been in the field of stimulating plant growth in the beds of sea lochs in Scotland by means of putting phosphate in the water. Experiment has shown that the quantity of fish inhabiting the waters has increased and thereby the catches.

Regulation of Fisheries.—The control of the F. of Great Britain was, from 1889 to 1903, vested in the F. dept of the Board of Trade. In 1903 these functions were transferred to the Board of Agriculture and Fisheries, now the Ministry of Agriculture, Fisheries, and Food. There is a separate Fishery Board for Scotland, which was instituted in 1882. It may be of interest briefly to consider the hist. of the administration of Brit. sea-F. The first effort to obtain definite and authoritative information on the state of sea-F. was made by the royal commission of 1860, which consisted of Mr John Caird, Prof. Huxley, and Mr G. Shaw-Lefevre. This reported in 1866 that the sources of supply gave reason for no uneasiness, and that fishing by all means should be allowed unrestricted freedom. The recommendations of the committee were included in the Sea Fisheries Act of 1868. Another royal commission in 1878 made

an inquiry into the effect of the use of beam-trawls and ground seines upon fish spawn and fry. A royal commission in 1883 for inquiry into the damage done to line and net fishing by the use of the trawl resulted in the estab. of fishery statistics (1885-7). The foundation in 1884 of the Marine Biological Association of the U.K., which receives a gov. grant, has done much to assist the scientific study of marine biology. When the International Council for the Exploration of the Sea was formed in 1902 the Marine Biological Association undertook the Eng. part of the investigations. But at the time of the First World War the gov. took over much of the F. research, which is carried on at a special laboratory at Lowestoft. The Sea Fisheries Regulation Acts of 1888-94 provided for the estab. of local committees with powers for the regulation of coast F. In 1899 the control of Irish F. was vested in the Dept of Agriculture and Technical Instruction for Ireland. Some valuable recommendations were made in 1902 by the committee on ichthyological research, appointed by the Board of Trade, and further suggestions were made by a departmental treasury committee in 1907, all urging the continuation and extension of scientific research on subjects connected with the F. The regulation of gov. aid to such investigations is now in the hands of the development commission, which was appointed under the Development and Road Improvement Funds Acts of 1909 and 1910, and makes advances for the development of F. as well as agriculture, etc.

The right of fishing in Brit. territorial waters belongs solely to Brit. subjects, and can be claimed by foreigners only by convention. This right strictly belongs to the Crown, but the royal right is only claimed in certain cases; e.g. whales, sturgeons, porpoises, and grampuses are royal fish and Crown property, by whomsoever they are caught, and salmon, oyster, and mussel F. are still held by the Crown. On the high seas, outside territorial waters, the right of fishing is open to all, but may be regulated by custom or convention. Such conventions were made between Great Britain and the U.S.A. in 1818, 1872, and, as a result of the Bering Sea arbitration, in 1892; between Great Britain and France in 1839 and 1867; and between the countries having a North Sea seaboard in 1882.

Summarised statistics of British Fisheries.—The catches of the more important food fishes in 1938 and 1953 are given below:

	Catch in tons	
	1938	1953
Cod and allies	735,300	708,800
Herring and allies	284,400	246,600
Flatfish	64,700	66,200
Skates, rays, dogfish	33,500	31,600
Mackerel	10,200	4,500
Shellfish	30,000	26,100
All species	1,197,800	1,121,600

For England and Wales the value of fish (excluding shellfish) on landing in 1953

E.E. 5—L

was £30,322,350. The shellfish were valued at £931,350. The corresponding figures for Scotland were £10,678,100 and £297,700.

Foreign vessels also land some white fish direct from the fishing grounds. In the year ending on 31 Mar. 1953, 42,500 tons were landed. The U.K. exports less fish than it did before the Second World War, this being due to competition from such countries as Norway and Denmark and to the good prices obtainable at home. In 1938 fish exports were approximately 239,000 tons while post-war the yearly figure has never exceeded 100,000 tons. Imports have remained more or less at the pre-war level.

However, the 30,000 or so fishermen of Britain catch an average of 35 tons per head, a figure exceeding that for Norwegian or U.S. fishermen. In 1951 the Brit. fishing fleet consisted of 9473 vessels (steam trawlers, other steam vessels, such as drifters, motor vessels, small motor-boats, and sailing boats). More detailed statistics on fish, fishermen, and fishing vessels can be obtained from the Sea Fisheries Statistical Tables and the Report on the Fisheries of Scotland, which are pub. each year by H.M. Stationery Office.

World Fisheries.—Asia, with an output of some 13 million tons of fish per year (in 1952) has the highest catch of any continent. The yearly totals for Europe and North America are 8,250,000 and 3,400,000 tons respectively. Of the Asian countries, Japan catches over 4½ million tons per year and China over 3 million, while India takes about 1 million tons. The particularly valuable fishes for Japan are tunny and allies, sardines and allies, and cod and allies. Molluscs are also a very important item, and so are salmon.

Norway, with a yearly catch of over 1½ million tons of fish easily leads any of the other European countries (if European Russia is taken as a unit). Much of the recent increase in Norway's output is due to improved methods of catching herring, due to skilful employment of echo-sounding to locate the shoals. European Russian production is now estimated at some 1½ million tons per annum, but including the Asian part of the U.S.S.R. the total catch is over 2½ million tons. The U.K. figures for 1953 were 1,121,600 metric tons. W. Germany caught 730,400 tons in 1953, while Spain and France caught 625,000 and 490,000 tons respectively. Taking the European region as a whole, the important food fishes are the herring and allied species, cod and allies, flatfishes, salmon and allies, sharks and rays, tunny and mackerel and shellfish.

In North America, the U.S.A. and Alaska, with a yearly output of 2,385,200 tons in 1953, is by far the leading fishing country. Canada and Newfoundland together account for nearly 1 million tons. The important fishes for the U.S.A. are pilchard, menhaden, herring, various molluscs, various kinds of sea perches, cod and allies, salmon, tuna and mackerel,

and various crustaceans. Both Canada and the U.S.A. take considerable quantities of fish from the Great Lakes. Salmon is the most valuable fish for Canada.

African F. yielded some 1½ million tons in 1953. The Union of South Africa has 2 particularly important food fishes in the Cape, hake and the sardine (*Sardinops sagax*), while sardines are also of importance in the Moroccan area and in parts of the Mediterranean.

The South Amer. catch is estimated at 600,000 tons per year, the output being mainly shared by Brazil, Chile, Peru, Argentina, and Venezuela. Various kinds of sea perches, herring and allies, tunny and mackerel, hake and grey mullet bulk large in the catches.

Finally, Australasia and the Pacific Is. had an estimated catch of about 150,000 tons in 1951, which is less than 1 per cent of the world total.

Fisher's Hill, precipitous bluff in the Shenandoah valley, Frederick co., Virginia, 30 m. SW. of Winchester. It is noted for a battle fought there in 1864, when the Federal troops under Sheridan gained a victory over the Confederates under Gen. Early. The Confederates lost about 1400 men, while the Union lost 500.

Fishery Board for Scotland was instituted in 1882 to take the place of the Board of Brit. White Herrings, which was simultaneously dissolved. Investigations had been made and plans had been brought forward to prevent the destruction of the spawn of sea fish, and the F. B. for S. was entrusted with the task of improvement. A comprehensive programme of investigations has since been carried on successfully with international co-operation. The fisheries laboratory of the Scottish Home Dept is at Aberdeen and there is a freshwater laboratory at

FISHGUARD HARBOUR

British Railways

Whaling.—The fishery for whales (q.v.) is now largely carried out in the Southern Ocean. The output of whale oil from whales caught S. of lat. 50° S. is now about ½ of the world total. The main countries using this region and their total yearly produce of whale oil for 1951 in tons is as

Norway . . .	195,600 tons
U.K.	83,300 tons
South Africa . . .	42,700 tons
Japan	34,600 tons
U.S.S.R.	31,000 tons

Pitlochry engaged on brown trout research. The important regulations of the Salmon and Fresh Waters Fisheries Act of 1923 do not apply to Scotland.

Fishguard, seaport tn of Pembrokeshire, Wales, situated at the mouth of the R. Gwaen in F. Bay, 18 m. SW. of Cardigan, and 248 m. from London. It gives its name to an urb. dist. which comprises the original fishing vil. of Lower F., modern F. on the cliff above, Goodwick, and the Harbour Vil. On the cliff top the tn centres round the market-place; below, the old fishing vil. retains its quay and pier as reminders of its former industry. F. Bay provides good shelter and anchorage; there is sufficient depth of water to take the largest ocean liners. Passengers mail, and freight are carried between F. Harbour and Ireland; this is the shortest sea crossing to Ireland, F. being 54 m. from Rosslare. Boats also go to Cork and Waterford. Pop. of urb. dist. 4900 (1953).

Fishing-eagle, see OSPREY.

Fishmongers' Company, one of the 12 greater livery companies of the city of London, whose first charter was granted by Edward I in 1272. Under charters the company's officials examine all fish coming into London, and condemn that which is bad. In addition to its charter powers, the company has statutory powers in connection with salmon and

fresh-water fisheries, and under other acts relating to fisheries. F. Hall has been on its present site since the 15th cent.; the existing building dates from 1834 and was extensively damaged by enemy air raids in 1940. The restoration was completed in 1951. The company administers the foundation of Gresham School, Holt, Norfolk, and maintains 2 almshouses.

Fiske, John (1842-1901), Amer. writer and philosopher. In 1869 he was appointed lecturer on philosophy at Harvard, and in 1881 at St Louis Univ. His first philosophical work in literature was *Outlines of Cosmic Philosophy*, 1874. Other works include: *The Unseen World*, 1876, *The Origin of Evil*, 1899, and historical works such as *The Discovery of America*, 1892, *Old Virginia and her Neighbours*, 1897, and *New France and New England*, 1902. His collected writings were pub. in 24 vols., 1902. See T. S. Perry, *John Fiske*, 1906.

Fission, in atomic science, the splitting of the nucleus of an atom by bombardment with neutrons or other atomic particles. Thus the nuclei of plutonium, uranium, and other elements undergo F. with the release of vast quantities of energy. The nuclei of heavy elements are more susceptible to F. than those of light elements. The products of F. are usually radioactive. See ATOM and ATOMIC THEORY; NUCLEAR POWER; ATOMIC BOMB.

Fistularia (Lat. *fistula*, a pipe), generic name of a fish belonging to the family of *Fistulariidae*, or flute-mouths. It is characterised by a long tubular muzzle, terminating in a small mouth, and by the pelvic fins consisting of 6 soft rays. The body is naked and the forked caudal fin has one or two of its middle rays produced into a long whip-like filament. This genus inhabits the tropical Atlantic, Pacific, and Indian Oceans, and the family is allied to the pipe-fishes and sea-horses.

Fistulina, genus of hymenomycetous fungi, of which one species, *F. hepatica*, is common to Britain. It grows principally on old oak-trees, and is the edible 'beefsteak' fungus, so called because it resembles the meat. It is also the cause of 'Brown Oak' timber used in furniture making.

Fitch, John, see SHIPS AND SHIP-BUILDING.

Fitch, Ralph (fl. 1583-1606), traveller, who is remembered as the pioneer Englishman to take the overland route to India. He set out in 1583 and returned in 1591. The account of this journey was pub. by Hakluyt in 1599. See J. H. Ryley, *Ralph Fitch, England's Pioneer to India and Burma*, 1899.

Fitch, William Clyde (1865-1909), Amer. playwright, b. Elmira, New York state. A very versatile writer, he wrote more than 30 popular plays, including melodramas, farces, social comedies, and historical plays. *Beau Brummell*, his first, was produced in 1890; others are *Nathan Hale*, 1899, *Barbara Frietchie*, 1900, *The Climbers*, 1901, and *The City*, 1909. *The Girl with the Green Eyes*, 1902, a psychological study, is commonly reckoned his

most important work. See M. J. Moses and V. Gerson, *Clyde Fitch and his Letters*, 1924.

Fitch, see FUR.

Fitchburg, city of Massachusetts, U.S.A., in Worcester co. It is situated 50 m. NW. of Boston on a branch of the Nashua R. The prin. manufs. are pulp, cotton, and woollen goods, also foundry, machine-shop, and electrical products, shoes, tools, and handbags. There are granite quarries. Pop. 42,700.

Fittig, Rudolf (1835-1910), Ger. chemist, b. Hamburg. Studied chem. at Göttingen. He assisted Wöhler, the organic chemist, in 1858, and taught in Göttingen, 1860-70. Prof. of chem. at Tübingen, 1870-6; thenceforward prof. at Strassburg. He discovered the lactones, or anhydrides of oxyacids, and synthesised sev. hydrocarbons. He was the discoverer of phenanthrene. F. re-ed. Wöhler's works, and wrote *Über Aceton*, 1858, *Das Wesen und die Ziele der chemischen Forschung und des chemischen Studiums*, 1870, and *Grundriss der unorganischen Chemie*, 1872.

Flitton, Mary (fl. 1600), maid of honour to Queen Elizabeth I, and one of the performers in the masque at the wedding of Lord Herbert in 1600, shortly afterwards becoming his mistress. Attempts have been made to identify her with the 'dark lady' of Shakespeare's sonnets.

Fitz, from the Norman-Fr. word *fitz* (Lat. *filius*), meaning son. It was and is used as a prefix to a surname to show descent—as the Scottish prefix *Mac* and the Irish *O'*—appearing in such words as Fitzwilliam and Fitzhamilton. It was also used as the surname of illegitimate children of kings or princes, as in Fitz-James and Fitzclarence.

Fitzalan, Edmund, Henry, and Richard, see ARUNDEL, EARLS OF.

Fitzgerald, Lord Edward (1763-98), Irish rebel and patriot, son of the 1st duke of Leinster. He served in the Brit. Army until 1792, when he was cashiered for being present at a revolutionary meeting at Paris. He was described by Cobbett, who served under him in the 54th Regiment, as the only really honest officer he had ever known. He now threw in his lot with the United Irishmen, and began to prepare schemes for an Irish rising. He was taken prisoner, and a wound that he had received in the struggle mortified; he d. in Newgate on 4 June.

FitzGerald, Edward (1809-83), poet, b. Bradfield House, Suffolk. He went to Trinity College, Cambridge, in 1826, and there made lifelong friendships with the Tennysons, Thackeray, Spedding, W. H. Thompson, and the rest of the coterie. When he came down from the univ. he settled at Woodbridge. He found pleasure in letter-writing and in yachting, but his prin. interest was in books. In 1851 he pub. anonymously *Euphranon, a Dialogue on Youth*, and in the following year *Polonius, a Collection of Wise Sayings and Modern Instances*. He issued in 1853 a free trans. of *Six Dramas of Calderon*, and 6 years later gave to the world his rendering of the *Rubdydyi* of Omar

Khayyam, which has made him famous in all the Eng.-speaking countries and has passed through innumerable eds. But Quaritch, who first pub. 250 copies in 1859, met no success with it, and it was only after Rossetti found a copy in the 'fourpenny box' outside Quaritch's shop that the work began its road to fame. Other and more faithful trans. have been produced, but none approaching that of F. for glow and atmosphere. His complete works and correspondence were ed. in 1902 by Aldis Wright, and there are biographies by Groome, 1895, Thomas Wright, 1904, A. C. Benson, 1905, and A. M. Terhune, 1947. See also essay by L. Housman and biography by G. F. Maine in Collins's ed. of *The Rubiydi*, 1947.

Fitzgerald, Francis Scott Key (1896-1940), Amer. novelist. b. St. Paul, Minnesota. Educ. at Newman School in New Jersey, and Princeton, he pub. his first book, *This Side of Paradise*, in 1920. *The Beautiful and Damned*, 1922, was a perfect expression of the prevalent post-war cynicism, while his finest novel, *The Great Gatsby*, 1925, shows up the false values of his generation, and *Tender is the Night*, 1934, he called his 'novel of deterioration.' An unfinished novel, *The Last Tycoon*, was pub. posthumously. His notebooks and letters were pub. in 1945 with the title *The Crack-up*. See A. Mizener, *The Far Side of Paradise*, 1951.

Fitzgerald, Robert, see AUSTRALIAN LITERATURE.

Fitzgibbon, John, see CLARE, EARL OF.

Fitzherbert, Maria Anne (née Smythe) (1756-1837), wife of George IV, though not acknowledged as such. She was b. in Hants, and had been twice married before meeting George—then prince of Wales—to whom she was married in 1785—the marriage not being valid according to the Royal Marriages Act of 1772 as it had taken place without the king's consent. On marrying Princess Caroline he, for a time, broke off relations with Mrs F., but the liaison was soon resumed, and not finally ended until 1803. See S. Leslie, *Mrs. Fitzherbert*, 1939.

Fitzjames, see BERWICK, DUKE OF.

Fitzmaurice, Edmond George Petty-Fitzmaurice, 1st Baron (1846-1935), politician and biographer. b. London, son of the 4th marquis of Lansdowne. Educ. at Eton and Trinity College, Cambridge, he became an M.P. in 1869. He was under-secretary for foreign affairs in 1882 and again in 1906, when he was raised to the peerage. His works include *The Life of William, Earl of Shelburne*, 1875-7, *Sir William Petty, the Political Economist*, 1895, *Charles William Ferdinand, Duke of Brunswick*, 1901, and *The Life of George Leveson-Gower, second Earl Granville*, 1905. He was made a fellow of the Brit. Academy in 1914.

Fitzmaurice, Sir Maurice (1861-1924), chief engineer of London Co. Council (1901-12), graduated as M.A. and M.E. from Trinity College, Dublin. Among his engineering works were the Rotherhithe tunnel, the subway for electric trams

below Kingsway, and the electric tramways, and the duplication of the main drainage system of London.

Fitzmaurice-Kelly, James (1857-1923), scholar, b. Glasgow, son of Col. T. Kelly. A Rom. Catholic, he made a special study of Spain, and in 1892 pub. a life of Cervantes. His *History of Spanish Literature*, 1898, caused him to be recognised as an authority on the subject. In 1909 he became prof. of Spanish at Liverpool, and in 1916 at King's College, London. Among his other works are *Lope de Vega and the Spanish Drama*, 1902, *Chapters on Spanish Literature*, 1908, and *Cervantes and Shakespeare*, 1916. He also ed. Cervantes's complete works, 1901, and the *Oxford Book of Spanish Verse*, 1913. He was made a Fellow of the Brit. Academy in 1906 and held many other distinctions.

Fitzroy, Augustus, see GRAFTON, DUKE OF.

FitzRoy, Robert (1805-65), adm., hydrographer, and meteorologist. From 1828 to 1830 he captained the *Beagle*, then employed in a survey of the coast of Patagonia, Tierra del Fuego, Chile, and Peru. It was during this voyage that he discovered the inland sea called Otway Water, and its connection with the salt Skyring Water by means of what came to be known as F. Channel. During a circumnavigating voyage in the *Beagle* in 1831-6, when Charles Darwin accompanied him, F. not only ran a chronometric line round the world, but recorded a number of invaluable meteorological observations, the most famous of which are his storm warnings. These were all gathered together in his *Weather Book* of 1863. He was the first director of the Meteorological Office (q.v.); and governor of New Zealand from 1843 to 1845.

Fitzroy: 1. City of Victoria, Australia, in Bourke co. It is 2 m. N.E. of Melbourne, and it forms a suburb of that place. Pop. 35,000.

2. Riv. of Queensland, Australia, formed by the junction of the Dawson and Mackenzie rivs. It flows E. into the Pacific, near the tropic of Capricorn, at Keppel Bay, and is navigable from its mouth for 35 m. to Rockhampton.

3. Largest riv. of W. Australia, whose source is in King Leopold Mts. It has a westerly course, flowing through beautiful well-watered plains, and finally enters King Sound. The source of the F. was discovered in 1842 by Stokes, although the riv. itself was not explored until 1897.

Fitzsimmons, Robert (1862-1917), prize-fighter, b. Helston, Cornwall; taken to New Zealand, 1871; became amateur boxing champion there. In 1890 he went to the U.S.A.; won middleweight championship in New Orleans, 1891; won heavyweight world championship from Corbett (q.v.) at Carson City, 1897. Beaten in Coney Is., 1899, by Jeffries. Beaten by Jack Johnson in 1907.

Fitzstephen, William (d. c. 1191), biographer of Thomas Becket, wrote in 1174 his valuable if biased *Life and Passion of Archbishop Becket* (first printed 1723). F. was present at Becket's death.

Fitzurse, Reginald (fl. 1170), Anglo-Norman knight, one of Becket's murderers. He is said to have *d.* in Palestine while doing penance for the murder. See BECKET, THOMAS.

Fitzwilliam, William Wentworth, 2nd Earl Fitzwilliam (1748-1833), statesman, succeeded the 1st earl in 1756. He succeeded in 1782 to the estates of his uncle, Lord Rockingham, and was one of the richest peers of his day. An enthusiastic Whig, he was one of the duke of Portland's party who joined Pitt in 1794, and was later in the year appointed lord lieutenant of Ireland. He held this office only for a

them a Titian, a Veronese, and a Rembrandt, an important series of Rembrandt's etchings, and numerous prints by other engravers, 130 medieval MSS., and a remarkable collection of MS. and printed music. The collections have been greatly enlarged by subsequent benefactions which have been continuous since the foundation of the museum. It now ranks with the finest in the world and houses excellent and representative collections of paintings of most schools, outstanding collections of medieval MSS., music, prints, coins, and ceramics (European and Oriental), besides Egyptian and

Reproduced by courtesy of the Director

FITZWILLIAM MUSEUM

few months, being recalled for supporting the Rom. Catholics' claims in defiance of his instructions. He was president of the Council in 1806 under Grenville, but after this did not again take office. He was a friend of Charles James Fox (q.v.).

Fitzwilliam Museum, Cambridge, founded in 1816 by Richard, 7th Viscount F. (M.A., 1764), who bequeathed to the univ. his fine art collections, his library, and the sum of £100,000 to provide and endow a museum. The building, a handsome example of 19th-cent. classical architecture, stands in Trumpington Street to the S. of Peterhouse. The Marlay Galleries and McClean Coin Room were added in 1934, the McClean MSS. Room in 1925, the Courtauld Galleries in 1931, the Henderson Galleries and Charrington Print Room in 1936, and the Graham Robertson Room, for drawings and water-colours, in 1955.

The collections bequeathed by the founder included 144 pictures, among

classical antiquities, armour, textiles, medieval and Renaissance works of art, and a library. The 3 most recent directors have been Sir Sydney Cockrell (q.v.), 1908-37; Mr Louis C. G. Clarke, 1937-46; and Mr C. Winter, since 1946.

Fiume, see RIJEKA.

Five Members, The, of parliament, were John Pym, Denzil Holles, Sir Arthur Haselrig, Wm Strode, and John Hampden. Charles I's attempt to arrest them on 4 Jan. 1642 was one of the incidents which helped to touch off the Civil war.

Five Mile Act, passed in 1593, penalised Rom. Catholics who had been convicted of recusancy for going a greater distance than 5 m. from their homes. It was repealed in 1844, but had become inoperative long before. A more famous act of the same name was passed in 1665, as part of the Clarendon Code, whereby no Nonconformist minister could come within 5 m. of any tn or bor. corporate or any place whatever where he had preached or

taught since the Act of Oblivion (1680) unless he first took the oath of non-resistance and subscribed to the Act of Uniformity. This law remained in force till 1689.

Five Towns, the phrase coined by Arnold Bennett, the novelist, to denote the dist. of Stoke-on-Trent (q.v.).

Five Year Plans, P. in Soviet Russia for the development of the country's economy. The 1st F. Y. P. covered the years 1928-32, the 2nd 1933-7, the 3rd 1938-42 (implementation interrupted by the war), the 4th 1946-50, the 5th 1951-5, and the 6th F. Y. P. was to extend over 1956-60. The P. are drawn up on the basis of directions from the highest Communist party authorities by the State Planning Committee (*Gosplan*) in conjunction with the ministries concerned, and their outlines are usually approved at a party congress. On the basis of the F. Y. P. yearly economic P. are drawn up for the country as a whole, for each branch of the economy, each territorial div., and each individual enterprise. All these P. ostensibly have the force of law. In fact they are practically never carried out as such, some targets being surpassed, others not reached. Considerable changes in the P. by the authorities during the plan period are also frequent. The P. do not eliminate disproportions and waste (sometimes they actually cause them), but they are useful in providing landmarks by which managements and the public at large orientate themselves. The 6th F. Y. P. was scrapped in 1957 and the *Gosplan* was charged with the task of working out a 'long-term plan' extending over 1959-65. The practice of F. Y. P. or similar P. has been introduced in all countries where Communist regimes were estab. after 1945, as well as (in modified forms) in some underdeveloped non-Communist countries. See H. Schwartz, *Russia's Soviet Economy*, 1951; M. Dobb, *Soviet Economic Development since 1917*, 1948.

Fives, game of handball, 2 or 4 players hitting a ball against a wall or walls to force an opponent into error. It probably derives, like racquets, from the Fr. *jeu de paume*, or hand tennis. Various explanations of the name have been offered, the most common being that it refers to the 5 fingers of 1 hand; in parts of Scotland a fist is still called a 'bunch of fives.' In England there are 3 forms of the game, distinguished from one another by the names of the schools in which they grew up—Eton, Rugby, and Winchester F. Under the name of handball a similar game is played in Ireland and the U.S.A. There is no need for any of the expensive and stylised courts described below—a smooth wall, a floor with marked lines, a golf ball, and gloves are enough to make an arduous and attractive game.

Eton F. is essentially a doubles game, though a singles game can be played. The court is enclosed on 3 sides and divided by a shallow step into 'upper' and 'lower' courts, the upper court being 10 ft by 14 ft. The 'pepper box' is a

buttress projecting from the left-hand wall, its larger part in the lower court. The server stands in the upper court, his partner and the 2 opponents in the lower court; he throws the ball against the front wall above 'the line' (a horizontal ledge running across at a height of 4 ft 6 in.) so that it bounces on to the right-hand wall near the top and falls into the lower court. The receiver has 'first cut,' taking the ball on its first bounce; he need not accept the serve until he gets one that he likes. After the 'first cut' each pair strikes alternately on the volley or first bounce until one side fails to return the ball above the line. Either the serving side scores a point or the first server gives place to his partner, then their opponents take service. Only the servers score. The game is played 15 up.

The Rugby F. court lacks the hazards of the Eton one, but the existence of a 4th wall gives the game its own character and peculiar difficulty. The court is 28 ft by 18 ft, the front wall is 15 ft high, the back wall 6 ft high, and the side walls slope between them. The ball has to strike above a board running across the front wall at a height of 2½ ft. During a rally a player may hit the ball directly on to the front wall, or against any other wall of the court instead, but before touching the ground it *must* strike the front wall above the board.

Winchester courts are about 28 ft by 18 ft at the front wall, and 9½ in. narrower at the back wall. The court narrows sharply on the left side to form a semi-buttress. In singles the buttress must not be struck full pitch with the first cut. In Rugby doubles only the server may take the striker's return of service, in Winchester P. either partner may do so.

In Irish handball, the 'alley' or court is about 60 ft by 28 ft, the front wall, 30 ft high, and the back wall, 9 ft high, being connected by sloping side-walls. The game (singles and doubles) consists of 21 points and the server alone can score, service passing to his opponent when he is forced into error. In the 1st innings of a doubles game a pair has only 1 serving 'hand,' otherwise partners serve alternately. The server, standing between two lines marked on the court, bounces the ball and hits it against the front wall from the first bounce. All-Ireland (hard ball and soft ball) Championships are held annually and there are occasional international matches with U.S.A.

Fivestones, traditional game played with pebbles, now surviving on the school playground. Each player goes through an elaborate marathon of manipulations with his 5 stones until he fails, when the next player tries. When the others have failed the first starts where he left off last time. Here are a few samples of the operations involved. Throw up 5 pebbles and catch them first on the back, then in the palm, of the hand. If one is caught, play continues. Stones on the ground are picked up in this way: lay down all caught stones but one, and throw this up; while it is in the air lift one of the dropped

stones, catch the falling one and carry on throwing and lifting until all the laid stones are gathered. Other later moves include making an eye with thumb and forefinger, placing the side of the hand farthest from the eye on the ground, throwing a stone, lifting another and dropping it through the eye before catching the one in the air, and so on until all the stones are dropped through the eye.

Fixed Stars, see STARS.

Fixed Trusts, see UNIT TRUSTS.

Fixtures. Generally speaking, the term F. denotes anything in the nature of personal property that has become annexed to the freehold so as to become part and parcel of it. More popularly, F. may be defined as things of an accessory nature annexed to houses or lands. The justification for the old common law doctrine of the irremovability of F. was that if any limited owner, e.g. a tenant for life or for years, removed the F., he necessarily committed waste, i.e. an act of destruction which injured or diminished the value of the inheritance; and, further, that the mere fact of annexation indicated an intention to abandon his ownership in the F. From early times the common law rule was relaxed in favour of the principle that the circumstances of the annexation might show an intention in the parties to the contrary of the common law presumption. The degree and object of the annexation became all-important, and the rule became estab. that whatever chattel was annexed merely for its more complete enjoyment and use as such could be removed, but that where the purpose of the annexation was the improvement of the freehold, the chattel was irremovable. This obviously did not go far enough. However much a tenant for life under a marriage settlement may desire to improve the freehold, no thought could be further from the mind of a trade tenant, or, indeed, any tenant having no sort of relation other than contractual with the freeholder. Consequently the law, in its relaxation of the old doctrine, on grounds of public policy, in favour of ornamental F., F. for convenience, trade F., and F. for business purposes, proceeded rather on the principle that what could be removed without material injury to the freehold was removable by the lessee or tenant in the absence of special stipulation to the contrary. Much greater indulgence, however, is and has always been extended to the case of trade than to merely ornamental F., and that greater indulgence is expressed in the orthodox rule that to take away the right to remove, the probable damage to the freehold must be so great as practically to destroy it. In the case of ornamental and domestic F., the rule appears to be that removal will only be allowed if little or no damage be thereby caused to the freehold or to the fixture itself. The common law doctrine has also been relaxed by a number of statutes in the case of agric. F., but this was a much more belated concession to the claims of natural justice. In connection with these relaxations, it is to be noted that the

above exceptions are construed more or less strictly according as the dispute is between (a) heirs and executors of the same owner; (b) executors of the tenant for life or tenant in tail (see *ENTAIL*), and the remainder man or reversioner; and (c) landlord and tenant. The law is strictly construed in favour of the inheritance in class (a), but it is relaxed in class (b) in favour of the limited owners, while in (c) the greatest indulgence is extended to tenants.

A more detailed reference may now be made to the law of F. as between landlord and tenant. A tenant may remove his F. only during the subsistence of his term unless expressly allowed to do so subsequently. Landlords' F. include those put up, not only by the landlord himself, but by any person other than the tenant, and such as have been put up but may not be removed by the tenant. It is usual, however, in leases to specify in a schedule not only the F. already on the premises or land, but such additions by the tenant as he may not remove even if he does hereafter make them. There is not a little confusion in the law as to landlords' and tenants' F. It is by no means clear what, in the absence of express stipulation, is the test of removability. As stated in the accepted text-books, the rule is that, however large the structure or thing may be, however solid or substantial, it is removable if it is so constructed as not in fact to be fastened to or let into the freehold. From one point of view this principle of the degree of physical annexation may be looked upon as no more than a test of the probable damage resulting from the removal. This reversion to the root principle of the law of F. involves, in effect, the abandonment of all the concessions so painfully won at the expense of the freeholder. This conflict of principle, however, works less confusion than may be imagined, and for 2 reasons: (1) contracts are generally so drawn as to provide for all eventualities; and (2) a great number of empirical exceptions to the auct. doctrine enable one in a moment to refer to one or other of them the great majority of chattels annexed to land or buildings, e.g. barns, mills, sheds, etc. Erections on blocks, rollers, pattens, or plates, the whole resting upon brickwork, but not united to the land or building by mortar or nails, are removable by the tenant. The decided cases also show that even if the structure is erected on a brickwork foundation let into the soil with uprights rising out of the brickwork, it is removable provided there be no actual fastening. Consistently with these decisions, stills set in brickwork have been held irremovable, but not vats merely supported by and resting on brickwork and timber. *Inter alia*, the following things of ornament or convenience are removable by the tenant: cornices, beds fastened to the walls or ceilings, furnaces and coppers, cupboards fixed with hold-fasts, bookcases screwed to the walls, clock cases, hangings, tapestry, marble chimney-pieces, wash-tubs and fixed water-tubs, grates, stoves and ranges, ovens, pier

glasses nailed to the walls, window-blinds, wainscot fixed by screws, and iron backs to chimneys. The following have been held irremovable: verandas the lower part of which is attached to posts embedded in the soil; conservatories erected on brick foundations affixed to or communicating with rooms in a dwelling-house; and greenhouses fixed with mortar or nailed to foundation walls of brickwork. It is to be noted, however, that some of these latter structures would be removable, despite the degree of their physical annexation, if they were erected for trade or business purposes. In regard to a tenant's trade F., the cases show that the following, *inter alia*, may be removed: salt pans, vats, chimneys, machinery, tables, steam- and fire-engines. It is clear that the removal of some of these trade F. would result in not a little damage, but the difficulty in point of principle is got rid of by creating the exceptions in spite of it. In a contract between landlord and tenant it is desirable, especially from the tenant's point of view, to insert clauses in his lease expressly limiting the effect of the *pro forma* clause to 'deliver up the premises at the end of the term *together with all fixtures*.' The effect of a covenant (q.v.) to deliver up premises and all F. belonging thereto, *without further explanatory words*, has been construed to mean that the tenant's F. are to be delivered to the landlord as well as other F. Consequently, to guard his own interests, the tenant should always put in a proviso expressly excepting his own F. The right of a tenant to remove F. does not extend beyond the subsistence of his term, unless power be expressly given him to enter and remove them after the expiration of the lease.

Agric. tenants were not allowed to remove their F. until 1851, when such F. as were erected with the landlord's written consent were allowed to be removed, provided no injury were done to the freehold, and a month's notice to the landlord of intention to remove were given, and provided also the landlord did not elect to buy the F. The Agricultural Holdings Acts, 1875-83, went further and allowed removal even though the erection was without the landlord's consent. The right of a tenant to remove agric. F., for which he is not by statute or otherwise entitled to compensation, and which have not been erected in place of some F. belonging to the landlord or in pursuance of some obligation to the latter, is subject to these conditions: (a) before removal all arrears of rent must be paid and all other obligations to the landlord fulfilled; (b) no avoidable damage to any other building or part of the agric. holding must be done; (c) such damage as has been unavoidably occasioned must be made good; (d) 1 month's notice must be given; and (e) any dispute as to the value where the landlord elects to purchase is to be settled by arbitration. Under the Agricultural Holdings Act, 1948, the tenant may, within a reasonable time after the expiration of his term, remove F. which he has

erected, unless the landlord chooses to take them over at a valuation.

For a full list of chattels held to be removable by a tenant, see *Woodfall on Landlord and Tenant*. See also LANDLORD AND TENANT; EXECUTOR; CONTINGENT REMAINDER; REVERSION.

Fjord, see FJORD.

Flabellifers, or Fan-bearer, name given to a certain order of isopods. These particular isopods have tail-fans at their extremities, formed by the end-piece or telson and the last pair of appendages. Within this tribe there are many varieties or families, and one classification is into parasitic and non-parasitic F. In the former div. come *Cirolana* and *Conilera*, whilst the gribble or *Limnoria ligorum* is one of the most important in the latter. See also GRIBBLE.

Flabellum (plural, -la), a ceremonial fan. (1) Two F. are carried in papal processions and stationed behind the papal throne. They are adorned with ostrich feathers. In 1902 new F. were presented to Leo XIII by Mrs J. Drexel of Philadelphia, in exchange for the old ones, now preserved in the museum of Pennsylvania Univ., U.S.A. The papal F. are thought by some to be derived from (2) the pair of sacramental fans once used in the sanctuary at Mass to keep flies away from the sacred elements. Records exist of their use in St Paul's Cathedral, London, York Minster, and Rochester Cathedral, and generally in Europe, but their use has been discontinued in the W. since the 14th cent. In the Oriental Christian liturgies F., called in Greek *Rhipidi*, are still used at Pontifical ceremonies, and are placed one at each side of the sanctuary.

Flaccus, Gaius Valerius (d. c. AD 92), Rom. poet, author of *Argonautica*, which was rediscovered by Poggio Bracciolini in 1416, and first printed in Bologna in 1472. F. was known to Martial, who urges him in one epigram to give up poetry for the more lucrative profession of law. The poem has many purple patches, and is disconnected, sometimes obscure, and not infrequently spoilt by the pedantry of the writer. Eight cantos only have come down to us. There is an ed., with trans. by J. H. Mozley, in the Loeb Library, 1934. See W. C. Summers, *A Study of the Argonautica*, 1894; H. E. Butler, *Post-Augustan Poetry*, 1909.

Flaccus, Lucius Valerius, Rom. soldier. As consul with Marius in 100 BC he helped to put down the revolt of Saturninus. Appointed consul for the 2nd time in 86 BC, he was sent against Mithridates, but was murdered by his own troops at the instigation of his legate Fimbria.

Flaccus, Marcus Fulvius (d. 121 BC), Rom. democrat, belonged to an illustrious patrician family, but identified himself with the Gracchan or popular party. On the death of Tiberius Gracchus (133), he was appointed one of the 3 commissioners to carry out the agrarian reforms. His proposal during his consulate of 125 that all allies should have the Rom. citizenship led indirectly to the plebeian revolt known

as the Social war. The senate, after making 2 unsuccessful attempts to banish him from Rome, was finally relieved of its hot-headed opponent by the assassination of F. together with Gaius Gracchus.

Flaccus, Quintus Horatius, see **HORACE**.
Flacius (or **Flachi**), **Matthias** (1520-75), whose proper name was **Viach** (known in Croatian literature as **Matija Vlačić Ilir**), and who was surnamed **Illyricus**, b. Albona, Istria, a follower of Luther; led so stormy a life that the vol. and merit of his writings are remarkable. He studied in Venice, Basel, and Tübingen, and in 1541 taught Greek and Hebrew at Wittenberg. He suffered from spiritual depression and despair, but Luther (q.v.) drove away his melancholy and doubts and made him an enthusiastic Protestant reformer. The siege of Wittenberg forced him to leave the city (1547), and on his return he was soon banished again because of his vehement opposition to Melancthon. His enforced wanderings carried F. to Magdeburg, Jena (1557-61), Regensburg, Antwerp, Strasburg, and Frankfurt, where he d. in extreme poverty. His *Magdeburg Centuries* is the first great list. of Protestantism, whilst in his *Catalogus Testium Veritatis*, 1556, *Clavis Scripturae Sacrae*, 1567, and *Glossa Compendiaria in Novum Testamentum*, 1570, he proves himself the first exponent of scriptural hermeneutics. See life by W. Proger, 1859-61, and W. Nigg, *Kirchengeschichtsschreibung*, 1934.

Flag: 1. In botany, the popular name of 2 species of Iridaceae found in Great Britain. *Iris pseudacorus*, the yellow or water F., grows in marshes and ditches. This name is also given to the tall blue irises of the U.S.A., *I. versicolor*, *I. prismatica*, etc.; and with a qualifying adjective to sev. other similar plants, *Gladiolus segetum*, the corn F., *Acorus calamus*, the sweet F., etc.

2. Piece of cloth attached to the end of a staff, serving as a national or local emblem, or used for naval and military purposes, or for signalling. It originated from the representations of various animals and other objects that ant. nations were wont to use for similar purposes. Thus the Romans first used the manipulus, a wisp of straw or fern attached to a pole, which served as the rallying-point of the soldiers. This was succeeded by the figure of animals, such as the eagle, wolf, horse, etc., of which the eagle alone survived until the days of the empire. The first Rom. flag was apparently the vexillum, the standard of the cavalry, a square piece of cloth attached to a cross-bar on the end of a gilt staff. (See also **LABARUM**.) One of the earliest forms of F.s was the gonfalon (q.v.) or gonfalon (from Middle High Ger. *gund*, battle, and *fano*, flag), a square or oblong piece of cloth, sometimes with streamers, attached to a cross-bar or fixed in a frame in which it could turn. The gonfalon of William the Conqueror bore a gold cross on a white ground with a blue bordure.

The pennon (Lat. *penna*, a wing) was the ensign of the medieval knight bachelor

and was a tapering F. forked at the fly, exhibiting the arms or badge of its owner. The pennoncel or pencil was a small streamer, triangular in form, wide at the staff, and pointed at the fly, carried by the esquires and bearing the cognisance of their leaders.

The banner was a rectangular F. borne by nobles of the rank of knight banneret and upwards, and displaying the owner's coat of arms. The standard was a large, long F. tapering towards the fly and slit at the end. It varied in size according to the owner's rank and displayed his badge. In addition, the various trades and guilds also had special F.s, which when necessary were borne to battle.

The diversity of F.s carried in medieval armies had necessarily to be replaced by greater uniformity when standing armies were introduced. At first each company of the regiment had its distinctive colour, but in the reign of William and Mary the number of F.s in the regiment was reduced to 3, and later by Queen Anne to 2, the royal and regimental colours, which number is still maintained. The foot guards have, however, remained unaffected by these innovations, and still retain a separate colour for each company. The regiments of household cavalry have each 3 regimental colours besides the royal standards, the dragoons have the usual 2 colours, while the lancers and hussars have no colours.

The use of F.s is far more extensive on sea than on land. Formerly ships sailed under the individual F.s of their captain, or the port of origin, but now they sail under the national colours or house F.s. Usually the ruler of a country has a F. personal to himself known as the royal standard, though it is generally rectangular like the banner. The royal standard of the Brit. Isles bears the quartered arms of England and Scotland, and formerly Ireland. It is flown at the place where the sovereign resides and on certain occasions of national celebration. The union F. was introduced in 1606 after the union of England and Scotland, and at first bore the crosses of St George and St Andrew. It was ordered by James I to be borne at the maintop of all Brit. ships, except ships of war, which bore it upon their jack-staff at the end of the bowsprit, whence it is erroneously termed Union Jack. With this F. was afterwards merged, at the union with Ireland in 1801, the cross of St Patrick, a red saltire on a white ground, and the F. thus formed has become the national F. It is still used as the man-o'-war's jack, and is also flown at the main-truck of the admiral's vessel. It also appears on all ensigns. The ensign is the F. flown upon the ensign staff of every vessel indicating its nationality. Formerly the Brit. red, white, and blue ensigns were distinctive of the red, white, and blue divs. of the fleet, but in 1864 these divs. were done away with and new ones allocated to the 3 ensigns. The white ensign, a white F. bearing the cross of St George and with the upper corner near the staff occupied by the union device, is the

exclusive F. of the Royal Navy and the Royal Yacht Squadron, and may be flown by no other vessel. The red ensign is a red F. with the union device in the upper quarter near the staff and is flown by Brit. merchant vessels and ships not belonging to the navy. The blue ensign is a plain blue F. with the union device in the upper quarter next the staff, and is flown by the Royal Naval Reserve, and by certain yacht clubs. The union F. and the blue ensign are also used with various additions to denote various officials or depts. Thus dominion war vessels fly the blue ensign with the dominion badge in the fly, while the F. for the colonies is the union F. with a white escutcheon in the centre, which bears the arms of the respective colony. The F. of the Lord High Admiral is red with a golden anchor and cable, the admiral's F. a cross of St George, red upon white ground, flown at the mainmast. The vice-admiral flies at the foremast a similar F., but with 1 red ball in the upper quarter near the staff, and the rear-admiral flies at the mizzenmast the same F. with a red ball in each of the quarters near the staff. A commodore flies a broad pennant, a swallow-tailed F. tapering towards the fly, and bearing the St George's cross, while other officers commanding ships of war fly the long pennant, a very long, narrow, and tapering F. bearing a red cross on white ground.

The Eire national F. has 3 stripes, green, white, and orange, of equal width, the green being nearest the pole.

The F. of the Union of South Africa was altered from the Union Jack and defined by an Act of the Union Parliament in 1927. It now comprises both the Union Jack, to denote the association of the union with the other members of the group of nations constituting the Brit. Commonwealth, and the national F., the design of which is 3 horizontal stripes of equal width from top to bottom, orange, white, blue. In the centre of the white stripe the old Orange Free State F. hangs vertically, spread in full, with the Union Jack adjoining horizontally, spread in full towards the pole, and the old Transvaal Vierkleur adjoining horizontally spread in full away from the pole, equidistant from the margins of the white stripe. The Australian national F. is blue with the stars of the Southern Cross in white, and the union F. in the top corner nearest the pole. The Canadian national F. is red with the dominion emblem in the centre and the union F. in the top corner nearest the pole. The New Zealand (Merchant) F. is red with the Southern Cross stars in white and the union F. in the top corner nearest the staff. The national F. of the dominion of India is a horizontal tricolour with bands of deep saffron, white, and dark green in equal proportions; on the centre of the white band is an Asoka wheel in navy blue. The national F. of Pakistan is dark green, with a white vertical bar at the mast, the green portion bearing a white crescent in the centre and a 5-pointed heraldic star.

The Fr. F. is the tricolour of blue, white, and red in vertical bars adopted during the revolution, and is used both in the navy and the mercantile marine. Before the revolution the royal standard was a blue F. bearing 3 *Neurs-de-Nis*. During the 2 empires the imperial standard was the tricolour, powdered with golden bees, and having the imperial eagle upon the white bar.

The Ger. imperial standard had a black iron cross with broadening arms, known as the cross patée, upon a gold field, each quarter of which was charged with a black crown and 3 black eagles, while the centre of the F. bore a gold shield, surmounted by a cross and surrounded by a collar of the black eagle. Within the shield were the imperial arms. The naval F. had a white ground bearing a black, white-edged cross, in the centre of which was the Prussian eagle in black on a white circular ground. The upper canton next the staff was divided into 3 horizontal bars of black, white, and red, upon which rested the black, white-bordered iron cross. This standard during the Nazi regime of Hitler was replaced by a black swastika within a white circle placed in a red ground.

The old Austrian imperial standard had a golden field, bearing the double-headed eagle of the empire with an indented border of gold, silver, blue, and black. After the union with Hungary the combined F. of Austro-Hungary consisted of 3 horizontal bars of red, white, and a bar divided vertically into 2 half bars of red and green, with 3 shields over the centre white bar, containing the arms of Austria and Hungary respectively. After the First World War the Austrian F. design was changed to 3 horizontal bars of red, white, and red.

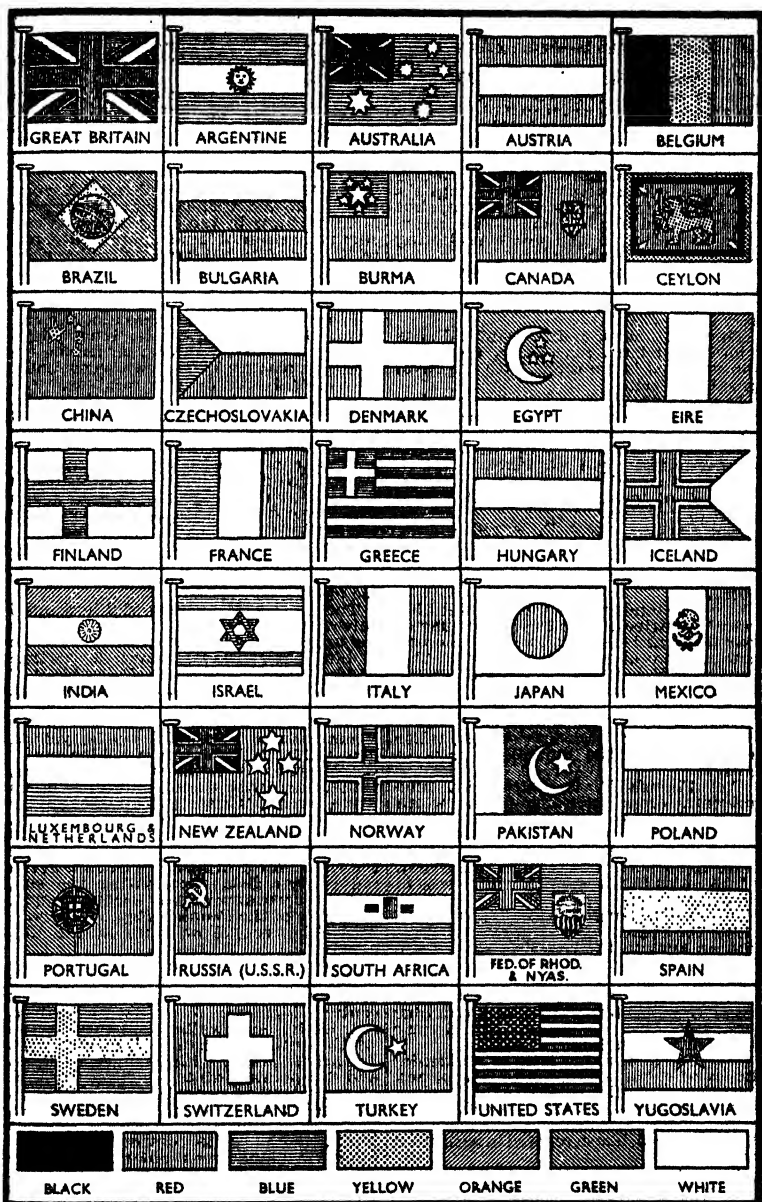

The old Russian imperial standard was yellow, bearing the arms of the empire, and the naval F. was simply a blue diagonal cross, or saltire, on a white ground. The Russian or Soviet F. is red with a yellow sickle crossing a yellow hammer, surmounted by a 5-pointed star.

The Hungarian F. now has 3 horizontal bars, red, white, and green, with the Hungarian arms, without supporters, in the centre.

The It. royal standard until the country's adoption of a republican form of gov. was a white F. with blue border, bearing the arms of the king of Italy. The national F. has 3 vertical bars of green, white, and red.

The F. of the Vatican City State, or Papal F., consists of 2 vertical stripes, yellow and white. The latter is charged with the tiara in its proper colours, surmounting 2 crossed keys (1 gold and 1 silver) tied together with a red cord.

The old Sp. standard bore the royal arms and the naval F. had red, yellow, and red horizontal bars, the middle bar bearing, near the staff, a circular shield with the arms of Leon and Castile surmounted by a crown. The mercantile F. is yellow with 3 narrow horizontal red bars. The republican F. in the Civil war

SOME NATIONAL FLAGS

had 3 equal bands—red, yellow, and violet.

The Portuguese F. (since 1910) is of dark green (next pole) and bright red in the proportion of 5 green to 8 of red. On the red and green ground, half in each, is a shield, and on it spheres and castles.

The Norwegian F. is red, with a blue cross bordered with white, the Swedish F. is blue, with a yellow cross. Both F.s are square for mercantile vessels, but swallow-tailed for standard and navy, with the arm of the cross projecting between the tails and pointed.

The Belgian naval and mercantile F. has 3 vertical bars, black, yellow, and red. The standard is the same, with the royal arms in the centre.

The Dutch naval and mercantile F. has 3 horizontal bars, red, white, and blue. The standard is the same, with the royal arms in the centre.

Luxembourg's F. is red, white, and blue.

The Dan. F., known as Dannebrog, is red, with a white cross, swallow-tailed for the navy, and rectangular for the army. The swallow-tailed royal standard bears a square in the middle with royal arms.

The F. of Iceland is blue, with white-bordered red cross.

The Turkish naval F. is red with a white crescent and an 8-pointed star near the staff. The mercantile F. is green with a white crescent upon a red circle in the centre.

The Gk standard has 9 horizontal blue and white stripes, while the upper quarter near the staff is blue, with a white cross, in the centre of which is a crown. The mercantile F. is identical but without the crown.

The Rumanian F. has 3 vertical bars of blue, yellow, and red.

San Marino, 2 horizontal bands, white and blue, with the republican arms in centre.

The Finnish F. is white with blue horizontal cross extending to the width and length of the F.

The Polish F. consists of 2 horizontal stripes, white and red, of equal width, white uppermost, with the arms of Poland.

The Swiss F. is red, with white cross in the centre.

The Czechoslovak F. has a blue triangle within the square extending from the pole, with an apex in the centre of the F., the top portion of which is white and the remainder red.

The Yugoslav F. has 3 horizontal stripes of equal width, blue, white, and red, blue uppermost, in the centre a red star bordered with yellow.

The Bulgarian F. has 3 horizontal stripes of equal width, white, green, and red, with the white uppermost.

The Albanian national F. is red, with a black double-headed eagle. The mercantile F. is red, black, and red in horizontal stripes.

The U.S.A. F., known as 'Old Glory,' consists of 13 red and white stripes, representing the original number of states, with the upper inner quarter blue, bearing 1 star for every state actually in the union.

The number of stars is now 48. Two stars were added in 1912 for Arizona and New Mexico.

Cuban national, oblong with red triangle next to staff extending one-third of F., containing a 5-pointed star in centre, the rest of the design being 5 horizontal stripes of equal width, blue and white alternately with blue uppermost.

The Mexican F. is a tricolour with green, white, and red vertical bars, bearing the Mexican arms in the central bar. Costa Rica: 5 horizontal bands, blue, white, red, white, blue (the red band twice the width of the others). Dominican rep.: red and blue, with white cross. Guatemalan: 3 vertical bands, blue, white, blue. Haitian: 2 horizontal bands, blue and red. Nicaragua: 3 horizontal bands, blue, white, blue with the republican arms on the white, displaying 5 volcanoes, surmounted by cap of liberty under a rainbow. Salvador: 3 vertical bands, blue, yellow, red. Panama: 4 diagonal squares—2 white, 1 blue, and 1 red, with the 5-pointed blue star in the middle of one white square and a red star in the other white square.

The Brazilian F. is a green F. bearing a yellow rhombus. In the rhombus is a blue circle dotted with stars and bearing the motto 'Ordem e progresso.'

The Argentine F. has 3 horizontal bars, blue, white, and blue, for the mercantile service, and a sun upon the white bar for the navy.

The Chilean F. consists of 2 horizontal halves, white and red. Near the staff in the upper bar is a 5-pointed white star on a blue ground. Peruvian: 3 vertical bands, red, white, red. Colombian: 3 horizontal bands, yellow (twice the width of the others), blue, red. Bolivian: 3 horizontal bands, red, yellow, green. Venezuelan: 3 horizontal bands, yellow, blue, red (with 7 white stars on blue band). Paraguayan: 3 horizontal bands, red, white, blue (with the republican arms on white band). Uruguayan: 4 blue and 5 white squares (surcharged with rising sun, next flagstaff). Ecuadorian: 3 horizontal bands, yellow, blue, and red (yellow twice the width of the others). The Jap. F. is a red central disk, representing the sun, with red spreading rays on a white ground.

The F. of the People's Rep. of China is red with five yellow stars in the first quarter.

Other F.s are: Persian (man-of-war): white, bordered with green (top) and red (bottom), with arms—lion and sun—in centre. Siamese: 5 horizontal stripes, red, white, blue, white, and red, of equal width, with an elephant as centre emblem. Egyptian: green, with 1 white crescent, and 3 5-pointed white stars, arranged as an equilateral triangle, between the horns. Ethiopian: 3 horizontal bands, green, yellow, red. Afghanistan: green, red, and black, with white device in centre. Saudi-Arabian: green oblong, white device in centre: 'There is no God but God, Mahommed is the Prophet of God,' and a white scimitar beneath the lettering. Moroccan sultan's F. is red, with green pentagram (the seal of Solomon). Syrian:

black, white, and green, with white stars. Lebanon F. is blue, white, and red, with a cedar of Lebanon on white stripe.

A white F. is the F. of truce, a yellow F. denotes quarantine, a red F. mutiny, and a black F. piracy. For the use of F.s for signalling, see **SIGNALLING**.

See G. C. Hounsell, *Flags of all Nations*, 1874; H. H. Horner, *American Flags*, 1910; W. J. Gordon, *Flags of the World*, 1928; G. Perreux, *L'Origine du drapeau rouge en France*, 1930; and E. H. Baxter, *National Flags*, 1934.

Flag-captain, captain of the admiral's ship in any squadron or detachment of the navy. He is commonly the admiral's nominee.

Flag-lieutenant, naval officer who transmits by signal or word of mouth the admiral's commands to the various ships. He is attached to his admiral exactly as in the army the aide-de-camp is to his general.

Flag-officer ranks above a captain in the Brit. Navy, and is usually a rear-admiral, vice-admiral, or admiral. He is so called because he is privileged to hoist a flag at his mast-head instead of a pennon, the flag being invariably a red St George's cross on a white ground. A rear-admiral carries it at the mizzen, a vice-admiral at the fore, and an admiral at the main. To F.s are given the commands of naval stations at home, and of fleets at home or abroad, whilst they may be entrusted with the surveillance of any important dockyard. They are appointed by the Admiralty at the sovereign's pleasure.

Flag-signalling, or **Flagging**, see **SIGNALLING** and **SEMAPHORE**.

Flageolet, see **RECORDER**.

Flagship, so called because it flies the admiral's flag. It carries the admiral and his staff. The F., however, remains under the command of her captain.

Flagstad, Kirsten (1895-), Norwegian dramatic soprano, b. Hamar, studied singing in Oslo and Stockholm. First appeared at the age of 18 and before 1933, when she was engaged for small parts at Bayreuth, she sang a great variety of serious and comic operatic parts in Scandinavia. She then began to specialise in Wagner, singing Sieglinde at Bayreuth in 1934, Isolde in New York in 1935, and that part as well as Senta and Brünnhilde in London in 1936-7. After that she was the finest, most noble Wagnerian soprano for nearly 20 years, and she wisely retired when still at the height of her powers.

Flagstaff, in of Arizona, U.S.A., the cap. of Coconino co., situated 84 m. E. of Prescott junction, in a large stock-raising dist. There are lumber mills, excellent yellow pine being produced. Beans, oats, and potatoes are the agric. products. In the city are the Lowell Observatory and the H.Q. of the Coconino Forestry Service. F. is a tourist centre in a scenic region (national parks, Indian reservations). Pop. 7663.

Flagstaff, pole or staff upon which a flag is hung; a F. on land is more often a tall mast, permanently fixed, while that on

board ship is generally the masthead, or at the stern.

Flagstones (geology), thin beds of sandstone which lend themselves to quarrying in slabs suitable for paving stones or rough slating. In the N. of England a flagstone quarry is synonymous with a slate quarry. The best F. are quarried from the Orcadian or Middle Old Red sandstone of Caithness and Orkney. Other good F. are the Carboniferous F. of the N. and midland cos. of England; while certain Jurassic rocks also yield good F.

Flahaut de la Billarderie, Auguste Charles Joseph, Comte de (1785-1870). Fr. general and diplomatist, the son of Mme de Souza, took the name of her first husband, F. de la B., who was executed in the Reign of Terror (1793), although it is generally believed that Talleyrand was his father. From 1800 till Waterloo he was continually in active service, fighting at Landbach (1805), Friedland and Leipzig (1813), and having served with distinction in the Russian campaign (1812). His liaison with Hortense de Beauharnais, queen of Holland, was the result of a devoted attachment. Having taken part in an unsuccessful attempt to put Napoleon II on the throne, he finally retired to England, where he married Margaret Elphinstone, afterwards Baroness Keith in her own right.

Flambard, Ranulf, or Ralph (d. 1198), chief justiciar in the reign of William Rufus; he was a Norman of humble birth. He became the king's chief adviser, and soon made himself hated by clergy and laity alike by his devices for enriching his master's exchequer. A favourite means was arbitrarily to keep a see vacant that the king might pocket the revenues. In 1099 he became bishop of Durham. When Henry I came to the throne he was imprisoned in the Tower, but escaped and fled to Normandy. He took part in Robert's rebellion, but was pardoned after Tinchebrai and regained his see. He completed the nave of Durham Cathedral.

Flamborough Head (O.E. *Flæmburg*; Domesday Book, *Flaneburg*; derivative from *Flein's burp*), on the coast of Yorks, England, situated 2 m. E. of Flamborough. An anct Brit. earthwork, misnamed Danes' Dyke, runs across F. peninsula, ending in the Head. F. H. is composed of limestone cliffs, and extends a considerable distance into the sea, rising in places to a height of 400 ft. Formerly beacons were lighted on the summit, and now a lighthouse, the light of which is visible at a distance of 21 m., stands 214 ft above high-water mark.

Flamboyant (from O.F. *flambe*, a flame), the last phase of Fr. Gothic architecture, was so called because the flaring lines of the window-tracery resemble flames in shape. The style is finicky in detail, and characterised by elaborate interpenetration of mouldings. See **FRENCH ARCHITECTURE**.

Flame can be defined as a gas which is temporarily luminous as a consequence of

chemical action (contrast Incandescence). The common distinction which is drawn between luminous and non-luminous F.s is not scientific, and can only be taken as representing a rough estimate of the degree of luminosity. F.s can also be induced by the medium of electricity; rapidly alternating high-tension discharges in air will produce an oxygen-nitrogen F., which cannot be distinguished from a F. produced by ordinary means.

Structure of Flames.—The term structure, as applied to F.s, is somewhat vague, and different accounts are given as to the number of differentiated parts in various F.s. The shape of F.s as a rule is that of a hollow cone. The gas which is unburnt forms the interior of the cone and the other gas surrounds it in the cases of F.s produced simply by the reaction of 2 gases. The F.s of the compounds of carbon, and especially of hydrocarbons, have received more attention and been more studied than other kinds, as is natural, owing to their extensive use and application. The cone of F. is simple when such elementary gases as oxygen and hydrogen only unite, but consists of 2 or more parts in more complex cases. At the base of a candle F. is a blue portion which forms the rudiment of an inner cone of combustion. When no air is mixed with the gas before coming out of the burner, no clear differentiation of the structure can be observed in a carbon-monoxide F. Hydrogen, when burnt in air at ordinary pressure, has very little luminosity or colour. The F. of cyanogen is peculiar in structure, consisting of a shell, almost crimson in colour, surrounded by a margin of bright blue. These 2 colours mark 2 stages in the process of combustion, as the carbon of the gas is oxidised first to carbon monoxide and then to carbon dioxide. If the gas of a hydrocarbon is supplied with sufficient air before leaving the burner, as in the case of the blast blow-pipe, the result is a sheet of undifferentiated F., blue in colour.

Luminosity of flames has sev. causes, of which the presence of solid incandescent matter in the F. is one. In some cases the solid is put into non-luminous F., which it renders luminous, as in the case of the incandescent gas mantle and the lime-light. In the candle, oil, and coal-gas F.s, small particles of carbon, set free by the decomposition of the hydrocarbons, form the chief cause of luminosity. In many F.s, however, solids are absent, and the luminosity is still great. Such are the F.s of oxygen and hydrogen under pressure, carbon disulphide, nitric oxide, etc. With an ordinary hydrogen F. luminosity is diminished as the purity of the hydrogen is increased and as the air is freed from dust. High temp. may increase the luminosity of F.s, in which are no solids, as in the case of coal-gas in a regenerative burner, or the same result may be obtained by increasing the density of the F. gases by pressure, as in the case of a hydrogen and oxygen F. The Bunsen burner is an illustration of the converse of the above process. Combustion in this case is rendered more complete by the addition of

air to the inside of the F., but the pressure is reduced by the consequent admixture of nitrogen and oxygen, and the luminosity is thus lessened. So in the case of an ordinary gas F., instead of air, nitrogen, or carbon dioxide is admitted to the interior of the F., the latter can be rendered practically non-luminous. The chemical energy required for the production of F. may be liberated in the process of either decomposition or combination of the component gases; the latter is the more usual, but gun-cotton is an instance of the former, as it gives off a F. in the process of decomposition. F. temps. have been measured in many ways, one of the best being the use of a platinum and platinum-rhodium thermocouple. The normal Bunsen F. is about 1570° C. at its hottest point, the oxyhydrogen blowpipe 2420° C., the acetylene F. 2550° C., and the oxy-acetylene blowpipe 3500° C. These may be compared with the temp. of the electric arc, which is about 3750° C.

Flame-flower, or Red-hot Poker, popular name of the various species of *Kniphofia*, a genus of Liliaceae. Some are hardy plants, such as *K. uvaria* and varieties, for cultivation in a light soil, and bear vivid scarlet flowers. Originally they came from S. and E. Africa.

Flame-thrower, military weapon, used in Byzantium, mainly as a siege and naval weapon, by special troops known as *siphonistai* (see GREEK FIRE). In the First World War the weapon was first introduced by the Germans, notably at Verdun (*Flammenwerfer*). Brit. and Fr. portable (infantry) and static copies were developed. The charge is a mixture of inflammable oils, the propellant compressed air or gas. Flame-throwing tanks employed by the Italians in the Abyssinian campaign of 1935 consisted of a trailer-mounted F., towed by a light tank. F.s were used fairly extensively in the Second World War. The Brit. 'Life Buoy' was carried by the individual soldier and the 'Wasp' was mounted in a Bren carrier. Flame-throwing armoured vehicles were the 'Cockatrice', the 'Boblink', and the 'Crocodile'—the last an adapted Churchill tank. See Sir D. Banks, *Flame over Britain*, 1946; A. Wilson, *Flame-thrower*, 1956.

Flamen (from Lat. *flare*, to blow the altar fire), a Rom. sacrificial priest. The chief or *maiores* were the *F. Dialis* (priest of Jupiter), *F. Martialis*, and *F. Quirinalis*, who were always patricians; the other 12 were plebeians and consequently known as *minores*. The chief function was daily sacrifice, and on 1 Oct. the *maiores* offered oblations on the Capitol to Fides Publica. A woollen mantle, called the *laena*, a white conical hat (*apex*), and a laurel wreath or olive branch were their insignia. The *F. Dialis* was hedged in by many restrictions; e.g. he might never leave the city for a night, or look at an army, or mount a horse. His wife, known as the *Flaminica Dialis*, helped him with his duties.

Flamingo (from Lat. *flamma*, flame), name given to a genus of beautiful birds

belonging to the family Phoenicopteridae, of the order Oiconiformes. They inhabit most of the countries bordering on the Mediterranean, a few individuals occasionally travelling as far as the Brit. Isles and N. Germany. By its long neck and legs, as well as by its internal anatomy, the F. gives evidence of an ancestral connection with the storks. There are 6 existing species of the *Phoenicopteridae*, and these constitute the true F.s. *Ph. roseus*, the European F., common in the S. of France and in Spain, has plumage of a pinkish-white, with scarlet wing coverts; the beak is rosy-red at the base and black at the tip; and the legs and feet are light vermillion. *Ph. ruber*, the Amer. F., has an entire plumage of vermillion. Large flights of these birds, travelling, as they

E.N.A.

FLAMINGOES IN A MEXICAN SWAMP

do, over the lakes, present a most beautiful spectacle. The F., though essentially a wader, is also a powerful swimmer. It feeds on small aquatic animals and water-plants. See E. Gallet, *The Flamingoes of the Camargue*, 1948.

Flaminian Way, see VIA FLAMINIA.

Flamininus, Titus Quinctius (c. 228-274 bc), Rom. gen. and statesman; consul in 198. In the following year he defeated Philip V of Macedon at Cynoscephalae and declared the independence of the Gk states. His genuine love of Greece and her culture enabled him to do important service in the E. between 192 and 183 bc, when he vanishes from hist. See the life by Plutarch.

Flaminius, Gaius, Rom. democratic leader and general. During his tribunate in 232 bc he granted a stretch of newly acquired land, 'ager Gallicus Piceus,' to the plebeians in defiance of the senate. Later he built the Circus Flaminius on the Campus Martius for the plebeians, and constructed the Via Flaminia. In 223 he gained a notable victory over the Insubres on the banks of the Addua, but in 217 he was slain at the battle of Trasimene.

Flammarion, Camille (1842-1925), Fr. astronomer, b. Montigny-le-Roi. He was entered in 1858 at the Paris Observatory as an astronomical student and worked for 4 years in the Bureau des longitudes, where he assisted in the compilation of a scientific nautical almanac. For some time he ed. the scientific columns of the *Sicile*, and soon became known as a popular lecturer on astronomy. In 1868 he made sev. ascents in a balloon in order to investigate aerial currents and the hygrometry of the atmosphere. Two years later he pub. an important work on the movements of celestial bodies, and in 1880 was awarded the Montyon prize of the Fr. Academy for his *Astronomie populaire*. In 1883 he estab. his private observatory—L'Observatoire Flammarion—at Juvisy-sur-Orge, and for some years devoted himself to work on the moon and the planets. One of his most important discoveries is that the rotatory movements of the planets are governed by the effect of gravity upon their various densities. In 1887 he founded the Fr. Astronomical Society. *Pluralité des mondes habites*, 1862, *Les Merveilles célestes*, 1865, *Voyages aériens* 1868, *Dans l'infini*, 1872, *Atlas céleste*, 1877, *Les Comètes, les étoiles et les planètes*, 1886, and *La Planète Mars et ses conditions d'habitabilité*, 1893, are some of his many pubs. Towards the end of his life he became much interested in the question of immortality and pub. sev. curious books dealing with it.

Flamsdal, or Flaamsdal, valley of Sogn-Fjordane (q.v.) co., Norway, running from the head of Aurlandsfjord a S. arm of the Sognefjord (q.v.) some 10 m. S. to Myrdal. The vil. of Flåm, some 5 m. from the head of Aurlandsfjord, is a centre for tourists, and the whole area is notable for its magnificent mt scenery. A railway runs as far as Myrdal.

Flamsteed, John (1646-1719), b. Denby, near Derby, first Astronomer Royal of England. He showed a lively interest in the heavens while still a boy, and was delighted to find himself installed in 1676 in the Royal Observatory at Greenwich, then just completed. At first he was harassed by lack of funds, and supplemented his £100 a year by teaching and by taking holy orders, which enabled him to obtain the small living of Burstow, near Horley, in Surrey. Unfortunate bickerings with Sir Isaac Newton (q.v.), who depended on F. for data in support of his lunar theory, cast a heavy shadow over later years. F.'s name will always be honoured as the first great Brit. observer who estab. precise astronomy on secure foundations. F. undertook, firstly, the construction of a catalogue of the fixed stars more extensive and more precise than any then existing; secondly, the systematic observation of the sun, moon, and planets with a view to revising the theories of their apparent motions and to constructing tables from which their positions could be computed with the desired accuracy. As no assistance was provided by the gov. F. had to defray the cost out of his own

pocket. He introduced new methods into practical astronomy, many of them still in use to-day. In accuracy his observations far exceeded those of his predecessors or contemporaries; they were, in fact, the earliest observations from which the phenomenon of aberration (q.v.) was clearly deducible. The task, which he did not live to finish, was completed by the labours of Crosthwait and Shart, who had been his private assistants. The 3 vols. of *F.'s Historia coelestis Britannica*, 1725, contain a record of all his astronomical observations and also the *British Catalogue* of nearly 3000 stars.

Flanders (Flem. *Vlaanderen*, Fr. *Flandre*), former name of a co. of Europe, which in the 7th cent. was applied only to Bruges and its surroundings, but it later extended along the North Sea from the R. Scheldt to the straits of Dover and Calais. To-day most of the ter. lies in 2 provs. of NW. Belgium, E. F. and W. F.

History.—The country was originally inhabited by Celtic tribes, the Morini and Menapii, who were subjugated by Caesar's forces, and the land became incorporated with Rom. Gaul. In the early centuries AD F. was overrun by invaders, many of the Franks taking up their abode permanently. By the treaty of Verdun in 843 F. was assigned to Neustria, or W. Francia, under Charles the Bald. F., though virtually a suzerainty of France, was politically autonomous, being governed by the counts of F. The 1st count whose name is recorded in hist. is Baldwin I, *Bras-de-fer*, i.e. Iron-arm (840–79), the son-in-law of Charles the Bald. The early counts were very much occupied in guarding their lands from the attacks of predatory northmen, and in extending their own dominions. Baldwin III (d. 962) laid the foundations of F.'s future commercial and industrial prosperity by establishing the first weavers and fullers at Ghent, and by patronising the ann. fairs in the chief Flem. cities. Baldwin IV (988–1035) obtained Valenciennes in 1006 from Emperor Henry II, thus becoming a feudatory of the empire as well as of the Fr. crown. During the rule of Baldwin V (1035–67) the cos. of Alost (Aalst), Tournai, and Hainaut were added to the principality. The counts of the 11th and 12th cents. were zealous in promoting the industrial interests of the country. Count Philip (d. 1191), encouraged the development of the free tns, and conferred certain municipal privileges on a number of seaports. On his death the countships of F. and Hainaut, which had been separated during the rule of Baldwin VI, were now reunited. Baldwin IX (1194–1206), the founder of the Lat. empire of Constantinople, was succeeded by his 2 daughters, Johanna and Margaret. It was during this reign that France began to exercise great influence in the country, and attempted to deprive the people of many of their privileges. Philip the Fair invaded the country during the reign of Margaret's son, Guy of Dam-pierre. Together with his 2 sons and his

nobles Guy was taken prisoner, and F. estab. as a Fr. dependency. The Flem. burghers rose in insurrection, and under the leadership of Peter de Conynne, a master cloth-weaver of Bruges, routed the Fr. army at Courtrai (1302). The cities increased in power and wealth, and many of them were governed locally on democratic principles. The internal struggle for superiority between the chief cities often disturbed the country with civil war. In the middle of the 14th cent. Jacob van Artevelde was the virtual ruler of F., and persuaded his countrymen to make an alliance with Edward III of England in defiance of their count. In a plot Jacob was murdered (1345), and the count of F. Louis van Male came to power. The last resistance of the cities was broken at Ghent in 1349. Under Philip van Artevelde, Jacob's son, Ghent rebelled again, until he, too, was slain at Rosebeke (1382). By the marriage in 1369 of Margaret, the heiress to the countship, and of Philip the Bold, of Burgundy, the hist. of F. became intimately connected with that of Burgundy, until in 1477 F. became part of the Austrian Netherlands. The Flem. coms. still attempted to assert their rights in defiance of their rulers, but the Burgundian dukes, while promoting Flem. industry and trade, sternly repressed any revolts against their authority. In 1529 France was obliged to yield her right of suzerainty in favour of Austria, and in 1633 F. reverted to Sp. rule. From 1659 to 1713, by the treaties of the Pyrenees (1659), Aix-la-Chapelle (1668), Nijmegen (1678), and Utrecht (1713), S. portions of the country were assigned to France, under the name of Fr. F. By the treaty of Vienna in 1815 it was incorporated in the Netherlands. In 1830 the new kingdom of Belgium was formed, and the old name of F. was retained in the 2 provs., E. and W. F.

E. F. lies to the NW. of Belgium, extending to the neighbourhood of Antwerp. It has rich and fertile soil, being well watered by the Scheldt and the Lys. The chief tns are Ghent (the cap.), Sint-Niklaas, Alost, Eekloo, Dendermonde, and Oudenarde (qq.v.). The prov. is famous for its flax, and the inhab. manuf. cloth, paper, leather, etc. Market-gardening is carried on under excellent conditions. Area 1147 sq. m.; pop. (1955) 1,249,435.

W. F. borders the North Sea for about 40 m. Like its neighbouring prov., the country is flat and the soil very productive. Agriculture and cattle breeding are the chief occupations of the inhab. Flax, hops, and tobacco are cultivated. The pop. is also engaged in fishing and in weaving, spinning, lace-making, bleaching, etc. The chief tns are Bruges (the cap.), Ostend, Courtrai, Roeselare, and Ypres (qq.v.). Area 1248 sq. m.; pop. (1955) 1,032,170. *See also* BELGIUM; EAST FLANDERS; WEST FLANDERS.

SECOND WORLD WAR and FLANDERS, BATTLE OF (1940).

See P. Hamelius, *Histoire politique et littéraire du mouvement flamand*, 1894; F. de Baeker, *Contemporary Flemish Literature*, 1934; R. van Roosbroeck (ed.), *De Geschiedenis van Vlaanderen*, 1936-39, 1948; F. Baur, A. van Duinkerken, and others, *Geschiedenis van de Letterkunde der Nederlanden*, 1839-48; J. Denucé and J. A. Goris (ed.), *Vlaanderen door de Eeuwen heen*, 1932; J. A. Goris (ed.), *Belgium*, 1945.

Flanders, Battle of (1940), fought between 10 May and 2 June 1940, and begun with a simultaneous attack by the Germans on Holland, Belgium, and France. During these fateful weeks the Brit. Expeditionary Force, under Gort, advanced into Belgium, and fell back again when the Germans pierced the Fr. armies and the Belgians capitulated, and finally fought its historic retreat to Dunkirk, where 211,500 fit men, 13,000 casualties, and 112,500 allied troops were embarked. Gort, who was under the immediate orders of Georges, commanding the Fr. front of the N.E., had no responsibility for the plan to meet a Ger. invasion of the Low Countries. There were strong arguments in favour of that which was adopted, the wheel to the Meuse-Dyle line. But its advantages depended on certain conditions, such as the capabilities of the Belgian Army and the mobility of the Fr. reserves, conditions which were not fulfilled.

When the Ger. attack was launched on 10 May the advance through Belgium was carried out successfully. On 15 May the Dutch Army capitulated. The excellent Fr. troops of the Seventh Fr. Army, who had rushed up to Holland, had to retire hurriedly on Antwerp. Sev. divs. of them were ordered to pass right across the communications of the B.E.F., and of their own First Army, and try to secure the disintegrating Ninth Army. This complicated move was successfully carried out on 18 May; but official dispatches record that it was too late. The divs. disappeared into the enemy maelstrom, and their leader, Gen. Giraud, arrived only to be captured. As for the B.E.F., which was not seriously attacked up to the night of 15 May, it was still conforming to the Dyle plan. But the enemy was moving ahead of schedule, and 16 May was the turning-point. The Germans had broken through on the Meuse and the Fr. S. flank was imperilled. Gort therefore asked for and obtained orders from Gen. Billotte, commanding the army group, to withdraw by stages to the Escaut. The withdrawal involved the abandonment by the Allies of both Brussels and Antwerp. On 18 May the enemy reached Amiens, and cut the lines of communication with ports S. of the Somme, and his strength of 5 armoured divs. made it certain that he would reach the Channel ports. The loss of the line of the Somme also cut off the arriving armoured div. (Brit.), which thus never came under Gort's effective command,

and also 5 battalions of the 12th and 46th Divs., together with the 51st Div., which was rushing back from the Saar. The gap in the allied line ought to have been closed by counter-attacks from N. and S., but the Fr. had not sufficient reserves, at their disposal. On 20 May orders were given to Gort to fight his way back S. to Amiens, carrying with him, if possible, the Fr. and Belgian Armies from the N. Gort was obliged to point out that this course was impracticable, as he would have simultaneously to fight a rearguard action against a superior enemy, and to break through a superior enemy. He knew that the Fr. and Belgian Armies could not have conformed even if they would, and the B.E.F. no longer had the supplies for protracted operations. On 23 May Calais was isolated. Its defence for over 4 days by the Royal Tank Regiment and the 30th Brigade was a most gallant action, which held off effectively this claw of the Ger. attack from Dunkirk. (See also CALAIS.) Plans for an Allied counter-attack towards the S. were prepared to begin on 26 May. But already on the 24th the enemy had driven in the Belgian line on the Lys, and the projected counter-attack never took place. On 26 May plans were agreed for withdrawal by stages to the Dunkirk perimeter. During that day it was evident that the Belgian Army could not retire on the Yser, and that a gap would open between it and the B.E.F. Thereafter the plans for the final withdrawal from Dunkirk were put in hand. See WESTERN FRONT in SECOND WORLD WAR. See E. Keble Chatterton, *The Epic of Dunkirk*, 1940; Lord Gort's Dispatches, *London Gazette*, 10 Oct. 1941; and F. Ellis, *The War in France and Flanders*, 1939-40, 1954.

Flandrin, Jean Hippolyte (1809-64), Fr. historical and portrait painter, b. Lyons. His fame rests chiefly on his monumental decorative work in the church of St Germain-des-Prés, notably his frescoes, 'Christ entering Jerusalem' and 'Christ going up to Calvary', 1842-4, and in the choir his figures of many saints and virtues, 1846-8. The cathedral of Nantes possesses his 'St Clair healing the Blind,' and his pictures may also be seen in the churches of St Paul at Nîmes, St Vincent de Paul at Paris, and St Martin d'Ainay at Lyons. He was much influenced by Ingres (q.v.).

Flange, projecting rim or edge, used in engineering, machinery, building, etc., either to strengthen an object, or to afford means of fixing it to another object, or to serve as a means of guidance. The variety of F.s is too great to be fully detailed here. A girder consists of a vertical web connecting horizontal parts called the F.s, which are necessary to its strength, and iron joists are a similar combination of web and F.s. The use of a F. for jointing purposes is seen in cast-iron pipes, the ends of which are joined by bolts passing through the F., while iron plates are also made with F.s at all 4 sides to enable them to be bolted together. Such plates

are used in the construction of the tubular tunnels for underground railways, the F.s serving as ribs and strengthening the structure. The most frequent use of the F. for guiding purposes is to be seen in the tyres of tramcar or railway carriage wheels, where the F.s prevent the vehicle from leaving the rail. A back F. is the plate placed over the end of a cylinder in order partly to close the aperture.

Fiannan Islands, or Seven Hunters, uninhabited is, group of Scotland, in the par. of Uig, Ross-shire, situated 20 m. NW. of Gallon Head, and consisting of 7 is. and 20 rocks, the highest point reaching 282 ft. The group contains some interesting Caledonian ruins, which are estimated as dating from the early 8th cent. Cragmen frequent the is. in June to obtain the eggs of the elder ducks, gannets, and other sea fowl, which breed there.

Flannel, soft woollen textile, made usually from loosely spun yarn. The origin of the word is probably Welsh, as F. made from the short staple wool of the mt sheep was a well-known production in Wales early in the 18th cent. A material known as balze, which is a sort of coarse F., was introduced into England by the Fr. refugees about 1578. With the changing fashions of the 20th cent. its use as an apparel cloth suffered a sharp decline and many garments and household textiles formerly made of F. are now made of flannelette, a lighter material made of cotton. In Rochdale, which is the historic seat of the industry, the manufacturers favoured wool from the South-down or Norfolk breeds. In the Rep. of Ireland the wool from the Cottagh breed is used. F. is now largely made from Australia, New Zealand, and S. Amer. wools.

Flash Point, temp. at which an oil will give off a vapour which can be ignited. This temp. varies with the pressure on the surface of the oil, and is higher when the oil is heated in an open apparatus than when a closed one is used. To obtain an exact ratio a standard apparatus must be used. In England the one used is Abel's closed oil tester. It consists of a closed receptacle surrounded by a water jacket. The temp. is taken by means of a thermometer in the water. The oil receptacle is fitted with a sliding lid. From time to time this is slipped back and a light applied to the opening. The lowest temp. at which a flame appears is taken as the F. P. of the particular oil that is being tested. In most countries there are special regulations with regard to the storage of oils with low F. P.s. In England the minimum legal F. P. (determined in a closed apparatus) is 73° F.

Flask Fungi, see PYRENOYCETES.

Flat (O.E. *flæt*, floor; Amer. 'apartment'), term applied to a section of a building which is used as a separate residence. F.-living is a prominent feature of mid-20th-cent. life because of the cost of the upkeep of houses, the scarcity of domestic labour, and the shortage of building space in modern cities.

In Europe, in addition to large-scale building of modern blocks of F.s, it is quite usual for existing houses to be converted into F.s and flatlets. In Amer. cities, especially New York, where sites are highly valuable, the attraction of apartment and tenement blocks has assumed far greater proportions than in Europe.

Flat (♭), character in musical notation which indicates that a note is to be sung or played a semitone lower than its natural pitch. The F. sign always occurs before the note to be flattened in the case of an accidental, for example, where the F. comes in temporarily in the course of a piece of music outside the prescribed key, and the effect does not extend farther than the bar in which the F. is put. But the F.s occurring regularly in the key chosen by the composer are placed in the key-signature at the beginning of each staff, and apply throughout unless contradicted by another accidental. A double F. (♭♭) is a sign placed before a natural note to show that the pitch is to be lowered by a whole tone.

Flat-coated Retriever, see RETRIEVER.

Flat-fish. Any species of the teleost order Heterosomata, fishes with long dorsal and anal fins, strongly compressed bodies, and with both eyes on one side of the head. They live at the bottom of the sea, resting on the blind side of the body. The family Pleuronectidae embraces the dextral F. (halibut, etc.), with eyes on the right side; Bothidae, the sinistral F. (turbot, etc.); Soleidae (the soles), eyes right; Cynoglossidae (tongue soles, tropical species), eyes left. Young F., met with in the open sea, are transparent and perfectly symmetrical, having 1 eye on each side of the head, and it is evident from individual metamorphosis that the order was originally normal in shape, though there is some difference of opinion as to the process of their evolution. The F. is exclusively carnivorous, and inhabits all seas except those of polar regions or off rocky coasts. Many species, such as flounders, ascend rivers, and some have become inured to a fresh-water existence. The pigment-bearing elements in the coloration of the dark side of the skin are known as chromatophores. When lying on the sandy bottom of the sea, which it chooses in preference to a muddy bed, the F. is hardly to be distinguished from its surroundings, as the bright spots on the skin harmonise exactly with the sand and pebbles. The least specialised or most primitive species is *Pectodes erumei*, which ranges from the Red Sea through the Indian Ocean to China, and is also found on the W. coast of Africa; it has the dorsal fin commencing at the nape of the neck, whereas in all others it commences above or in front of the eyes. *Hippoglossus hippoglossus*, the halibut, has both eyes on the right side. The genus typified by *Scophthalmus maximus*, the turbot, contains also *S. iowae*, the brill. *Pleuronectes platessa*, the plaice, and *P. flesus*, the flounder, are characterised by the narrow mouth aperture. Another

group includes *Solen soles*, the common sole; *S. lascaris*, the sole; *S. variegata*, the banded sole; *S. minute*, the dwarf sole, and other allied species. See FISHERIES.

Flat-foot, acquired deformity of the foot, in which both arches of the foot are impaired, more especially the longitudinal arch. It is caused generally by long periods of standing, and is therefore commonly seen in policemen, domestic servants, hospital nurses, etc. The tendency to F. is increased by any constitutional weakness, by lack of proper food, and by general debility. It is especially liable to occur after Potts's fracture of the ankle. In its earlier stages the condition is accompanied by pain along the under and inner part of the foot.

Treatment.—It is important that the condition should be treated early. Excellent results may then be obtained by rest, massage, and suitable exercises. The most useful exercises are standing and walking on tiptoe, rising on tiptoe and falling back on the heels; balancing on the outer edge of the feet; and walking on the outer edge of the feet. Many patent supports are made for this condition, and are very generally used. They are not to be recommended, as they tend to stretch further the tendons and ligaments of the sole of the foot which are already lax, and so, too, increase the F. High heels should be especially avoided. In the later stages of F., attempts have been made to improve the condition by setting the foot in the correct position in plaster of Paris splints. Some surgeons operate for the condition. If, however, the condition has been allowed to go far, it becomes extremely intractable, and the results of operation are often disappointing.

Flat-racing, see HORSE-RACING.

Flat Worms, see PLATYHELMINTHES.

Flatbush, formerly a township of Long Is., near Prospect Park, Brooklyn. It is now part of the bor. of Brooklyn.

Flatøyjarbok, or the *Book of Flatøy*, collection of Icelandic legends and true stories, which was compiled in the 14th cent., and which deals chiefly with the 10th and 11th cents. AD. One story tells how certain Norsemen reached America some 4 centuries before Columbus. The MS. is now preserved in Copenhagen. A photo-lithographic facsimile ed. appeared in 1930 as vol. 1 of the *Corpus codicum Islandicorum medii ævi* series.

Flatford, beauty spot in the par. of East Bergholt, on the R. Stour, Suffolk, England. F. Mill, the property of the National Trust, and Dedham Mill (on the Essex side of the Stour) figure in famous paintings by Constable.

Flatheads, name given to certain Amer. Indian tribes, especially the Salish (q.v.), Choctaw (q.v.), Chin-jok (q.v.), and Waxhaw. The name distinguished them from certain neighbouring tribes who compressed infants' skulls to produce a peaked shape; the F. left their heads in the natural condition, flat on top.

Flatman, Thomas (1637-88), poet and miniature painter, educ. at Winchester

and New College, Oxford, being a fellow of the latter in 1676. Two miniature self-portraits survive. Granger says: 'One of his heads is worth a ream of his Pindarics.' Saintsbury, on the other hand, says his 'unlucky name by no means expresses his poetic quality.'

Flattery, Cape, headland of Washington state, U.S.A., washed on the NE. by the strait of Juan de Fuca, and on the SW. by the Pacific. A lighthouse and meteorological station are here on Tatoosh Is.

Flatulence, condition characterised by the presence of gas (*flatus*) in the stomach or intestines. Digestion is accompanied by bacterial action which, to a certain extent, aids the activity of the digestive ferments. Bacterial fermentation is accompanied by evolution of gaseous products. A common cause of F. in infants and adults is air swallowing.

Flaubert, Gustave (1821-80), Fr. novelist, b. Rouen. He was the son of a

GUSTAVE FLAUBERT

surgeon, and did not leave his native place till 1840, when he went up to Paris to study law. His mother having been left alone through the death of his father and sister, he abandoned the idea of a legal profession, and made a home for her at Croisset, on the Seine, not far from Rouen, where he lived till his death. At this time he became an intimate friend of M. Maxime du Camp, with whom he travelled in Brittany in 1847, and Greece and Asia Minor from 1849 to 1851. From 1846 to 1854 he had an *affaire de cœur* with Mlle Louise Colet, apparently the only one of his life, although the unrequited love he conceived for Mme Elisa Schlesinger at the age of 15 had more influence on his character.

He began to write about 1846, and started with poetry, which he soon abandoned for prose. On his return from Greece he set to work on his great novel, *Madame Bovary*, which took many years to prepare, and finally appeared in serial form in the *Revue de Paris* (1857). It is the story of a girl of high aspirations married to a well-meaning but stupid

doctor. Her various lapses into vice and her ultimate suicide are related with startling vividness. The pub. caused a great deal of scandal, and the author and publisher were prosecuted on a charge of violating morals, but were acquitted. In the following year F. paid a visit to Carthage and began a serious archaeological and historical study of its surroundings, which he made use of in his 2nd work, *Salammô*, finished in 1862, a romance of the struggle between Rome and Carthage.

In 1866 he was decorated with the Legion of Honour. Three years later he pub. a realistic novel of contemporary manners of the type of *Madame Bovary*, called *L'Education sentimentale*. It was followed in 1874 by *La Tentation de Saint Antoine*, a fantastic romance, worked up from fragments which he had written as early as 1857. He was now a distinguished member of a small literary set, which included Turgenev, Zola, Daudet, and the Goncourts. He was, moreover, a personal friend of George Sand, his correspondence with whom was pub. posthumously. By temperament he was shy and morose, and wrote with great intensity, labouring over every word and never satisfied with what he had written. In 1877 he pub. *Trois Contes*, including *Un Cœur simple*, *La Légende de Saint Julien-l'Hospitalier*, and *Hérodias*. His last work, *Bouvard et Pécuchet*, was unfinished, and was pub. posthumously in 1881. He d. of apoplexy, and was buried in the family vault at Rouen.

F.'s style is a model of purity and strength. His work is tinged with satiric melancholy. He loathed everything mediocre, and his hatred for the *bourgeois* amounted almost to monomania. He wrote with an extraordinary knowledge and insight of the manners of his time, and as a literary artist must be placed between the realistic and romantic schools, belonging to neither and yet having much in common with both. His undoubted preference was for romanticism, and it was rather in spite of himself that he achieved so great a triumph with his realistic novel, *Madame Bovary*, and so much so, that he is regarded as the true inspiration of all modern realist fiction.

His *Œuvres complètes* were pub. in 8 vols. in 1885; his *Correspondance* in 4 vols., 1887-93. Of his works not already mentioned should be noticed 2 plays, *Le Candidat*, 1874, and *Le Château des cœurs*, 1877; and *Par les champs et par les grèves*, 1885. See Maxime du Camp, *Souvenirs littéraires*, 1882-3; E. Zola, *Les Romanciers naturalistes*, 1881; lives by E. Faguet (*Grands Écrivains français*), 1899; L. Bertrand, 1912; and A. Thibaudet, 1935; also R. Duménil, *Gustave Flaubert, l'homme et l'œuvre* (with bibliography), 1932; H. Guillemin, *Flaubert* (with *vie et devant Dieu*), 1939; F. Steegmüller, *Flaubert and Madame Bovary*, 1947.

Flavigny-sur-Ozerain, Fr. vil. in the dept of Côte d'Or, noted for its culture of linseed. Pop. 820.

Flaviobriga, see CASTRO URDIALES.

Flavionavia, see AVILÉS.

Flavius, Julius, see CONSTANTIIUS II.

Flavius Porphyrogenitus, see CONSTANTINE VII.

Flavius Valerius, see CONSTANTIIUS I.

Flavones, Flavonols, 2 classes of colouring substances of plants also known as anthoxanthins, closely related chemically to the anthocyanins, and, like them, sap soluble, and usually occurring as glycosides, but differing in colour, which ranges from ivory to deep yellow.

Flawil, small tn, 8 m. W. of St Gallen, with which it is connected by rail, between the lakes Constance and Zürich in the NE. of Switzerland. Pop. 6000.

Flax (*Linum usitatissimum*), dicotyledonous plant of the order Linaceae. It is an ann., growing from 20 to 40 in. in height. The stems are generally solitary and terminate in a loose corymb of blue or white flowers. The stem of the plant yields F. fibre used for the manuf. of linen, while the seed of the plant (linseed) is of value commercially in the paint industry (linseed oil), and for the manuf. of cattle feeding stuffs. Varieties have been bred to give either a high yield of fibre with little seed (fibre varieties) or a high yield of seed at the expense of fibre (linseed varieties). The plant thrives in most types of soil in temperate climates, rich alluvial soils being especially well suited to its culture. As a crop, F. is not able to compete well with weeds and, therefore, some form of weed control is generally essential. F. fibre was used in the earliest periods of civilisation; it is mentioned in the book of Exodus, and Egypt was famous for her linen.

The preparation of F. fibre entails 5 stages, viz. (i) *Pulling*—The crop is generally pulled up by the roots instead of being cut; (ii) *Dec seeding or Rippling*—This involves removing the seed bolls from the stalks; (iii) *Retting*—This is done either by steeping in water (a) in dams or ponds in the ground (dam-retting), or (b) in concrete tanks at a higher temp. for a shorter period of time (tank-retting), or by leaving the F. straw lying on the ground exposed to dew and rain (dew-retting); (iv) *Drying*—The retted straw may be dried in 'gaits' out in the field or by artificial means in hot-air driers; (v) *Scutching*—This is the mechanical separation of the fibre from the woody part of the stem. It may be done mechanically in turbines or by hand.

Retting (iii) may be omitted altogether and the dec seeded straw scutched 'green.' The green F. so produced is chemically treated at a later stage to compensate for the lack of retting. Processes have also been devised for chemically treating the straw prior to scutching instead of biologically retting it.

The F. fibre production industry of Great Britain has steadily declined since the middle of the last century. F. is still grown in Ireland, Russia, Belgium, and Holland are large F. fibre-producing countries. In the U.S.A. F. is largely grown for linseed.

Flax, New Zealand (*Phormium tenax*), also called **Flax-lily**, **Flaxbush**, monocotyledonous plant belonging to the Liliaceae order. It grows wild in N. Z., but is half hardy in Great Britain, where it is generally grown in cool greenhouses. Its leaves are from 2 to 6 ft long, and 2 or 3 in. broad. Their fibres are very strong and fine, and in N. Z. are used to make clothes, dresses, mats, etc. In England the N. Z. F. is used chiefly for ropes and sailcloth. It is obtained by cutting the leaves from a plant and macerating them, after which the fibres are easily extracted. The New Zealanders obtained more perfect F. by a laborious process of manual separation without maceration. Intensive research work has been carried out in N. Z. at Massey College on the breeding and selection of improved strains of *Phormium* with a view to raising the general standards of strength and productivity, and encouraging results have been obtained by the college.

Flaxman, John (1755-1826), sculptor, b. York. He was the son of John F., a

JOHN FLAXMAN

Engraving after the painting by John Jackson

moulder of plaster figures and casts in Covent Garden, London. He was a sickly, slightly deformed boy, and spent his childhood mostly indoors, drawing and playing with moulds. He exhibited models at the Free Society of Artists in 1767 and 1769, and won the silver medal of the Royal Academy in 1770. During 1775-87 he earned a livelihood by his beautiful designs for the china-ware of Messrs. Wedgwood. In 1782 he married and settled in a studio in Wardour Street, where he executed monumental memorial sculpture. His work of this class includes monuments of Chatterton in St Mary Redcliffe, Bristol; of Collins, and of the Rev. T. and Mrs Morley in Gloucester Cathedral; and from 1787 to 1794 he lived in Italy, studying and perfecting his

art, and while there, executed his famous designs for Homer (pub. 1793), Aeschylus, 1795, and Dante's *Divina Commedia*, 1797, as well as a marble group of 'The Fury of Athamas,' and a 'Cephalus and Aurora,' from the stories in Ovid's *Metamorphoses*.

He was elected R.A. in 1800; appointed prof. of sculpture to the Royal Academy in 1810. He tried, with some success, to introduce a purified classicism into sculpture and may be compared with Canova (q.v.) and Thorwaldsen (q.v.). The most notable of his later works are monuments of Nelson, Howe, and Sir Joshua Reynolds in St Paul's, Lord Mansfield and Capt. Montague in Westminster Abbey, and 'St Michael' at Petworth. The F. gallery in Univ. College, London, was founded by his wife's sister. His *Lectures* were ed., with a 'Brief Memoir' in 1829. See A. Cunningham, *Lives of the Most Eminent British Painters, Sculptors, and Architects* (vol. iii), 1830; S. Colvin, *The Drawings of Flaxman*, 1876; W. G. Constable, *Flaxman*, 1927.

Fleabane, popular name for plants of the genera *Pulicaria* and *Erigeron* (q.v.), both of the Compositae; from the former a volatile oil is prepared, which keeps away insects, and the scent of the *Erigeron acris* serves the same purpose.

Fleas, parasites of the *Pulex* genus. There are about 500 varieties known, many of which are specific to some particular bird or mammal. The word is commonly used to refer to the variety that chiefly infests man, the *Pulex irritans*.

The flea is a wingless insect, with a laterally compressed body strongly cased in chitin to withstand pressure, small head, and 6 long powerful legs. It lives on the blood of warm-blooded animals, though it can evidently live for long periods without such food. The piercing organ is the mandible, and not the maxilla, while the upper lip forms the sucking tube. The flea is justly famous for its jumping powers, which are equal to those of the locust, that is, it can jump 200 times its own length.

The eggs are not very numerous as a rule. They hatch in from 6 to 12 days, when wormlike bristly larvae emerge. These live for about a fortnight feeding on decaying organic matter before forming cocoons. Thus *Pulex irritans* takes about a month to reach maturity. The Indian rat-flea, *Xenopsylla cheopis*, transmits the plague (q.v.).

The chigoe or jigger of South America and West Indies is another famous member of the family. See CHIGOE.

Flèche, La, tn in the dept of Sarthe, France, on the R. Loir. A school founded by Henry IV in 1607 has become a famous military academy for officers' sons. The tn has an agric. market, a timber trade, and manufs. paper and leather goods. Pop. 11,300.

Flèche (Fr. *flèche*, arrow), in architecture, a small and slender wooden spire covered with lead. There is a fine example on the cathedral of Notre Dame, Paris.

Flecker, James Elroy (1884-1915), poet and playwright, b. Lewisham, London. He was the elder son of W. Herman F., headmaster of Dean Close School, Cheltenham, where he was educ. before going to Trinity College, Oxford. James was his substitution for Herman, his baptismal first name. Prepared for consular service by 2 years at Cambridge, where he studied oriental languages, he served in Constantinople in 1910 and 1911, and transferred to Beirut, where he was vice-consul till 1913. He d. of consumption at Davos Platz. His works include: *The Bridge of Fire*, 1907, *Forty-two Poems*, 1911, *The Golden Journey to Samarkand*, 1913, *The Old Ships*, a collection of 17 poems pub. posthumously, 1915, a novel, *The King of Alcazar*, 1914, 2 plays, *Hassan* and *Don Juan*, both pub. posthumously. F. follows the objective methods of the contemporary Fr. poets of the Parnassian school, eschewing the personal and emotional. Except in *Hassan* he rarely got beyond the stage of experimentation in verse. *Hassan* is notable more for its lyrics than for any dramatic qualities. It was produced at the Haymarket in 1923. See J. C. Squire's introduction to *The Collected Poems of James Elroy Flecker*, 1916.

Flecknoe, Richard (d. c. 1678), poet and playwright, b. Oxford. He is said to have been a Jesuit priest. He travelled between 1640 and 1650 in Europe, Asia, Africa, and Brazil. Andrew Marvell visited him in Rome and wrote a satirical account of him which gave Dryden the idea of *MacFlecknoe*, by which F. is chiefly remembered, though Shadwell (q.v.) is the real object of this satire. F. pub. a vol. of poems entitled *Miscellanæ*, 1653, sev. plays, and *A Short Treatise of the English Stage*, attacking the prevailing indecency. See study by A. Lohr, 1900.

Fleet (O.E. *flentan*, to float; cf. Ger. *fließen*), word denoting a collection of ships, and particularly a collection of warships belonging to the navy of one nation, and under the supreme command of a single officer. The word is also applied to a number of vessels for fishing or other commercial purposes.

Fleet Air Arm consists of those aircraft, and the men who fly and tend them, that are embarked in H.M. ships; it is a part of the R.N., and not of the R.A.F. In the Second World War it did not fly from H.M. ships alone, if the needs of the moment required otherwise. Naval squadrons at home operated as units of one or other command of the R.A.F.—coastal (q.v.) or fighter (q.v.)—for operations in the Channel or in other seas. In the battle of Britain (q.v.) more than 40 naval pilots, few of whom survived, joined the fighter command and fought alongside their brethren of the R.A.F. Among the many operations in which the F. A. A. greatly distinguished themselves were those at Taranto, when many It. warships were sunk or damaged (see *WORLD WAR, SECOND, Naval Operations*), the battle of Matapan (q.v.), the sinking of the *Bismarck* (see 'BISMARCK, THE'),

and the Malta convoys. Some 6 old Swordfish planes of the F. A. A. made a most heroic if abortive attempt to stop the escaping Ger. warships *Scharnhorst*, *Gneisenau*, and *Prinz Eugen* in the Eng. Channel on 12 Feb. 1942. Lt.-Cdr. Esmonde, who led these aircraft on that occasion, receiving a posthumous V.C. Aircraft carriers are the moving airfields of the F. A. A. See *The Fleet Air Arm* (pub. by the Admiralty, H.M.S.O.), 1943, and J. Moore, *The Fleet Air Arm*, 1943, and *Escort Carrier*, 1944.

Fleet Prison, famous London jail, was in existence 1197, possibly earlier, and was situated on an is. formed by ditches on the E. bank of the riv. from which it took its name. It was used for a variety of prisoners, including those sentenced under the Star Chamber and Court of Chancery, and for Catholic and Protestant martyrs. After abolition of the Star Chamber (1641) it came to be used largely for debtors and bankrupts. It became notorious for the clandestine marriages in the chapel from c. 1613 until 1753, when they were declared null and void by act of parliament, though such marriages were celebrated within the liberties of the F. until 1774. The prison was rebuilt on each occasion after destruction by the Wat Tyler rebels, the Great Fire, and the Gordon rioters. It was closed in 1842 and demolished in 1844, when the site was used as the city stone-yard until purchased by the London, Chatham, and Dover Railway in 1864. See J. Ashton, *The Fleet, its River, Prison and Marriages*, 1888.

Fleet Street, London, named after the R. Fleet (O.E. *flot*, 'stream,' 'creek'), runs from Ludgate Circus to where it joins the Strand (q.v.) at the Temple Bar Memorial. The earliest extant reference to it is c. 1188. In early times it was so called up to the palace of the Savoy in the Strand. Up to the mid-15th cent. it was, apart from Thames Street, the only paved street in the city and its immediate vicinity. It became celebrated for its taverns and signboards, and was the route of coronation processions. In modern times it has become the centre of London's newspaper industry. See W. G. Hell, *Fleet Street in Seven Centuries*, 1912.

Fleetwood, Charles (d. 1692), commonwealth soldier, 3rd son of Sir Miles F. of Aldwinkle, Northants. His eldest brother was a royalist; the second, George, was a gen. in the Swedish Army; and Charles, studying law in Gray's Inn when Civil war began, joined the parl. army as a trooper. He was colonel of horse at Naseby, governor of the Isle of Wight, 1649, and fought with Cromwell at Dunbar, 1650. He became a member of the council of state and lieutenant-general of the horse in 1651. He led cavalry at Worcester. F. married (2nd of 3 wives) Bridget, daughter of Cromwell and widow of Ireton, 1652. In Ireland as commander-in-chief till 1655—for last year lord-deputy. He was one of the major-generals of 1655, and one of 'Oliver's lords.' He was popular with the sectaries. He took a leading part in the

overthrow of Oliver's successor, Richard, in 1659, and was made lieutenant-general and commander-in-chief by the recalled Rump parliament. The Rump deprived him of all his commands following his support of Lambert's (q.v.) *coup d'état* in Oct. 1659. He was included in the indemnity at the Restoration. F. was buried in Bunhill Fields.

Fleetwood, bor. and port at the mouth of the R. Wyre, Lancs, England, 9 m. N.E. of Blackpool. It has steamship services to the Isle of Man. The chief industries are steam-trawler fishing and holiday catering. Pop. 27,525 (1954).

Flegel, Eduard Robert (1855-86), Ger. traveller in West Africa, b. of Ger. parentage at Vilna in Russia. After a commercial education he devoted his life to acquiring for Germany the major share of the trade of the Niger. He ascended this riv. first in 1879 in the London Missionary Society's steamer, and a year later in his second ascent reached Sokoto. In 1883 he discovered the sources of the Benue to the S. of Adamawa. He wrote *Loose Blätter aus dem Tagebuche meiner Hausaufreunde*, 1885, and *Vom Niger-Benue* (ed. by K. Flegel), 1890.

Fleischer, Heinrich Leberecht (1801-88), the greatest Ger. Arabist of the 19th cent. Pupil of S. de Sacy. 1835 onwards, prof. at the Univ. of Leipzig. Ed. sev. Arabian texts including Abū'l-Fidā's *Pre-Islamic History*, 1831, Az-Zamakhshari's *Anthologies*, 1835, and Al-Baidāwī's *Commentary on the Koran*, 1847-8. Also wrote numerous articles, collected in *Kleinere Schriften* (3 vols.), 1885-8.

Fleming, Sir Alexander (1881-1955), bacteriologist, b. Lochfield, Darvel, Scotland. Educ. at Kilmarnock Academy and St Mary's Hospital Medical School, London. M.B., B.S. (London), and the Univ. gold medal, 1908; F.R.S., 1943; F.R.C.P., 1944. Prof. of bacteriology at St Mary's Hospital, 1924-48. He is best known for his discovery (in 1928) of the anti-bacterial substance penicillin (q.v.), extracted by him from a green mould, *Penicillium*, which contaminated a culture of bacteria on which he was working. His early extracts proved unstable, and it was not until the Second World War that a stable product was prepared on a large scale, and was the means of saving countless lives. For his part in this work F. was knighted in 1944, and in 1945 shared the Nobel prize with Sir H. W. Florey and E. B. Chain. His earlier discovery of lysozyme, 1922, an anti-septic present in tears, was also important. He pub. many papers on bacteriological subjects, and gained numerous distinctions beside those here detailed. Biography by L. D. Ludovici, 1952.

Fleming, David Hay (1849-1931), Scottish historian, b. St Andrews, and educ. at the Univ. there. He retired from business to devote himself to Scottish hist. Pubs. include *Scotland after the Union of the Crowns*, 1890, *Mary Queen of Scots*, 1897, *The Story of the Scottish Covenants in Outline*, 1904, and *The Reformation in Scotland*, 1910.

Fleming, Sir John Ambrose (1842-1945), electrical engineer, b. Lancaster. He entered St John's College, Cambridge, in 1877, and after a brilliant career was appointed univ. demonstrator in applied mechanics; first prof. of mathematics and physics at Univ. College, Nottingham; electrical engineer to the Edison Electric Lighting Company, 1881, in which capacity he superintended the introduction of incandescent electric lighting in England. In 1885 he became prof. of electrical engineering in Univ. College, London, and obtained the erection of its engineering and electrical laboratories. He made the first thermionic valve in 1904. Chief pubs.: *Short Lectures to Electrical Artisans*, 2nd ed., 1885, *Magnets and Electric Currents*, 1897, *Wireless Telegraphy*, 1905, *Radio-telegraphy and Radio-telephony*, 1908, *Propagation of Electric Currents in Telephone and Telegraph Conductors*, 1911, *The Wonders of Wireless Telegraphy*, 1913, *The Thermionic Valve in Radio-telegraphy*, 1919, *Fifty Years of Electricity*, 1921, *Electrons, Electric Waves, and Wireless Telephony*, 1923, and *The Interaction of Scientific Research and Electrical Engineering*, 1927. He was knighted in 1929.

Fleming, Peter (1907-), travel writer, b. London. Educ. at Eton and Oxford, he took up journalism and travelled in Mexico, Brazil, China, Japan, and other countries, often as a special correspondent of *The Times*. His books include *Brazilian Adventure*, 1933, *One's Company*, 1934, *News from Tiarari*, 1936, *The Flying Visit*, 1940, *A Story to Tell*, 1942, *The Sixth Column*, 1951, *A Forgotten Journey*, 1952, *Invasion 1940*, 1956, *From Russia with Love*, 1957.

Fleming, Sir Sandford (1827-1915), Canadian engineer, b. Kirkcaldy, Scotland. He became chief engineer for the dominion gov. (1867-80), when he superintended the construction of the Intercolonial railway. Author of *The Intercolonial: a History*, 1876, *England and Canada*, 1884, and *The New Time Reckoning*, 1889. See L. J. Burpee, *Sandford Fleming, Empire-Builder*, 1915.

Flemings, see FLANDERS.

Flemings in England. Flem. settlers probably first came to England in the reign of Henry I. A number were settled in Pembrokeshire, where they maintained their position in spite of the hostility of the native Welsh pop. The colony retained its separate and distinct character for sev. centuries. During the reign of Stephen, Flem. weavers estab. themselves in the E. coos. and made Norwich famous as the centre of the cloth industry. The close commercial relations between England and Flanders estab. by the *Magnus Intercursus*, 1496, encouraged emigration. During the Reformation many Flem. Protestants sought refuge in this country.

Flemish Art. During the 14th cent. painters in Flanders still worked in the Fr. miniature style. This was transformed and a true and splendid beginning given to F. A. by the Van Eycks, Hubert (b. 1426) and Jan (d. 1441) (qq.v.).

Little is known of Hubert but both may have collaborated on the famous Ghent altarpiece, 'The Adoration of the Lamb.' A Flem. school arose soon after in the 15th cent., comprising many notable masters. They include Robert Campin (d. 1444), Petrus Christus (c. 1410-c. 1472), Dirk Bouts (c. 1415-1475), and Rogier van der Weyden (c. 1399-1464). Van der Weyden (q.v.) is the leading figure in this first period—a successful master with an active workshop in Brussels. Hans Memling (or Memlinc) (q.v.) (c. 1430-94), a native of the Rhineland who settled in Bruges, is famous for his panels of religious subjects. Rogier van der Weyden, too, exerted an important influence on Memling. Memling's art is notable on account of his regard for unity, composition, and finish, and he was celebrated as a portrait painter. Most of his portraits are inspired by a religious emotion; thus he portrayed the donors of his altar-pieces praying under the protection of their patron saints. It is generally believed that Memling painted in oils. In the old chapter-house of the Hôpital Saint-Jean, Bruges, before the Second World War, were to be found sev. of his masterpieces: 'The Mystic Marriage,' 'The Adoration of the Wise Men,' 'The Shrine of Saint Ursula,' 'The Descent from the Cross,' and others. Of this period, too, are Gerard David (q.v.) (c. 1450-2) of the Bruges school, who was famous for altar-pieces, Quentin Matsys (q.v.) (1466-1530), who also painted religious subjects, and Hugo van der Goe (1440-82). There follows what has been called a 'first golden age.' The painters now include Jan Gossaert, called Mabuse (q.v.) (c. 1475-1536), who may be said to have changed the whole spirit of antecedent F. A. by Italianising it under the influence of the work of Leonardo and Michelangelo (q.v.). Mabuse is at his best in compositions with an elaborate architectural setting. His magnificent altar-piece, 'The Adoration of the Kings,' in the National Gallery, London, is essentially Flem. in outlook and is one of the glories of European art. Of equal importance is the fact that the remarkably minute finish of every part of the picture faithfully reflects the conscientious methods that inform the subtle work of the famous Flem. illuminators of MSS. Contemporary with Mabuse was the extraordinary painter (who must be classified with the Flem. school, though technically Dutch) Jerome Bosch (q.v.) (c. 1450-1516), whose fantasy and weird symbolism have captured the modern imagination in particular. Joachim Patenier (q.v.) (c. 1480-1524), the artist who first painted landscape for its own sake, i.e. not merely as a background or irrespective of its inherently exciting or dramatic qualities, is another highly original artist. His 'Repose in Egypt,' at Brussels, is a good example of his method. Henri de Bles (q.v.) (1480-c. 1550) is believed to have been a pupil of Patenier. His virgins and holy families, influenced by his long stay in Italy, show a departure from the original spirit of F.

A. Other 16th-cent. painters were Bernard van Orley (q.v.) (d. 1542), who was famous for tapestry designs; Michael Coxie (q.v.) (1494-1592), a pupil of van Orley, whose work shows the influence of Raphael; Lambert Lombard (q.v.) (1506-1560), who was also an engraver; Antonio Moro (q.v.) (c. 1525-81), painter to Queen Mary of England; and Pieter Brueghel (q.v.) (c. 1520-69), founder of the celebrated family of Flem. painters of that name, a great master in paintings of peasant life. Flem. painting reached its second golden age in the 17th cent.—the cent. of Rubens, van Dyck, and Teniers. Peter Paul Rubens (q.v.) (1577-1640), the most eminent representative of F. A. and one of the greatest painters of any school, excelled in every branch of his art, in portraiture, landscape, religious, mythological, and allegorical subjects. He does not aim at It. refinement or airy grace, but then neither does his work generally reflect the stiffness of Italianate imitators; rather is it Flem. in warmth and life throughout, and indeed it was Rubens who, reacting from the school of Mabuse, brought F. A. back to its true spirit and to nature. Some critics have charged him with historical improprieties or anachronisms; but he is too good a classical scholar not to be fully aware of what he is doing, and in this he followed the example of Titian, Paul Veronese, and others. For nearly a century the Flem. school of art may be said to have been but a reflection of the principles of Rubens and neither in name nor in fact did that school ever find a second Rubens; and his paintings (at least before the Second World War) were to be found in all the prim. galleries of Europe. Sir Anthony van Dyck (q.v.) (1599-1641) early in life worked with Rubens. At the outset of his career his power of conception was greatly superior to his refined taste as a portrait painter. One of the most brilliant figures in the hist. of art, he yet cannot be said to have formed a school. It was hardly possible for him to reach an equal degree of expression when choosing the same subjects as Rubens; but in applying the same principles of bold and comprehensive imagination to portrait painting he was no less successful; nor indeed are Titian, Raphael, Rembrandt, or Velazquez superior to him in this branch. The harmony of figure with background seems to have been with him a guiding principle, whether in light and shade or colour, while his physiognomical interpretation gives an enduring character to all his portraits because it is so closely related to picturesque necessity. Sometimes he may be thought to be deficient in solidity, but such a defect, if it is one, is outweighed by his sense of proportion, elegance of outline, and altogether admirable technique. David Teniers the Elder (q.v.) (1582-1649) and David Teniers the Younger (q.v.) (1610-94), though Flem. by birth and education, belong more closely to the Dutch school. The younger Teniers was a pupil of Rubens. In style he followed his father,

but with a much superior power of conception. He shows also the influence of Adrian Brouwer (q.v.) (1608-40) early in his career. Truth in physiognomy and beautiful effect of light and shade, frankness in expression, and freedom of attitude characterise his famous 'Jubilee Meeting of the Civic Guards,' which went to St Petersburg. Few artists worked with greater ease, and hundreds of his pictures are or were to be found in European museums or in private collections. While many of his interiors are masterpieces, they do not often equal his open-air

W. F. Mansell

VAN DYCK'S 'PORTRAIT OF A LADY'

scenes, which are alive with carefree joyousness and everlasting sunshine. Some of his tavern scenes are characteristic of this *genre*, though Brouwer was better acquainted with this *milieu* than was Teniers, while his cottage interiors are less realistic than those of Ostade and, as an etcher, Teniers compares unfavourably with both Ostade and Cornelius. Other 17th-cent. painters are Frans Snyder (q.v.) (1579-1657), painter of animals and of battle-pieces; Casper de Crayer (q.v.) (1582-1669), whose chief works are altarpieces; Jakob Jordaens (q.v.) (1593-1678) who, after Ruben's death, was the acknowledged leader of the Antwerp school; Gonzales Coques (or Cox) (q.v.) (1618-84), a pupil of Pieter Brueghel, who excelled in cabinet portraiture, taking van Dyck as his model; Pieter van der Faes (or Sir Peter Lely) (q.v.) (1671-80), whose *chef-d'oeuvre*, a series of portraits of women of the court of Charles II of England, is at Hampton Court; Lucas van Uden (1595-1672) and Jan Fyt (1609-61). A large

number of Flem. painters of small importance in the 17th cent. worked in the enormously productive workshop of Rubens. Among 18th-cent. painters are Cornelius Huysmans (1648-1727) and Jan van Bloeman (1662-1740).

Evidently one cannot speak of a contemporary Belgian school of art, whether Flem. or Walloon, or of any tendency to group artists of to-day under the inspiration of a common ideal. This might have been possible 20 years or more ago in the epoch of Expressionism. Considered the greatest Belgian painter of the last century is James Ensor (q.v.) (1860-1947), in whose imaginative pictures it has been said that the spirit of Bosch and Brueghel lives again. Of Belgian expressionist painters Fritz van der Berhe has sunk into oblivion and the reputation of Gustave de Smet has not survived a temporary popularity. Permeke and Tytgat are contemporary painters who cannot be easily classified. Tytgat is the most refined of to-day's Belgian painters. No coherent movement has succeeded Expressionism. Wolvens is perhaps the most richly gifted of all the modern Belgian painters, with his luxuriant colouring and heavily laid-on paint. The admirers of Paul Delvaux, who has been influenced by surrealism, do not hesitate to acclaim him the foremost Belgian painter, although in the effort to realise his dreams or obsessions he employs an academic technique.

The Last Flowering of the Middle Ages, by J. van der Elst, 1945, collates all the essential things that should be known in order to understand Flem. painting of the 15th cent. See also H. Florens-Gevaert, *Études sur l'art flamand: La Renaissance, septentrionale*, 1905; R. Oldenburg, *Die Flämischen Malerei im siebzehnten Jahrhundert*, 1922; and L. van Puyvelde, *The Flemish Primitives*, 1948.

Flemish Bond, see BRICKWORK.

Flemish Language and Literature. Flem. belongs to the Teutonic group of the Indo-Germanic or Indo-European family, and is thus closely connected with German and with Eng. Together with the Dutch tongue it is generally called *Netherlandish*. There is very little documentary evidence of Old *Netherlandish* apart from an interesting trans. of the Psalms. The literature of Middle *Netherlandish*, which developed about the 11th or 12th cent., is particularly rich in romances and fables, among the former being *Karel ende Elegast* and *Floris en Blancefloer*, among the latter *Reinert*. Of the mystics of the 14th cent. Ruysbroek was the most important. New *Netherlandish*, or Dutch, dates from the early 15th cent. The love of literature and pride in the national tongue were promoted by the formation of *Kamers* or literary clubs. One of the oldest, the *Violler*, at Antwerp still exists. During the 17th and 18th cents., owing to historical reasons, literary activity was almost completely concentrated in the Dutch provs. But at the beginning of the 19th cent., after the separation of Belgium

from the Netherlands, there was a great revival of letters. The Flem. language had been largely superseded by Fr., and was regarded almost as a patois. The pioneer of the new movement was Willem (1793-1846), who aroused interest in Flem. literature by editing the old classics, and by founding in 1834 a literary organ for Flem. writers. The novelist Hendrik Conscience (1812-83) and the poet Guido Gezelle (1830-99) were the outstanding figures of this period. They prepared a new and most fertile literary activity. Among the poets of the modern school should be noted A. Rodenbach (1856-80), Pol de Mont (1867-1931), P. van Langendonck (1862-1920), K. van de Woestijne (1878-1929), P. van Ostayen (1896-1929), and M. Gijzen (b. 1899), and among the novelists are numbered C. Buyse (1859-1932), S. Streuvels (b. 1871), A. Vermeulen (1872-1945), M. Sabbe (1872-1938), H. Teirlinck (b. 1879), A. de Ridder (W. Elisehot) (b. 1882), F. Timmermans (1886-1947), M. Roelants (b. 1895), and G. Walschap (b. 1898).

See Fr. Cloeset, *Aspects et figures de la littérature flamande*, 1943; M. Gijzen, *De literatuur in Zuid-Nederland sedert 1830* (4th ed.), 1951. See also BELGIUM, Literature.

Flensburg, Ger. seaport in the Land of Schleswig-Holstein (q.v.), near the Dan. border, 45 m. NW. of Kiel (q.v.). It stands at the end of the F. fiord, an inlet of the Baltic Sea. The tn passed from Denmark to Prussia in 1864, and has many old churches and houses of interest. The prin. industries are shipbuilding, and the manuf. of paper, agric. machinery, and foodstuffs. The port has a large trade in rum, coal, timber, and cereals. In the closing days of the Second World War F. was the seat of the stop-gap gov. of Adm. Dönitz (q.v.). Here and at Kiel and Copenhagen the Germans had concentrated what remained of the Ger. Navy. The Dönitz gov. seems to have contemplated another redoubt in Norway; but it had only a precarious hold on F. and the adjacent area, and did not survive the unconditional surrender announced by Dönitz on 6 May 1945 (see GERMANY, History). Pop. 100,000.

Flers, Fr. tn in the dept of Orne. There is a 16th-cent. chateau. The tn was severely damaged in the Second World War. Linen and cotton are manufactured, and there are chemical and brick works. Pop. 12,300.

Flesh (O.E. *fleasc*), the softer tissues of the body, the muscles, adipose tissue, and generally those parts of an animal commonly used as food. The term is applied also to the body, and its capacity for receiving sense-impressions from phenomena in the world of matter as opposed to spirit, consequently F. stands for the baser parts of human nature. According to Ger. physiologists, F. is substance in the human body whose constitution approximates to that of muscle.

Flesh-fly, see HOUSE-FLY.

Fleishy school, name given by Robert Buchanan (q.v.) to the pre-Raphaelite

group of poets, more particularly to D. G. Rossetti (q.v.), in an article which he wrote attacking them. The article appeared in the *Contemporary Review* of Oct. 1871, under the pseudonym Robert Maitland, but the authorship soon became known and a violent controversy ensued. Rossetti wrote a temperate reply with the title 'The Stealthy School of Criticism.'

Fleta, early Lat. treatise on the common law of England, with the sub-title *Seu Commentarius juris Anglicani*. It is supposed to have been written during the reign of Edward I, about the year 1290. The author is unknown, but wrote it during his confinement in the Fleet prison; hence the name. The work is divided into 6 books, the author having adopted the plan of Bracton, and in many instances transcribed whole pages from him. F. was originally pub. by J. Selden from a MS. in the Cottonian Library in 1647, a 2nd ed. appearing in 1685. It is also printed in Honard's collection.

Fletcher, Andrew, of Saltoun (1655-1716), politician, b. Saltoun, East Lothian. He opposed the measures of the duke of York (subsequently James II) and was obliged to flee to Holland. In 1685 he accompanied Monmouth on his expedition to the W. of England. He returned to Scotland at the revolution of 1688 and his estates were restored to him. On the passing of the Act of Union, of which he disapproved, F. retired from public life.

Fletcher, Sir Banister Flight (1866-1954) architect, b. London, son of Prof. Banister F., architect. He entered his father's office in London, 1884, and became a partner in 1889. He continued to practise up to the time of his death, and carried out a good deal of varied building, notably the large Gillette factory near Isleworth, when he was 70 years of age. He was also a popular lecturer for many years, and he was president R.I.B.A. 1929-31; but his reputation rests almost entirely on the admirable *History of Architecture on the Comparative Method*, originally compiled and pub. in 1896 by the prof. and his son jointly. This has since been enlarged, revised, and repub. again and again, attaining a phenomenal success entirely on its merits.

Fletcher, Giles (c. 1588-1623), poet, b. London, son of Dr Giles F., a poet, and cousin of John F. the dramatist. He was educ. at Westminster School and Trinity College, Cambridge, where he became reader in Gk grammar (1615) and in Gk language (1618). He took holy orders and received the rectory of Alderton, Suffolk. His chief work is *Christ's Victorie and Triumph, in Heaven, in Earth, over and after Death*, 1610, a poem in the epic style, divided into 4 cantos. The poem owes much to Spenser and in turn influenced Milton. F. also contributed to *Sorrowes Joy* on the death of Elizabeth, and wrote *The Reward of the Faithful*, 1623. His poetical works were ed., along with those of his brother Phineas (q.v.) by F. S. Boas, 1908-9. See Fuller's *Worthies of England*, ed. 1811.

and H. E. Cory, *Spenser, the School of the Fletchers, and Milton*, 1912.

Fletcher, John (1579-1625), dramatist, b. Rye, Sussex, son of the vicar, who afterwards became bishop of London. A cousin of Giles and Phineas F. (qq.v.), he was educ. at Benet College, Cambridge, but very little is known of his life. From about 1606 to 1616 he carried on his famous literary partnership with Francis Beaumont (q.v.), and they collaborated in some dozen plays, of which the best are *The Scornful Lady*, 1610, *Philaster*, 1611, *The Maid's Tragedy*, 1611, *A King and*

Variorum Ed. of the plays of Beaumont and F., 1901-12 was under the general editorship of A. H. Bullen; A. Glover and A. R. Waller ed. a collation of all printed texts of them, 1905-12. See J. M. Mason, *Comments on the Plays of Beaumont and Fletcher*, 1798; O. L. Hatcher, *John Fletcher, a Study in Dramatic Method*, 1905; E. H. C. Oliphant, *The Plays of Beaumont and Fletcher*, 1927; J. H. Wilson, *The Influence of Beaumont and Fletcher on Restoration Drama*, 1928; U. M. Ellis-Fermor, *The Jacobean Drama*, 1936; and B. Maxwell, *Studies in Beaumont, Fletcher, and Massinger*, 1939.

Fletcher, John Gould (1886-), Amer. poet, b. Little Rock, Arkansas. Educ. at Phillips Academy, Andover, Massachusetts, and Harvard, he used his travelling experiences in his verse to good purpose. His sojourns in various parts of Europe and in the W. states of America, together with steamboat trips down the Mississippi, extended from 1908 to 1916, when he settled in London. His vols. of verse include *Fire and Wine*, 1913, *The Dominant City*, 1913, *Irradiations—Sand and Spray*, 1915, *Goblins and Pagodas*, 1916, *The Tree of Life*, 1918, *Japanese Prints*, 1918, *Breakers and Granite*, 1921, *Parables*, 1925, *Branches of Adam*, 1926, *The Black Rock*, 1928, *XXIV Elegies*, 1935. *The Epic of Arkansas*, 1936, *Selected Poems*, 1938, *South Star*, 1941, *The Burning Mountain*, 1946, and *Arkansas*, 1947. In 1933 he was awarded the Pulitzer prize for poetry. His critical works are *Paul Gauguin, His Life and Art*, 1921, *John Smith—also Pocahontas*, 1928, and *The Two Frontiers*, 1930. *Life is My Song*, 1937, is an autobiography.

Fletcher, Phineas (c. 1582-1650), poet, b. Cranbrook, Kent, elder son of Dr Giles F. He was educ. at Eton and King's College, Cambridge. With his brother Giles he contributed to *Surrowes Joy*, 1603. His pastoral drama, *Sicelides, a Piscatory*, 1615, was written for performance before James I. He took holy orders, and ultimately became rector of Hilgay, Norfolk, where he remained for the rest of his life. His prin. work is *The Purple Island: or the Isle of Man*, 1633, written in 12 cantos of 7-line stanzas. It is an allegory of the human body, written in the manner of Spenser. There are many passages of great beauty, but much of the poem is marred by far-fetched conceits. F.'s other works include 2 prose treatises, *The Way to Blessedness* and *Joy in Tribulation*, both 1632, and a poem called *The Locusts, or Apollyonists*, 1637, attacking the Jesuits. His complete poetical works were ed. by A. B. Grosart in the Fuller Worthies Library, 1869, and along with those of his brother Giles by F. S. Boas, 1908-9. See H. E. Cory, *Spenser, the School of the Fletchers, and Milton*, 1912; and A. B. Langdale, *Phineas Fletcher*, 1937.

Fletton, par. of Hunts, England, close to Peterborough, and noted for its brickfields. Other industries include the manuf. of electrical appliances and machine and precision tools, the canning

National Portrait Gallery
JOHN FLETCHER
Artist unknown

No King, 1611, *Bonduca*, 1614, and *Thierry and Theodoret*, 1616. They were credited with a great many more, as publishers found that their names on the title-page made a good selling line. Of the pair, F. is generally reckoned the more fluent and creative, and had a keener sense of 'theatre.' He was the sole author of some 16 plays, of which the most important, with their approximate dates, are *The Faithful Shepherdess*, 1609, *Valentinian*, 1618, *Monsieur Thomas*, 1619, *The Humorous Lieutenant*, 1619, *The Chances*, 1620, *The Pilgrim*, 1621, and *The Wild Goose Chase*, 1621. He probably collaborated with Shakespeare in *Henry VIII*, 1613, and possibly also in *The Two Noble Kinsmen*. F. also collaborated with Massinger in sev. plays, and probably with Rowley and Middleton in others. He d. of the plague. The

of fruit and vegetables, and processing of beet sugar. Pop. 8955.

Fleurance, Fr. tn in the dept of Gers, on the Gers. It has a trade in cereals, wine, and brandy. Pop. 3700.

Fleur-de-lis, heraldic device in armorial bearings of many countries, but it is especially associated with the royal house of France. The design is held by some to be based on the white lily, and shows 3 flowers joined together, the central one erect and the other two bending outward. Others, and with more probability, think it represents the white iris, the 'flower de luce' of Shakespeare.

FLEUR-DE-LIS

Fleurus, mrrkt tn in the prov. of Hainaut, Belgium, 7 m. NE. of Charleroi. It is noted for 3 important battles. In 1622 the Germans, under the duke of Brunswick and Count Ernst von Mansfeld, gained a victory over the Spaniards. In 1890 the Fr. under the duke of Luxembourg, defeated the allied Dutch and Ger. forces, who were led by the prince of Waldeck. In 1794 the Fr., under Jourdan, defeated the Austrians under the duke of Coburg. Pop. 7200.

Fleury, André Hercule de (1653-1743), Fr. cardinal and statesman, b. Lodève. In 1679 he obtained the post of chaplain to Queen Maria Theresa, wife of Louis XIV, and in 1698 he became bishop of Fréjus. He was made a cardinal in 1726. F. was over 70 when he became chief minister to Louis XV. His financial administration was so efficient that the usual deficit was turned into a surplus of 15,000,000 livres, but he failed to deal with the fundamental causes of Fr. financial corruption. His foreign policy was pacific. His severe economies found him unprepared for the war of the Polish Succession (1733), though through it Louis XV gained Lorraine. In 1740 F. was again forced into a war with which he had no sympathy, that of the Austrian Succession. He d. soon after the evacuation of Prague.

Fleury, Claude (1640-1723), Fr. eccles. historian, b. and educ. in Paris. In 1672 he was appointed sub-preceptor to the dukes of Anjou, Burgundy, and Berry. He was then presented with the rich priory of Argenteuil. In 1691 he commenced his great work, the *Histoire*

ecclésiastique, pub. in 20 vols., continued by J. C. Fabre and Goulet.

Fleury, Flory, or **Flouet**, in heraldry, indicates that the object is patterned all over with the fleur-de-lis (q.v.). The cross flory is a cross of which the extremities are tipped with a fleur-de-lis.

Flevoland, S.E. Polder in the IJsselmeer, Netherlands, in the course of construction. It is divided into E. F. (133,000 ac.) and S. F. (110,000 ac. when completed). See IJSSSELMEER.

Flexile Collodion, see COLLODION.

Flies. All insects which belong to the Diptera (q.v.) are commonly called F. This order comprises many families, and is widely distributed over the earth's surface, though certain species are limited to particular dists., as *Glossina morsitans*, the tsetse-fly, to equatorial Africa. *Musca domestica* is the specific name for the common house-fly; *Calliphora erythrocephala*, the blue-bottle, Culicidae, the gnat family, etc., may be found under their respective headings.

Flight, see FLYING.

Flight, Theory of, see AEROPLANE; AERONAUTICS; AERIAL NAVIGATION.

Flight-lieutenant, commissioned officer in the R.A.F., holding rank equivalent to a naval lieutenant or an army captain.

Flinders, Matthew (1774-1814), hydrographer, navigator, and explorer, b. Donington, Lincs. He entered the navy in 1789, and served in the *Bellerophon* at the battle of the 'glorious first of June.' In 1795 he went as midshipman in the *Reliance* to New South Wales, and spent his time studying the outlines and bearings of the Australian coast with George Bass, the surgeon of the *Reliance*. He explored the George R., and later much of the then unknown coast S. of Port Jackson. In 1798 he made a survey of the Furneaux Is., N. of Tasmania. In 1801 he sailed for Australia with sev. well-known scientific men in the sloop *Investigator*, and thoroughly explored the coast. On his return in H.M.S. *Porpoise* he was wrecked on a coral reef; on his rescue in the schooner *Cumberland* he was taken prisoner by the Fr. at Mauritius. His captivity lasted 6 years and ruined his health. He wrote many scientific and interesting works, among them *A Voyage to Terra Australis*, with a vol. of maps, 1814. See life by E. Scott, 1914.

Flinders Petrie, see PETRIE, SIR W. M. F.

Flinders Range, range of mts in South Australia. It extends from the N. of Spencer Gulf diagonally across the lake dist. of the S. for about 150 m. The heights are not lofty, the chief summits reaching from 1000 to 3100 ft. Mts Remarkable, Eyre, Serle, Arden, and McKinley are the most important.

Flindersia, genus of Australian hardwood trees, of the Meliaceae family. *F. australis* of New South Wales and Queensland, is regarded as one of Australia's finest hardwoods. It weighs over 50 lb. per cub. ft. and its greasy quality makes it more or less impervious to damp. Hence it is much used in dock works, flooring, shipbuilding, etc. It is yellow in

colour, with brown and white streaks, thus being suitable for cabinet work. See **TIMBER**.

Flint, Robert (1838-1910), philosopher and theologian. In 1864 he became prof. of moral philosophy at St Andrews Univ., and in 1876 prof. of divinity at Edinburgh Univ. He was also Stone lecturer in 1880, and Croall lecturer in 1887-8. Among his works may be mentioned *Christ's Kingdom on Earth*, 1865, *The Philosophy of History in France and Germany*, 1874, *Theism*, 1877, *Sermons and Addresses*, 1899, and *On Theological, Biblical, and other Subjects*, 1905.

Flint: 1. Bor. and cap. of Flintshire, North Wales. It is situated on the Dee estuary, 12 m. from Chester and 173 m. from London. There are important rayon works, smelting and iron foundries, paper mills, etc. F. Castle was begun in the reign of Henry II and completed by Edward I. It was here that Richard II was betrayed to Bolingbroke in 1399. In 1643 the Roundheads captured it. Pop. 14,257.

2. City, cap. of Genesee co., Michigan, U.S.A., on Flint R., 55 m. N.W. of Detroit. It manufs. automobiles, foundry products, structural steel, and chemicals, and is the seat of the Michigan School for the Deaf. Pop. 163,100.

Flint, hard brown mineral, consisting mainly of silica, found in chalk. It has a sp. gr. of 2.6, is frequently harder than quartz, is brittle and breaks with a conchoidal or shell-like fracture. In colour it ranges from dark brown to light yellow or grey. It occurs usually in nodular masses, but under the microscope exhibits a crystalline structure. Its composition resembles that of quartz; it is almost pure silica with traces of lime, iron, and organic matter. When received from the chalk the outer surface is opaque, rough, and greyish. On being broken it has a glassy lustre with cloudy, opaline, and speckled effects in its colouring. F.s are found usually in bands or layers in chalk, but are sometimes scattered. Layers of F. pebbles are common on riv.-beds and beaches in the E. of England, and concretions of the same nature are found under the name of chert in beds of limestone. The origin of F. is, to an extent, a matter of conjecture. The silica composing it was obtained from the skeletons of sponges and radiolaria. It evidently passed into solution, diffused through the porous mass of the chalk, and was precipitated in concretionary masses where the conditions of pressure, etc., were suitable. It appears to have taken the place of chalk, and fossils situated in the area of precipitation were outlined in silica. The uses of F. arise from its hardness, durability, and its abundance in certain dists. It is used for buildings and road making. When used for mending the surface of roads, some disadvantage results from its breaking up in angular fragments with sharp edges. Before the days of the lucifer match, flakes of F. were used for lighting tinder by striking them with a steel edge. They were also used for dis-

charging guns before the introduction of percussion caps; earlier still, tools and weapons were fashioned out of F. by dexterously breaking off flat or curved flakes by successive blows. At the present time F.s are ground down for use in the manuf. of earthenware of a superior kind. See also **FLINT IMPLEMENTS**.

Flint Glass, see **GLASS**.

Flint Implements, tools and weapons made from F. which, with others of similar tough fine-grained stone, are the earliest relics of man's activity. The first to be recognised as a piece of human workmanship was found in a London gravel pit about 1690 and is now in the Brit. Museum; and in 1797 worked F.s found 12 ft below the surface in a brick-earth pit at Hoxne, Suffolk, were recognised as of a period when metals were not known to man. The 19th cent. saw great advances in the study of F. I. in N. France and Great Britain, while systematic research in the present century has carried the enquiry to Asia, Africa, and America with outstanding success. It can now be said with some confidence that the earliest of man's tools in Europe are some half a million years old. Technological advance, however, has been far from uniform, and F. arrowheads were still in use in remote parts of N. Africa almost within living memory.

There has always been controversy about the earliest of man's efforts at making F. I., for it is sometimes held that these implements were formed by natural processes. The *boliths* ('dawn-stones') from the plateau gravels of N. Kent, and the 'sub-crag' implements from E. Anglia, are not now accepted as of human origin, but pebble-tools of lava and quartz found in E. Africa may perhaps carry man's antiquity there back nearly 1 million years.

The F. I. of the *Palaeolithic* (Old Stone Age) fall into sev. well-defined cultures, though their manifestation is not uniform. The Lower Palaeolithic is characterised by hand-axes, general purpose tools used for cutting and scraping, and by coarsely flaked tools some of which were struck from tortoise cores: the cultures are the Abbevillian, Acheulian, early Lavalloisian, and Clactonian. The Middle Palaeolithic is distinguished by flake-tools and points with finely retouched edges, and scrapers and hand-axes used probably for skinning animals: the cultures recognised are the Châtelperronian, Aurignacian, Gravettian, Solutrean, and Magdalenian. The knives and points of these cultures were often well finished by pressure flaking, and show complete control and mastery of process and material. It should be remarked that there were great differences between the various Palaeolithic cultures as represented in Africa, Asia, and Europe.

In the *Mesolithic* (Middle Stone Age of Europe), F. tools include scrapers and borers, graters, untrimmed flakes used as tools, and very small implements called microliths which did duty as arrow-points, saws, and barbs for fish-spears,

FLINT IMPLEMENTS

1. Pointed hand-axe of Abbevillean type from deep gravels at Fordwich, Kent; 2. Middle-Acheulean pointed hand-axe from Milton Street pit, Swanscombe, Kent; 3. Late Acheulean cordate hand-axe in highly finished technique, from Bournemouth, Hants; 4. Neolithic axe from Great Bealing, Suffolk; 5. Neolithic polished axe from the Thames at Teddington. (*The Trustees of the British Museum*).

The *Neolithic* (New Stone Age) saw the grinding and polishing of F. and other stone tools, and it was this technological advance, new in pre-hist., which first gave the stage its name. Axe-heads, arrow-heads, daggers, and sickle-blades of F. were in use, while axe-heads of other kinds of stone were widely traded from their centre of manuf.

Some tools of F. such as barbed and tanged arrow-heads, discoidal and plano-convex knives, and copies of bronze daggers were in use in the *Bronze Age*.

The various cultures to which F. I. are assigned are named after the places where they were first found or where they are best represented, and more than 40 such type-sites are now recorded.

Further information is contained in the articles PREHISTORIC, STONE AGE, and ARCHAEOLOGY, where bibliographies are provided, and from these articles it will be seen that F. I. provide only part of the story of early man. Their study and typology must be regarded as a means to this end, and not the end in itself.

Flint River, riv. in W. Georgia, U.S.A., with a length of 330 m. It joins the Chatahoochee at the SW. extremity of the state, and together they form the Apalachicola. It is navigable as far as Albany.

Flints, *Liquor of*, solution of flint or silica in potash (silicate of potash). This has the property of being soluble in water.

Flintshire, maritime co. of North Wales, the smallest Welsh co., consisting of a main portion with a detached part to the SE. The former is bounded by the Irish Sea, the Dee estuary, Denbighshire, and Cheshire, while the enclave is situated on the r. b. of the Dee, and bounded by Denbighshire, Cheshire, and Shropshire. The Clwydian Range lies on the SW. border of the co., which is drained by the Dee and Clwyd, the prin. rivs. The soil is fertile, and stock-raising and dairy-farming are carried on. There are manufs. of iron and steel, chemicals, and artificial silk; coal is mined in the co., though on a smaller scale than formerly. Iron, lead, copper, and limestone are worked, and there are potteries. The prin. tns are Mold (the co. tn), Flint, Holywell, Buckley; St Asaph is the seat of a bishop and Rhyl is a popular seaside resort. Area 256 sq. m.; pop. 145,100.

Flintwood, section of the Australian *Eucalypti*, yielding a hard, heavy, and durable timber, much used for railway sleepers, piles, and flooring.

Flinty Slate, see TOUCHSTONE.

Fitch, see DUNMOW.

Fitter-mouse, see BAT.

Floating Battery, vessel which is fully armed with cannon and used as a defence from or attack on an enemy. In the siege of Gibraltar (1779-83) the Fr. and Spaniards used them, but without success. They were used again in 1854 by the Eng. and Fr. against Russia.

Floating Beacons, see LIGHTHOUSE.

Floating Bridge may be a permanent construction used for ordinary traffic across a riv., or temporary, as used in

military operations. The former is built of pontoons or boxes of iron, on which is supported a roadway raised considerably above the water, the B. being securely connected at each end with the shore. In the temporary constructions the pontoons, which may be boats or rafts, are planked over to allow the men to cross the stream. Until it was replaced by a suspension B. a good example of a F. B. was that at Calcutta; it was over 1500 ft long, 48 ft wide, and was carried on 28 iron pontoons. It was constructed over the Hugli R., the bed of which is too loose and the current too rapid for permanent bridge foundations.

Floating Debt, see PUBLIC DEBT.

Floating Docks, see DOCK.

Flodden, Battle of, was fought on 9 Sept. 1513, about the base of the hill of F. in Northumberland, near Branxton, and 10 m. NW. of Wooler, between the Scots and the Eng. The Scots were under James IV and the Eng. were commanded by the earl of Surrey. Henry VIII was at Tournai prosecuting his war against the Fr. in connection with the 'Holy League.' James IV of Scotland declared himself the active ally of France, crossed the border with an invading army of 30,000 men and took up a position on F. Hill, facing S. Surrey crossed the Till and drew up in the rear of the enemy, between it and Scotland. The Scots then took up a fresh position, facing N., on Branxton Hill. Each army was in 4 distinct bodies. After a devastating attack from the Eng. archery and cannon, the Scots rushed down the hill and came into close quarters. The earls of Huntly and Home got the better of the Eng. right, under Sir Edmund Howard, but only for a time; it soon rallied with the help of Lord Dacre's reserve corps. The Scots right, under Lennox and Argyle, was completely routed by Sir Edward Stanley. James, fighting bravely among his soldiers, attacked Surrey, but Stanley, turning about, attacked the king's corps in the rear. This corps fought to the last man, but the battle was decided—the Scots were most grievously defeated. They had lost their king, up to 10,000 men, and the flower of all the noble families of Scotland. The Eng. loss was 5000 men. See Scott's *Marmion*, where the battle is described with some accuracy and some imagination, and A. Mure Mackenzie, *The Rise of the Stewarts*, 1935.

Flogging and Whipping. The powers of the courts to pass a sentence of corporal punishment were abolished by the Criminal Justice Act of 1948, both for adults and juvenile offenders.

Before 1948 the courts could order the F. or W. of a male adult as follows: (1) under the Vagrancy Act, 1824, for a second or subsequent offence of indecent exposure, sleeping out, failure to support a family, etc.; (2) under the Larceny Act, 1916, for robbery with violence and armed robbery; (3) under the Criminal Law Amendment Act, 1912, on indictment for procuring, for a second or subsequent offence of living on immoral earnings or soliciting for immoral purposes.

There were also powers under certain acts that were practically obsolete. In practice corporal punishment was almost entirely limited to robbery with violence.

It is noteworthy that although crimes of violence as a whole have increased since 1948, when corporal punishment was abolished, robbery with violence has decreased. Corporal punishment still remains as a punishment for mutiny in prison or gross personal violence to a prison officer. It can only be ordered by the visiting justices or board of justices and the order must be confirmed by the secretary of state.

In Scotland corporal punishment for prison offences was limited to the convict prison at Peterhead, but the Criminal Justice Act (Scotland) abolished this as well as corporal punishment by order of the courts.

'*Floire et Blanchefleur*,' medieval legend, probably of Oriental origin. Writers in most of the European countries, including Boccaccio in Italy, told the tale from the Fr. version. It is the story of 2 children who loved each other, were separated, and who came together again happily after passing through many difficulties and dangers. Gaston Paris says that the *chante-fable*, *Aucassin et Nicolette* (q.v.), is another form, though greatly altered, of this story. See the poem in Eng. ed. by A. Lang, 1910 (Early Eng. Text Society).

Flood, Henry (1732-91), statesman, entered the Irish Parliament in 1759, and in 1773 held office as vice-treasurer of Ireland. At one time he joined forces with Grattan (q.v.) in order to endeavour to translate into reality their dream of an independent Irish Parliament; but, differing on other matters, especially on Catholic emancipation (q.v.), they quarrelled, and in 1783 were within an ace of fighting a duel. In that year, though still an Irish member, he was returned to the Eng. House of Commons, but there he was less successful, and made little or no mark in that assembly. He was an able parliamentarian, and one of the greatest orators that Ireland has ever produced. There is a biography by Warden F., 1838.

Flood, the, described in the book of Genesis. Traditions of such a F. are found among many races besides the Hebrews, e.g. among the Indians, Persians, Babylonians, Syrians, Americans, and Polynesians, and there is the classical story of Deucalion related by Ovid. The Babylonian accounts are most interesting ones and show remarkable parallels with the biblical version. They agree with the latter in making the F. a punishment for sin, but the theology is frankly polytheistic. These traditions speak of the F. as covering the whole earth, and the biblical account naturally suggests this to us; but it has been pointed out that Heb. idiom uses universal expressions with restricted reference to the subject matter in hand—i.e. to Mesopotamia. The accepted view of the F. now is that it was partial and local, possibly owing its origin to a sudden and extraordinary rising in the Euphrates

valley, occurring at the same time as a great rainfall. Excavations in Mesopotamia have shown evidence of many severe and extensive F.s at various levels. Sir Leonard Woolley found at Ur (q.v.) 8 ft of clay laid by a F.-so prolonged that it was identified by him with the Bible F. See also ZIUSUDRA. See H. Usener, *Sinfliutsagen*, 1899; G. Gerland, *Die Mythos von der Sintflut*, 1912; C. L. Woolley, *Ur Excavations*, 1927; and H. Peake, *The Flood: New Light*, 1930.

Floods and inundations are due most commonly to excessive rains or melting snows, which cause rivers to rise and overflow their banks. Some rivers present this phenomenon annually. The rising and falling of the Nile in this way is no disaster, but has been made by man the basis of Egyptian agriculture. The Mississippi, the Missouri, and the Ohio valleys are liable to F., and these can be predicted with comparative accuracy; great I. occurred in 1897, in 1927, and in 1937, the last being the most serious since records of the river, and of its tribes, have been kept, over 1,000,000 persons being made homeless. In China the Hwang-ho R. is especially liable to become swollen after leaving its mountainous region and entering upon its long, low delta course. Levees 70 ft high proved ineffectual in the disaster of 1887, when 1,000,000 people were drowned and tens of thousands perished by disease and famine ensuing. In 1938 breaches in the bank of the Hwang-ho (or Yellow R.) caused either by the Chinese themselves or by Jap. gunfire flooded thousands of sq. m. of land, killed many thousands of people, and held up the Jap. advance in the prov. F. in the Yangtze and Yellow river valleys (China) in summer 1949 made 20 million people homeless. The breaking up of ice and glacier dams cause I. in the valleys of the tribes of the Indus. Riv. F. less catastrophic in nature, but sufficiently disastrous, occurred in France in Jan. 1910, and in England in the summer of 1912 and in 1952 (Lynmouth). In France heavy rains caused the waters of the Marne, Loire, Yonne, and other rivers to flood their valleys; this swelled the Seine and Paris was inundated.

In England, following a rainfall unprecedented in the records of the meteorological office, many of the E. and midland coasts, especially Norfolk and Suffolk, suffered disastrous F. in Mar. 1947 after prolonged snow storms and rain. Flood waters spread in the Thames valley, the record levels of 1894 being passed, and below Chertsey the river was 3 m. wide. There was an unbroken stretch of water from Windsor to Weybridge and the F. were 6 ft deep in places. Troops and prisoners of war were drafted into the Fen country for anti-flood work, where there were sev. breaches in the banks of the Great Ouse. The Severn valley was flooded for over 40 m. from Caersws to Shrewsbury. There was extensive flooding in the E. Riding of Yorks when the Derwent overflowed its banks from Malton to where it joins the Ouse, a

distance of 50 m. Altogether there were F. in some parts at least of 30 cos., and the area mainly affected covered almost the whole of central England roughly in a square with its 4 corners in mid-Wales, Lincs, Somerset, and Essex. Disastrous F. in the Anhwei and Kiangsu provs. in China, Aug.-Sept. 1950, destroyed or damaged almost 1 million houses and affected about 10 million people. 1954 was an abnormal year, when heavy storms caused extensive F. in Bavaria, Austria (Danube and tribs.), Italy, and Yugoslavia in summer; also in Great Britain and Ireland (R. Shannon, Dec.). F. in Persia, India, and China drowned thousands of people during July and Aug. 1954. Very severe F., which were considered the worst for 85 years, occurred in Uttar Pradesh, India, in July-Aug. 1955, leaving more than 5 million persons homeless; and in Sept. in the Indus valley, India, affecting about 45 million people. The state of Kentucky suffered one of the most devastating F. in history early in 1957. In June 1957, violent storms and F. caused heavy destruction in the Po valley (Italy), Val d'Isère (France), Austria, and Switzerland. 'Tidal waves,' occurring when high winds drive the waters of the sea on to the land at periods of high tides, are a less frequent cause of inundation. Notable F. of this nature occurred in the Netherlands in 1421, but the construction of more and more invulnerable dikes has made the country decreasingly subject to these disasters. Inundation by the sea may cause serious F. as in Bengal in 1876, when 200,000 lives were lost, and again in 1937, when 300,000 people were killed; and, more recently, in the Netherlands, Jan.-Feb. 1953, when N. Sea storms and tides flooded the S. of the country, killing about 2000 people and leaving 100,000 homeless. The West Indies, the Gulf Coast, the Middle Atlantic States, etc., are liable to inundation at the periods of tropical hurricanes. Earthquake shocks disturbing the sea may cause inundation of the adjoining land; the catastrophe in which Lisbon was destroyed in 1775 was of this nature. Devastating F. have been caused by the bursting of reservoirs; that of the Bradford reservoir, Sheffield (1864), is an instance. *See also* FENS. *See* C. E. Brooks and J. Glasspoole, *British Floods*, 1928; Institution of Civil Engineers, *Interim Report of the Committee on Floods in Relation to Reservoir Practice*, 1933; B. D. Richards, *Flood Estimation and Control* (2nd ed.), 1950; *The Battle of the Floods: Holland in Feb. 1953*, 1953.

Floorcloth, term applied to a number of materials used as substitutes for carpet. These include oilcloth, linoleum (q.v.), kamptulcon, corticine, cork carpet, etc. Oilcloth consists of coarse canvas (burlap) made of jute or flax, to which a coating of size and sev. coatings of thick oil paint are applied. It is then often ornamented with patterns. This hard and cold F. was partly superseded (1844) by kamptulcon, made of ground cork and

indiarubber; it was expensive and is now little used. Cork carpet is a F. now extensively employed; it is warmer than the others and deadens the sound of the footsteps. It is made of a preparation of ground cork and oxidised linseed oil reduced to a pulp and pressed in a machine; it has a canvas backing. There is more cork in this than in linoleum, which is, however, extremely popular. Rubber flooring is widely used either in sheet or tile form and is manufactured in every variety of marbled and plain colouring.

Floors. The F. referred to as 'ground floor,' 'first floor,' etc., in Britain are known as 'first floor,' 'second floor,' etc., respectively, in America.

F. are designed primarily to support the loads they are intended to carry; they should also be sufficiently resistant to the spread of fire and may need to provide sound and heat insulation. Solid F. on the ground may need to include membranes to stop rising ground moisture. *Suspended F.* span between walls or beams; in small buildings they may be of timber joists carrying boards; for greater strength and fire resistance, the beams may be of steel or reinforced concrete, with hollow clay blocks in between, or reinforced concrete slabs may be used. *See also* BUILDING.

Floquet, Charles Thomas (1828-96), Fr. statesman, b. St Jean Pied-de-Port. In 1876 he became a member of the chamber of deputies, of which he was president from 1885 to 1888, and prime minister in the latter year. In 1888 he wounded Boulanger in a duel, and in the next year resigned from his office. He was career
con-

Flora, Rom. goddess of the spring, of flowers, and of the 'flower of youth.' The *Floralia*, a theatrical festival in her honour, from 28 April to 3 May, was noted for licentiousness and unrestrained merriment.

Flora, term used to denote (1) all the plants that grow in a particular region, country, or locality; (2) all the plants of an epoch of time, such as the Miocene F.; (3) a book that describes plants so grouped.

Florac, Fr. tn, cap. of an arron., in the dept of Lozère, on the Tarnon. It has an anc. château and convent. Pop. 1500.

Floral Decoration, *see* FLOWER DECORATION.

Floralé (month of flowers), 8th month of the year in Fr. revolutionary calendar. *See* CALENDAR.

Florence (It. Firenze): 1. Prov. of Italy in N. Tuscany (q.v.). It is generally mountainous, with ranges of the N. Apennines (q.v.), but has a plain in the E. The broad and fertile valley of the R. Arno (q.v.) crosses the prov. SE.-NW. and then E.-W. Sheep are raised, and wine, fruit, flowers, olive-oil, and silk are produced. The prin. tns include F., Empoli, and Prato (qq.v.). Area 1497 sq. m.; pop. 942,000.

2. (ancient Florentia) It. city, cap. of the prov. of F., and chief pt. of Tuscany, 104 m. NNW. of Rome (q.v.). It is situated at the foot of the Fiesole (q.v.) hills, in the fertile valley of the Arno, on both banks of the riv. F. is well called *la città dei fiori* for flowers grow in luxuriance in its gardens and fields. The greater part of the city is on the N. bank of the riv. It has long since spread beyond the confines of its 2 circles of ancient walls (the inner circle c. 800; the outer circle medieval) of which only a few towers remain. There were modern extensions in 1865-71, when F. was the cap. of Italy, and there has been continuous growth since then. The city, with its riv., bridges, cupolas, market places and fine squares, its streets and encircling boulevards, is a marvellous sight, which is well seen from the *Piazzale Michelangelo*, the highest point of the *Viale dei Colli*, a magnificent promenade of modern construction in the hills to the S. The riv. is at present crossed by 8 bridges, some of them temporary erections taking the place of bridges destroyed by Ger. mines in 1944. The only bridge then to escape destruction was the picturesque Ponte Vecchio (1345), the oldest in F. This is lined with goldsmiths', silver-smiths', and jewellers' shops, and links the Palazzo Vecchio with the Palazzo Pitti. The bridge of Sta. Trinità has been rebuilt to its original plan, on which Michelangelo (q.v.) is said to have offered advice. The most remarkable building of F. is the archiepiscopal *duomo* (cathedral) of Santa Maria del Fiore. It was begun by Arnolfo di Cambio in 1296, and consecrated in 1436, when it was called 'del Fiore' (of the flower) either after the name of the city or in reference to the municipal arms, a red lily on a white ground. Its detached campanile was begun by Giotto (q.v.), and Brunelleschi (q.v.) designed its famous dome. In front of the *duomo* is the octagonal baptistery of San Giovanni, the old cathedral. Of its 3 splendid bronze doors 1 is the work of Andrea Pisano (q.v.), and the other 2, called by Michelangelo in admiration 'The Gates of Paradise', are the masterpiece of Ghiberti (q.v.). Other famous churches are: Santa Maria Novella (14th cent.); Santa Croce, the pantheon of F., with frescoes by Giotto; San Lorenzo, begun by Brunelleschi, near to which is the Medici Chapel (q.v.); Santa Maria del Carmine, containing frescoes by Masaccio (qq.v.); and San Marco, the convent of which has frescoes by Fra Angelico (q.v.) and was the home of Savonarola and Bartolommeo (qq.v.). The streets of F. are renowned for their splendid medieval and Renaissance palaces and mansions, once the residences of the Florentine nobles: the Palazzo Vecchio, the fn hall, with its superb tower (Torre di Arnolfo), has statues by Donatello (q.v.) and Michelangelo; the Palazzo Medici-Riccardi, was the home of the Medici (q.v.) until 1540; the Palazzo Pitti and the Palazzo degli Uffizi (the latter of which is the greatest art gallery in Italy) contain masterpieces by Raphael, Andrea del Sarto, Perugino,

Ghirlandajo, Botticelli, and the Lippi (qq.v.), amongst others. There are other rich collections of artistic and historical treasures, and there are 9 important libraries, of which the Biblioteca Nazionale (1747) contains 3,500,000 vols., and the univ. library contains 1,400,000 vols. The univ. (1391) is one of the first in Italy, and there are many trade and professional schools, and some important learned societies, such as the Accademia della Crusca (q.v.) for the study of the It. language, and the Società Danteale. The prin. industry is tourism, and there are manufs. of pottery, cigarettes, textiles, and jewellery. F. is a junction for trans-Appennine road and rail (F. Bologna, q.v.) traffic. Pop. (city) 313,400; (com.) 370,500.

History.—*Florentia*, an old Rom. colony, was rebuilt by Julius Caesar (q.v.) in 59 BC to protect the ford of the Arno. It rose to some importance under the Carolingians (q.v.) and was included in the Tuscan margravate. It was bequeathed to Pope Gregory VII by Matilda (q.v.) of Tuscany, and became, in consequence, a source of conflict between the popes and the emperors. F. stood for the papacy, but early began to develop a spirit of local patriotism and of freedom, and soon became bold and strong enough to close her gates against the Emperor Frederick I (q.v.). The Florentines were already great traders, and they now formed themselves into *arti* or trade guilds; in order to hold public office it was necessary to belong to one of these guilds. The citizens waged war against the feudal lords whose castles were in the neighbourhood, forcing them to become citizens and to live in F. for at least 3 months in the year. F. gradually threw off the rule of the emperors, and after the death of Frederick II (q.v.) was proclaimed a rep. In the 12th and 13th cents. it was involved in the struggles between the Guelphs and the Ghibellines (q.v.). F. was chiefly Guelph, and formed with other cities the 'Tuscan League', which fought against Pisa, Siena (qq.v.), and other Ghibelline tns. The rich burghers, with their guilds, now divested the nobles of power by the 'Ordinances of Justice'. The executive power, formerly residing in the *podestà* and captain of the people, was now transferred to the *priori* (8 members) and the *gonfaloniere* of justice. And now F. was torn by the feuds of the Neri and Bianchi ('blacks' and 'whites'), 2 factions born of the opposition of the nobles to the new constitution. Dante was one of the Priori, and was banished with the whites in 1302. In spite of the constant fighting entailed by these feuds, F. grew in splendour and prosperity—fine churches, palaces, and libraries were built, Florentine cloth merchants, jewellers, and goldsmiths visited all the foreign markets and estab. banks everywhere, about 400,000 gold florins were minted every year, and the city was a centre of art and letters. All this was made possible by the solidarity of the trade guilds. In 1348

decimated by plague, the Black Death, described by Boccaccio. From 1434 to 1537 the Medici held sway, and under them F. attained the summit of its magnificence. Cosimo, the first of the name, a princely merchant, was very popular, and rose to a position of great power. Lorenzo de' Medici, called the Magnificent, was the most famous and powerful of the family. They were sev. times banished for aiming at sovereign power, and were many times recalled. They patronised art and letters, and a school of painters came into being, represented by Cimabue, Leonardo, Giotto, the

troops reached the outskirts of the city on 4 Aug. 1944, and on the 11th the Allies took F. The great monuments, most of which lie N. of the R. Arno, escaped undamaged because, though the Germans held the N. bank, the Brit. troops deliberately abstained from firing upon them. No damage of any significance is attributable to Allied action. But to the historic tn of F. the damage was very heavy. On the N. bank the heart of the old city round the Ponte Vecchio, with all its associations, is gone. The bridge itself escaped serious damage, but the old houses on it suffered severely from blast,

FLORENCE: THE PONTE VECCHIO

W. F. Mansell

The bridges in the background were destroyed in 1944.

Lippis, Del Sarto, and others. F. was the centre of the Renaissance. But the succeeding members of the Medici family degenerated in character, and with them, to some extent, the Florentines. The work of Savonarola, who tried to reform the manners and morals of the citizens, and to re-establish a democratic gov. after the city had been delivered from the Medici, took place in the latter part of the 15th cent. He was abandoned by the people and burnt at the stake. F. ceased to be an independent rep. in 1532 to become the cap. of the grand-duchy of Tuscany. In 1808 Tuscany, and F. with it, was annexed to the Fr. Empire, and in 1865 the city became the cap. of the kingdom of Italy, and remained the cap. until 1871. F. was the bp. of Dante, Donatello, Ghiberti, Machiavelli, and Florence Nightingale (qq.v.).

In the Second World War South African

and most of the old houses on the S. bank were totally destroyed. As early as Mar. 1944 the Germans had made a photographic survey of the area they subsequently mined and ruined, including the narrow approaches. On the S. side of the riv. the whole of the Via de' Guicciardini, from the Pitti Palace to the riv., was destroyed, and the whole of the famous view looking up the riv. to the Ponte Vecchio, with the medieval houses reflected in the water, is lost for ever, together with 3 of the old Florentine towers, and the 16th Bagno dei Medici. Twelve palaces were either completely destroyed or ruined beyond repair, amongst them the Casa Macchiavelli and the Casa del Giambologna. The Casa del Torre de' Bardi collapsed, and with it the Columbaria library and its MSS., though half these latter and most of the ant. library were saved by the prompt action.

of the Allied Monuments, Fine Arts, and Archives officers. On the N. side of the riv. other old towers were destroyed, including the Torre degli Amidei, the best-preserved of all the Florentine towers. Among *palazzi* destroyed or damaged were the Accinotti, de Angelis, and Buondelmonte. A great loss was that of the old houses—the Piazza del Pesce, right up to the church of San Stefano, which itself was damaged, the Via Por Santa Maria, and with these have disappeared all the most characteristic remains of medieval F. By contrast the area which the Germans held against Allied attack was relatively immune, and, apart from the Columbaria, the libraries and archives did not suffer. From the galleries of F. all the more important pictures had been removed to places of safety outside the city limits. Of the villas round F. many suffered damage, but the most important fared best on the whole. See ITALIAN FRONT, SECOND WORLD WAR CAMPAIGNS ON; and H.M.S.O., *Works of Art in Italy, Losses and Survivals*, 1945, 1946.

3. City of Alabama, U.S.A., co. seat of Lauderdale co., situated on a plateau 200 ft above the Tennessee R., on its N. bank. Its industries are connected with lumber, coal, and iron-mining. Pop. 23,900.

4. Co. seat of F. co., South Carolina, U.S.A. Its industries include tobacco and cotton growing. It is a rail junction, a manufacturing, trade, and shipping centre, and has lumber-milling and printing, foundries and machine shops. Pop. 22,513.

Florence of Worcester (d. 1118), chronicler. Little is known of his life, except that he was a monk of Worcester. He wrote the *Chronicon ex Chronicis*, beginning with the creation and ending in 1117. John of Worcester continued the work up to 1141. The section of the work of value to the historian is that covering F.'s own life. It was trans. and ed. by B. Thorpe in 1848.

Florentia, see FLORENCE.

Flores, Juan José (1800–64), Sp.-Amer. soldier, b. Puerto Cabello, Venezuela. He became first president of Ecuador, and fought under Bolívar in the War of Independence. He was commander-in-chief in the campaign against Peru, and when Ecuador became independent (1830) he framed her constitution and was elected president.

Flores: 1. Is. of the Lesser Sundas,

Indonesia, situated between the F. sea (N.) and the Savu Sea (S.). Area c. 5850 sq. m. Volcanic and mountainous, rising to 8000 ft. Agric. products include rice and maize. Sandalwood and copra are exported. The chief tn and port is Ende. The Dutch connection began in 1618. Occupied by the Japanese in the Second World War, F. became part of Indonesia in 1950.

2. Is. of the Azores (q.v.).

3. Dept. of Uruguay. Its chief tn is Trinidad on the railway to Durazno and the main road to Montevideo. Sheep are reared; corn and wine are produced. Area 1744 sq. m.; pop. 38,100.

Florey, Sir Howard Walter (1898–), Australian pathologist, b. Adelaide, where he received his medical education and qualified in 1921. Awarded Ph.D., Cambridge, 1927. He was prof. of pathology at Sheffield Univ., 1931–5, and since then has occupied the chair of pathology at Oxford. His most im-

and by 1940 he was able with his colleagues to introduce penicillin as a valuable therapeutic agent. For this work he shared the Nobel prize with Sir Alexander Fleming and E. B. Chain (qq.v.) in 1945. He is the recipient of many other honours, including a knighthood in 1944. Pubs. include contributions to scientific journals on physiological and pathological subjects; *Antibiotics*, Florey and others, 1949; *Lectures on General Pathology*, ed. Florey, 1954.

Florian, Jean Pierre Claris de (1755–94), Fr. poet, novelist, and dramatist, b. château of F., near Sauve. His uncle, the marquis of F., introduced him to Voltaire, who greatly influenced his ideas on literature. He obtained a commission in a dragoon regiment, but at the beginning of the revolution he retired to Sceaux, where he was captured and imprisoned. He only lived a few months after his release. One of his first literary works was an eclogue entitled *Ruth*, crowned by the Fr. Academy in 1784. He wrote many poems and comedies; among them are *Le Bon Ménage*, *Le bon père*, *La bonne mère*; and novels of peasant life; also *Numa Pompilius*, and *Galatée*. In 1792 he wrote his famous *Fables*, and trans. *Don Quixote* into Fr. His style was sentimental, and his comedies are delicately expressed with a certain amount of charm and piquancy. He was elected to the Academy in 1788.

Florianopolis (formerly **Desterro**), city and seaport of Brazil, named after Marshal Floriano Peixoto, president of that country (1891–4). It is situated on the W. side of the is. of Santa Catarina off the coast of the state of Santa Catarina, of which it is the cap. Agriculture is the prin. industry and dairy produce is largely exported. The port affords good accommodation for smaller vessels. A suspension bridge, joining the city to the mainland, was completed in 1926. Pop. 52,000.

Florida (Land of Flowers), 'peninsula' or 'everglade' state, the most S. of the states of the U.S.A. It lies between the Atlantic and the Gulf of Mexico, and across the Straits of Florida from Cuba; it is bordered on the N. by Georgia and N.W. by Alabama. Its length is 400 m., its average width 95 m., and its area 58,560 sq. m., about 4298 of which are lake and riv. Its surface seldom rises more than 200 ft. above sea-level; the highest point, in Walton co., is 345 ft. Lakes, swamps, and savannah are common in the centre, while the S. is characterised by submerged sawgrass called everglades. F.'s largest lake, Lake Okeechobee (730 sq. m.), contributes a subterranean supply to the everglades. The prin. rivs. are the St Johns (285 m. long), St Marys, Withlacoochee, and Caloosahatchee. The climate of F. is so equable and healthy that the state has often been called the Amer. Riviera, and it has become a favourite health resort and winter playground. F.'s prin. source of income is tourism (one-third of the state's total income). The leading industries are those connected with agriculture (cereals, peanuts, potatoes, tomatoes, beans, tobacco, celery), and F. supplies 40 per cent of the truck crop of the South and 10 per cent of that of the U.S.A. Other important industries are lumber (yellow pine, cypress, red cedar, oak, and catalpa grow in abundance) and fruit-growing (oranges, pineapples, limes, grapefruit, and so on). A newer development is the growing of sugar-cane around the Lake Okeechobee dist. Between the truck and citrus areas are the chief cattle areas of the state, the Kissimmee Prairies, centred on Kissimmee and Arcadia. F. ranks second in beef cattle among states E. of the Mississippi. Wood manufs. are also important. F. ranks second in naval stores production, and leads the U.S.A. in cigar-making. F. also produces 50 per cent of the shrimp output and 95 per cent of the sponge output of the U.S.A. Commercial fishing at Apalachicola, Fernandina, Pensacola, St Augustine, Smyrna, Stuart, and in the F. Keys is important. F. produces 70 per cent of the U.S.A. phosphate output. Limestone, sand, and gravel are other products. The pop. is 2,771,305. The chief towns are Miami, 249,276; Jacksonville, 204,517; Tampa, 124,681; St Petersburg, 96,738; Orlando, 52,367; Pensacola, 43,479; West Palm Beach, 43,102; and Tallahassee (cap.), 27,237. Institutions of higher learning include the univ. of F. (Gainesville), univ. of Miami (Coral Gables), F. State Univ., and F. Agric. and Mechanical College (Tallahassee), Rollins College (Winter Park), F. Southern College (Lakeland), John B. Stetson Univ. (De Land), Barry College (Miami), the Bethune-Cookman College (Daytona Beach), and the univ. of Tampa. F. was discovered in 1512 by Ponce de León, was ceded by Spain to England in 1763, became an Amer. possession in 1821, a ter. of the U.S.A. in 1822, and was admitted to the Union in 1845. See C. H.

Brevard, *A History of Florida from the Treaty of 1763 to Our Own Times, 1924-5*; F. W. Dau, *Florida, Old and New, 1934*; and Kathryn T. Abbey, *Florida: Land of Change, 1941*.

Florida, dept of Uruguay, whose cap. of the same name (pop. 16,000) is c. 70 m. N. of Montevideo. Agriculture and dairying are the prin. occupations. Area 4670 sq. m.; pop. 107,000.

Florida Keys, bow-shaped chain of small is. and sand reefs (or keys) extending S.W. for 150 m. from Virginia Key. They parallel the E. coast of F. and enclose an inland waterway. The ports Fernandina, Jacksonville, and Key West (southernmost city in U.S.A.) are on the F. K. There are active sponge and commercial fishing industries.

Floridsdorf, see VIENNA.

Florin (Fr. *florin*, from It. *florino*, a florin, the word being derived from *florē*, a flower, because the coin bore a lily on the obverse), name first given to a gold coin struck in Florence in the 11th cent. It was called also a 'florencia' in Europe, and was much used in commerce, other countries issuing similar coins. In England Edward III ordered every pound of gold to be coined into 50 florences (value 6s. each); and the 'gulden' and 'guilders' of Germany and Holland came into being. Edward's florences were soon discontinued, but in 1849 Queen Victoria issued a silver F. (2s.), which became known as the 'goddess' or 'graceless' F., because the words *Dei Gratia* were omitted; this omission was rectified in 1852. The double F. of 1887 was discontinued in 1890.

Florina (Filurina), dept of Gk Macedonia. Pop. 69,400. Cap. F. (12,300).

Florio, John (c. 1553-1625), author and translator, b. London, son of It. Protestants who had taken refuge there. He became a prof. of languages at Oxford, and in 1603 was appointed to read Italian with Queen Anne, being made groom of the chamber in the following year. He also taught Prince Henry, son of James I. He is best known by his trans. of Montaigne's essays, 1603, in stately if somewhat stiff Elizabethan Eng. Among his other works are *Florio his firste fruites which yielde familiar speech, merie proverbes, wittie sentences and golden sayings, also a perfect Introduction to the Italian and English Tongues*, 1578, and *A Worlde of Wordes or most Copious and Exact Dictionarie in Italian and English*, 1598. See F. A. Yates, *John Florio*, 1934.

Floris, Frans (1516-70), Flem. painter whose real name was de Vriendt, b. Antwerp. He began as a sculptor under his father, and later went to Liège, where he studied painting under Lambert Lombard. He then visited Italy, and while in Rome studied the work of Michelangelo (q.v.), which left evident traces on his style. In 1540 he opened a school of painting in Antwerp. Among his best works are: 'The Last Judgment' (in Brussels); 'The Fall of rebellious Angels' (in Antwerp). His brother Cornelis (1514-75) was an architect and sculptor, whose chief work was the tn hall at Antwerp.

Florists' Flowers, *see* FLOWERS, FLOWERS'.

Florus, Lucius Annaeus (A. C. AD 150), Rom. historian, author of *Bellorum Romanorum Libri II*. This work, which is based principally on Livy, traces the rise and eclipse of Rom. military power down to the reign of Augustus. There is an ed. with trans. by E. M. Forster (Loeb Library, 1929).

Flory (in heraldry), *see* FLEURY.

Flotation, study of the conditions under which bodies float. If the weight of a body be greater than the weight of the fluid displaced, the body will tend to sink; if the weight of the body be equal to that of the displaced fluid, it will rest anywhere in the fluid; if the weight of the fluid displaced be greater than the weight of the body, the body will be forced upwards to the surface, so that it floats partly immersed. As the pressure upwards upon a floating body must be equal to the pressure downwards due to the weight of the body, it follows that the weight of the fluid displaced is equal to the total weight of the body. It also follows that the pressure upwards shall act in the same straight line as the pressure downwards, so that the centre of gravity of a floating body is in the same vertical line as the centre of buoyancy, or the centre of gravity of the displaced fluid. If the body be slightly displaced, the moment of the 2 forces tends to restore it to its original position or tends to overturn it. Hence the necessity for keeping the centre of gravity of a ship as low as possible, because the higher it is the greater is the danger of its being above the metacentre (q.v.). A certain amount of displacement is inevitable, and if the centre of gravity be raised by heavy deck loads there is risk of capsizing, while the lowering of the centre of gravity by ballasting tends to ensure stability. *See* HYDROMETER and SPECIFIC GRAVITY for the use of F. in the determination of sp. gr. *See* *Extraction Metallurgy* under METALLURGY for F. as used in the treatment of ores. *See* also HYDROSTATICS; ARCHIMEDES PRINCIPLE.

Flotow, Friedrich, Baron von (1812-83), Ger. composer, b. Teutendorf in Mecklenburg. His first great success was *Le Naufrage de la Méduse*, an opera produced in Paris (1839), and he wrote sev. other Fr. operas before he made his greatest success with the Ger. *Alessandro Stradella*, in 1844, and *Martha*, in 1847. None of his 15 later operas achieved the same popularity, although the fact that they were in German, Fr., Italian, and Russian shows that he was widely famous in his time. The characteristics of his works are liveness and grace, combined with pleasing melodies.

Flotsam, Jetsam, and Ligan, names given in Eng. law to goods lost at sea as distinguished from *wreck* or goods which come to land. *Flotsam* 'is where goods continue swimming on the surface of the waves' (Blackstone). *Jetsam* or *jettison* connotes goods cast into the sea which remain under water; *ligan* are goods which are attached to a cork or buoy in order

that they may be found again. F., J., and L. are adjudged to the Crown if no owner appears within a year and a day, while *wreck* belongs to the Crown in any case.

Flounder, or *Pleuronectes fleus*, flat fish (q.v.). It is common to the N. temperate and Arctic seas of both hemispheres, and is almost as much an estuarine fish as a sea fish. The F. rarely exceeds a length of 12 in., or a weight of 1½ lb., but those caught in America are larger and heavier. Nearly all F.s are excellent eating.

Flour (the word is a variant of *flower*), in general language the powdered grain of wheat. When the word is used to denote the powdered grain of other cereals, a qualifying term is added—rye F., barley F., etc. Wheat F. is used for making bread in preference to the F. of other grains, not on account of any superiority in its nutritive properties, but because of the presence in it of a special gluten, a highly tenacious, sticky substance which enables the dough to retain the carbonic acid gas introduced into it in the form of yeast or baking powder. This makes the bread light and spongy. Dough made with the F. of other grains is granular, and this allows the gas to escape. The following comparison shows that in essential nutritive constituents other grains equal or surpass wheat:

	Protein	Sugar, starch, etc.
Wheat . . .	11.9	71.9
Oats . . .	11.8	59.7
Barley . . .	12.4	69.8

The best bread-making wheat in commerce comes from the prairie provs. of Canada. Great Britain imports F. from Canada and, to a lesser extent, from Australia, the total amounts approximating to 6-10 per cent of the total consumption.

The main types of F. produced commercially are bread F., biscuit F., and household F. (including self-raising F.), each type possessing its own characteristics and baking qualities; normally each separate type is produced from a mixture of wheats specially blended by the miller for that purpose.

Bread F. comprises sev. categories: 'patent' F. is fine white F. of high quality milled at a low extraction rate; 'standard' F. is white F. milled at an extraction rate of approximately 70 per cent; 'brown' or 'wheatmeal' F. is F. produced at an extraction rate of 80-95 per cent and from which the coarsest fragments of the bran have been excluded. 'Wholemeal' or 'wholewheat' F. signifies F. of an extraction rate of 95-100 per cent; the latter term more strictly defines F., comprising the wholewheat from which nothing has been extracted during the milling process.

Flour-milling. Ancient method.—More than 6000 years ago people ceased to eat grain in its wild state and began to break it up with a rude kind of pestle and mortar. Later a primitive hand mill came into use. This consisted of 2 stones with roughened

surfaces between which the grain was ground. The next mill evolved was the *quern*, formed of 2 circular stones, the upper revolving on the lower, to which it was attached by a metal or wooden pin. The corn was introduced between the stones by means of a funnel in the upper stone which had also a small hole near its edge into which a stick was inserted to serve as a handle. The quern is still used by semi-civilised peoples, and in remote parts of Ireland, the Hebrides, and the Shetlands. Down to 1874 the grindstone remained the basis of the flour-mill, but the 'power' was supplied by animal labour, by wind, and by water. Grindstones are still used here and there, for certain types of flour, in the smaller mills. They are made of *buhr*, a very hard silicate. They are from 4 to 6 ft in diameter, and their surfaces are grooved or furrowed from centre to circumference. The 'hopper' supplies the grain through the centre of the upper stone; the wheat is pushed along the grooves and broken upon the ridges.

Modern method.—In modern F. chilled iron rollers have taken the place of grindstones. The first successful steam mill was erected in London in 1784, and iron rollers were first used in 1840, following their introduction in Budapest. Hungary became the world centre for F. on account of this improvement. Minneapolis soon adopted it, becoming the most important F. centre in the world; she remains one of the most important centres to-day. From 1880 the system of roller-milling has been in operation in all large mills. As a source of motive power, steam has largely been replaced by electricity.

The first operation consists in breaking open the grain to expose the contents attached to the outer skin (bran). That this may be successfully done, that is, without particles of bran becoming incorporated with the flour, the grain is 'tempered' (damped) after being thoroughly cleaned in a series of cleaning and sieving operations. Then it is passed through sev. pairs of fluted rollers, each pair having finer flutes than the last as well as a different angle of fluting and a different rate of movement. Two products mainly result: bran, and 'middlings' or 'semolina'; a certain amount of flour is also unavoidably made at this stage and this is blended with the final flour. Next the semolina is 'purified,' i.e. the finer and coarser particles are separated, and any 'offal' or extraneous particles of tissue and fibre carried off by means of air currents. Flour-making proper is the object of the next operation. The semolina is passed through various pairs of smooth reduction rollers and 'flour' results. The flour is further treated in a 'dresser,' or revolving cylinder covered with fine Swiss silk, so as to remove any minute fragments of bran still present. The product alone which is able to pass through the meshes (12,100 to the sq. in.) is accepted as flour. The by-products of F., namely the bran and offals, are widely used by farmers for animal feeding stuffs

in the production of milk, bacon, and eggs. See R. Bennett and J. Elton, *History of Corn Milling*, 1898.

Flourens, Marie Jean Pierre (1794–1867), Fr. physiologist, b. Maureilhac, Hérault. He began his career by assisting Cuvier in 1828, and later received an appointment at the Jardin du Roi. He afterwards held a professorship at the Collège de France, became perpetual secretary of the Académie des Sciences, and in 1840 a member of the Fr. Academy. He made important discoveries relating parts of the brain and the body functions controlled by them. F. showed that the cerebrum is the organ of thought and the cerebellum the organ controlling co-ordination of body movements and will-power. He was first to show that chloroform had an anaesthetic value similar to ether. F. wrote many books on physiology, among them *Recherches expérimentales sur les propriétés et les fonctions du système nerveux, dans les animaux vertébrés*, 1824.

Flourish, literally a fanfare (q.v.), or, in Shakespeare's Eng., a tucket or sennet, but in modern musical terminology a short figure used as an embellishment rather than as a theme.

Flower, Robin Ernest William (1881–1946), scholar and poet, b. Meanwood, Yorks. Educ. at Leeds Grammar School and Oxford, he joined the staff of the Brit. Museum in 1906, and from 1929 to 1944 was deputy keeper of manuscripts there. He learned Irish, became an authority on Gaelic literature, and was appointed honorary lecturer in Celtic at Univ. College, London. He also at different times held lecturing appointments with the Brit. Academy, the Royal Society of Literature, and various Amer. univs. His vols. of verse include *Eire*, 1910, *Hymeneae*, 1918, *Monkey Music*, 1925, *The Pilgrim's Way*, 1927, *Poems and Translations*, 1931, and *The Western Island*, 1944. He also trans. Tomás O'Crohan's *The Islandman*, 1929, from the Irish.

Flower, Sir William Henry (1831–89), anatomist and zoologist, b. Stratford-on-Avon. He held the curatorship of the Hunterian Museum of the Royal College of Surgeons in 1861; and, in 1884, the directorship of the Brit. Museum of Natural Hist. He wrote *An Introduction to the Osteology of the Mammalia*, 1870, *Fashion in Deformity as illustrated in the Customs of Barbarous and Civilised Races*, 1881, *The Horse*, 1891, and *Essays on Museums and other subjects connected with Natural History*, 1898. Knighted 1892.

Flower, shoot bearing a number of leaves modified for the purpose of reproduction. A typical F. consists of 4 distinct parts; the gynoecium or pistil of carpels, the androecium of stamens, the corolla of petals, and the calyx of sepals, but there are many and varied modifications from this type. The pistil and the stamens are the essential organs of a plant, because seeds cannot be formed if these are absent. When sepals and petals are indistinguishable from one

another, as in daffodil and many monocotyledons, etc., a perianth occurs. In dicotyledons the calyx, when present, is usually green as in primrose, and of a protective nature, but it may be yellow as in marsh marigold, or blue as in larkspur. The corolla is usually brightly coloured, or white; sometimes it is absent altogether, as in *Thalictrum*, the rue. A typical stamen consists of a stalk, or filament, bearing a terminal anther which contains the pollen. The pollen is the male element in the sexual process. The pistil is the female organ and consists usually of 3 parts, the ovary or seed bag, made up of carpels, above which is a shaft-like tube, the style, at the apex of which is the stigma, the receptive organ

DIAGRAMMATIC REPRESENTATION OF THE STRUCTURE OF A FLOWER

AX, axis; R, receptacle; S, sepal; P, petal; ST, stamen; AN, anther; OV, ovary; STG, stigma.

for the pollen grains. A F. is said to be complete when both calyx and corolla are present; it is incomplete if one or both of these envelopes are absent. If both stamens and pistil occur together, the F. is said to be perfect or hermaphrodite; it is imperfect or unisexual when only one class of essential organs is present, and the F.s are then either staminate (male) or pistillate (female). Where the floral leaves in each whorl are similar in size and shape, the F. can be divided symmetrically in sev. directions, and is said to be regular, as in buttercups; otherwise it is irregular, as in peas, orchids, etc. Much of the classification of plants is based upon the characters of the F., thus dicotyledons are subdivided into polypetalae and gamopetalae. The F.s of the former have petals free from one another, as in buttercup; those of the latter have their petals joined to one another, so forming a tube, cylinder, etc., as in primrose. In dicotyledonous plants the parts of the F. are usually in fours or fives of their multiples; thus a primrose has 5 sepals, 5 petals, 5 stamens, and a pistil made up of 5 carpels;

members of the pink genus (*Dianthus*) usually have 10 stamens. Monocotyledons, on the other hand, have their parts in threes or multiples; thus in the lily there are 6 perianth leaves, 6 stamens, and 3 carpels. Mention must be made of the receptacle, a very important structure in the classification of flowering plants, as upon it depends the insertion, as it is called, of the floral leaves. Thus if sepals, petals, stamens, and carpels spring one beneath the other from a more or less conical receptacle, such as occurs in the buttercup, the F. is said to be hypogynous and the ovary is superior. It is perigynous when the stamens spring from the same level as the ovary, as in rose, blackberry, etc.; and it is epigynous when the petals and stamens are inserted above the ovary, as in the lily, and members of Umbelliferae and others; in this case the ovary is said to be inferior.

For a F. to produce seed, fertilisation by pollination is necessary. Pollination is the depositing of pollen on the stigma of the pistil, and there are many devices in plants to effect this end. The 2 chief ways are by the agency of insects, and sometimes by birds, and by wind. Insect-pollinated or entomophilous plants attract either by their colour or smell or both, and the insect visits the F. for pollen or honey, incidentally causing the pollen of one F. to fall or brush on the stigma of another. The ways in which certain F.s are specially adapted for visits from certain insects, and the relative positions of stamens and pistil so as to be used to the best advantage, is a subject in itself. F.s which open in the evening are usually of a pale colour and have a strong smell—they are pollinated by moths and evening insects. Wind-pollinated or anemophilous plants often bloom before the leaves are developed, their F.s are usually inconspicuous, they produce no honey, they have no smell, and pollen is produced in large quantities; grasses and many trees belong to this type. Experiment has shown that cross-fertilisation, i.e. when the pollen of one F. unites with the ovules of another F., whether on the same or on a different plant (but always of the same genus), is more beneficial than self-fertilisation, but often if cross-pollination does not take place, the plant becomes self-pollinated. In some cases, however, self-pollination is impossible, for various reasons: (1) The anthers and stigma are in such relative positions to one another that pollen cannot possibly reach the stigma of the same F., e.g. aristochloa. (2) The stigma and anthers of the same F. mature at different times; F.s in which this occurs are either protandrous, when the anthers are first developed and have already shed their pollen when the stigma of the same F. is capable of receiving it; or they are protogynous, when the stigma is withered before the pollen is shed; this is the more uncommon of the 2 forms, but occurs in arum and in the figwort, etc. Most composites, campanulas, etc., are protandrous. (3) When the F.s are unisexual, as in willow, etc. When pollination

has once been effected, the pollen grain germinates on the stigma and sends out a tube which forces it way down the style until it reaches the micropyle of an ovule. The contents of the pollen grain then travel down the tube and fuse with the contents of the ovule. This act of fusion is fertilisation, the most direct result of which is the development of the embryo, and the conversion of ovule into seed. See also BOTANY. See K. T. Hinkson and F. Maitland, *A Book of Flowers*, 1909; W. O. James and A. R. Clapham, *Biology of Flowers*, 1935; W. J. Stokoe, *Observer's Book of British Wild Flowers*, 1937; and M. Hadfield, *Everyman's Wild Flowers and Trees*, 1938; M. C. Carey and Dorothy Fitchew, *Wild Flowers at a Glance*, 1949.

Flower Decoration. The arrangement of F.s for interior adornment has achieved a high degree of popularity at the present time. This may be due in part to the diminution of numbers of individual craftsmen and an era of mass production coinciding with the ever-growing consciousness of the importance of the décor of the home. In this unlearned era it is a means of self-expression involving less time than the more recognised arts. Personality and individual tastes can be expressed through the medium of F.s, and a high degree of beauty is to be achieved by the considered use of simple materials.

While the tradition of gardening in England is an old one, the arrangement of F.s in vases is less so. It is interesting, however, to find that there are pictures that indicate that F.s were arranged in vases even as early as the middle of the 16th cent.; there is, for example, a painting of the family of Sir Thomas More by Holbein around 1530, showing charming vases of F.s. Appreciation of their beauty and scent caused them to be used over the centuries in a different way: one reads of them being strewn on floors, tables, and beds, to give a fleeting pleasure. Eng. D. is influenced naturally by background lavishness of material and climate, while the richness and gaiety shown in the F. paintings of the early Dutch, Flem., and Fr. artists have certainly contributed to our tradition.

The Oriental tradition of F. arrangement is an ancient inheritance and seems to be closely linked with the philosophy of the country from which it derives. That of China is extremely ancient and reflects in its gentle, almost casual, nature some of the qualities of the people. Jap. F. arrangement derived from the Chinese goes back over a thousand years and again is influenced by racial characteristics, showing a precise, stylised, and, perhaps, more self-conscious art, an art designed in its earlier times for the temple rather than the home.

It would seem probable that the best and most suitable D.s with F.s are achieved when the characteristics of a race are allowed full sway, and a too rigid attempt to copy faithfully the truly beautiful Oriental work could lead to a form of adornment not entirely sym-

pathetic to the Eng. home. Nevertheless there is much to learn from illustrations of the Oriental art, of line and of management of mass. The prevalent interest, the study of the work of other countries through pictures, books, and exhibitions has brought about increased understanding of the whole subject, and in particular of the suitable treatment, care, and use of a great range of decorative material. In Victorian days F.s were not so freely to be bought in the cities as they are now. Those who possessed greenhouses and gardens used their F.s somewhat conventionally, while from the cottage gardens came the precise, formal bunches which we think of in connection with that age. There are also the more romantic associations of moss roses and forget-me-nots, lily of the valley, and white roses, and such like. During the Edwardian era F.s began to be more freely used both as to quantity and method of arrangement, although stereotyped ideas still prevailed.

Now, with wider horizons, the palette of the painter of F.s is greatly extended and all kinds of materials come under review. With this new consciousness there is consideration now for the suitability of vases in relation to F. and to background and no longer are we satisfied with a range of restricted, conventional vases. From sculptured containers of stone, marble, lead, and bronze such as are depicted in the grander paintings, through delicate china and domestic objects both rich and homely, our choice is now made. F.s are chosen to emphasize some special quality of the room which they are to adorn; they may be used to reflect the colour of pictures or hangings, to emphasize dignity or homely simplicity. Increased appreciation of F.s in D. has led to a study of their care; they die as a result of transpiration and all that is possible to do to enable them to withstand the dry air of living rooms is now borne in mind. A preliminary sojourn for hrs in deep water, the crushing or splitting of stem tips, the removal of superfluous growth, leaves, for example, that will come below the waterline of the vase, the reduction of over-heavy foliage, the reviving powers of warm water, all are discussed in current textbooks. In these are also to be found advice concerning the mechanics of F. arrangement, the means whereby F.s, leaves, heavy branches of berries and fruit may be held securely in place, the range of possible material, and the preservation of seed heads and F.s for winter use. See Constance Spry, *Floral Decoration*, 1953, and *How to Do the Flowers*, 1954, etc.; Julia S. Berrall, *A History of Flower Arrangement*, 1953.

Flower-de-luce, see FLEUR-DE-LIS; IRIS.
Flower Gardens have from earliest times been cultivated for pleasure and profit. Especially in the E., where the confinement of a building is so oppressive, we have records of G. of surpassing beauty. The first mention of them is the description of Solomon's G., which were, however, overshadowed by the hanging G. of

Babylon, one of the seven wonders of the world. They were irrigated by water from the Euphrates, and contained a wonderful variety of effects. Persian G. supplied the type which the Gk. gardeners followed. Coming to comparatively modern G., the Fr. style is one of characteristic elegance. Le Nôtre (q.v.) obtained fame in the reign of Louis XIV by laying out the G. of Versailles. In 1742 Richard, Viscount Ranelagh, threw open the fine G. which he had built to his mansion at Ranelagh, and they remained a favourite public resort till 1803. In 1861 Vauxhall G. also became famous. Landscape gardening reaches a state of highest perfection in Japan, where they attain the most successful results by following a picturesque irregularity. F. G. have always been a source of pleasure to Eng. people. Bacon's essay 'Of Gardens' is a fine description of one of the Elizabethan period. As in other things, garden flowers have their period of popularity and change for newer varieties, and the foxglove, lavender, marigold, lobelia, calceolaria, and pansy are superseded by geranium, hyacinth, tulip, and chrysanthemum. See also GARDEN ART.

See T. Hammer, *The Garden Book*, 1659; F. Watson, *Flowers and Gardens*, 1901; E. S. Rohde, *Scented Garden*, 1931, and *Gardens of Delight*, 1934; M. Hadfield (ed.), *The Gardener's Companion*, 1936; and S. B. Whitehead, *In Your Flower Garden*, 1948.

Flower Painting. In Europe figure-P. has always been the form of art most studied, nature study being a late development. F.s., although used often in a conventionalised form to decorate illuminated MSS. (see ILLUMINATION or MSS.), did not themselves form the subject of pictures in the earlier centuries of the Christian era. In the 17th and 18th cents. the Dutch and Flem. painters developed the art of F. P. to a high degree. Jan Brueghel (1568-1625), the subject painter, exquisitely reproduced living F.s. Frans Snyder (1579-1657) frequently collaborated with Rubens by supplying the still life in the master's paintings. Very delicate in his treatment of blossoms was Jan Davidz de Heem (1606-83), whose son Cornelius inherited his father's gift to a lesser degree. Daniel Seghers (1590-1661) was a noted painter of F.s., refusing to blend his subject with any other forms of still life; others are Willem van Aelst (1626-79), and Jan van Huysum (1682-1749). Among the Fr. artists F. P. became an important study in the 19th cent. Henri Fantin-Latour (1836-1904) was a master of this delicate art. From the time of the Impressionists, however, it has tended to become a study of light or colour rather than botanical form, as in 'A Vase of Roses' by Edouard Manet (1832-83), 'Nymphéas' by Claude Monet (1840-1926), or 'Sunflowers' by Vincent van Gogh (1853-90). In the E. it has been a cult for many centuries. 'Before a masterpiece of Fantin-Latour we feel that the flowers have been taken

from a field or garden to be grouped before us, a feast for the eye,' says Laurence Binyon in *Painting in the Far East*, 'but the Chinese artist brings us to the flower, that we may contemplate it and take from it into our souls something of the beauty of life which neither sows nor spins.' The plum blossom and lotus F. provided a sufficient theme for the Oriental artists without need of human figures, and among the most famous F. painters of the Sung period are Hsu Hsi (10th cent.), Chao Ch'ang (11th cent.), and Li Ti (12th cent.). See CHINA, *Chinese Art*. See E. Haig, *Floral Symbolism of the Great Masters*, 1916; T. W. Karp, *Flower Painting*, 1928; and I. Nishikawa, *Floral Art in Japan*, 1936.

Flower Shows were first sponsored by the Royal Horticultural Society of London, which was founded by Thomas Andrew Knight in 1804 and received its first charter in 1809. The object of the society is to encourage and promote the cultivation of plants, F.s., fruits, and vegetables, and to provide horticultural instruction, education, and scientific demonstration. To this end the society has experimental gardens, formerly at Chiswick, now at Wisley, Surrey, and sponsors practical demonstrations and S. throughout the year. The most important F. S. held in London are the Chelsea Flower Show, held in spring each year, and the Great Autumn Show, held in Sept. In addition, fortnightly S. are held throughout the year, in the R.H.S. New Hall, Greycoat Street, or the Old Hall, Vincent Square, London, S.W.1, of F.s., fruits, vegetables, shrubs, and trees appropriate to the season. Under the auspices of their societies, special F. S. are also held during the year: Brit. Iris Society's Show in June; National Rose Society's Show, late June; Brit. Delphinium Society's Show, early July; National Sweet Pea Society's Show, July; Brit. National Carnation Society's Show, July; Brit. Gladiolus Society's Show, early Aug.; National Dahlia Society's Show, Sept.; National Rose Society's Show, mid-Sept.; National Chrysanthemum Society's Show, late Sept. and Nov.; and S. are held under the Alpine Society, the Geranium Society, the Cactus and Succulent Society, etc. Important prov. F. S. are held at Birmingham, Shrewsbury, Southport, Harrogate, etc., while most towns and vills. throughout Britain sponsor local F. S. in summer. F. S. are promoted in many cities by certain newspapers. In Scotland, the Royal Caledonian Horticultural Society, founded in 1809, holds April and Sept. F. S. in Edinburgh. See HORTICULTURAL SOCIETIES. See *Royal Horticultural Society's Gardener's Pocket Diary and Note Book* (ann.).

Flower Wines, see WINES, HOME-MADE.

Flowering Ferns, see OSMUNDA.

Flowering Plants, see GARDENING.

Flowers, in chem., substances which are sublimated as the result of physical or chemical action. The chief are F. of sulphur, the fine powder which is obtained

when crude sulphur is heated to vaporisation and condensed in a cooling chamber; F. of phosphorus, a flocculent powder consisting of phosphorus pentoxide, formed when phosphorus is burned in excess of air or oxygen; F. of tin (*flores stanni*), a mixture of powdered metal and stannic oxide formed by fusing the metal in excess of air; F. of zinc, antimony, arsenic, etc.

Flowers, Artificial, imitations of natural F. used for various purposes of ornamentation, including millinery, dresses, and decorations in the house. The Fr. make most of these A. F., though some are made in England and other countries. The materials most commonly employed are sarcenet, cambric, velvet, gauze, threads, and wire, and in some cases paper. The petals and sepals are first stamped out and then gauffered, the same process being pursued with regard to the leaves, which are made of green taffeta, the stems being made of wire. The F. made for tombs are of pottery or enamelled iron, and sometimes of wax. The Chinese make A. F. from rice-paper, and in the Bahama Is. they are made of shells. Plastics are also used for this purpose.

Flowers, Florists', are plants with horticultural varieties, whose parent species are unknown or not cultivated, as the dahlia or gladiolus. Dahlias have only been introduced into England in comparatively modern times, but their beautiful colours, and the fact that they are easily grown and require no especially rich soil, has made them very popular. *Gladiolus*, a genus of the order Iridaceae, bears brilliant F., blossoming in mid-summer. In America F. F. is the term applied to any F. raised to be cut for ornamental purposes, as rose, carnation, violet. They are brought to a high state of perfection and elaborate establs. are maintained for their rearing, transportation, and disposal, giving employment to thousands of people, the increase of wealth in the cities being responsible for their demand.

Flowers, Language of. F. have been used from remote times as symbols of specific ideas and sentiments; their use as a sort of sign L., adopted in the E. and well known to the anc. Greeks and Romans, was revived in medieval Europe during the age of chivalry. In modern times many F. have a significance which is universally accepted; the rose is the emblem of beauty or love, the lily of purity, the violet of modesty, the daisy of innocence. But the L. of F. even extends to definite messages. Thus the gift of a garden daisy means 'I share your sentiments'; a Michaelmas daisy means 'Farewell'; peach blossom, 'I am your captive.' Meanings may also be varied with a single flower; a rosebud having its leaves, but with thorns removed, conveys the message 'I fear but I hope'; if the leaves also are removed it means 'There is everything to fear'; while a full-blown rose placed over 2 buds signifies secrecy. See John Ingram, *Flora Symbolica*, 1875; *The Language of*

Flowers, an Alphabet of Floral Emblems, 1875; *The Language of Flowers*, 1902.

Flowery, see FLEURY.

Fludd (Flud, or Flaid), Robert (1574-1637), physician, Rosicrucian (q.v.), and mystic philosopher, of Kent. He entered St John's College, Oxford, 1591, then spent 5 years studying on the Continent, taking his medical degree at Oxford, 1605. He was a follower of Paracelsus, and tried to form a philosophic system based on his teachings. F. was author of many obscure Lat. works, theosophical, philosophical, and mathematical. His works include: *Apologia Compendiaria Fraternalitatem de Rosea Cruce Affuens*, 1616, *Veritatis Proscenium* (a reply to Kepler), 1621, *Philosophia Sacra et Vere Christiana*, 1629, *Summum Bonorum* (reply to Mersenne), 1629, *Dr Fludd's Answer unto M. Foster* . . ., 1631, *Integrum Morborum Mysterium*, 1631, *Clavis Philosophiae et Alchymiae Flussianae*, 1633, and *Philosophia Moysaica*, 1638 (Eng. ed.), 1659. See J. Webster, *Displaying of Supposed Witchcraft*, 1677; A. Waite, *The Real History of the Rosicrucians*, 1887; J. B. Craven, *Doctor Robert Fludd, the English Rosicrucian*, 1902; and D. Saurat, *Milton et le matérialisme chrétien en Angleterre*, 2nd ed., 1944.

Flügel, Otto (1842-1921), Ger. philosopher, b. Lutzen, son of the burgo-master. Pastor at Wansleben, 1871. Co-editor, *Zeitschrift für exacte Philosophie*, from 1873; of *Zeitschrift für Philosophie und Pädagogik*, from 1894. After Kehrnbach's death F. took over the editorship of Herbart's works. His own writings include *Materialismus*, 1865, *Die Bedeutung der Metaphysik Herbarts*, 1902, and *Herbarts Leben und Lehre*, 1907.

Fluid, name given generally to substances devoid of rigidity. Gases and liquids (qq.v.) are included in the term, since these bodies offer no sensible resistance to change of form, though they resist compression. Thus when a F. is acted upon by any distorting combination of forces it *flows*, so long as the rate of shear is not too great. Hydrodynamics is the name of the branch of applied mathematics which deals with the motion and equilibrium of F.s. The word F. is figuratively applied to things which are not in reality such. For example, we speak of electric F. in the sense of electricity, whose general properties and motions are known to conform to certain differential equations which the motions and properties of true F.s strongly suggest. Nowadays, however, most scientists avoid this figurative use of the word as far as possible, for it dates from the time when electricity, magnetism, etc., were actually believed to be due to F.s, which were supposed to have a real objective existence. All F.s are elastic, but liquids are highly incompressible, whereas gases can be easily compressed. There is more or less frictional resistance to the molecular motions in every F. It is somewhat difficult to draw a sharp distinction between the solid and the liquid state. Some substances, when exposed to long

continued gentle stress, flow like visco-liquids, whereas they would splinter if subjected to sudden intense stress.

Fluid Measure, *see* METROLOGY.

Fluke, *see* LIVER-FLUKE; TREMATODES.

Fluoboric Acid Gas, pungent, soluble gas obtained by heating a mixture of boron trioxide and fluorspar with concentrated sulphuric acid. It does not attack glass, but has a great affinity for water and rapidly chars many organic substances. It combines readily with ammonia gas, forming various compounds according to the relative proportions of the 2 gases.

Fluorescein ($C_{20}H_{12}O_6$), i.e.

a chemical product or dye obtained by heating phthalic anhydride with resorcin at 200° till the mass becomes viscid. It is a reddish or yellow-brown powder, dissolving in water or an alkali to form a solution with a beautiful green fluorescence. It is little used itself for dyeing purposes, as the colours are not fast, but eosins are derived from it, and rival safflower and saffronin for rose-red dyes. *See* DYE; PHTHALIC ACID.

Fluorescence, optical property possessed by certain substances whereby light of one colour is absorbed and light of another colour is emitted. The word is also used to describe the emission of light from a substance as a result of the excitation of that substance by X-rays or electrons. It is usual to limit the term F. to the emission of light within 10^{-8} sec. of the absorption of the incident energy. For longer periods of delay the process is termed *phosphorescence* (q.v.). When light falls on sulphate of quinine, for example, the liquid exhibits a bluish colour, which is continued some distance below the surface. The light which passes through the liquid is incapable of producing the same effect on another quantity of the substance, so that it appears that light of certain qualities, i.e. frequencies, has been absorbed to produce the F. The phenomenon was first described by Sir D. Brewster in 1833, was investigated by Sir John Herschel, and later by Sir G. G. Stokes. If a beam of sunlight is focused on a solution of quinine sulphate by means of a lens of long focus, a blue cone of light is formed and can be plainly followed by the eye through the liquid, though the intensity of the light rapidly diminishes as it recedes from the surface. In order to discover what rays are responsible for the blue light, a test-tube containing quinine sulphate may be passed through the different parts of the spectrum. No change is observed when the tube is held in the red, orange, and yellow, that is, in the less refrangible rays, but as it approaches the violet, rays of a blue colour proceed, and this continues beyond the visible spectrum into the ultra-violet rays. The general effect then is that light waves of short-wave length are absorbed and waves of longer wave length are emitted. On the quantum theory

(q.v.) this would be expressed as the absorption of a quantum of a certain energy and the emission of one of lower energy. Among fluorescent substances may be mentioned fluorspar, chlorophyll, aesculin, uranium glass, tincture of turmeric, paraffin oil, barium platino-cyanide, magnesium platino-cyanide, fluorescein, and various sulphides. The phenomenon of F. is now put to use in electric discharge lamps. The electric current in the discharge tube produces ultra-violet radiation and when this falls on a coating of a fluorescent material deposited on the wall of the tube light of the visible spectrum is emitted. *See* LUMINESCENCE; PHOSPHORESCENCE. *See* Sir G. G. Stokes, *Mathematical and Physical Papers* (vols. iii and iv), 1880-1905; J. A. Radley and J. Grant, *Fluorescent Analysis in Ultra-Violet Light*, 1933; R. W. Wood, *Physical Optics*, 1934.

Fluorescent Lighting, *see* LIGHTING, *Artificial lighting*.

Fluorescent Paint, *see* LUMINOUS PAINT.

Fluorescent Whitening Agents, *see* BLEACHING.

Fluoric Acid, *see* HYDROFLUORIC ACID.

Fluorine, chemical element of the halogen group, atomic weight 19, atomic number 9. It is an extremely active gas, combining readily with most chemical elements. It was isolated in 1886 by Moissan, who obtained it by electrolysis of potassium fluoride in liquid hydrofluoric acid free from water. As anhydrous hydrofluoric acid is itself a non-conductor of electricity, the addition of a quantity of potassium hydrogen fluoride was necessary to convey the current. The electrolysis was carried out in a U-tube made of an alloy of iridium and platinum, this substance being less readily acted upon than other metals. The electrodes were made of the same material, and the products of electrolysis were carried off by lateral tubes, the entrances to the U-tube being stoppered with fluorspar. As an additional precaution a temp. of -23°C . was maintained during the operation, this being done by surrounding the tubes by the vapour from boiling methyl chloride. The object of this cooling is to condense any hydrofluoric acid gas present. F. is now prepared on a large scale by the electrolysis of fused potassium hydrogen fluoride in an electrically heated copper V-tube with graphite electrodes. F. is a pale yellow gas with an irritating smell. It condenses at -187°C . to a yellow liquid, and forms a light yellow solid at -233°C ., whilst at -252°C . it becomes white. It is the most active element known, decomposing water readily, and liberating appreciable quantities of ozone. It combines violently with non-metals such as bromine, iodine, carbon, sulphur, silicon, phosphorus, arsenic, etc., frequently causing them to burn with incandescence; it readily attacks mercury, sodium, potassium, magnesium, and other metals, and is only unaffected by oxygen, nitrogen, and chlorine. Curiously enough the gas can be kept over mercury if it is

not shaken, but this is due to the formation of a layer of fluoride which protects the metal from further attack. The only compound of F. with hydrogen is *hydrofluoric acid*, prepared commercially by heating fluorspar with sulphuric acid in leaden vessels. It is a colourless liquid boiling at 19°C .; its vapour is extremely poisonous, and it combines readily with many metals, forming fluorides. Its most useful property is that demonstrated by its action on glass; it attacks the silica, and may thus be used for etching glass. When the materials are dry, no action takes place. F. is found in nature in fluorspar (CaF_2), cryolite, and other minerals, and traces are found in sea-water and in the enamel of teeth. Various compounds of F. have recently become of considerable industrial importance, and many of them are of high significance in atomic energy operations.

Fluorspar, or **Fluorite**, mineral mainly consisting of calcium fluoride (CaF_2). It occurs crystallised in the cubic system and in the massive form. The crystals have a perfect cleavage, a hardness of 4, sp. gr. 3.2, and occur in a wide range of colours from transparent to almost black. It often contains calcium chloride and traces of organic matter. Many crystals contain an internal cavity, which is found to contain liquid or gas. The colour, too, is attributed to organic matter, as when the mineral is heated the colour tends to disappear and small quantities of carbon monoxide, hydrogen, etc., are evolved. Some varieties exhibit the phenomenon of fluorescence (q.v.), and phosphorescence is observed when the mineral is submitted to Röntgen rays. F. occurs in association with ores of tin, lead, copper, and silver, and also in cavities in volcanic rocks. It is of wide distribution, and is common in England, particularly in Cornwall, Devon, Derbyshire, and Cumberland. In mining dists. F. is used as a flux for copper, lead, and gold ores. The violet variety, known as 'Blue John' in Derbyshire, is made into ornaments. The mineral was highly prized by the ancients for this purpose, but the spar is too soft for personal ornaments. F. is the chief source in the manuf. of commercial hydrofluoric acid, used for etching glass. The transparent variety is used in the construction of optical instruments.

Flushing (Dutch *Viissingen*), seaport and holiday resort in the prov. of Zeeland, Netherlands, on the S. coast of the is. of Walcheren, at the mouth of the W. Scheldt. It was once an important naval station and a fortress, but is now a leading port of commerce, carrying on, in normal times, an extensive trade with England and South America. The tn has grown in favour as a summer resort. It has a royal dockyard, and since 1875 a large floating dock. The chief industries are shipbuilding, brewing, and the manuf. of oil and soap. Exports agric. produce and shrimps. In the Second World War the greater part of F. was captured on 1 Nov. 1944 by a strong force of Brit. commandos who were landed on Wal-

cheren. Pop. (1954) 26,620. *See also* WESTERN FRONT IN SECOND WORLD WAR.

Flushing and Flushing Bay, once a vil. of Queens co., New York, U.S.A., but since 1897 has been part of the bor. of Queens, New York city. It is situated on Long Is., at the head of F. B., and is named after early Nonconformist settlers from F. in Holland. It is the seat of Queens College of the City of New York.

Flute, musical wind instrument consisting of a long tube of wood or sometimes metal, in sev. detachable joints and open

at the lower end. The vibration of the air in the tube is caused by blowing into the upper end through an oval-shaped hole in the side. There is no mouthpiece, as in other wind instruments. The different intervals in the pitch are obtained by closing or opening the different finger-holes in the lower part of the tube, by which the vibrating column of air is lengthened or shortened as required. The F. in general use possesses a workable compass of about 3 octaves from the low C in the treble clef with all the chromatic intervals. There are 6 finger-holes in the lower part of the tube arranged at fixed intervals from each other in order to produce all the notes which form a major scale; the 2nd octave is obtained by overblowing, which raises each note to an octave higher, and the 3rd octave can be added by a system of cross-fingering. For chromatic intervals the instrument must have additional finger-holes which are manipulated by means of keys. Cocus-wood is the material from which the majority of F.s are constructed, but gold, silver, and other metals are sometimes used. Ebonite also is used. The F. has been in use from the earliest times. Olympus the Phrygian has been credited with the introduction of F.-playing into Greece, where it was largely used in religious ceremonies and encouraged by means of competitive trials; but the ancient F.s were blown vertically, like the old Eng. recorder and the Fr. *flûte à bec*, so called from its supposed resemblance to the beak of a bird. (*See* RECORDER.) The 'German' F. (*flauto traverso*) gradually superseded the *flûte à bec* from its invention about 1720. Handel

was one of the earliest composers to introduce the 'German' F. into the orchestra, employing it for some of the solos in *The Ode on St Cecilia's Day*, 1739. The F. of Handel's day, however, owing to the arrangement of the finger-holes and the

MODERN
CONCERT
FLUTE

difficulty of manipulating the fingering, could be played in tune only in certain keys; this difficulty was abolished by Boehm about 1834, when he introduced the cylindrical bore in place of the old conical bore and a new system of fingering. *F. solos* are less common than they were formerly, but the instrument still plays an important part in orchestras, where the *F.* part is generally placed at the top of the score and is written in the violin or G clef. Other varieties of the *F.* are the *fife*, simply an octave *F.* in B \flat , much used in military bands; the *flageolet*, a smaller variety of the old *flûte à bec*; the *piccolo*, an octave *F.*; and the *flûte d'amour*, a minor 3rd below the ordinary *F.* Among the foundation stops of most organs there are generally one or more '*F.*' stops. See also *FIFE*, *PICCOLO*, *RECORDEE*. See R. S. Rookstro, *The Flute* (new ed.), 1928; H. M. Fitzgibbon, *The Story of the Flute*, 1928.

Flute-stop, organ stop of the diapason species and so called because its tone resembles closely that of a flute. The bell diapason, as it is often called in Britain, is the *flûte à pavillon*, a stop of *F.* invention, and is characterised by its peculiarly powerful tone.

Fluting, in architecture, a concave channel cut vertically on the surface of the shaft of a column or on a pilaster. In Doric columns the flutes round the shaft are 20 in number and meet with a sharp edge. They are carried up above the necking and end abruptly at the base of the cap. In the other Orders, the flutes are 24 in number, and are separated one from the other by small fillets. Sometimes the flutes are cabled, that is to say, they are filled in with a bead for about a 3rd of the length of the shaft from the base. See **ORDERS OF ARCHITECTURE**.

Flux (from Lat. *fluere*, to flow), substance used to aid in separating metals from the other constituents of their ores. The action may be either the removal of silica or other earthy matter by promoting fusion, or actual combination with the oxygen, sulphur, etc., in the compound from which the pure metal is to be extracted. Black *F.* is a reducing *F.*, that is, it extracts oxygen from the ore. It consists of a mixture of finely divided carbon and potassium carbonate, and is made by heating crude cream of tartar with about half its weight of nitre. White *F.* is a mixture of carbonates of soda and potash. Other *F.s* are lime, borax, silica, calcium sulphate, fluorspar, and red lead.

Fluxions, method of mathematical computation devised by Sir Isaac Newton. The method was used by Newton for some time before he disclosed its principles to the world in 1683. For some years the system was used by Eng. mathematicians, but was gradually abandoned in favour of Leibnitz's notation. Leibnitz looked upon quantities as made up of very small parts, as the circumference of a circle may be represented as a polygon of an infinite number of sides. Newton, on the other hand, represented a linear quantity as the effect of the continuous motion of a point

the velocity of which in equal intervals of time measures the magnitude of the quantity. The method of *F.* was fully treated in the *Treatise on Fluxions* of Colin Maclaurin, pub. in 1742. The method of *F.* is a primitive form of the present-day calculus (q.v.).

Fly, see **DIPTERA**; **HOUSE FLY**.

Fly, Artificial, see **ANGLING**.

Fly-bilster, see **CANTHARIDAE**.

Fly-catcher, a bird of the passerine family Muscipidae, but it is used in a wider sense generally to describe all birds who catch flies on the wing. There are over 40 genera and 280 species. The *F.s* are small-sized, bright-plumaged birds, and abound in warmer parts of the old world and in Australia. They are not found at all in North and South America. The bill is a distinctive feature; it is strong and short, and has bristles on the broad, flat base. The common Brit. *F.*, *Muscicapa grisola*, is a tiny brownish-grey bird. The pied *F.* (*Muscicapilla atricapilla*) is a native of Great Britain, rare in the S., not uncommon in the N. The beautiful paradise *F.* of the East Indies and the 'grinder' of Australia do not belong to the family Muscipidae.

Fly-fishing is the sport of catching fish by use of an artificial fly as bait. It is rightly considered to be the most fascinating branch of angling, and great ingenuity has been bestowed upon the manuf. of the various flies used for the purpose. Not only has the angler to choose a fly closely resembling in colour and shape the flies dancing over the stream at the time, but he must also cast the bait in such a way as to preserve the appearance of life. *F.* is principally used for the salmon, trout, and grayling. Sometimes 3 or 4 flies are cast together upon the water and drawn below the surface somewhat at random, while another method is to select a particular fish and cast a fly a short distance up-stream, allowing it to float down over the fish's head. The sport requires considerable dexterity and has innumerable devotees. See bibliography for **ANGLING**.

Fly River, New Guinea, rising in the NW. corner of the Brit. part of the is., and flowing into the Gulf of Papua by a wide delta. MacFarlane and d'Alberty ascended it 90 m. in 1875, and in 1885 Capt. Everill explored it for 200 m. It is navigable for 500 m. of its 650 m. course. Its banks are densely wooded.

Fly-trap, see **DIONAEA MUSCIPULA**.

Fly-wheel, wheel of large diameter and heavy rim connected with the driving-shaft of an engine in order to equalise the motion. Where the motion of an engine proceeds from the to-and-fro movement of a piston-rod it is evident that the velocity decreases towards the end of the stroke. The moving parts of the engine thus tend to proceed in jerks. The function of a *F.* is to receive the excess of energy when the impulse is great, thus retarding the motion of the engine, and to aid the engine when the impulse is less than the mean, acting as a reservoir of energy. It is used: (1) when the engine

is moved by force applied in successive strokes, as in a single-acting engine, a treadle lathe, etc.; (2) when the work which the engine is called upon to perform consists of intermittent strokes, as in punching machines, etc. For effective working the F. should be placed near the seat of intermittent motion; thus, a punching machine driven by gas should have a F. on the crank-shaft to regularise the motion of the gas engine, and another on the punching mechanism to store the energy to be given out in successive punches.

Flying, or **Flight**, the act of moving through the air by propulsion given by wings. In the strict sense of the term the power of flight is only possessed by certain insects, birds, and bats, the latter including the so-called F.-fox. There are other animals which modify their progression through the air by various means which give their actions a certain similarity to actual flight, and they are therefore loosely termed F. animals. It is uncertain to what extent the extinct reptiles (ptero-dactyls) were actually capable of F., but they certainly possessed wings very similar to those of the bat. The so-called F.-fish (q.v.) give themselves an initial impulse by means of a powerful spring effected by their muscular tails; and use their pectoral fins after the manner of a gliding vane, being thereby able to sustain themselves for some hundreds of ft in the air. The action of the fin, however, can hardly be said to be analogous to that of the wing in birds. Certain species of lizards, as, for example, the *Draco volans*, have a skin formation attached to their ribs, which are peculiarly elongated, in such a way as to form a kind of kite, and this enables them to make short darts through the air. The F.-opossums or F.-phalangiers, a genus of small arboreal marsupials found in Australia, have a fold of skin along the flanks which, serving as a parachute, allows them to make prolonged leaps with considerable agility and grace. A smaller member of the same species is known as the F.-mouse. There are also 2 genera of squirrels (*Pteromys* and *Sciuropterus*) which have a development of the skin between the fore and hind legs and possess the power of making leaps for great distances through the air. In doing so they also make use of their tail, the hairs of which stand out on either side and serve to some extent as feathers for supporting them, while the tail also helps to direct their flight. The parachute action exhibited by the animals mentioned above is developed to a greater extent in the F.-lemur (*Galeopithecus*), an insectivorous animal in whom the hairy fold of the skin reaches from the throat to the end of the tail and includes the whole length of both fore and hind legs up to the claws. These animals can leap a distance of over 200 ft. and are found in the Indian archipelago. Zoologically it is difficult to say whether the F.-lemurs should be classed with lemurs, bats, or insectivores, but the latter is the usual method of classification adopted. There are also

kinds of squid, known as the F.-squid, having broad lateral fins which enable them to spring high out of the water. See also BAT; BIRD; DRAGON; FLYING-FISH; INSECT; OPOSSUM; PTERODACTYL; SQUIRREL. For F. machines see articles on AERONAUTICS; AEROPLANE.

Flying Bomb, pilotless jet-propelled aircraft used by the Germans as a long-range bombardment weapon against London and other targets, both in England and on the Continent, in 1944. Its speed was between 350 and 400 m.p.h., the weight of explosives about 1 ton, and the range approximately 150 m. During the 80 days of the most intense bombardment of London between June and Aug. 1944 some 2300 of a total of 8000 F. B.s launched reached the London area; 25 per cent were erratic, many diving into the sea; a few of the others strayed as far as Norfolk and Northampton; and the remainder were brought down by the combined efforts of anti-aircraft guns, fighter pilots, and barrage balloons. In the first week of the bombardment 33 per cent were brought down, while rather more than that reached London. By the end of the 80 days 70 per cent were being brought down by the defences, and only 9 per cent reached London. In the ensuing months F. B.s were launched pick-a-back from Heinkel planes over the North Sea, but the number that reached England was negligible. In the intense period the record destruction of F. B.s was on 28 Aug., when out of 101 which approached the Eng. coast 97 were brought down by the defences. As far back as April 1943 reports from secret agents suggested that the Germans were developing a long-range bombardment weapon of a novel type. Reconnaissance aircraft obtained photographs in May showing that at Peenemünde on the Baltic coast there was a large experimental station where jet-propelled F. B.s for launching from inclined ramps fitted with rails were being tried out. Later it was seen that the Germans were building all along the Fr. coast, from Cherbourg to Calais, a series of concrete structures similar to those seen on the Baltic coast, and all the Fr. sites were seen to be oriented in the direction of London. These ramps or sites were repeatedly and successfully bombed, and then in Mar. 1944 the Germans began constructing an entirely new series of firing points, which though speedily constructed were effectively camouflaged. The Ger. attack started a few days after the Allied landings in Normandy (June). An awkward problem was that of seeing the F. B.s at all. Pilots on patrol had the greatest difficulty in spotting so small and fast-moving an object sev. thousand ft below, though over-land help was rendered by radio telephone. In darkness, however, it was easy to spot the flaming tail of the F. B. many m. away, but in order to bring down the bomb the pilot had to fire his guns at a range of 300 yds. If he fired when too far away he would probably miss the bomb; if he fired when he was too near the bomb might blow up and kill

the pilot. Meanwhile Sir Thomas Merton produced a simple and ingenious range-finder, which proved to be the complete solution for this difficulty. In July 1944 a light-scale attack was made on Portsmouth and Southampton, but most of the F. B.s fell in the sea or in open country, showing that the weapon was not accurate enough against targets of that size, and during the rest of the summer the attack was directed indiscriminately at the unique target of London, and about 92 per cent of all the fatal casualties occurred in the London region. In the summer Brit. and Amer. Air Forces dropped over 100,000 tons of bombs on the F. B. sites. Large stores of F. B.s were located in tunnels and caves near Paris, and many of these were discovered and destroyed. There is no doubt that but for timely interference the bombardment would have started early in 1944 at a time which would have seriously affected the efficiency of the defences. The only completely effective answer was to capture the sites, especially those in the Pas de Calais. The successful Allied invasion achieved that purpose, though the previous destruction of the first 100 launching sites not only delayed the bombardment, but also forced the Germans, for the sake of concealment, to construct their second series of sites on simpler and less efficient lines. It may be added that during 1944 some 24,000 houses in London were destroyed and 800,000 more or less badly damaged. F. B.s and rockets were also fired by the Germans at Antwerp and Liège in Belgium between 13 Oct. 1944 and the end of Mar. 1945. Antwerp in particular was subjected to incessant attacks, which caused much loss of life and damage, but this did not interfere with the working of the port and the moving of military supplies. See also ROCKETS.

Flying Bridge, see FERRY.

Flying Dragon, or Draco, genus of lizards, belonging to the family Agamidae. The species are brilliantly coloured and are found in Malaya; in habit they are entirely terrestrial, and in diet insecti-

vorous; their harmlessness makes them suitable for pets. Their great peculiarity lies in the wing-like membranes, which extend from their sides, can be opened and shut at their owners' will, and serve as a parachute when they leap from one branch to another. *D. volans*, a Malayan lizard, is the best-known species; in length it is about 5 in., with another 5 in. for the long, thin tail.

'Flying Dutchman,' name given to a spectre ship, supposed by popular belief to haunt the waters round the Cape of Good Hope. According to the legend, the captain of the vessel, Vanderdecken, was condemned for his blasphemy to sail for ever round the cape in the F. D., always unable to 'make' a port.

Sailors considered the appearance of the F. D. a bad omen and quickly changed their course to avoid it. The legend has sev. variants in many tales of Ger. mythology, and its prototype is likewise current in other countries. According to Sir Walter Scott, the vessel was originally laden with bullion, a murder was committed on board, and plague broke out. Wagner's opera, *Der fliegende Holländer*, is based on this legend.

Flying-fish, a species of bony fish belonging to the family Exocoetidae and

FLYING-FISH (*Exocoetus volitans*)

FLYING DRAGON

allied to the half-beaks (Hemirhamphidae), garfishes (Belontiidae), and skippers (Scombrosocidae), these families together forming the order Syngnathiformes. All F.s have large plane-like pectoral fins by means of which they glide over the sea. Some species also have large pelvic fins. The mouth is small and the teeth are minute. F.s occur in the warmer parts of the ocean. See also FLYING.

Flying-fox, see FRUIT-BAT.

Flying-lemurs, or Colugos, order Dermoptera, have no close affinity with the lemurs (q.v.) but are more closely related to the insectivora. There are 2 species: *Galeopterus volans*, found in the Philippine Is., and *Galeopterus temminckii*, ranging from Siam and Malaya to

Borneo. They are about the size of small domestic cat and are nocturnal and arboreal, feeding on fruits and leaves. They plane from tree to tree by means of the 'parachute' of skin (patagium) extending from the neck to the limbs and tail.

Flying Machines, see AERIAL NAVIGATION; AERODYNAMICS; AERONAUTICS; AEROPLANE; AIR FORCE; BOMBER; FIGHTER.

Flying-squirrel, member of the family Petauristidae of rodent animals, having a parachute-like expansion of the skin of the flanks, partly supported by bony processes of the feet, which enable it to take extraordinary leaps, gliding for a great distance through the air. There are 3 widely distributed genera, *Petaurista*, including the larger species, are characteristic of the Indian and East Indian region. The European species, *Sciuropterus russicus*, is about the size of a rat, of a greyish-ash colour, with a short tail, and it lives in the forests. Its fur is of little value. The North Amer. species, *Glaucomys volans*, on the contrary, is a good deal larger, and its tail is as long as its whole body. In general appearance F.s resemble ordinary ones, and their habits, food, etc., are much the same. They are rarely seen except at night. Members of the family Anomaluridae (q.v.) are also known as F.s.

Flynn, John (1880-1951), Australian churchman, b. Moliagul, Victoria, moderator-general of the Presbyterian Church of Australia, 1939-42. F. was a member of the home mission staff of the Presbyterian Church of Victoria, 1902-10, was ordained 1911, and became superintendent of the Australian inland mission of the Presbyterian Church, 1912. He was virtually responsible for the estab. of the flying-doctor services and the wireless communication for those services throughout the isolated areas of Australia. He ed. *The Inlander*, pub. occasionally, first issue 1913. See I. L. Idriess, *Flynn of the Inland*, 1932.

Flysch, remarkably thick mass of sandstones and shales extending almost continuously from the S. Alps to the Vienna basin, and then round the Carpathians into the Balkan peninsula. Although uniform in character, it is not of the same age in every place, and probably extends from the Lower Cretaceous period to the Tertiary. It consists of material eroded from newly uplifted mts, but being itself folded is demonstrably formed during the process of mt building. This is an essential feature of F. Nowhere are fossils abundant except in the Oligocene bed of Glarus. Similar formations to the F. are found in the Pyrenees, the Apennines, the Caucasus, and in the Siwalik beds of the Himalaya. According to locality the F. is variously known as Vienna sandstone, Carpathian sandstone, Macigno, Red F., Wild F., etc.

F.O.B., abbreviation for 'free on board,' used in contracts for the sale of goods to denote that costs of carriage and delivery of the goods on board ship must be paid by the seller.

Foch, Ferdinand (1851-1929), Fr. general, b. Tarbes, of old Pyrenean descent. Educ. at Metz and was here when the Franco-Prussian war broke out, and during that war was posted to an infantry regiment. Entered the artillery school, and passed out with distinction as a gunner officer. He was a lieutenant in 1875, and captain in 1878, after a course at the École Polytechnique, Paris. In 1885 he entered the staff college, and in 1895 became instructor in military hist., strategy, and applied tactics at the college. His lectures, which are repub. in his *Principles of War*, 1903, 1918, were at once recognised as a profound analysis of the elements and conditions that had brought success to the Ger. arms in 1870-1871, and success to Fr. arms in the 40

Topical Press

MARSHAL FOCH

years prior to the battle of Waterloo. He was known before the First World War as author of a number of standard books on tactics and strategy. He was promoted lieutenant-colonel in 1898, colonel in 1903, and general commanding 13th Infantry Div. in 1907. In the First World War he served on the W. front, becoming a marshal of France in 1918, and generalissimo of the whole of the Brit., Fr., and Amer. forces in France and Flanders. From the very first days of the campaign F., who in 1914 was a corps commander, estab. his reputation as one of the most brilliant of the Allied leaders. At the Marne battle he played a prominent part in arresting the advance of the Ger. armies and saving Paris. He was in command of the Fr. centre between Sézanne and Mully, and for 3 days he was compelled, against the repeated efforts of the Germans to pierce his line, to retire. Yet promptly in the succeeding days he renewed the offensive with a stubbornness which was characteristic of his whole nature, and at last, having drawn the enemy ever further into the marshes, he took him in flank and hurled him back

the riv. He again distinguished himself in 1915 during the first battle of Ypres, his aid being invoked by F.-M. Sir John French (later Earl Ypres) when the Germans launched their first gas attack. In the great Somme offensive begun by the Brit. in the middle of 1916 the co-operation of the Fr. armies was under the direction of Gen. F. Finally in the darkest days of 1918, when it became apparent to every one that the success of the enemy armies in Europe generally was largely due to unity of command among Ger. H.Q., it was agreed by the Allies to co-ordinate the action of the allied armies on the W. front under Gen. F. The decision was taken in April 1918, and from the turning point of the last Ger. rush, namely in the middle of July at the second battle of the Marne, the Fr. marshal, by a series of remarkable actions along the entire front, gradually 'rolled up' the Ger. armies, and forced them to sue for an armistice.

As a mark of appreciation Marshal F. was made a field-marshal of Great Britain and awarded the Order of Merit. His chief pub. are *The Principles of War* and *The Conduct of War*, 1904. In these it is clear that his model is Napoleon, and that after earnest and searching examination he rejected the Ger., and particularly von Moltke's, system in principle and endeavoured to restore principles which were more in keeping with the genius and traditions of the Fr. Army. The strategy of F. inspires confidence from the fact that his own guiding maxim is that 'to hold positions is to prepare implicitly for defeat, if nothing further is attempted, if the offensive is not immediately assumed.' In his professorial capacity at the École Supérieure de la Guerre F. was before 1914 a master of the science of war. His success was therefore the practical application of sound principles of strategy combined with an absolute mastery of technique. After the Armistice F. engaged in a strenuous but fruitless struggle for a military frontier on the Rhine, though he never advocated a political annexation of the Rhineland and the Palatinate. He took his case to all the authorities: Clemenceau (who favoured it), the Council of Four, the Fr. Cabinet, and the plenary conference of the Allies. He was defeated all along the line in this political campaign, which opened a breach between himself and his old friend and ally, Clemenceau, which was never to be closed. See *The Memoirs of Marshal Foch*, trans. by T. B. Mott, 1931; and M. Weyand, *Foch*, 1947.

Fochabers, vil. of Morayshire, Scotland, situated on a height overlooking the R. Spey, 8 m. S.E. of Elgin. Gordon Castle, now partly demolished, is near by, and in the vil. is a handsome public educational building which was erected by Alexander Mylne, who was a native of the par. Pop. 1000.

Focșani, or **Fokshani**, tn of Rumania, in the prov. of Brlad, situated on the Milcov, 125 m. N.E. of Bucharest. It is an im-

portant commercial centre, having trade with Galați. Before the World War there were soap and oil factories, tanning works, and a trade in wine and grain. The Turks were defeated here in 1789 by the Austrian and Russian allies. Pop. (1930) 32,500.

Focus, point to which converging rays are directed or from which rays diverge. When rays of sunlight, which may be taken as parallel, are received upon a concave mirror, they are reflected to a small area in which any object will appear to be intensely illuminated; the geometrical point corresponding to that area is called the F. of the mirror. If light is received upon a convex mirror the reflected rays diverge, but their direction may be followed backwards to a point behind the mirror, which is therefore called the 'virtual' F. When parallel rays are made to converge by means of a lens, the point where they meet is called the F. of the lens, and it is at this point, or near it, that sun's rays may be made to ignite paper, wood, etc. In geometry a F. is a point which has some definite relationship to the points on a continuous curve. Thus the F. of a parabola is a point the same distance from a point on the curve as the latter is from a fixed straight line—the directrix. An ellipse is a curve whose distance from a fixed point called the F. bears a constant ratio, less than unity, to its distance from a fixed straight line. There are 2 such foci, except in the case of a circle, where the centre is the F. In estimating the propagation of earthquake shocks, the F. is that point from which the earth-waves diverge in all directions; frequently there are 2 such foci. See also **LENS**.

Fodder, see **FATTENING FOODS**.

Foerster, Josef Buhuslav (1859–1951), Czech composer, studied in Prague, where he later held various appointments as organist, teacher, and critic. From 1898 he lived for 10 years at Hamburg, where his wife, Berta Foerster-Lanterer (1869–1936), sang at the opera. After 1903 they lived in Vienna, where he taught at the Conservatory, but from 1918 until his retirement in 1931 he was prof. of composition in Prague. He wrote 6 operas, incidental music for plays, church and secular choral music, 5 symphonies and other orchestral works, 2 violin, and a cello concerto, chamber music, numerous piano pieces and songs, and about 30 recitations with piano accompaniment.

Foeth, see **FET**.

Foetus, embryo in its later stages of development, when it is recognisable as belonging to the species of its parents. In the first week of fertilisation the human ovum passes into the cavity of the uterus, in 2 weeks it is about $\frac{1}{2}$ in. long and $\frac{1}{4}$ in. broad, and the folds which ultimately determine the head and the caudal region are developed. By the 4th week the embryo is curved upon itself, the rudiments of the ears appear as small nodules, and oval buds indicate the coming of limbs. The eyes are recognisable in the 5th week, and the main segments of the limbs

are defined. At 8 weeks the F. has a distinctly human appearance, the nose is prominent, the fingers are separate, and the tail becomes reduced to a rudiment; the length of the F., excluding the legs, which are small and curved inwards, is about 1½ in. In the 3rd month the limbs assume more definite proportions, nails appear on the fingers and toes, and sex can be distinguished. In the 4th month hairs are developed, and the hind limbs gain in proportion to the fore limbs; the F. is from 6 to 8 in. long. In the 6th month the length has increased to about 12 in.; eyelashes and eyebrows appear. In the 7th month the body is plumper, the eyelids open, and the F. is capable of living if b. In the 8th and 9th months the body increases in size and plumpness, the colour takes on a rosy flesh tint. At the end of the 9th month, when the F. is b., it should measure about 20 in. in length, and should weigh from 6½ to 7½ lb. In its foetal stage the embryo is of course dependent upon the maternal blood supply for nutriment. The organ of nutrition is the placenta, in which an interchange of products of the maternal and foetal circulation takes place. The connection between the F. and the placenta is the umbilical cord, which after birth becomes atrophied. *See also* EMBRYOLOGY; PREGNANCY; and OBSTETRICS.

Fog, or Mist, condition of the atmosphere produced in sev. different ways. It is due to the condensation of aqueous vapour which is always present in the air and begins to condense when the point of saturation is reached. F.s are often produced by the sudden cooling of air, owing to its meeting another current at a lower temp., and morning mists disappear as the sun's heat increases. Vapour is more readily condensed if there are nuclei for such condensation, such as salt particles. The density of the F. or M. produced depends upon the amount of aqueous vapour in the atmosphere, the temp. and pressure, and the number and size of nuclei of condensation. A cloud is simply a M. formed high up above the earth's surface. If the drops of condensed vapour are sufficiently large they fall as rain.

The drops of water in a F. are extremely small, 1 thousandth (.001) of an in. or less in diameter. A drop of .001 of an in. in diameter falls through the air at about 200 ft per hr. A F. of drops of this size would soon clear, if it were not renewed, as the height of F.s is generally less than 1000 ft. But F.s are renewed by cooling at their upper surface and by evaporation from the ground; frequently, too, there are many smaller drops which fall more slowly; a drop half the size (diameter) falls at 1 quarter of the speed. The F.s prevalent in large cities, and especially in London, are made denser and more persistent by the large number of carbon particles floating in the air. A F. will arise also where a warm, damp current of air passes over a cold surface. This phenomenon is particularly to be noticed in the region of ice floes. The F.s on the

coasts of Nova Scotia and Newfoundland are due to the warm air from the Gulf Stream passing over the colder water from the Arctic Ocean. On the other hand, M.s frequently arise from the contrary cause of cold air passing over warm water. Thus at eventide, or when a sudden fall of temp. sets in, the air cools more quickly than the water, and the water vapour becomes saturated, leading to the production of M.s so often seen over sheets of water or marshy ground. In London F.s frequently occur during the winter months, beginning usually in Sept. and reaching their greatest frequency in Nov., whence they gradually decline until the middle of Feb., after which a greater falling off takes place, the least foggy month being July. F.s usually occur on a calm day or when there is a light E. wind blowing. The record of London F.s kept since 1863 shows that the worst F. was that of 1879, which lasted practically from the beginning of Nov. to the following Feb., Dec. having no fewer than 17 foggy days. In the year 1873 no fewer than 74 F.s were recorded. The presence or absence of F. has a great effect upon the death-rate, sufferers from asthma, bronchitis, pneumonia, pleurisy, and other diseases of the lungs, as well as whooping cough, being especially affected thereby. Dense F.s in great cities are of considerable inconvenience owing to the general or partial suspension of traffic caused, and they are the chief obstacle to safe air travel. The worst example of this in London was the 'smog' of Dec. 1952 which was responsible for the deaths of many thousands of people from bronchitis and other diseases (*see* AIR POLLUTION). F.s are classified by the meteorological authorities, with the concurrence of the aviation and shipping authorities, according to the distance at which objects can be seen in daylight—a distance called the visibility. In a dense F. visibility is less than 55 yds; this may seem too great an allowance, but the classification is based primarily on the needs of planes and ships, and for these a F. is prohibitively dense if the visibility is less than 55 yds. A thick F. is one with a visibility between 55 and 220 yds, while a moderate F. is one with a visibility between 550 and 1100 yds. The distances of visibility of lights at night are adjusted to ensure uniformity of classification; an ordinary street lamp would be visible at 100 yds in a F. in which the daylight visibility was only 50 yds. *See also* METEOROLOGY. *See* D. Brunt, *Meteorology*, 1928; H. H. Clayton, *Atmosphere and the Sun*, 1930; and S. Bone, *British Weather*, 1946.

Fog Signals are audible S. used on board ship, on railways, or elsewhere, at times when lights or ordinary S. would be of no avail. The maritime code, first made in 1862, is contained in the Collision Regulations of 1910, and is universal. According to this code steam vessels under way are to sound a prolonged blast every 2 min. upon a steam whistle or siren; if under way, but stationary, 2 prolonged blasts at the same interval. A sailing

vessel under way must sound a foghorn, giving 1 blast every 2 min. if on starboard tack, 2 blasts if on port tack, and 3 blasts when sailing before the wind. When at anchor each vessel is required to ring a bell at intervals of not more than 1 min. F. S. are given on railways by laying small detonating caps upon the lines, which explode as the front wheels of the engine pass over them.

Fogazzaro, Antonio (1842-1911), It. poet and novelist, b. Vicenza. He studied literature and divinity under the Abate Zanella; law and music in Padua and Turin. His first attempts were poetry: *Miranda*, 1874, a romance in blank verse, and *Valsolda*, a vol. of peasant lyrics, 1876. Turning to fiction he produced *Malombra*, 1881, and *Daniele Cortis*, 1885, both unworthy of his genius. His next novel, *Il Mistero del Poeta*, 1888, was his first great success. His *Piccolo Mondo Antico*, 1895, is generally accepted as his masterpiece, and has been called one of the greatest It. novels. It was followed by *Piccolo Mondo Moderno*, 1901, *Il Santo*, 1905, and *Leila*, 1910. F. is a novelist of character rather than of plot, and his heroes are often the prey of grave moral conflicts. His later novels were trans. into most European languages. He also pub. 2 collections of short stories, and sev. vols. of essays. See T. Gallarati-Scotti, *La Vita di Antonio Fogazzaro* (Eng. trans. 1922); L. Portier, *Antonio Fogazzaro*, 1937; P. Nardi, *Antonio Fogazzaro*, 1938.

Fogelberg, Benedict Erland (1786-1854), Swedish sculptor, b. Gothenburg. Son of a copper-founder, he studied under Pierre Guérin, the sculptor, and Bosio. In 1820 he fulfilled the dream of his life, and went to live and work in Rome. He was recalled to his native country by royal command in 1854, but returned to Trieste in the same year, and d. there suddenly. His works display independence of thought and imagination influenced by ancient Gk art. His statues of Odin, Thor, and Balder at the National Museum at Stockholm, completed in 1845, are strong and beautiful expressions of his art. His portraits of Gustavus Adolphus, 1840, Charles XII, 1851, and of Birger Jarl, the founder of Stockholm, 1853, are full of life and vigour. See life by J. Böttiger, 1880.

Foggia: 1. Prov. of Italy, in NW. Apulia (q.v.), with a long coastline on the Adriatic. It is mountainous in the S. and the W., and in the NE. is the great mountainous peninsula of Gargano (q.v.). The centre is a plain and there are coastal plains in N. and SE. There are coastal lagoons, and sev. rivs., including the Ofanto, Cervaro, and Candelaro. The dist. was formerly a prov. of the kingdom of Naples (q.v.) called Capitanata. The prin. tns include F., Lucera, San Severo, and Cerignola (q.v.). Area 2834 sq. m.; pop. 686,000.

2. It. tn, cap. of the prov. of F., 73 m. NW. of Bari (q.v.). It stands in the centre of a plain called the *Tavoliere* (Chess-board), and was severely damaged in the Second World War. There is a

Romanesque and baroque cathedral. F. is an important centre of communications, and has cellulose, paper, engineering, and flour industries. Pop. (com.) 98,100.

Foghorn, see FOG SIGNALS.

Fogo, one of the Cape Verde Is., 184 sq. m. It is the highest in the group and has an active volcano, reaching 8800 ft above sea-level, which last erupted in 1857. The climate is good, despite occasional tornadoes. A good quality coffee is grown, as well as maize, millet, sugar, and sub-tropical grains and fruits. São Filipe is the chief tn. Pop. 16,705 (1950).

Fogou, local name given to souterrains (q.v.) in Cornwall, particularly in the Land's End dist. Carn Euny in Sancreed par. and Trelowarren in Mawgan-in-Meneage par. are well-preserved examples.

Föhn (Lat. *favonius*), originally a warm, dry wind blowing down the valleys of the Alps from high central regions, generally in the winter months. As the air sweeps over the mts it is cooled and forced to condense its water vapour. On the lee side it is warmed as it descends and is also dry. The F. wind often blows with great violence, and causes much discomfort and strain on the nervous system. Similar local winds occur in many parts of the world, on the W. coast of Greenland, in the Rocky Mts, Colorado, and New Zealand. This wind is often known as the *sirocco* in the S. Alps, though its nature and cause are not the same as with the true *sirocco* wind and the chinook in the Rocky Mts. See Buchanan, *Atmospheric Temperature during Föhn*, and E. Walter, *Der Schweizerföhn*.

Föhr, one of the N. Frisian Is. in the North Sea, belonging to Germany, off the W. coast of Schleswig-Holstein. Wild fowl abound in the autumn, oysters are exported to Hamburg, and fishing is largely carried on. Wyk is the chief tn. Area 30 sq. m.; pop. 10,700.

Foil: 1. General name for thin plates or sheets of metal, resembling a leaf in thinness. It is used in chem. for electrical apparatus, and by jewellers for backing gems of the less precious kind. The latter is sometimes known as Dutch F., and consists of small sheets of silvered copper, rolled very thin. It is coated with a mixture of isinglass and translucent colour, and is highly polished. Aluminium F. is the commonest kind, used for wrapping chocolate, tobacco, etc. Tinfoil was formerly used for these purposes. Gold-F. is chiefly used by dentists for filling teeth, and is thicker in substance than gold-leaf, which is employed principally for gilding purposes. Gold-leaf is prepared by a prolonged beating out of the metal between sheets of vellum and thick skin. The leaves can be produced in 10 different shades of colour, according to the amount of silver or copper alloy used, and are about 3½ in. square.

2. See FENCING.

Foix, title of a distinguished old Fr. family, which was famous from the 11th to the 16th cents., resident in the tn of F.

Count Roger, grandson of the count of Carcassonne (d. 1012), was the first to assume the title of count of F. He d. c. 1064. In 1190 Count Raymond Roger fought in Palestine, and assisted in the capture of Acre; afterwards he fought in the wars of the Albigenses. His estates were seized by the Church because of his alleged heresy and given to Simon IV de Montfort, but F. regained them before he d. His grandson, Roger Bernard III, was a more famous poet than a warrior; his great-grandson, Gaston III, was the best-known member of the family (see below). Gaston IV (d. 1479) married Leonora, daughter of King John of Aragon and Navarre. His grandson, Francis Phoebus (d. 1483), became king of Navarre. His sister Catherine succeeded him (d. 1517), having married Jean d'Albret (d. 1516). After Henry of Navarre became king (1589), the estates of F. became part of the royal domain of France. Another grandson of Gaston IV was Gaston de F. (d. 1512), a distinguished soldier; his sister Germaine became the second wife of Ferdinand I, king of Spain. Gaston took the command of the Fr. troops in Italy, and d. at Ravenna.

Foix, Gaston (Phoebus) III de, Comte de, and Vicomte de Béarn (1331-91), son of Gaston II. He was surnamed Phoebus because of his handsome appearance; he also bore a golden sun in his escutcheon on account of this name. He fought for France against England and defended the frontiers of Gascony, but later went to fight in Prussia. Returning to France in 1358 he rescued the royal princesses from the Jacquerie at Meaux, and at once began a war against the count of Armagnac, whom he defeated and compelled to pay a large ransom. He was appointed governor of Languedoc, but when Charles VI became king he was recalled, the duke of Berry being chosen as governor. Gaston, however, refused to give up Languedoc, and fought for 2 years, eventually retiring defeated to his own estates. His magnificent court is described in some detail by Froissart.

Folk: 1. Anc. co. of France, joined to the crown by Henry IV in 1607. It is now part of the dept of Ariège.

2. Fr. tn, cap. of the dept of Ariège, on the Ariège. It was the former cap. of F., and is a picturesque tn with many anc. buildings, including a fine, unfinished 14th-cent. church and wooden-fronted houses. It is overlooked by a castle on a rock. There are iron and leather manufs. Pop. 7800. See FOIX, family of.

Fokine, Michel (1880-1942), Russian dancer and choreographer, b. St Petersburg. He began his training under Mme Karsavina's father at the old Imperial School of Ballet. His versatility soon marked him out as an altogether exceptional dancer, and thus early he suggested reforms of the conventional ballet which have now become familiar. F. was responsible for the choreography of *Les Sylphides*, *Le Pavillon d'Armide*, and of the *Prince Igor* dances. Other triumphs of his art were *L'Oiseau de feu* and

Schéhérazade, but perhaps his supreme masterpiece was *Petrushka*. F.'s choreography showed a keen sensibility to musical style, besides a mastery of romance and the dramatic motif through expressive action, mime, and gesture. As a reformer of the dance he ranks with Noverre and, in co-operation with Diaghilev, he raised the status of the ballet among the arts. See C. W. Beaumont, *M. Fokine and his Ballets*, 1935.

Fokker, Anton Hermann Gerard (1890-1940), Dutch aeroplane builder, b. Kediri, Java, educ. at Haarlem. Became an aviator at the age of 20, and in 1912 competed successfully in Russia—also erected a factory at Johannesthal, Berlin; in 1913 opened another at Schwerin. During the First World War he kept the Germans supplied with fighting aircraft—his biplanes and triplanes being named after him. The Ger. general staff valued his services so highly that he was naturalised by military decree, but in 1919 he liquidated his Ger. affairs and opened business in Holland. In 1924 he became a director of an Amer. aeroplane company. He developed a means of shooting through the field of a tractor-propeller. The machine with perhaps the greatest flying record was the Fokker F-7, used by Kingsford-Smith among others; it was a 3-engined monoplane, and in 1928 was flown over all the great oceans and across the Amer. continent.

Fokshani, see FORSANI.

Folard, Jean Charles, Chevalier de (1669-1752), Fr. officer and tactician, served at the battles of Cassano, 1705, and Malplaquet, 1709. His writings include *Nouvelles Découvertes sur la guerre*, 1724, *Commentaires sur Polybe*, 1727-30, 1753, *Traité des colonnes et de l'ordre profond*, 1727-30. Napoleon later adopted this column formation recommended by F. See *Mémoires pour servir à l'histoire de la vie de Folard*, 1753, and *Esprit du Chevalier de Folard*, 1761, pub. by Frederick II.

Fologemot, see FOLKMOOT.

Folcland, see BOC-LAND.

Fole-right, or Folkright, body of customs recognised as law in England before the Norman Conquest. The term later became synonymous with common law (q.v.). See F. Pollock and F. W. Maitland, *History of English Law*, 1898; and J. E. A. Jolliffe, *The Constitutional History of Medieval England*, 1937.

Fold, in geology, a bending of layers of rock, which is generally due to long-continued compression in the crust of the earth. F.s vary in size and shape according to the properties of the rocks affected and the nature of the forces acting on them. An arch or upfold is known as an anticline, a trough or downfold as a syncline, and an abrupt steepening in the dip of an otherwise regularly inclined bed as a monocline.

Földvár, see DUNAFÖLDVÁR.

Folengo, Teofilo (1491-1544), It. poet, (pseudonym Merlino Cocciajo), b. Cipada, near Mantua. He wrote mainly in Macaronic Lat., a mixture of normal Lat.

and It. words with Lat. endings. He became a Benedictine monk, but in 1524 sought release from his vows. His first pub. was *Il Baldus*, 1517, a humorous and highly unmonastic epic; this proved a success, and was followed by *Orlandino*. In 1534 he returned to his monastery, where he wrote an account of his roamings entitled *Ubaos del Triperuno*. Towards the end of his life he wrote a life of Christ called *L'umanità del Figliuolo di Dio*. Rabelais quotes and even copies him; the early eds. of his *Opus macaronicum* are very rare.

OPEN SYMMETRICAL FOLD

An anticline or upward bend and a syncline or downward bend

Foley, John Henry (1818-74), sculptor, b. Dublin. His first exhibits were his models of 'The Death of Abel' and 'Innocence' in 1839. His 'Ino and Bacchus', 1840, executed in marble for the earl of Kilmorke, made him well known. With 'The Death of Lear', 1841, 'Prospero and Miranda', 1843, 'Contemplation', 1845, 'The Mourner', 1849, and 'Caractacus', 1867, he became one of the most popular Victorian sculptors. His bronze equestrian statue of Lord Hardinge, now in front of the gov. house, Calcutta, the statues of Goldsmith and Burke in Trinity College, Dublin, and a symbolical group, 'Asia', and a statue of the Prince Consort for the Albert Memorial in Hyde Park, are his main works. His portrait busts are noted for their likenesses.

Folgore Da San Gimignano (c. 1270-1330), It. poet. His poems, mostly sonnets, are written in a smooth and polished style, all more or less humorous and satirical. He writes about knightly customs and political questions, and also a number of poems on the months of the year and the days of the week. Rossetti trans. them into Eng., and there are also trans. by J. A. Symonds. See Rossetti, *Dante and his circle*, 1874, and *I Sonetti di Folgore* (ed. F. Neri, 1925); see also L. Santucci, *Folgore da San Gimignano*, 1949.

Foliation, geologically used to describe a plane in a rock brought out by a concentration of a certain mineral or by the parallel arrangement of many of the minerals within that plane. A gneissose F. consists of alternations of pale streaks rich in quartz and feldspar with darker streaks made up of some other constituent, usually one of the ferromagnesian minerals. As an example of the second kind of F., the arrangement of minerals parallel to a bedding plane or cleavage

can be mentioned; in this way bedding plane- or cleavage-F. arises.

Foligno, Niccolò da (1430-1502), Umbrian painter of the 15th cent. (who has been wrongly called Alunno) who lived at Foligno. He excelled in expression, and some of his works are: the altarpiece at Deruta, 1458; a Madonna in the Duomo, Assisi, besides many other works at Assisi; an altarpiece at the church of San Niccolò, Foligno; and 'The Saviour' and 'A Virgin of Mercy' in the Louvre. The 'Crucifixion' shows his ability to portray strong emotion.
